

Figure 5 (left). March accumulated total precipitation in inches. Eastern and parts of central Wisconsin received between three and five inches of precipitation, while totals closer to two inches were seen in the west and north.

Figure 5 (middle). March precipitation departure from average, where the majority of the state saw above-average precipitation. Areas near St. Croix County and parts of Monroe County were slightly drier than average.

Figure 5 (right). March precipitation percent of normal, highlighting sections of central and eastern Wisconsin that received over 200 percent of average monthly precipitation.
