

General thoughts on fall fertilization

- Potassium
 - Don't apply on sandy soils
- Phosphorus
 - Incorporate to reduce surface P runoff
- Nitrogen
 - Use limited rates for fall seeded crops or cover crops
 - Don't apply on sandy soils
 - Wait until soil temperatures are below 50°F & use a nitrification inhibitor (still better to wait until spring)
- Don't apply on frozen & snow-covered soil
- Mind setbacks from streams, wells, etc.
- Rate determined by soil test results
