1-Pager — on **Standalone Photo Package** —

Setting up a standalone photo package with more than one photo.

» OVERVIEW

The concept is that we want the captions edited for each photo separately so they go online edited, but we need a print only version for print.

» THE PROCESS

Step 1
Place the first photo onto an Adobe InDesign page.

Step 2
Place the second photo onto the same page and continue the process for each additional photo.

Step 3
Move all the cutline, or caption, frames onto the pasteboard, on the side of the page.

Step 4
Delete all the standalone headline frames except for the main photo that you placed first.

Step 5
Take the main photo's headline frame and move it where desired (if needed) and format it as desired.

Step 6
Create a new text frame for the combined caption.

Step 7
Set the element type for the combined caption to "caption_jump."

Step 8
Add the file reference of the main photo to the new combined caption frame.

Step 9
Create the assignment using the BLOX Total CMS menu option.

NOTES

SLUGS: Make sure each photo gets a unique slug. Using suffix of p01, p02, p03, etc. is a great addition to the slugs.

COLLECTION: If these photos are going to be in a collection, that can be setup in BLOX Total CMS in the browser interface before or after the print product is produced.

FUTURE UPDATE: At some point BLOX Total CMS for Adobe InDesign will support placing a collection to get all the images at once. That is probably a year away. So the photos must be brought onto the page all at once. Having a similar slug will help when this feature is added, so plan accordingly.
