## Acknowledgments

The Oregon Department of Environmental Quality's Materials Management Program conducted the 26<sup>th</sup> annual Oregon Material Recovery Survey for calendar year 2017. DEQ extends its appreciation to industry representatives, collection service providers, local governments, and landfill administrators and staff for providing recovery and disposal data for 2017, and working with DEQ staff to complete this report. The survey team also thanks DEQ personnel who contributed to the accuracy and integrity of the information contained in this report:

**Michelle Shepperd, Anna Li, Martin Brown, Loretta Pickerell, Peter Canepa, Sanne Stienstra, Peter Spendelow and Julie Miller** Materials Management, DEQ Headquarters

**Cathie Rhoades, Cathy Brown and Craig Filip** Materials Management Technical Assistance, DEQ Western Region

**Eric Clanton and Matt Slafkosky**, Materials Management Technical Assistance, DEQ Eastern Region

**Daniel Hough** Materials Management Technical Assistance, DEQ Northwest Region

This report provides one of the most complete and accurate collections of state-level disposal and recycling data in the country.

Documents can be provided upon request in an alternate format for individuals with disabilities or in a language other than English for people with limited English skills. To request a document in another format or language, call DEQ in Portland at 503-229-5696, or toll-free in Oregon at 1-800-452-4011, ext. 5696; or email [deqinfo@deq.state.or.us](mailto:deqinfo@deq.state.or.us).

# Executive summary

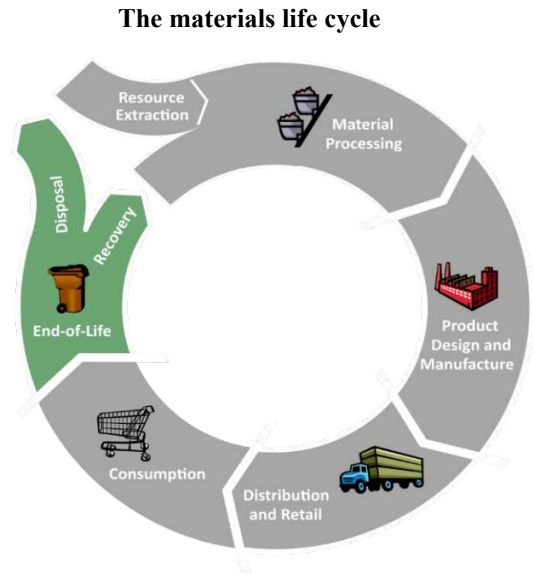

Materials management takes a holistic view of environmental impacts across the full life cycle of materials, as well as actions to reduce those impacts. It includes resource extraction and use of recovered materials, the design and production of materials, their use, and end-of-life management, including solid waste disposal and recovery.

This report focuses on how we manage materials at the end of their life, via disposal and recovery.

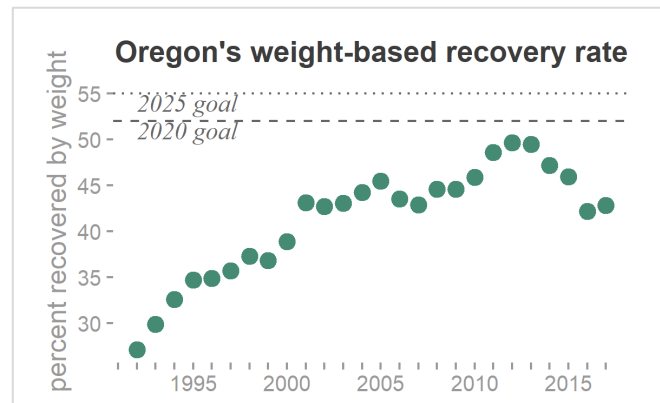

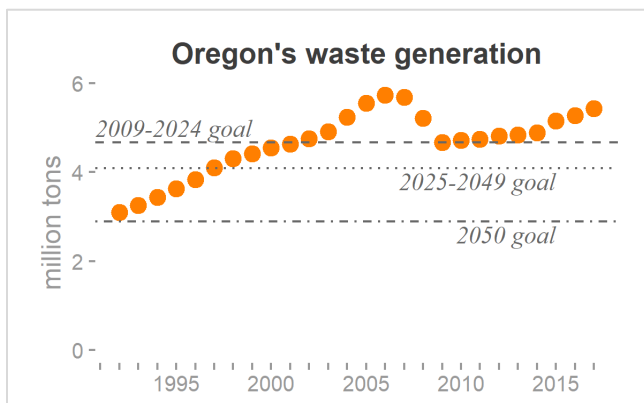

- *Disposal* refers to all materials placed in landfills and many materials burned in incinerators.
- *Recovery* refers to recycling, composting and some incineration for energy recovery.
- *Generation* is the sum of disposal and recovery and represents the total tonnage of the waste stream.
- The *recovery rate* is the percentage of generation recovered.

## In 2017 Oregonians:

- Generated 5,434,333 tons of waste, up nearly three percent from 2016;
- Disposed of 3,106,688 tons into landfills and incinerators, up 1.8 percent from 2016; and
- Recovered 2,327,645 tons of material, 42.8 percent of the waste generated, up from 42.2 percent in 2016.

The rise in generation was likely the result of a busy economy with abundant construction activity and purchasing of consumer goods. Aluminum, container glass, and plastic containers all showed increased recycling in 2017, likely due to the doubling of the refund value of beverage containers under the Oregon Bottle Bill in April 2017. Overall though, recovery remained lower than the peak in 2012-2013, due to the continued absence of markets for recovered wood. Compared to 2016, recovery of scrap metal and cardboard increased, but recovery of film plastics and miscellaneous paper declined.

These charts show trends in waste generation and recovery in relation to the Oregon's long-term goals for reducing generation and increasing recovery (Oregon Revised Statute 459A.010).

Recovery via recycling and other means has environmental value. DEQ estimates that for greenhouse gas emissions, in 2017:

- Recovery reduced 3.3 million metric tons of CO<sub>2</sub> equivalents compared to a scenario where all waste was disposed.
- Another 2.5 MMTCO<sub>2</sub>E in reductions are possible, if recovery rates could be raised to the maximum possible level.

While recovery provides significant environmental benefits, Oregonians will need to do much more than increase recovery to achieve deep reductions in the environmental impacts of materials and waste. For context, Oregon’s total GHG emissions exceeded 60 MMTCO<sub>2</sub>E in 2017. Large reductions in the impacts of materials will require other strategies, such as reducing overall material use and the resulting generation of waste.

*This graphic shows the limited scale of recovery as a solution to reducing GHG emissions. DEQ and partners will need to address the entire life cycle of materials, and take action to not only improve the way we manage materials at the end of their life, but also to reduce impacts earlier in the life cycle.*

# Introduction and purpose

This report describes results and methodology for Oregon’s Material Recovery Survey for calendar year 2017. “Material recovery” includes all materials collected for recycling or composting, and for a subset of materials, incineration with energy recovery. Each year, the Oregon Department of Environmental Quality compiles data on municipal post-consumer waste recovery. DEQ sends a survey to all collection service providers and private recycling companies that handle materials for recycling, composting and energy recovery. Survey data is combined with data gathered from quarterly and annual disposal site reporting forms. Together, recovery and disposal numbers make up the amount of waste generated by Oregonians each year.

<p><b><i>Total Recovered</i></b>  <b>2,327,645 tons</b></p> <hr style="width: 50%; margin: 0 auto;"/> <p><b><i>Total Generated</i></b>  <b>(Total Recovered + Total Disposed)</b>  <b>5,434,333 tons</b></p>	<p>= <b><i>Recovery Rate</i></b></p>	
	<table border="1" style="margin: auto;"> <tr> <td style="padding: 5px;"> <p><b>2017 OR Rate</b> <b>42.8%</b></p> </td> </tr> </table>	<p><b>2017 OR Rate</b> <b>42.8%</b></p>
<p><b>2017 OR Rate</b> <b>42.8%</b></p>		

DEQ uses this information to estimate energy savings and greenhouse gas reductions, two important environmental benefits from material recovery. DEQ also uses it to calculate material recovery rates and waste generation. The recovery rate is the percentage of the total waste generated in Oregon that is recycled, composted or recovered for energy. Waste generation is the amount of waste recovered plus the amount of waste disposed. Recovery, disposal and generation data, as well as recovery rates, are calculated for the state and for each of Oregon’s 35 individual wastesheds.

Individual wastesheds also use this information to implement and improve their waste prevention and material recovery programs.

This is the 26<sup>th</sup> year that DEQ has used the survey to gather this data. The 1991 Oregon Legislature enacted requirements for this annual survey and set goals for state and local recovery rates. These recovery goals were amended by the Legislature in 2001, and then again in 2015 (effective 2016). Wasteshed goals range from 15 percent (Lake Wasteshed) to 64 percent (Metro and Marion Wastesheds) by 2025. The statewide recovery goals are 52 percent recovery by 2020 and 55 percent recovery by 2025.

In 2001, the Legislature also established statewide goals for reducing waste generation. These goals were revised by the Legislature in 2015. The waste generation goals require that the generation of solid waste in the years 2025 to 2049 be 15 percent below the amount of solid waste generated in 2012, and for 2050 and beyond, the generation goal is 40 percent less than the waste generated in 2012.

## Requirement to report

Oregon law requires that all publicly and privately operated recycling and material recovery operations complete a Material Recovery Survey form. This includes landfills, local recycling collectors, private recycling collection companies and depots, transfer stations, material recovery facilities, composters, local governments and any other operation that handles post-consumer recoverable materials. One exception, due to the difficulty of separating post-consumer scrap metal from commercial and industrial scrap metal, are companies handling only scrap metal. These companies are not required to report on privately obtained post-consumer scrap metal, but many do report on a voluntary basis.

The survey requires that companies report all recyclable materials they handle, including the amount of each material collected, the county of origin, the company they received any transfers from, and where or to whom the materials were marketed.

Oregon law further requires DEQ to keep confidential the information reported by private recyclers. This includes customer lists and specific amounts and types of materials collected or marketed by individual companies. Only aggregated information may be released to the public.

## Materials included in the analysis

Oregon's analysis of the environmental benefits from material recovery and the recovery rates includes only post-consumer materials generated in Oregon for recycling, composting or energy recovery. Per Oregon's recycling law (ORS 459A.010 (3)(a)), waste from manufacturing and industrial processes (pre-consumer materials), reconditioned and reused materials, material that can be disposed of as clean fill without being put in a landfill such as brick and concrete, and waste originating out of state (but handled in Oregon) are excluded. Some scrap metals, including discarded vehicles or parts of vehicles and metal derived from major demolition activities handled by scrap metal dealers, are also excluded. Scrap metal collected at disposal sites by collection service providers, at community recycling depots or through municipally sponsored collections events counts as recovered material.

The first Material Recovery Survey for the 1992 calendar year included 30 types of materials. Since then, some new materials have been added and other materials consolidated, so that the survey now contains 33 types of material. The major materials for 2017 are:

- Yard Debris
- Metals – Tinned cans, aluminum and other scrap metals
- Cardboard
- Wood Waste
- Paper Fiber – Other paper fiber (combined high-grade paper, newsprint and mixed scrap paper) not including cardboard
- Other – Including tires, used motor oil, antifreeze, batteries of all types, gypsum, asphalt roofing materials, textiles, paint, and animal waste and grease
- Container Glass
- Plastic – Rigid plastic containers, plastic film, other plastics and composite plastic (including carpet pad)
- Food Waste – Residential and commercial food waste
- Electronics

A complete list of materials recovered is included in Table 8, at the end of this report.

# Recovery and reductions in environmental impacts

## Summary of analytical results

Oregon’s recovery activity in 2017 can be associated with:

- 3.3 million metric tons CO<sub>2</sub> equivalents of savings in greenhouse gas emissions; and
- 31 trillion British thermal units of savings in energy expenditures.

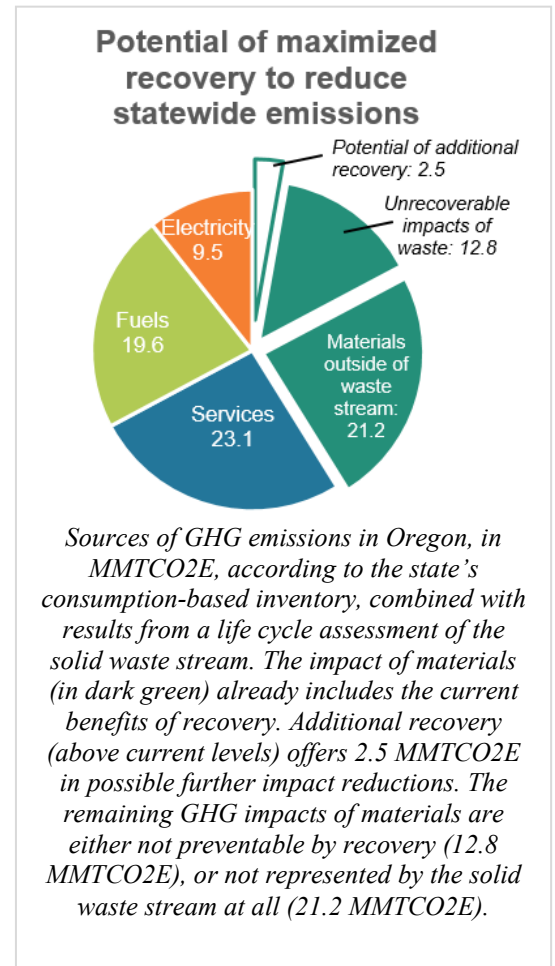

If recovery could be increased from its current rate (about 43 percent by weight) to the currently conceivable maximum rate (about 90 percent by weight), it can be calculated that:

- GHG emissions would decline an additional 2.5 MMTCO<sub>2</sub>E; and
- Energy expenditures would decline an additional 31 trillion BTU.

Such savings must be placed within the context of the state’s total environmental impacts.

- Oregon’s total GHG emissions are more than 60 MMTCO<sub>2</sub>E. A recent DEQ report<sup>1</sup> gives recent yearly totals as 66.2 MMTCO<sub>2</sub>E, from a sector-based method, and 88.7 MMTCO<sub>2</sub>E, from a consumption-based method. The consumption-based results are illustrated at right.
- Oregon’s overall direct energy expenditures are nearly 977 trillion BTU per year, in a recent Oregon Department of Energy report.<sup>2</sup>

While increased recovery does present an opportunity for environmental impact reductions, the opportunity is limited. Increased recovery cannot provide the sizeable decreases in impacts anticipated by the state’s greenhouse gas reduction goals (ORS 468A.205), or the *2050 Vision*.<sup>3</sup> Achieving greater reductions in environmental impacts of materials will require other materials management strategies.

## Understanding impact reductions

All products and materials can be seen within the context of the materials life cycle. Everything people touch or use has been created somehow – usually via “extraction” from the earth or soil, followed by production, distribution, consumption and use, and “end of life” processes such as disposal or recycling. Environmental impacts occur at every stage of this life cycle. For example, extracting ore, or operating a farm, uses machinery that emits GHGs and expends energy. The sum total of impacts associated with the materials life cycle are called the “life cycle impacts.”

Recovery activities such as recycling and composting also create impacts. For example, recycling trucks emit GHGs and expend energy as they collect material, as does processing collected recyclables to create new products.

Where, then, do the “impact reductions” or “savings” associated with recovery come from?

DEQ assumes, as is conventional in the field of life cycle assessment, that use of recovered materials prevents production from newly extracted material, or otherwise prevents some undesired environmental impact. For example, production of a metric ton of glass from recycled sources may save about 300 kg of GHG emissions, *compared to the emissions of production from newly extracted material*.<sup>4</sup> Similarly, while aerobic composting does lead to CO<sub>2</sub> emissions, composting may still represent a savings *compared to the methane emissions that could result from disposal in a landfill*.<sup>5</sup>

Accordingly, “impact reductions” or “savings” are not direct measurements, but *projections* of how impacts could differ if materials had been managed differently at end-of-life.<sup>6</sup>

It is important to note that these impacts may occur spread over time instead of in a single year, and may occur in areas outside of Oregon. Though we associate the materials in the waste stream with a particular place (Oregon) and time (for example, 2017), the life cycle impacts of those materials are not always so localized. An item recycled in 2017 in Oregon may have been created in another state or country in a different year. An item disposed in 2017 may decay in a landfill, but slowly over a period of many years. Environmental impacts, and “savings,” are spread out over time and space.

The materials life cycle

<sup>5</sup> US EPA, “Organic Materials Chapters [Documentation for Greenhouse Gas Emission and Energy Factors Used in the Waste Reduction Model (WARM)],” February 2016, [www.epa.gov/sites/production/files/2016-03/documents/warm\\_v14\\_organic\\_materials.pdf](http://www.epa.gov/sites/production/files/2016-03/documents/warm_v14_organic_materials.pdf).

<sup>6</sup> The assumptions behind such projections are important to note. Such calculations, including DEQ’s, presume that demand for materials is unaltered by the presence of recycled materials, and that collected recyclables actually replace newly extracted materials at a high rate, often 1:1. Authors such as Zink and Geyer question both these assumptions – see [doi://10.1111/jiec.12545](https://doi.org/10.1111/jiec.12545) and [doi://10.1111/jiec.12355](https://doi.org/10.1111/jiec.12355).

## Methodological details, in brief

DEQ calculates impact reductions through a multi-step process. First it characterizes Oregon’s solid waste stream, which includes both disposed and recovered materials, by weight and end-of-life disposition (for example, recycling, composting or landfilling). Next it links those weights to “impact factors” that convert weights into environmental impacts for both production processes and end-of-life dispositions. Appropriate credits are given for recovery activities when it can be presumed that recovery has prevented some other, greater environmental impact, as described earlier. Then it sums life cycle impacts for three possible management scenarios:

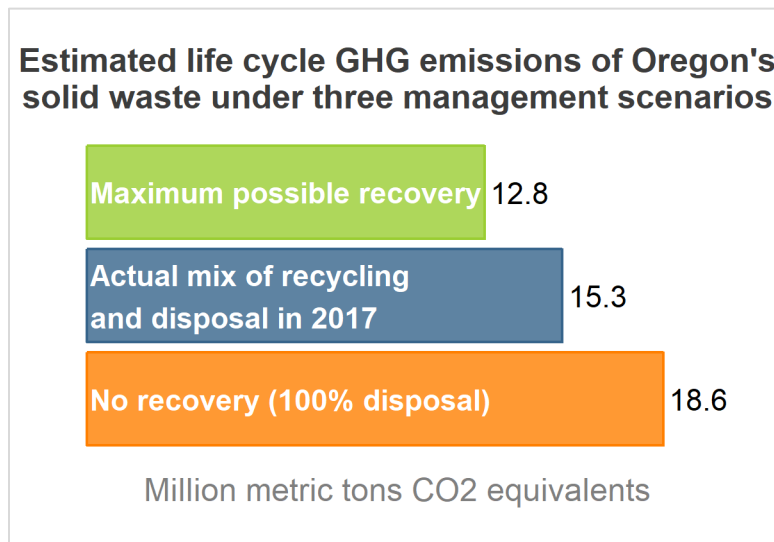

- *Actual*: the life cycle impact of materials in the solid waste stream, given the current mix of recovery and disposal.
- *No recovery*: the life cycle impact of materials in the solid waste stream, if no recovery had taken place and all materials had been disposed.
- *Maximum possible recovery*: the life cycle impact of materials in the solid waste stream, if all recoverable materials had in fact been recovered.

Note that:

- In all scenarios the weights of materials are the same. The scenarios only differ in the end-of-life dispositions of those materials.
- The *maximum possible recovery* scenario assumes that about 90 percent of the solid waste stream is recovered. The figure is 90 percent, not 100 percent, because approximately 10 percent of the solid waste stream, by weight, consists of materials which have no currently viable recovery disposition.

Finally, “impact reductions” or “savings” are calculated as differences between the scenarios. The currently realized savings are the difference between the *no recovery* impact and the *actual* impact. The additional savings, which might be realized by maximizing recovery, are the difference between the *actual* impact and the *maximum possible recovery* impact.

For example, the currently realized GHG savings of 3.3 MMTCO<sub>2</sub>E, and the additional potential savings of 2.5 MMTCO<sub>2</sub>E, were calculated by comparing life cycle emissions for the three scenarios, totaling 18.6, 15.3, and 12.8 MMTCO<sub>2</sub>E:

The weight data describing Oregon’s waste stream comes from several sources.

- Quantities and dispositions of recovered materials come from DEQ’s Material Recovery Survey for 2017.

- Quantities of disposed materials are derived by combining two data sources: the total amount of material disposed in Oregon in 2017, from DEQ's disposal records, and the Waste Composition Study<sup>7</sup> for 2016/17, which describes the proportions of disposed waste in various material categories.

With a few exceptions, impact factors are copied from the EPA's WARM model,<sup>8</sup> version 14. DEQ staff have modified WARM's impact factors for wood waste and yard debris based on their own research and analyses. For uncommon materials appearing in Oregon's waste stream that are not covered by WARM, weighted averages of WARM's impact factors were used.

## Differences compared to 2016

The savings in energy and greenhouse gases reported for 2017 (31 trillion BTU and 3.3 MMTCO<sub>2</sub>E) are somewhat higher than the values reported for 2016 (27 trillion BTU and 2.9 MMTCO<sub>2</sub>E). These differences in impact savings between 2016 and 2017 were not the result of major changes in the solid waste stream; as this report shows, total weights for generation, recovery, and disposal only changed a few percent.

Instead, the differences in impact savings result from a change in DEQ's analytical method. Calculating life cycle impacts from solid waste data is a rapidly evolving field, and for 2017 DEQ made some changes. The changes in method with the biggest influence on differences between 2016 and 2017 were:

- In 2017, DEQ used its own impact factors for wood waste, the most abundant organic material. Determining appropriate impact factors for wood is an active area of inquiry for DEQ's Materials Management program.
- In 2017, paper fiber (not including cardboard and kraft paper) was collected into a single material category with a single set of impact factors. In 2016 paper fiber had been broken down into a number of more specific subcategories. The model for 2017 is simpler, but realistic given the nature of the market for recycled paper.
- In 2017, the analysis included practically all materials in the waste stream. The 2016 analysis ignored less common materials which were difficult to associate with WARM impact factors.

For further information about how DEQ calculates impact reductions contact Martin Brown of Oregon DEQ at 503-229-5502, or [brown.martin@deq.state.or.us](mailto:brown.martin@deq.state.or.us).

# Recovery rates

The recovery rate is the percentage of total waste generation that is recovered. DEQ calculates both the statewide recovery rate and a recovery rate for each of the 35 individual wastesheds in the state.

## 2017 statewide recovery rate

In 2017, the state recovered 2,327,645 tons of material. This represented 42.8 percent of the municipal post-consumer waste stream, well below the statewide goal of 52 percent recovery by the year 2020. Recovered tons increased by 4.6 percent from the previous year surveyed, 2016.

From 1992 through 2005, tons of material recovered increased regularly each year. From 2006 through 2009, recovered tons declined even though recovery rates were fairly flat, as declining consumption of newspapers and magazines, followed by a general decline in overall consumption due to the recession, reduced the amount of material available to be recovered. In 2010, Oregon saw an increase in recovery, as the economy gradually recovered from the recession. In 2016, with the closure of the largest paper mill that accepted wood waste for fuel, and an unexpected decrease in cardboard recovery, there was a decline in the state’s recovery rate. However, in 2017, cardboard recovery increased by nearly 56,000 tons and wood waste increased over 10,000 tons over 2016 levels. Close to 300,000 tons of wood waste were recovered in 2017, still well below the record of more than 500,000 tons recovered in 2006.

A total of 3,106,688 tons of municipal post-consumer waste from Oregon were disposed in 2017, up 1.8 percent from 2016. This is still well below the peak disposal tonnage in 2007. Per-capita is still just barely below the 1992 figure of 1,513 pounds per person.

Total tons disposed added to total tons recovered equaled 5,434,333 tons of total waste generated in 2017 (see Waste Generation on page 12). Total generation rose by 3.0 percent, with per-capita generation increasing by 1.4 percent from 2016 levels.

Waste recovery increased 4.6 percent (+101,702 tons) and disposal increased 1.8 percent (+56,255 tons), resulting in the increase in generation (+157,958 tons). Although waste generation has increased steadily since 2010, moving us away from our waste generation goals, total generation in 2017 was still 295,546 tons less than it was

**Oregon State Recovered Tons and Recovery Rates**

Year	Tons Recovered	Tons Disposed	Calculated Rate <sup>9</sup>
1992	839,679	2,263,099	27.1
1993	974,685	2,280,513	29.9
1994	1,118,912	2,312,669	32.6
1995	1,257,204	2,362,146	34.7
1996	1,338,259	2,497,170	34.9
1997	1,462,114	2,633,017	35.7
1998	1,604,985	2,695,903	37.3
1999	1,626,271	2,788,699	36.8
2000	1,765,817	2,778,463	38.9
2001	1,999,085	2,635,072	43.1
2002	2,029,261	2,723,365	42.7
2003	2,116,880	2,796,787	43.1
2004	2,317,064	2,923,462	44.2
2005	2,523,367	3,026,457	45.5
2006	2,494,050	3,235,828	43.5
2007	2,437,569	3,248,126	42.9
2008	2,326,146	2,890,503	44.6
2009	2,082,631	2,586,721	44.6
2010	2,163,957	2,523,808	46.2
2011	2,306,124	2,437,767	48.6
2012	2,391,490	2,424,833	49.7
2013	2,390,859 <sup>1</sup>	2,513,404 <sup>1</sup>	48.8 <sup>1</sup>
2014	2,307,269 <sup>1</sup>	2,634,653 <sup>1</sup>	46.7 <sup>1</sup>
2015	2,369,080 <sup>1</sup>	2,784,467 <sup>1</sup>	46.0 <sup>1</sup>
2016	2,225,943 <sup>1</sup>	3,050,432	42.2 <sup>1</sup>
2017	2,327,645	3,106,688	42.8

<sup>1</sup> These tonnage figures are corrected from earlier published values.

<sup>9</sup> Between 2001 and 2015, Oregon’s law specified that “credits” be provided towards the statewide recovery goal for jurisdictions that promoted programs for home composting and for material reuse - programs for which recovery is difficult to measure directly. At the state level, these credits added about 3.6 to 3.8 percent to the statewide recovery rate in those years. Changes in legislation in 2015 eliminated the recovery credits, and so they have been dropped from this table.

at its peak in 2006. This is a drop of 5.2 percent in waste generation between 2006 and 2017, or 15.5 percent if measured on a per-capita basis.

## How DEQ calculates the statewide recovery rate

DEQ combines information about quantities of material collected from privately-operated recycling and material recovery facilities with recovery information from collection service providers and disposal site collections, in a manner that eliminates double-counting of material that is passed on from collectors through processors to end-users. This determines the total weight of material recovered.

Next, DEQ adds the total weight of material recovered to the total weight of material disposed, obtained from disposal site reports. This sum is the total weight of material generated. The total weight of material recovered is divided by the total weight generated. This results in the calculated recovery rate.

## How DEQ calculates individual wasteshed recovery rates

The total weight of material recovered is allocated to the wasteshed of origin. Direct collectors of materials are the primary and best information source for the collected materials' wasteshed of origin. When information from direct collectors is not available, or when a survey respondent does not know the wasteshed of origin for the collected materials, DEQ uses information from the companies receiving materials from the collectors in order to allocate material back to wastesheds. Material is allocated back to wastesheds based on population in rare cases when survey respondents and market information is insufficient.

DEQ also uses information from disposal site reporting forms to determine the total weight of material disposed to the wasteshed of origin. For each wasteshed, total weight of material disposed is added to total weight of materials recovered to ascertain the amount of waste generated in the wasteshed. The total weight of material recovered is divided by the total weight generated to determine the calculated recovery rate for each wasteshed.

### Marion County adjustment

As home to the state's only municipal waste-to-energy incinerator, Marion County's recovery and disposal tonnages are revised each year to include certain wastes burned for energy as recovered, as directed by the 2001 Legislature. For 2017, the five materials that could be counted toward the recovery rate when burned for energy were wood, yard debris, used motor oil, fuels, and paint. In 2017, 15,538 tons of these materials burned for energy in the county's incinerator were counted as recovered instead of disposed. DEQ obtained this tonnage by multiplying the quantity of non-industrial, in-county, counting solid waste processed at the facility by the percentage that those six materials make up of Marion County's municipal solid waste disposal stream. Marion County also recovered 7,995 tons of scrap metal from the incinerator ash. DEQ subtracted the scrap metal tonnage from the Marion County disposed tons so that the same tons would not be counted as being both disposed and recycled.

### Wasteshed recovery rates

Oregon has 35 individual wastesheds<sup>10</sup>, each with its own recovery rate and goal. Based on the new goals established by Senate Bill 263, eight wastesheds are already at or above their goal for 2025.

---

<sup>10</sup> A "wasteshed" is defined in Oregon law as being an area of the state that shares a common solid waste disposal system, or an appropriate area in which to develop a common recycling system. For the most part, individual Oregon counties are designated as wastesheds. Three exceptions are that:

- The greater Portland tri-county area, consisting of Clackamas, Multnomah and Washington Counties, is designated as the Metro wasteshed.
- Milton-Freewater, a city within Umatilla County, is designated as a separate wasteshed.

## 2017 Oregon Material Recovery and Waste Generation Rates Report

The Survey Report Tables listed on page 20 of this report show 2017 recovery rates for each wasteshed (Table 1), tons of materials recovered in 2017 by wasteshed (Table 2), and tons of solid waste disposed by wasteshed in 2017 (Table 3).

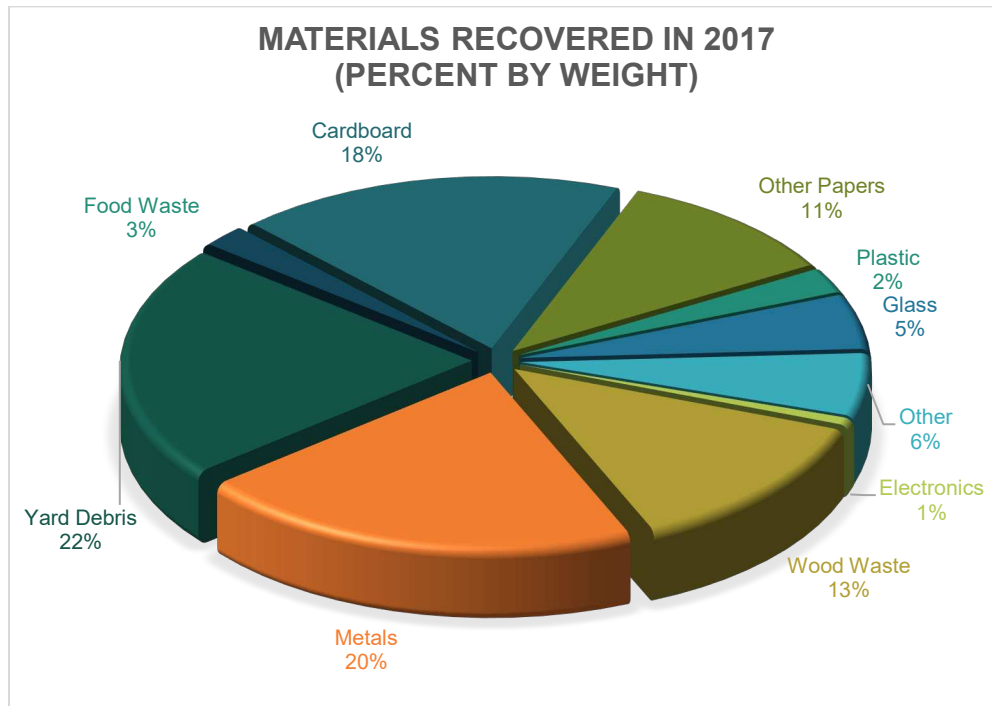

For a historical look at recovery, disposal and generation data in Oregon, see Survey Report Tables 4, 5, 6 and 7, which provide the recovery rates, recovered material tons, disposal tons, and tons of solid waste generated each year since the Material Recovery Survey began in 1992.

- 
- For most cities such as Albany that have populations in two counties, the entire city was included in the wasteshed that included the larger portion of the city population. The exception is Salem, where most of Salem is in the Marion Wasteshed, but West Salem is included in the Polk Wasteshed.

# Materials recovered

Oregon’s material recovery rate for 2017 includes materials that were recycled, composted (including yard debris, food waste and some wood waste), and burned for energy (including tires, fuels, oil-based paint, used oil, wood waste and some yard debris). Sixty-four percent of the material recovered was recycled, 23 percent was composted and 13 percent was burned for energy.

The chart below shows major categories of materials recovered in 2017 and the percentage of total recovery (by weight) for each category. Specific materials included in these categories are listed on page 3.

The following describes changes in amounts of materials recovered in 2017:

**Bottle Bill Materials.** 2017 saw substantial increases in the recycling of aluminum, container glass, and plastic containers (mainly bottles) compared to 2016. These increases are likely linked to the doubling of the refund value for beverage containers from five cents to ten cents in April 2017, increasing people’s incentive to recycle these containers. Oregon may see another increase in 2018, with the addition of juice, tea, and many other beverages to the Bottle Bill.

**Metals.** The total amount of other recovered metals increased by more than 14 percent in 2017 compared to 2016. This increase may be due to scrap metal prices rising in 2017, and is expected to continue increasing in 2018.

**Paper (including cardboard).** In 2017, cardboard tons recycled increased by 15 percent compared to 2016 tons. Increased economic activity often leads to increased sales of products, requiring more cardboard for packaging. In contrast, printing, writing, and other paper tons recycled declined by nearly seven percent, continuing a long-term decline as the use of electronics for news and communication increases.

**Plastic.** Recycling of rigid plastics increase by two percent in 2017 compared to 2016, while film plastic recycling tonnage decreased by seven percent. Although the increase in beverage container refund values increased bottle bill recycling, toward the end of 2017, markets for recycling plastic were greatly disrupted as China began implementing bans or restrictions on the importation of a number of recyclable materials, including a

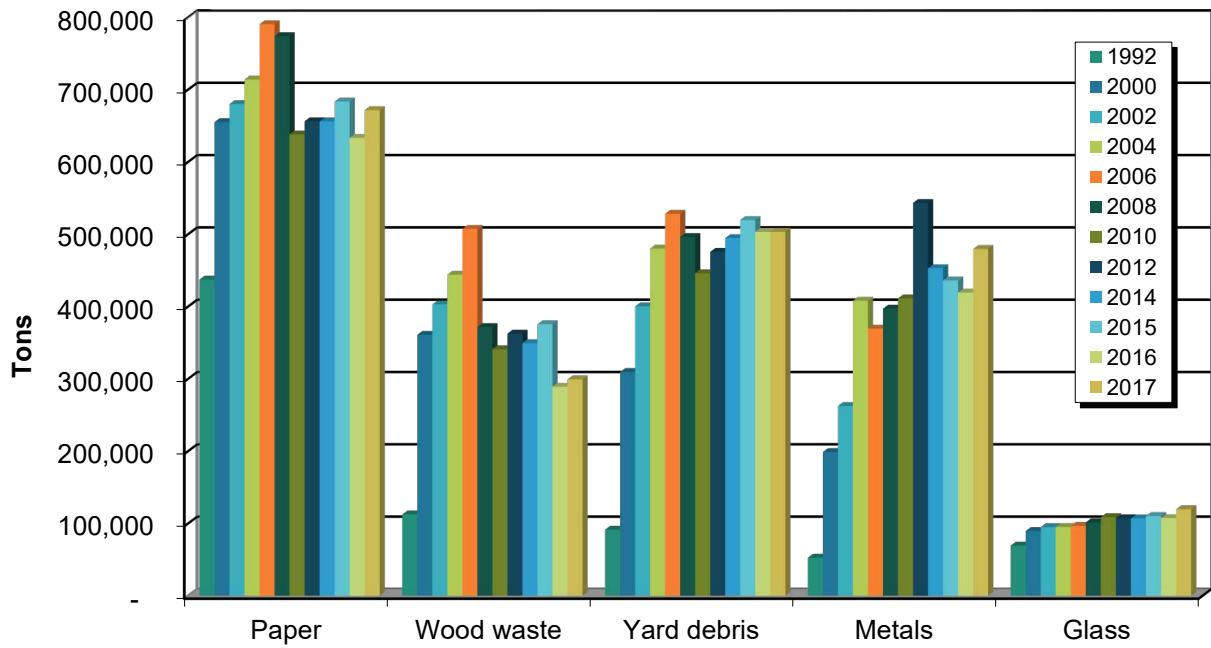

ban on post-consumer plastics. China previously had been by far the largest importer of these plastics. A number of cities dropped plastic tubs from their curbside programs in 2018 as a result of the poor markets for some plastics, and this could have a significant impact on plastics recycling in 2018.

**Electronics.** Electronics recovery continued its decline showing a decrease of over 15 percent in 2017 compared to 2016. This is partially due to the decrease in the number of cathode ray tube monitors and TVs returned for recycling as lighter flat-screen devices replace the heavier CRT devices.

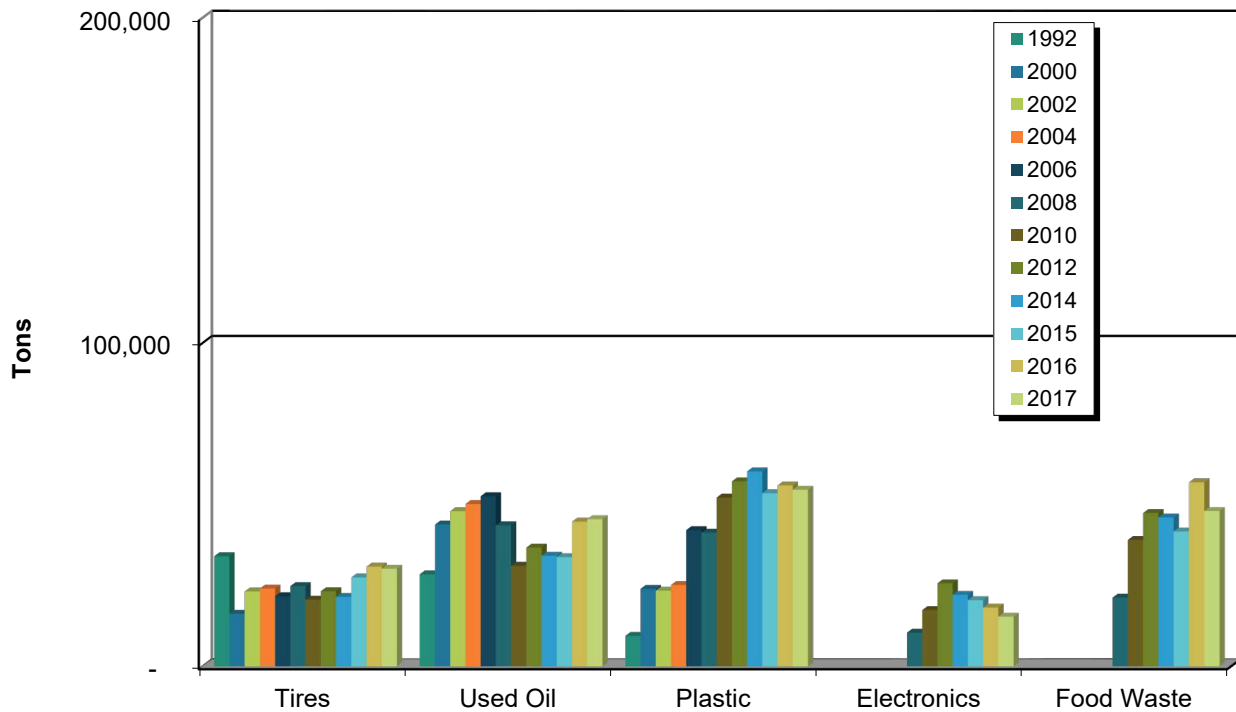

**Organics.** Total recovery of organics (which includes wood waste, yard debris, food waste and animal waste/grease) decreased less than one percent in 2017 compared to a nearly ten percent decrease in 2016.

The following charts compare the materials recovered over the past 26 years.

**Materials Recovered in Oregon  
1992 - 2017**

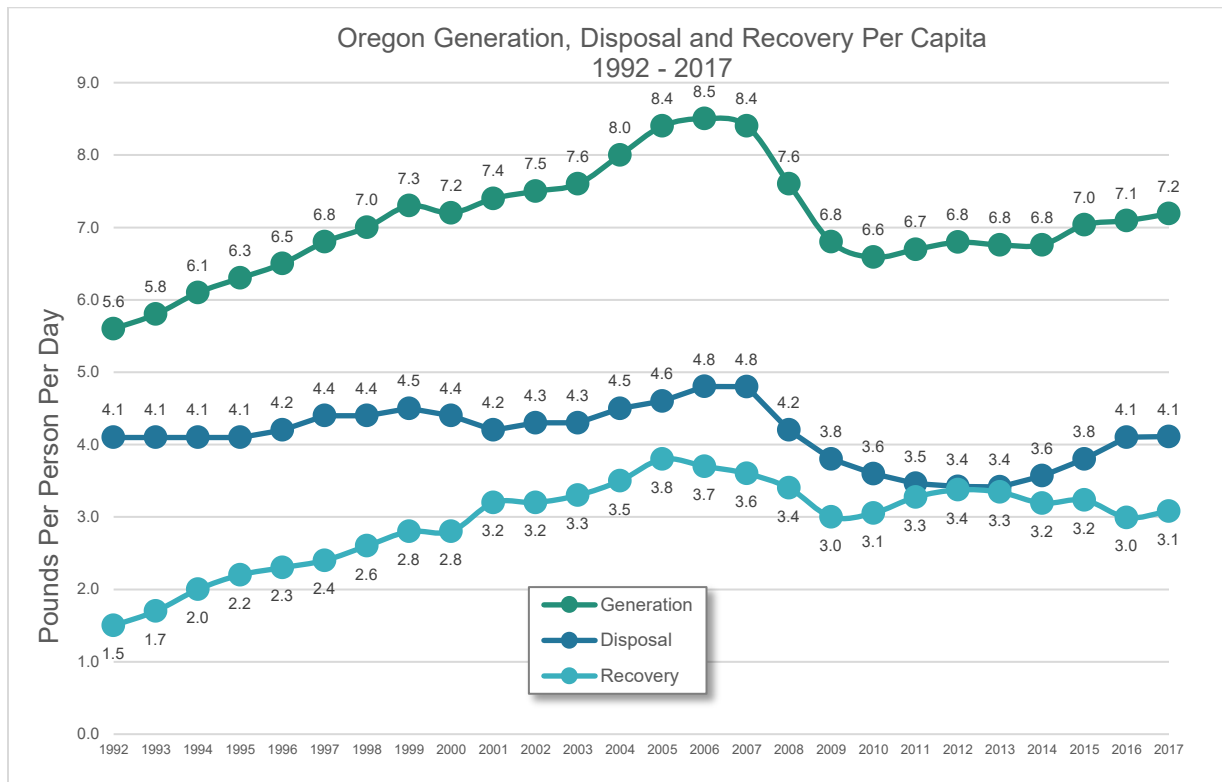

**Materials Recovered in Oregon  
1992 - 2017**

# Waste generation

Changes in the total amount of municipal solid waste generated (materials recovered plus waste disposed) in Oregon over time tell an interesting story. From 1992 to 2006, total waste generation increased every year, often steeply. Waste generation then declined slightly in 2007 and sharply in both 2008 and 2009, coinciding with the economic recession. Between 2009 and 2014, waste generation started growing again, but at a very slow pace, averaging less than one percent increase per year. In 2017 Oregon generated 5,434,333 tons of municipal solid waste, an increase of nearly three percent over 2016. This equates to per-capita generation of 2,625 pounds per person (7.2 pounds per day), a 1.4 percent increase from 2,589 pounds per person (7.1 pounds per day) in 2016. In 2017, the state missed both its goals for no increase in per-capita and total waste generation. Still, total waste generation in 2017 was well below (295,546 tons less) its peak in 2006. This is a drop of 5.2 percent in total waste generation between 2006 and 2017, or a 15.5 percent drop in the per-capita amount.

Generation can be seen as a crude measure of consumption, and for many materials, the environmental impacts of production (the corollary of consumption) are many times higher than the impacts of disposal. For example, EPA has estimated that roughly 40 percent of the country’s greenhouse gas emissions are associated with the production and transportation of goods<sup>11</sup>. The leveling off of waste generation in 2006, the sharp decline in 2007 through 2009, and lack of restoration to pre-recession levels since then suggests that some of the changes in waste generation that occurred during the last recession may be long-lasting, and that the reduction in use of materials is not temporary. Reduction in materials use would, in turn, likely result in a reduction of greenhouse gas emissions associated with all stages of the life cycle of materials. Many other adverse environmental impacts associated with materials likely also decreased.

<sup>11</sup> Figure ES-1of *Opportunities to Reduce Greenhouse Gas Emissions through Materials and Land Management Practices*. US Environmental Protection Agency, Sept. 2009.

The following table shows the disposition of the municipal solid waste generated in Oregon in 2017. See Table 9 for individual wasteshed dispositions.

<b>Disposition of Waste Generated in Oregon in 2017</b>	
<b>Disposition</b>	<b>Percent by weight</b>
Disposed*	57.2
Recycled	27.5
Composted	9.7
Recovered for Energy*	5.6

\*For the Marion County’s waste-to-energy facility only the portion of waste that counts toward the county’s and state’s recovery rates is included here in “recovered for energy” (see Marion County Adjustments on page 10). Other wastes burned at the facility are counted here as disposed.

# Discussion

The energy savings and greenhouse gas reductions associated with materials recovered for recycling, composting and energy recovery in 2017 were notable. Energy savings were 31 trillion BTUs, and reductions in GHGs were 3.3 MMTCO<sub>2</sub>E. There is potential for further savings via recovery. If recovery were increased to the maximum possible level using current technology, another 31 trillion BTUs, and 2.5 MMTCO<sub>2</sub>E, in savings might be realized.

These numbers should be viewed in the context of Oregon's total environmental impacts. Oregon's total yearly energy expenditure is about 977 trillion BTUs, and Oregon's total yearly GHG emissions are 62.0 or 88.7 million metrics tons, depending on analytical method. Recovery can reduce impacts, but it cannot reduce them on the scale of the changes anticipated by state goals such as the *2050 Vision*.

Greater impact reductions should be achievable by other materials management strategies, such as reducing the generation of waste in the first place. Unfortunately, overall waste generation in 2017 increased. This likely indicates an overall increase in the use (and production) of materials, with associated increases in emissions across all stages of their life cycle.

In 2015, Oregon adopted new statutory goals of 52 percent recovery by 2020 and 55 percent by 2025. At the time these goals were adopted, we did not anticipate the closure of the paper mill that by far was the largest user of post-consumer wood waste as a fuel, nor the discontinuance of the use of wood by other mills, strongly impacting the ability to recover and use wood. Though much less impactful, we also did not anticipate that Oregon and the world would experience disruptions in the markets for most plastics and for mixed paper, as China, the largest importer of recyclable material in the world, has restricted the importation of these materials and has banned the importation of unsorted paper and all post-consumer plastics in 2018. Oregon recovered 2,327,645 tons of material for recycling, composting and energy recovery in 2017, giving a recovery rate of 42.8 percent, a slight increase of the 42.2 percent rate in 2016. Other anticipated changes in products and packaging are likely to make it even harder to achieve the state's goals in 2020 and 2025, as products and packaging become increasingly difficult to recycle due to such factors as substituting light-weight non-recyclable packaging for heavier recyclable packaging. Although these changes may make achieving a weight-based recovery goal more difficult, they can often lead to environmental benefits since less material is needed for the packaging, resulting in less energy use and greenhouse gases produced and even less solid waste generated and disposed.

# Adjustments to reports from previous years

DEQ continues to review and use survey data even after publishing the final report each year. Occasionally, we encounter and correct errors in previously reported results. Thus, tonnages published in this report for previous years may not match the tonnages originally reported for that year.

## DEQ made the following adjustments for the 2017 report:

- A correction to recovered tonnage of yard debris was made to the 2015 and 2016 survey period, due to a double count discovered.
- A correction was made to some asphalt roofing tons that were found to be used as alternative daily cover at a local landfill but that had been reported as recovered. “Alternative daily cover” - material used to cover garbage daily at a landfill instead of using soil, is considered to be a form of disposal rather than recovery. This correction was made to 2015 and 2016 data.
- The yard debris and asphalt roofing corrections resulted in adjustments to the previous year’s recovery rates; the recovery rate for 2015 dropped from 46.2 to 46.0 percent, the recovery rate for 2016 dropped from 42.6 to 42.2 percent.

## DEQ corrected data in previous years, for the following reasons:

- A correction to recovered tonnage of yard waste was made to the 2015 survey period, a reporting facility for 2016 sent in a missing 2015 report.
- In 2016 a correction was made to some “plastic other” and “plastic film” incorrectly converted to tons from pounds, this increased the total recovered for both materials.
- A couple of 2015 disposal reports were revised. This adjustment increased disposal tonnage for 2015; which dropped the state recovery rate from 46.5 percent to 46.2 percent for 2015.
- A correction to recovered tonnage of wood waste in two wastesheds was made to survey years 2014 and 2013, as some tonnage was determined to be pre-consumer material.
- Adjustments were made to 2014 and 2013 animal waste/grease collection amounts, as well as correctly identifying wastesheds of origin, based on revised reporting by an end-user.
- Disposal tonnage was reported for the wrong wasteshed. This adjustment increased disposal tonnage for 2014 for one wasteshed; which changed the wasteshed rate of the two wastesheds involved. This did not affect the state’s recovery rate.
- An error in reporting was discovered by one of the recycling processors; a large amount of newspaper was double counted in the previously published 2004 results. The paper was counted both at the processing facility and at the paper mill.
- An enforcement action carried out by Metro showed that most of the brick reported as being recycled by one facility was falsely reported. DEQ subsequently decided that brick more closely resembled other inert materials such as cement and asphalt. Since these are not counted toward the recovery rate, brick was removed from all previous recovery tonnages.
- New information showed that corrections needed to be made to tonnages for roofing and non-container glass in 2003 and 2004, as well as other minor adjustments in other categories.
- Field visits showed that some plastic for 2005 had been reported as ‘Plastic Other’ and that this material was actually ‘Rigid Plastic Containers.’ The 2005 numbers have been adjusted for this change, along with a few other minor adjustments.
- Field visits and continued investigation showed that previously reported ‘Wood Waste’ collections for 2006 were actually collected in three years – 2004, 2005 and 2006. These years are now correct.
- The 2006 and 2007 plastics numbers were adjusted between grades of “Rigid Plastic Containers,” “Plastic Other,” and “Plastic Film.” This may have led to small changes in the recovered tonnages for these materials.
- Investigation of disposal numbers at two landfills led to deductions in the amount of SW disposed – these were really Industrial Waste, non-counting for the purposes of this survey.

## 2017 Oregon Material Recovery and Waste Generation Rates Report

- Some changes were made in 2006 and 2007 to disposition of materials. Changes were made to composted, burned for energy recovery and disposed amounts.
- Adjustments were made to the 2007 collection amounts, correctly identifying the watershed of origin.
- For 2006 and 2007, some non-counting slaughterhouse material was deleted from the recovered tonnage.
- Sawdust material from manufacturing was deleted for 2006 and 2007.
- Beginning with 2006, material previously identified as “CD – Construction and Demolition” was separated out into individual materials.
- Textiles previously counted were determined to be re-used, which does not count for recovery. 2006, 2007, 2010 and 2011 recovered tonnage was decreased.
- Some gypsum sent for disposal was included in the 2006 and 2007 tonnage – this was removed.
- Bottle bill materials, container glass and aluminum had better reporting for 2009, and DEQ made some adjustments to those materials for 2008.
- Municipal solid wastes from another landfill were determined to be industrial and were deleted from the 2007 and 2008 counting tonnages.
- Minor disposal adjustments were made to two watersheds for 2006 data with incorrectly reported county of origin.
- Yard debris numbers contained a large double counting for the Metro region – the correction caused a decrease in recovered tons
- Some roofing material was deleted - it was determined to be industrial material.
- Added in disposal tonnages for 2009 and 2010 for material sent out of state for disposal.
- Corrected the disposition methods for food waste and yard debris in 2011.
- Fixed the disposal tonnages originally recorded for the incorrect watershed in 2011.
- An error in food waste reporting discovered by DEQ showed a large amount of food waste was double counted in the 2011 and 2012 reports. The food waste was counted both by the composting facility and by the recycling collectors.
- More accurate reporting identified corrections needed in tonnages for used oil, antifreeze, solvents and used oil filters in 2011 and 2012.
- Adjustments were made to 2013 and 2012 collection amounts, as well as correctly identifying watersheds of origin.
- Municipal solid waste from one landfill was reported incorrectly as out-of-state waste, this adjustment increased the “counting” disposal tonnage for 2013. This in turn adjusted the state recovery rate from 54 percent for 2013 to 53.4 percent.

<sup>1</sup>Phone books included in mixed waste paper in 1992, 1993 and 2001 and subsequent years.

<sup>2</sup>About 900 tons of plastic bottles was included with mixed plastics in the 1995 survey.

<sup>3</sup>Includes only batteries collected at household hazardous waste collection events until 2001.

<sup>4</sup>From 1998 rubber tire buffings were included with tires.

<sup>5</sup>Includes Marion Co. materials in 2001 and subsequent years burned for energy.

<sup>6</sup>In 2007 and subsequent years, Mixed Waste Paper, Hi Grade & Newspaper was combined into Paper Fiber

<sup>7</sup>Asphalt Roofing was included as burned for energy only in years 2001-2006

Data from some years is not shown due to page formatting. Please contact DEQ directly for data from these years.
