Meadowgates last for decades

"[13] is not considered a superstitious number," said study author Brett C. Bols, a UC Berkeley mathematician. "We're going to have to think there's not much in the future in superstition. We can't be more accurate than in the past. The worst that can happen is you might put all the digits together and end up with 13!"

According to the study, based on the correlation of increases in rising emissions of carbon dioxide and climate changes in Canada from 1000 to 1999, the number of years in the record period that end in 13 would be more than twice the number that do not end in 13. The study concludes that the climate would be more severe, with more extreme weather events and less agriculture growth. However, it is not possible to predict with certainty whether such changes will occur, due to the limited data available.

The study was conducted by the University of California, Berkeley, and published in the journal Geophysical Research Letters.

Superstitions can have impact on health
