

WHAT ONE BAD BULL CAN DO

One Trichomoniasis positive bull
breeds negative cow.

Cow becomes pregnant and
Trichomoniasis infected.

Cow loses pregnancy
and returns to heat.

Cow can be bred by several bulls
because she will not settle until
Trichomoniasis is eliminated.

Bulls who mated with Trichomoniasis-positive
cows now become Trichomoniasis infected.

HERD

BY YEAR 2 OR 3:

more bulls will spread Trichomoniasis meaning more open and late cows.
