Patricia McConnell	Y	Feb192023	10:13:55	Comments re Draft Wolf Mgt Plan	COMMENTS, DRAFT WISCONSIN WOLF MANAGEMENT PLAN Patricia B. McConnell, PhD, Certified Applied Animal Behaviorist Emeritus Black Earth, WI I would like to thank the DNR and all other contributors for this work. The sections on wolf biology, ecology and population dynamics, are valuable, comprehensive additions to our collective understanding of wolves in Wisconsin. The Department's perspective on dropping a state-wide population goal is also to be commended. Ecologically, it makes no sense to create an arbitrary number for the total number of wolves allowed to be killed in the state, when it is clear in this document that predation on domestic animals, undoubtedly an issue to be taken seriously, occurs in specific zones in specific circumstances. More flexibility allows areas with special concern to be treated differently than area with little or no domestic animal depredation. Additionally, as cited in the draft, wolf populations, as in many territorial species, tend to self-regulate over time. I am also grateful to the authors of this draft plan for their long over-due acknowledgement of the attitudes and rights of the Native American communities in our state. These rights, as we are all aware, have often been ignored or abused. Given the attitudes about wolves and the unique legal rights accorded to tribal lands, the proposed buffer zones around tribal land is a step forward. There are concerns, however, some of them serious, relating to the details of a wolf hunt. First, ecologically, it makes more sense to have no annual wolf hunt at all, use lethal control when necessary, and provide support to livestock producers to prevent depredation, than to open up the state to an arbitrary annual wolf hunt. However, the WI legislature, in its wisdom, has passed Act 169 that the DNR shall allow hunting and trapping of wolves, including with free-ranging packs of dogs, if the wolf is not listed as endangered. Thus, until that law is overturned, the DNR has a responsibility to use its powers of management to ameliorate some of the worst aspects of an arbitrary public hunt. Radically decrease the number of wolves allowed to be killed: The research is clear that recreational hunting does not decrease depredations. (Bruns et al 2020 for example.) There is evidence, however, that non-lethal control can be effective in ameliorating livestock losses (Gehring 2010, Treves et al 2016). Everything that can be done to increase non-lethal decreases in livestock/dog losses should be proposed”including more resources for non-lethal management than have been described. The use of hounds as a method of killing wolves must be better regulated. Ideally, it would be discontinued altogether. Setting packs of free-running dogs after a wolf or wolves is inhumane, and an embarrassment to our state. Wisconsin is the only state that allows hunters to set packs of large dogs after wolves, and for good reason”the potential for unnecessary suffering is obvious. Indeed, this is so distasteful that there is little support from both the public and most WI hunters. (Bradshaw et al 2022) From my involvement in hearings related to using dogs to hunt wolves, the only hunting community that is highly supportive of using dogs to hunt wolves is the bear hunting community, who also put their dogs in situations of great harm while going after large predators. (Veterinarians from northern counties, Minocqua area, for example, have gone on record that they see about 100 dogs a year who are badly injured by bears. The number of dogs who have simply died without treatment is not known. I am away from my office and files, but contact me”info below”if you would like specific names and

Name	Resident	Date	Time	Subject	Email Body
					dates.) Again, the use of dogs has been made into law by the legislature, but there is still a tremendous amount that the DNR can do to ameliorate some of the worst consequences: --- First, reconsider the compensation program for bear hunting dogs injured by wolves. I understand that this program was put into place to assuage negative perceptions about wolves and concerns about wolves injuring dogs while bear hunting. But the fact remains that bears are extremely large, well-equipped predators who can, and do, injure dogs. The fantasy that all bears climb trees and are humanely shot by hunters is only that. Most importantly, there is no evidence that I am aware of, or cited in the draft, that those who dislike wolves have a change in attitude because they are allowed $2,500 or more if one of their dogs is killed by a wolf while hunting a far-more dangerous predator. --- Second, do not allow hound training on wolves during the wolf breeding season. Ignoring the well-known biology of the wolf subverts everything else written into this draft: We know that disruptions during the breeding season impacts territorial defense, pair bonding, and successful breeding. Stress is a well-known factor that decreases fecundity in mammals (Geraghty et al 2015). Allowing wolves to be chased, harassed, (and what else? Killed?) during this time period not only creates unnecessary challenges to healthy wolf populations, this kind of disruption can create the exact problem that we are attempting to ameliorate"wolves hunting outside of highly-forested territories into more agricultural area where livestock predator is potential. --- Third, more carefully monitor and regulate hounds hunting wolves. The DNR may not be able to disallow the use of dogs to hunt wolves, but it can do a lot more than proposed to decrease some of the negative consequences of what evidence suggests is an inhumane activity. There are few specifics in the draft about exactly how dogs are used and trained to hunt wolves. For example: Page 114 in the report mentions ¦ review department wolf capture and handling protocols to maximize animal welfare and minimize risks.□ (Product A4d) Does this include individual wolves that are captured to train wolves to focus on wolves versus other species? Are wolves captured at all to train hounds to chase them? It's not clear in either this draft or the current regulations. DNR regulations are clear about the use and management of captive bear, coyote, bobcat, etc, by licensed individuals, but I could find no reference to training dogs to focus on captive wolves anywhere in the regulations. The use of captive individuals, itself highly controversial as inhumane, but is justified by hunters as an important means of training their dogs to focus on one species, rather any species whose scent the dogs come across. Yet, nowhere in the regulations can I find reference to the use of captive wolves to train hunting dogs to focus on wolves versus other species. For that matter, the entire subject of training dogs to hunt wolves□ is so vague as to be almost useless. How is the training conducted? What happens to wolves who are caught by dogs/hunters during the training period? What if a wolf/wolves injures a dog during training? It has been suggested by many (personal communication, DNR staff) that facilities housing captive wild animals for use in hound training are not well monitored or regulated. This is a concern to all WI residents who are in support of responsible hunting, but appalled at some of the abuses that have come to light. As thorough as the draft document is, and I give its authors a tremendous amount of credit, I am surprised by the lack of detail regarding the most controversial aspect of the WI wolf hunt"the use of free-running packs of large dogs to hunt wolves. I strongly request that these issues be more carefully explored and addressed. Respectfully, Patricia B. McConnell, PhD, CAAB Emeritus Black Earth, WI [redacted]
Ross Hutchinson	Y	Feb202023	5:59:29	Support for the Draft Wolf Management Plan	Dear Randy Johnson, Because of wolves place in helping to keep an ecosystem healthy. The need to regulate hunts based with science and not due to pressure from organizations (with the desire to ?hunt? just for the sake of killing). I would like to see a stop to the use of hounds in wolf , coyote and bear hunts and the reimbursement to hunters for hounds lost to wolves during these activities.. Rather than the state paying for lost hounds, hunters should be required pay a large licensing fee that would fund the payout for lost hounds or to carry ?insurance ? to cover their losses. Honestly the whole hunting with hounds should be stopped , at the very least the payment for lost hounds. Why should the state be liable for hunters putting their hounds at risk? Thank you and your team for the effort developing the 2022 draft Wisconsin Wolf Management Overall, I support the draft plan. I am pleased that it is guided by best available science, public input, and Tribal engagement- the core tenets of the best way to protect, conserve, and sustain natural resources! I also applaud the Department for conducting a very extensive and inclusive survey on the "public opinions regarding wolves in Wisconsin?. Things I support about the plan as written: ? The plan removes a numeric population goal, allowing for an adaptable population: I support the goal of a self-sustaining, self-regulating, and genetically diverse wolf population that maintains connectivity with wolf populations in neighboring states and fulfills their ecological roles. ? The plan creates low limit zones around Tribal lands where the Tribes requested it: These lands are treaty-protected with documented wolf packs. Making this update is an important and welcome addition to the plan. Ideally, the plan would expand these zones beyond just the few that are listed and further reduce the limit to one wolf per subzone. ? The plan is reflective of the public opinions survey that finds opinions toward wolves have grown significantly more favorable. ? There is expressed commitment to science and continued research with partners and acknowledgement that ?keystone species such as wolves are an important component of a healthy ecosystem?. ? The plan outlines the strategies related to increasing public education related to the implementation of non-lethal conflict deterrent techniques. ? I support the plan?s recommendations to pursue more administrative rules, including the reduction of the window to report wolf kills to 8 hours or less and making the purposeful destruction of occupied wolf dens illegal Things I would like to see added or reviewed before plan is finalized: ? The plan should outline the concerns with ACT 169 and recommend legislative changes so that the DNR is able to make decisions on wolf stewardship in alignment with the goals of the wolf plan. ? A recommendation that the department issues wolf hunting licenses which are valid only in the specific wolf management zone(s) specified on the license. ? The DNR should better regulate hound training on wolves. The DNR should close wolf-focused hound training activities as each wolf hunting zone closes. The plan currently would allow hounds to chase wolves for training purposes during the wolf hunting season, across the entire state, until the very last wolf zone is closed. This could go on for months and would interfere with the wolf breeding season and population tracking of which both occur in late winter. ? There is currently no guidance in plan for next review or update ? Ideally, the plan should include a provision to update every 5-7 years rather than simply being ?valid until it is replaced.? ? There should be permanent, ongoing oversight by a stakeholder group AND a science committee to oversee wolf stewardship in Wisconsin. The stakeholder group must be inclusive and recognize the importance of Tribal oversight. ? I recommend identifying specific metrics that will define successful wolf management in Wisconsin. Examples should include metrics include pack integrity, average pack size, distribution of CWD in wolf range, the relative distribution of wolves across the state, and genetic connectivity and flow between packs across the state. ? The plan acknowledges that there are responsible farming practices and other non-lethal options to reduce wolf and livestock conflicts but should recommend that the DNR prioritizes these opportunities. Bottom line: Please continue to push for more science-based research in our state as well as wolf co-existence education across Wisconsin. Thank you for your consideration and careful work involving the on-going wolf stewardship of wolves in our state. ronny harris	Unknown	Feb202023	13:54:55	Wolves and our ecology	Wolves have existed in nature for many thousands of years. Just because people are afraid of them doesn't mean that we can do without them. The wanton killing of wolves is foolish, ignorant and must be stopped. We simply cannot allow this important predator to become extinct. Humans have made many stupid mistakes but we can avoid this one by banning the recreational killing of wolves and making strong laws that protect them. Wolves are a very important link in the food chain. We must act now on their behalf and ours before it is too late.
Myra Burns	Y	Feb202023	15:30:19	Support for the Draft Wolf Management Plan	Dear Randy Johnson, Thank you and your team for the effort developing the 2022 draft Wisconsin Wolf Management Overall, I support the draft plan. Mike Kowalski	Y	Feb202023	20:47:03	Support for the Draft Wolf Management Plan	Dear Randy Johnson, I live in northern Wisconsin and was appalled by the way the pseudo poachers and dog fighters handled the last wolf "hunt". It made our DNR appear impotent and useless as the quota set was steamrolled. Adding the recent unethical approach to their responsibility evidenced by the NRB and its squatter chairman, I don't trust any state representative or agency to make decisions on something as important as wolf management. No hunts and no target population numbers. As with any species, problem animals or cases of self defense are naturally a different story. Thank you and your team for the effort developing the 2022 draft Wisconsin Wolf Management Overall, I support the draft plan. I am pleased that it is guided by best available science, public input, and Tribal engagement- the core tenets of the best way to protect, conserve, and sustain natural resources! Debra Taylor	N	Feb212023	9:19:27	Support for the Draft Wolf Management Plan	Dear Randy Johnson, My husband and I have spent so much money going to Yesllowstone National Park to view Wolves there. Now we see boycotting because of their slaughtering. MN is on our list once we find a reliable guide, who never offers trophy hunting outfitting! Please encourage groups to get into wildlife tour programs. We paid $3k pp for the 5 day tour, including a average hotel, and breakfasts and lunches. There were 12 people in our group, our one guide, and a driver! They were booked for months. There are competing groups besides the one we used. Why cannot Wisc do this too? P.s. I was born and raised in Wisc, Milwaukee suburbs . You can and should encourage wildlife programs. Us retired people spend a lot on

Name	Resident	Date	Time	Subject	Email Body
					wildlife tourism. Thank you and your team for the effort developing the 2022 draft Wisconsin Wolf Management Overall, I support the draft plan. I am pleased that it is guided by best available science, public input, and Tribal engagement- the core tenets of the best way to protect, conserve, and sustain natural resources! I also applaud the Department for conducting a very extensive and inclusive survey on the "public opinions regarding wolves in Wisconsin?. Things I support about the plan as written: ? The plan removes a numeric population goal, allowing for an adaptable population: I support the goal of a self-sustaining, self-regulating, and genetically diverse wolf population that maintains connectivity with wolf populations in neighboring states and fulfills their ecological roles. ? The plan creates low limit zones around Tribal lands where the Tribes requested it: These lands are treaty-protected with documented wolf packs. Making this update is an important and welcome addition to the plan. Ideally, the plan would expand these zones beyond just the few that are listed and further reduce the limit to one wolf per subzone. ? The plan is reflective of the public opinions survey that finds opinions toward wolves have grown significantly more favorable. ? There is expressed commitment to science and continued research with partners and acknowledgement that ?keystone species such as wolves are an important component of a healthy ecosystem?. ? The plan outlines the strategies related to increasing public education related to the implementation of non-lethal conflict deterrent techniques. ? I support the plan?s recommendations to pursue more administrative rules, including the reduction of the window to report wolf kills to 8 hours or less and making the purposeful destruction of occupied wolf dens illegal Things I would like to see added or reviewed before plan is finalized: ? The plan should outline the concerns with ACT 169 and recommend legislative changes so that the DNR is able to make decisions on wolf stewardship in alignment with the goals of the wolf plan. ? A recommendation that the department issues wolf hunting licenses which are valid only in the specific wolf management zone(s) specified on the license. ? The DNR should better regulate hound training on wolves. The DNR should close wolf-focused hound training activities as each wolf hunting zone closes. The plan currently would allow hounds to chase wolves for training purposes during the wolf hunting season, across the entire state, until the very last wolf zone is closed. This could go on for months and would interfere with the wolf breeding season and population tracking of which both occur in late winter. ? There is currently no guidance in plan for next review or update ? Ideally, the plan should include a provision to update every 5-7 years rather than simply being ?valid until it is replaced.? ? There should be permanent, ongoing oversight by a stakeholder group AND a science committee to oversee wolf stewardship in Wisconsin. The stakeholder group must be inclusive and recognize the importance of Tribal oversight. ? I recommend identifying specific metrics that will define successful wolf management in Wisconsin. Examples should include metrics include pack integrity, average pack size, distribution of CWD in wolf range, the relative distribution of wolves across the state, and genetic connectivity and flow between packs across the state. ? The plan acknowledges that there are responsible farming practices and other non-lethal options to reduce wolf and livestock conflicts but should recommend that the DNR prioritizes these opportunities. Bottom line: Please continue to push for more science-based research in our state as well as wolf co-existence education across Wisconsin. Thank you for your consideration and careful work involving the on-going wolf stewardship of wolves in our state. Sincerely, Debra Taylor [redacted] Den, CO 80246 [redacted] This message was sent by KnowWho, as a service provider, on behalf of an individual associated with Sierra Club. If you need more information, please contact Lillian Miller at Sierra Club at [redacted]
Jason Maloney	Y	Feb212023	9:24:26	Support for the Draft Wolf Management Plan	Dear Randy Johnson, I live in far northern Wisconsin on the shore of Lake Superior. There are several active wolf packs in my neighborhood. I spend a great deal of time in the forests of Bayfield County. The proposed wolf management plan is quite good in many respects. The proposed wolf management plan is based on science. It includes essential ongoing consultation with the Native American nations in Wisconsin. It includes low quota zones around Tribal lands. There are parts of the proposed plan that should be improved. In particular, hunting of wolves with dogs should be eliminated and the plan should include that recommendation. Exposing domestic dogs to needless danger by using them to hunt wolves is inhumane. Reimbursing dog owners whose dogs are injured while hunting wolves is a waste of scarce funds that should be used for conservation in Wisconsin. As it is, I rank the proposed plan at 8 out of 10 with 10 being a perfect plan and 1 being a terrible plan similar to the current outdated plan. Thank you and your team for the effort developing the 2022 draft Wisconsin Wolf Management Overall, I support the draft plan. I am pleased that it is guided by best available science, public input, and Tribal engagement- the core tenets of the best way to protect, conserve, and sustain natural resources! I also applaud the Department for conducting a very extensive and inclusive survey on the "public opinions regarding wolves in Wisconsin?. Things I support about the plan as written: ? The plan removes a numeric population goal, allowing for an adaptable population: I support the goal of a self-sustaining, self-regulating, and genetically diverse wolf population that maintains connectivity with wolf populations in neighboring states and fulfills their ecological roles. ? The plan creates low limit zones around Tribal lands where the Tribes requested it: These lands are treaty-protected with documented wolf packs. Making this update is an important and welcome addition to the plan. Ideally, the plan would expand these zones beyond just the few that are listed and further reduce the limit to one wolf per subzone. ? The plan is reflective of the public opinions survey that finds opinions toward wolves have grown significantly more favorable. ? There is expressed commitment to science and continued research with partners and acknowledgement that ?keystone species such as wolves are an important component of a healthy ecosystem?. ? The plan outlines the strategies related to increasing public education related to the implementation of non-lethal conflict deterrent techniques. ? I support the plan?s recommendations to pursue more administrative rules, including the reduction of the window to report wolf kills to 8 hours or less and making the purposeful destruction of occupied wolf dens illegal Things I would like to see added or reviewed before plan is finalized: ? The plan should outline the concerns with ACT 169 and recommend legislative changes so that the DNR is able to make decisions on wolf stewardship in alignment with the goals of the wolf plan. ? A recommendation that the department issues wolf hunting licenses which are valid only in the specific wolf management zone(s) specified on the license. ? Penny Warner	Y	Feb212023	13:07:29	Wisconsin Wolf Management	Hello, Please let me know that you received this email with my comments. Thank you! 1. Name: Patricia Warner 2. I have read ALL of the draft plan. 3. I am a Wisconsin resident 4. Overall, the plan is very comprehensive. I attended all the Wolf Management Committee planning meetings via zoom and appreciate the amount of work that went into this draft. I do however

Name	Resident	Date	Time	Subject	Email Body
				Plan Draft Review Public Comment	feel the committee was heavily weighted with the anti-wolf groups. These are the elements that I liked: * The previous plan had a numerical goal of 350 wolves, and I am glad it has been removed as there has been much controversy over the intent of that number. I like the new direction of the department to use science when determining harvest numbers in future hunts. I hope science dominates planning and future quotas are set at zero as science has proven the wolf can manage their own numbers and will not exceed the carrying capacity of the landscape they inhabit. * Recent surveys indicate a shift toward more acceptance of wolves in Wisconsin with wolf advocacy being in the majority of responses. Social media has promoted misconceptions concerning wolves and has encouraged hatred toward the animal that promotes cruel and inhumane practices. * I would like you to revisit Product D3a and D3b on p. 131 in the proposed Wolf Management Plan and actually begin the work of creating materials such as lesson plans, wolf boxes, wolf units and guest speakers, etc. that can be distributed to our public schools, clubs, church groups, scouts, etc. This would ensure that our future generations would have accurate information about wolves. Reach out to organizations such as HSUS, the Sierra Club, TWIN, TWA, etc. that could work in conjunction with DNR personnel to create a variety of materials. TWIN was very successful in the 1980's and 1990's with their development of a variety of educational materials. Their creation of the Adopt-a-Wolf-Pack program not only generated revenue for the DNR, but was distributed around Wisconsin and several other states and succeeded in educating participants in wolf ecology and their role in completing a diverse and robust environment. The public's understanding of the wolf's role in our environment is particularly important now with the proliferation of CWD across our state. 5. These are the elements that I disliked: * Product C2H Hound hunting training should be taken out. It is not part of the law. I own a home and 170 acres of forest land in Oneida County, and I do not want hounds harassing the wildlife on my property. Hound hunting is no better than sanctioned dog fighting which is against the law. Since hound owners are purposely encouraging their dogs to fight with another canid, zero compensation should be awarded to the owners of those dogs. Instead, those dog owners should be prosecuted for cruelty to animals, which is part of the law. * Ban the use of chocolate and Xylitol in baits. This inhumane and cruel practice kills not only wolves, but dogs as well. * Ban hunting at night. * Wolf Population Monitoring p. 64-66 As stated in your plan, radio telemetry collars on average lasted 5 Â½ years. Since the implementation of the GPS collars, the life of a collar is less than a year. This is very costly for the department and suggests that the wolves are being tracked by their collars and killed by poachers. The 2020 report stated that of the 16 recovered illegally killed wolves, 13 were wearing collars. Additionally, 60 of the 76 collars were no longer sending signals. That GPS failure rate is unacceptable. Reinstate the radio telemetry collars. The below methods need to be continued since the department has transitioned to the new occupancy model, which is comprised of a hit-or-miss approach of guesstimating the number of wolves in our State. * Summer howling surveys are the only accurate way to determine if pups have been produced in any given pack. It also gives an estimate of how many wolves are present in that pack. There should be at the minimum, a summer howling sampling of known packs in Wisconsin. * If the department continues to rely on volunteer trackers for winter wolf counts, then the volunteers need to have training in the field with DNR personnel. An internet course cannot sufficiently train a volunteer. Over counting by inadequately trained volunteers is not helpful. 6. It is very difficult to rate this plan until it is implemented, and we see the results. I watched the NRB meetings with horror as they tried to completely eradicate the wolf from its rightful place in the environment by overriding the DNR's recommendations during the last hunt. 7. Considering the 2022 survey and the changing attitudes towards wolves in Wisconsin, this plan should promote policy changes that will bring an end to wolf hunting and trapping in the state. In future committees, greater emphasis should placed on wolf advocacy groups to more accurately reflect the majority of the citizens in Wisconsin.
Linda Frank	Y	Feb212023	13:29:04	Support for the Draft Wolf Management Plan	Dear Randy Johnson, Thank you and your team for the effort developing the 2022 draft Wisconsin Wolf Management Overall, I support the draft plan. I am pleased that it is guided by best available science, public input, and Tribal engagement- the core tenets of the best way to protect, conserve, and sustain natural resources! I also applaud the Department for conducting a very extensive and inclusive survey on the "public opinions regarding wolves in Wisconsin?. Things I support about the plan as written: ? linda hendrix	Y	Feb212023	16:15:28	Comments on Wolf Mgmt. Plan	There are many good elements to this plan including... ...inclusion of all stakeholders. ...adaptable and science based. ...inclusive of the publics positive attitudes towards wolves and that they should be protected in prime wolf habitat. ...no numerical population cap. ...zone specific areas for hunting which focus on wolf conflict areas. ... kill time registration being brought down to 8 hours. I do NOT believe that hounding/training should be allowed in zones 1, 2 and 5 (knowing that 85% of the wolf harvest were killed by hounds in 2021.) The public wants

Name	Resident	Date	Time	Subject	Email Body
					SAFE areas for wolves in their PRIME habitat! They need protected areas. The zone quota cannot be enforced efficiently knowing packs of hounds are after wolves. The Feb 2021 hunt showed us this is impossible. My recommendations are... ...that farms with chronic depredation should be mandated to use nonlethal measures or should not recieve financial reimbursement. ...money reimbursed for hound depredation should only occur if there is verified proof that hounds were not released into wolf caution areas. ...more limits on and registration of bait piles during bear hunting/ training as that is when most wolf depredations on hounds occur and much more conflicts are created with other wildlife. ...much greater enforcement needed to ensure no illegal hunting is taking place. Give wardens the ability to issue trespass citations. ...create wolf safe zones such as zones 1, 2 and 5 to stifle CWD spread. ...limited wolf hunting restricted to conflict areas only. ...no night hunting/use of Lazer technology or snaring allowed. We have a primitive cabin just outside of the Chequaumegon forest and we also camp at the campgrounds in that forest. We have had issues with hounds racing thru our campground two days in a row, 2 summers ago so decided not to camp there last summer. Also, we have been awoken to the sounds of hounds yelping while camping. Also watched a bear swim clear across the lake to avoid hounds. One summer we awoke to incessant horn honking to direct a hound back to a vehicle. Hounding is ruining this state in my opinion. There are huge trespassing issues occurring up north. We were told to tether our 13 year old, 3 legged dog at Black lake campground ....yet hounds raced through the campground unaccompanied and that's OK? We were also told by the sheriff it would take him over an hour to get there. He never came. We lost 50 wolves in zone 1 by our cabin during the Feb 2021 wolf hunt within 3 days time due to hounding. This was heartbreaking to us. After 2012 , we rarely if ever hear a wolf howl at our cabin anymore. Because of hounding, we have considered selling our beautiful cabin. I am concerned that Wisconsin Northwoods is changing and drawing the wrong people to this state. According to a HSUS 2021 study, 62% of Wi voters dislike the idea of hunting wolves. 66% oppose using packs of radio collared hounds. One important fact is that there is but a .02 % DNA variance between hounds and wolves. In essence , hounding is dog fighting ! Knowing that wolf hunting is disliked by the majority of citizens in this state, I believe citizen input on wolf hunting should be garnered more frequently and given greater significance. The WCC recently threw out over 7 resolutions that passed in this state to protect wildlife. They also threw out their own 3-2 rule for moving forward resolutions that gained a lot of citizen support. This is still a democracy. We need to be heard. Included is a recent land usage chart showing the percentages of folks who engage in hunting and nonhunting activities. Please listen to ALL citizens in this state when formulating the new wolf mgmt plan. Thank you ! Linda M Hendrix [redacted] New Richmond, WI. 54017. [redacted] content://media/external/images/media/1000001950
Betty Cordova	N	Feb212023	23:13:32	Support for the Draft Wolf Management Plan	Dear Randy Johnson, For healthy ecosystems you need the Carnivores to kill weaker food source, Please save the wolves!! A recommendation that the department issues wolf hunting licenses which are valid only in the specific wolf management zone(s) specified on the license. ? The DNR should better regulate hound training on wolves. The DNR should close wolf-focused hound training activities as each wolf hunting zone closes. The plan currently would allow hounds to chase wolves for training purposes during the wolf hunting season, across the entire state, until the very last wolf zone is closed. This could go on for months and would interfere with the wolf breeding season and population tracking of which both occur in late winter. ? There is currently no guidance in plan for next review or update ? Ideally, the plan should include a provision to update every 5-7 years rather than simply being ?valid until it is replaced.? ? There should be permanent, ongoing oversight by a stakeholder group AND a science committee to oversee wolf stewardship in Wisconsin. The stakeholder group must be inclusive and recognize the importance of Tribal oversight. ? I recommend identifying specific metrics that will define successful wolf management in Wisconsin. Examples should include metrics include pack integrity, average pack size, distribution of CWD in wolf range, the relative distribution of wolves across the state, and genetic connectivity and flow between packs across the state. ? The plan acknowledges that there are responsible farming practices and other non-lethal options to reduce wolf and livestock conflicts but should recommend that the DNR prioritizes these opportunities. Bottom line: Please continue to push for more science-based research in our state as well as wolf co-existence education across Wisconsin. Thank you for your consideration and careful work involving the on-going wolf stewardship of wolves in our state. Sincerely, Elizabeth Barreras [redacted] NE Albuquerque , NM [redacted] This message was sent by KnowWho, as a service provider, on behalf of an individual associated with Sierra Club. Rosenberg Joy	Y	Feb222023	10:46:42	Support for the Draft Wolf Management Plan	Dear Randy Johnson, The wolves are an essential part of Wisconsin's complex wildlife system. Over-hunting this valuable resource causes damage for generations to come. Thank you and your team for the effort developing the 2022 draft Wisconsin Wolf Management Overall, I support the draft plan. I am pleased that it is guided by best available science, public input, and Tribal engagement- the core tenets of the best way to protect, conserve, and sustain natural resources! I also applaud the Department for conducting a very extensive and inclusive survey on the "public opinions regarding wolves in Wisconsin?. Things I support about the plan as written: ? The plan removes a numeric population goal, allowing for an adaptable population: I support the goal of a self-sustaining, self-regulating, and genetically diverse wolf population that maintains connectivity with wolf populations in neighboring states and fulfills their ecological roles. ? The plan creates low limit zones around Tribal lands where the Tribes requested it: These lands are treaty-protected with documented wolf packs. Making this update is an important and welcome addition to the plan. Ideally, the plan would expand these zones beyond just the few that are listed and further reduce the limit to one wolf per subzone. ? The plan is reflective of the public opinions survey that finds opinions toward wolves have grown significantly more favorable. ? There is expressed commitment to science and continued research with partners and acknowledgement that ?keystone species such as wolves are an important component of a healthy ecosystem?. ? The plan outlines the strategies related to increasing public education related to the implementation of non-lethal conflict deterrent techniques. ? I support the plan?s recommendations to pursue more administrative rules, including the reduction of the window to report wolf kills to 8 hours or less and making the purposeful destruction of occupied wolf dens illegal Things I would like to see added or reviewed before plan is finalized: ? The plan should outline the concerns with ACT 169 and recommend legislative changes so that the DNR is able to make decisions on wolf stewardship in alignment with the goals of the wolf plan. ? A recommendation that the department issues wolf hunting licenses which are valid only in the specific wolf management zone(s) specified on the license. ? The DNR should better regulate hound training on wolves. The DNR should close wolf-focused hound training activities as each wolf hunting zone closes. The plan currently would allow hounds to chase wolves for training purposes during the wolf hunting season, across the entire state, until the very last wolf zone is closed. Jim and Louise Martell	Unknown	Feb222023	15:49:25	Wolf plan	I would like to see a population goal for the state it is not mention in the plan. Also the buffer zone around the Native American reservation is too large it will protect too many wolves. The population of wolves in northwestern Wisconsin is too high. People who live here and including me are getting numerous pictures on there trail cameras. Hunters are getting tired of moving out of hunting areas because of large number of wolves. People are seeing them in there yards and have to watch their pets . The population needs to be controlled . Otherwise there will be an increase in conflicts between people and wolves. The state will be responsible for the damage wolves create. I live in this area and something will have to done to control the wolf population. Thank you for your time.
Judith Green	Y	Feb222023	16:03:17	Support for the Draft Wolf Management Plan	Dear Randy Johnson, My father and husband hunted, fished and were/are avid conservationists. It is possible to be all. Let Wisconsin be the Wisconsin of Aldo Leopold and Gaylord Nelson. Be proud of our state again. Thank you and your team for the effort developing the 2022 draft Wisconsin Wolf Management Overall, I support the draft plan. Roland Hoffman	Y	Feb222023	16:35:19	Support for the Draft Wolf Management Plan	Dear Randy Johnson, I have been learning more about wolves in Wisconsin over the past three years. I have a strong belief in advocating for effective protections for wolves. I understand there have been conflicts with livestock over the years. We need to emphasis non-lethal ways to resolves these conflicts. This draft plan is a great start in acknowledging the ecological importance of wolves and their right to be part of our environment. The history of wolf management has always included a hunter aspect when wolves are not listed on the Endangered Species List. I would like the plan to include the most specific rules for this hunt and how the DNR can make sure a hunt does not exceed quotas put forth in the plan. Making sure science is the leading source for implementing the plan is important. Thank you and your team for the effort developing the 2022 draft Wisconsin Wolf Management Overall, I support the draft plan. I am pleased that it is guided by best available science, public input, and Tribal engagement- the core tenets of the best way to protect, conserve, and sustain natural resources! Carol Larsen	Y	Feb222023	16:40:01	Support for the Draft Wolf Management Plan	Dear Randy Johnson, I have a fundamental understanding of keystone species and their benefit to our ecosystems. I know that we all want healthy ecosystems because we want to have a habitable earth for all its creatures, not only humans, because in the end our lives depend on it. I think that the Sierra Clubs work in species support is very well thought out and reasoned considering all uses and problems with wolves. Their ideas should be adopted ASAP Personally, with the knowledge of the rapid depletion of all the world's species I think we should leave the wolves alone to manage themselves. A human centric view of wolf management is hubris. Thank you and your team for the effort developing the 2022 draft Wisconsin Wolf Management Overall, I support the draft plan. I am pleased that it is guided by best available science, public input, and Tribal engagement- the core tenets of the best way to protect, conserve, and sustain natural resources! I am pleased that it is guided by best available science, public input, and Tribal engagement- the core tenets of the best way to protect, conserve, and sustain natural resources! I also applaud the Department for conducting a very extensive and inclusive survey on the "public opinions regarding wolves in Wisconsin?. Things I support about the plan as written: ? The plan removes a numeric population goal, allowing for an adaptable population: I support the goal of a self-sustaining, self-regulating, and genetically diverse wolf population that maintains connectivity with wolf populations in neighboring states and fulfills their ecological roles. ? The plan creates low limit zones around Tribal lands where the Tribes requested it: These lands are treaty-protected with documented wolf packs. Making this update is an important and welcome addition to the plan. Ideally, the plan would expand these zones beyond just the few that are listed and further reduce the limit to one wolf per subzone. ? The plan is reflective of the public opinions survey that finds opinions toward wolves have grown significantly more favorable. ? There is expressed commitment to science and continued research with partners and acknowledgement that ?keystone species such as wolves are an important component of a healthy ecosystem?. ? The plan outlines the strategies related to increasing public education related to the implementation of non-lethal conflict deterrent techniques. ? I support the plan?s recommendations to pursue more administrative rules, including the reduction of the window to report wolf kills to 8 hours or less and making the purposeful destruction of occupied wolf dens illegal Things I would like to see added or reviewed before plan is finalized: ? The plan should outline the concerns with ACT 169 and recommend legislative changes so that the DNR is able to make decisions on wolf stewardship in alignment with the goals of the wolf plan. ? A recommendation that the department issues wolf hunting licenses which are valid only in the specific wolf management zone(s) specified on the license. ? The DNR should better regulate hound training on wolves. The DNR should close wolf-focused hound training activities as each wolf hunting zone closes. The plan currently would allow hounds to chase wolves for training purposes during the wolf hunting season, across the entire state, until the very last wolf zone is closed. This could go on for months and would interfere with the wolf breeding season and population tracking of which both occur in late winter. ? There is currently no guidance in plan for next review or update ? Ideally, the plan should include a provision to update every 5-7 years rather than simply being ?valid until it is replaced.? ? There should be permanent, ongoing oversight by a stakeholder group AND a science committee to oversee wolf stewardship in Wisconsin. The stakeholder group must be inclusive and recognize the importance of Tribal oversight. ? I recommend identifying specific metrics that will define successful wolf management in Wisconsin. Examples should include metrics include pack integrity, average pack size, distribution of CWD in wolf range, the relative distribution of wolves across the state, and genetic connectivity and flow between packs across the state. ? The plan acknowledges that there are responsible farming practices and other non-lethal options to reduce wolf and livestock conflicts but should recommend that the DNR prioritizes these opportunities. Bottom line: Please continue to push for more science-based research in our state as well as wolf co-existence education across Wisconsin. Thank you for your consideration and careful work involving the on-going wolf stewardship of wolves in our state. Rachel Rakaczky	N	Feb222023	22:30:40	Support for the Draft Wolf Management Plan	Dear Randy Johnson, There are so many non-lethal ways to avoid 'conflict' with wildlife. Stop letting ranchers and hunters set policy that always exclusively results in dead carnivores. Wolves are a magnificent keystone species that belong to ALL Americans for all generations to enjoy and study and appreciate. Killing does not equal management, and wolves aren't 'game', they're living beings with complicated, loving family lives and a vital role to play in the grand scheme of Nature. They absolutely should not die for the sake of your idiotic livestock that are themselves worsening our climate crisis. Any plan that involves the killing of wolves is stupid, short-sighted and belies a serious lack of humanity on the part of its proponents. Thank you and your team for the effort developing the 2022 draft Wisconsin Wolf Management Overall, I support the draft plan. I am pleased that it is guided by best available science, public input, and Tribal engagement- the core tenets of the best way to protect, conserve, and sustain natural resources! Deborah Williamson	Unknown	Feb232023	11:45:51	Wolf Management Plan	Thank you for updating the wolf management plan, and although there is much about the plan that is progressive, I urge you to re-evaluate the plan and take the following into consideration: The plan runs contrary to public values towards wolves (and omits mention of such majority values from the plan), despite department surveys evidencing that the broad public cares about wolves as individuals (and not just for the viability of the population). Given the recent liberalization of killing wolves by the state, it would be incredibly informative to note majority support of the following reasons for opposing a regulated wolf hunting/trapping season (which are all omitted from the plan): opposition to specific methods of harvest like hounds (64%) or traps (70%), feelings that hunting wolves is unnecessary (62%) or culturally offensive to Native American tribes (57%). ● All such reasons convey majority disagreement with practices currently promoted and endorsed by the legislature and the WDNR, and such a conflict between managers and the public should not only be acknowledged, but foregrounded and carefully considered in policy (instead of dismissed). Such decisions to omit literature or downplay evidence (e.g., such as majority opposition to killing wolves and their reasons) are contrary to principles of scientific integrity (e.g., present all relevant scientific evidence to the public) as well as ethics (e.g., disguising ethical decisions, such as recreational wolf killing, as robustly supported by science). Again, thank you for allowing public input on the plan. I urge you to include public concerns and observations in a new revised plan- one that will truly benefit the public for generations as well as the wildlife impacted by these actions. Sincerely, Deborah Williamson
Edward Morgan	Unknown	Feb232023	11:51:29	Wolf management plan	I appreciate the efforts of all WDNR staff involved in updating the state's wolf management plan. Although we believe the current plan needs significant updating (see next section), we recognize the efforts and improvements made to the previous plan, including: ●⍰ Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. ●⍰ There is much greater recognition of the ecological role of wolves ●⍰ The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves ●⍰ The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed) What we don't like: ●⍰ The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on (see reference list below): ● wolf ethology, sentience, sapience, sociability, agency and wellbeing ● effectiveness of non-lethal interventions, especially relative to lethal ones ● the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings. Curtail Hounding or hound training, which are akin to allowing legalized dogfighting. Thank you, Edward Morgan
Rosalind Connell	Unknown	Feb232023	12:10:17	Wolves in Wisconsin	Hi , The YellowStone rewinding project proved the biodiversity ecological beneficial impact of rewilding wolves . Wolves belong in Wisconsin . They are Native Americans . They , have Eco Tourism benefits for the state . Rosalind Connell
Karen Kravcov Malcolm	Unknown	Feb232023	12:12:07	Wolf Management Plan Comments	I appreciate the efforts of all WDNR staff involved in updating the state's wolf management plan. Although I believe the current plan needs significant updating (see next section), I recognize the efforts and improvements made to the previous plan, including: * ●⍰ Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. * ●⍰ There is much greater recognition of the ecological role of wolves * ●⍰ The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves * ●⍰ The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed) What I don't like: * ●⍰ The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on (see reference list below): * ● wolf ethology, sentience, sapience, sociability, agency and wellbeing * ● effectiveness of non-lethal interventions, especially relative to lethal ones * ● the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution * ●⍰ The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. * ●⍰ The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ● A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings. ● Hounding or hound training, which are akin to allowing legalized dogfighting, should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public. * ●⍰ The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. * ● Despite Act 169, which mandates a wolf hunting season, the department can still restrict the implementation of lethal methods by setting minimal quotas, including a quota of '0' wolves, restricting timing and methods. * ● Several studies have proven a proactive non-lethal approach leads to better conflict mitigation. * ● Lethal management often fails to provide a long-term solution to wolf predation and has the least consistent success rates when compared to non-lethal practices. In addition, there is significant evidence showing that lethal wolf management may be less functionally effective at mitigating subsequent livestock losses than non-lethal deterrents. * ●⍰ The plan should require the implementation of abatement measures as well as the use of non-lethal conflict minimization techniques by domestic animal owners for the latter to receive compensation for confirmed predation. * ●⍰ The plan also runs contrary to public values towards wolves (and omits mention of such majority values from the plan), despite department surveys evidencing that the broad public cares about wolves as individuals (and not just for the viability of the population). Given the recent liberalization of killing wolves by the state, it would be incredibly informative to note majority support of the following reasons for opposing a regulated wolf hunting/trapping season (which are all omitted from the plan): opposition to specific methods of harvest like hounds (64%) or traps (70%), feelings that hunting

Name	Resident	Date	Time	Subject	Email Body
					wolves is unnecessary (62%) or culturally offensive to Native American tribes (57%). * ● All such reasons convey majority disagreement with practices currently promoted and endorsed by the legislature and the WDNR, and such a conflict between managers and the public should not only be acknowledged, but foregrounded and carefully considered in policy (instead of dismissed). * ● Such decisions to omit literature or downplay evidence (e.g., such as majority opposition to killing wolves and their reasons) are contrary to principles of scientific integrity (e.g., present all relevant scientific evidence to the public) as well as ethics (e.g., disguising ethical decisions, such as recreational wolf killing, as robustly supported by science). Thank you for your consideration. Karen Kravcov Malcolm
Linda Shaw	Unknown	Feb232023	12:16:31	2022 Wolf Management Plan	To whom it may concern: Please refer to the Adrian Treves and Francisco J Santiago-Avila paper "Estimating wolf abundance with unverified methods" regarding the use of the scaled occupancy model (SOM) for estimating wolf populations in Wisconsin. The SOM is flawed because it relies on old data and compounded uncertainty. The precautionary approach should rely on better methods to avoid the 2021 Wisconsin wolf overharvest debacle. No harvest should be allowed but if you are going to allow one, at the very least you should use valid methods that prevent another unnecessary bloodbath. Thank you for the opportunity to comment. Linda Shaw
Dianne Channell	Unknown	Feb232023	12:59:09	Wolves	WOLVES are essential. You have not fully educated yourself about their place. We need them. Check it out. Dianne Channell
Julie O'Connor	N	Feb232023	13:06:42	WI Draft WMP Comments	Dear Wildlife Officials: The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. The plan should require the implementation of abatement measures as well as the use of non-lethal conflict minimization techniques by domestic animal owners for the latter to receive compensation for confirmed predation. Sincerely, Julie O'Connor, PhD [redacted] Tenafly, NJ 07670
Sharon Gaskill	Y	Feb232023	13:31:12	Submitting comments on wolf management plan	February 23, 2023 Having read the full wolf management plan proposed by the DNR, I wish to weigh in with my comments and suggestions. To begin I must say that I believe two key points: ”a healthy and seasonably-sized and resilient wolf population is important to Wisconsin and its biological diversity; ”I think all decisions regarding the wolf must be based upon science, upon a substantial, continuing and long-lasting body of data and observation. There is much to like in the proposed plan: ”taking away the goal of particular population numbers ”changing the zones to represent more realistic borders that have specific numbers and that respect the views and behaviors of the Native American nations, realizing that their culture reveres the wolf ”requirements for quick registration of killing ”enhanced and continuing education of the public about wolf biology and patterns, deterence to attacks, with an emphasis on the ecological benefits of wolves I feel the plan should have included other points: ”the Minnesota wolf management plan emphasizes collaboration, sharing of information, and cooperation with federal, state and local governments, tribes, non-governmental organizations and citizens; it refers to a well-connected population as a goal, as well as emphasis on educating and engaging the public in minimizing human/wolf conflict; the specificity of these goals is important ”collaborate on research and sharing of data within the region, including MI, MN, and Canada ”a strong and on-going wolf advisory committee needs to exist, one which represents all interests, such as mine, not just those involved in management, in killing or suffering predation ”more emphasis should be put on increased wolf population monitoring, including continuing winter tracking counts; the scaled occupancy model is only one tool and shouldn't be relied upon alone ”do not allow hunting during breeding season; this disrupts packs, establishment of territories and pair bonding, which much data shows leads to increased unwanted predation ”right now those who use hounds to hunt wolves are given more allowance than they should; dog training should be limited to the period when trapping and hunting are allowed in a zone, and all zones should close to training of dogs at the same time ”the DNR should educate and lobby for a change in the laws that allow hunting with dogs; these practices are unusual, unscientific and inhumane; as a frequent hiker in the forests of Wisconsin, I feel my rights are abused and my enjoyment reduced by their presence ”as a tax payer, I resent having state funds paid to compensate for the loss of dogs used to hunt, especially when the owners are well-aware of the areas where wolves frequent; the compensation was created to pay for livestock and pets, not hunting hounds Finally, I am very pleased that the attention has finally been given to replacing the outdated and ineffective plan which has been in existence. I appreciate being given the chance to voice my opinion. Sharon Gaskill [redacted] Black Earth 53515 [redacted]
Jill Sullivan	Y	Feb232023	13:34:24	Support for the Draft Wolf Management Plan	Dear Randy Johnson, Our wolves and all predatory animals are ABSOLUTELY necessary for the balance of our eco system. If we continue to destroy our beautiful and necessary animals we are in turn destroying ourselves! PLEASE STOP GIVING INTO BIG MONEY POLITICS !!!! Thank you and your team for the effort developing the 2022 draft Wisconsin Wolf Management Overall, I support the draft plan. I am pleased that it is guided by best available science, public input, and Tribal engagement- the core tenets of the best way to protect, conserve, and sustain natural resources! I also applaud the Department for conducting a very extensive and inclusive survey on the "public opinions regarding wolves in Wisconsin?. Things I support about the plan as written: ? The plan removes a numeric population goal, allowing for an adaptable population: I support the goal of a self-sustaining, self-regulating, and genetically diverse wolf population that maintains connectivity with wolf populations in neighboring states and fulfills their ecological roles. ? The plan creates low limit zones around Tribal lands where the Tribes requested it: These lands are treaty-protected with documented wolf packs. Making this update is an important and welcome addition to the plan. Ideally, the plan would expand these zones beyond just the few that are listed and further reduce the limit to one wolf per subzone. ? The plan is reflective of the public opinions survey that finds opinions toward wolves have grown significantly more favorable. ? There is expressed commitment to science and continued research with partners and acknowledgement that ?keystone species such as wolves are an important component of a healthy ecosystem?. ? The plan outlines the strategies related to increasing public education related to the implementation of non-lethal conflict deterrent techniques. ? I support the plan?s recommendations to pursue more administrative rules, including the reduction of the window to report wolf kills to 8 hours or less and making the purposeful destruction of occupied wolf dens illegal Things I would like to see added or reviewed before plan is finalized: ? The plan should outline the concerns with ACT 169 and recommend legislative changes so that the DNR is able to make decisions on wolf stewardship in alignment with the goals of the wolf plan. ? A recommendation that the department issues wolf hunting licenses which are valid only in the specific wolf management zone(s) specified on the license. ? The DNR should better regulate hound training on wolves. The DNR should close wolf-focused hound training activities as each wolf hunting zone closes. The plan currently would allow hounds to chase wolves for training purposes during the wolf hunting season, across the entire state, until the very last wolf zone is closed. This could go on for months and would interfere with the wolf breeding season and population tracking of which both occur in late winter. ? There is currently no guidance in plan for next review or update ? Ideally, the plan should include a provision to update every 5-7 years rather than simply being ?valid until it is replaced.? ? There should be permanent, ongoing oversight by a stakeholder group AND a science committee to oversee wolf stewardship in Wisconsin. The stakeholder group must be inclusive and recognize the importance of Tribal oversight. ? I recommend identifying specific metrics that will define successful wolf management in Wisconsin. Examples should include metrics include pack integrity, average pack size, distribution of CWD in wolf range, the relative distribution of wolves across the state, and genetic connectivity and flow between packs across the state. ? The plan acknowledges that there are responsible farming practices and other non-lethal options to reduce wolf and livestock conflicts but should recommend that the

Name	Resident	Date	Time	Subject	Email Body
					DNR prioritizes these opportunities. Bottom line: Please continue to push for more science-based research in our state as well as wolf co-existence education across Wisconsin. Thank you for your consideration and careful work involving the on-going wolf stewardship of wolves in our state. Doris Theodorou	Unknown	Feb232023	15:05:03	Wolf	Please save our wolves Without them the whole ecosystem would be off
Evangeline Su	Unknown	Feb232023	15:20:06	objections to the wolf management plan	To Whom It May Concern: Indigenous people view wolves as individuals and relatives. It's not in Wisconsin's interest to allow hunting of wolves because of the perceived lack understanding of the native outlook on wolves. As we work on improving relationships with indigenous peoples, we should be aware and sensitive to this concern. Hounding or hound training, which are akin to allowing legalized dogfighting, should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike. Most people in WI are against any form of dogfighting. Despite Act 169, which mandates a wolf hunting season, your department can still restrict the implementation of lethal methods by setting minimal quotas, including a quota of '0' wolves, restricting timing and methods. Several research studies have proven a proactive non-lethal approach leads to better conflict mitigation. Lethal management often fails to provide a long-term solution to wolf predation and has the least consistent success rates when compared to non-lethal practices. In addition, there is significant evidence showing that lethal wolf management may be less functionally effective at mitigating subsequent livestock losses than non-lethal deterrents. The plan should require the implementation of abatement measures as well as the use of non-lethal conflict minimization techniques by domestic animal owners for the latter to receive compensation for confirmed predation. Thanks for hearing my concerns, Evangeline Su -- Evangeline I acknowledge and honor the Ojibwe, Potawatomi, and Odawa, as well as the Menominee, Miami and Ho-Chunk nations upon whose stolen land I live and work. I honor and recognize the loss of social networks, trade, languages, recipes, gathering and healing for more than a dozen other Native tribes that occurred on this land as well as the 100,000+ tribal members who currently live in this area.
Dana Herman	Y	Feb232023	15:26:14	Comment on Wolf management plan	As science and research have proven, Wolves are of vital importance to the ecosystems they live in, being referred to as the immune system of the forest, they help to control deer populations and kill sick animals, like deer with chronic wasting disease. I am opposed to any hunting of wolves, however if it becomes legal again, I believe a plan should be based on the following: *Centers on, and is committed to, science and continued research and not an arbitrary numeric population goal, so that ecological changes can be accounted for. *Tribal engagement with respecting buffer zones around Tribal lands and expanding these zones. *Emphasis on non-lethal methods of controlling wolf-livestock conflict. *Public education on the above point along with focusing on the ecological benefits of wolves and how they are imperative to a healthy ecosystem. *No trapping, no night hunting and no use of hounds to hunt wolves. *Reflective of public input, including the favorable opinions that have grown to protect wolves. Wisconsin is the only state to allow wolves to be killed using dogs; this is barbaric and often times results in deplorable practices. We have lived on 20 acres in Shell Lake, Wisconsin, for over 17 years and have never had any problems with wolves, coyotes, bears or other predators. However, we have had problems with hunters who use hounds to hunt these animals. These hunters run their dogs with impunity and have zero respect for exiting laws and private lands. We walk our dogs, on leash, throughout our property. We have never had any problems with wild animals, but we have had problems with hunters who knowingly run their hounds on our property as they hunt. Each time this happens we contact law enforcement, and depending on which deputy is contacted - sometimes we get support, sometimes we do not. We would like to see an end to all hunting with hounds. It is dangerous for wildlife, the public and for the hounds themselves. Thank you, Dana Herman Shell Lake
Debra Jurey	Unknown	Feb232023	16:08:38	2022 Wolf Management plan	Many thanks to the WDNR staff for taking action to update the states wolf management plan. This gives me hope that our view on wolves & wildlife is beginning to change in the right direction. I am an out of state resident, I find wolves to be an intelligent valuable apex predator and in desperate need of protections with an established new & different mindset towards their extreme value & worth. We need to move forward and not get stuck on old management tactics that cause so much damage & destruction to our wildlife & the states they live in. I believe Wisconsin is starting to move in the right direction. I was happy to see in parts of the plan that wolves are now given greater recognition in the ecological roles they play for a healthy environment. This is a major step to help in opposing motives used in killing wolves. However, the current draft falls short in using the best available science. Emphasis on sustainable recreational killing as a main management strategy runs contrary to scientific evidence, & does not establish a positive constructive outcome for wolves or humans. The plan should end any & all lethal management of wolves with the main emphasis on coexistence, except in rare cases. The cruel & barbaric practice of hounding & hound training needs to end. It is something I was not familiar with until the news came out on the horrific slaughter of Wisconsin wolves over a year ago, using hounds to run them down to exhaustion making them an easy target, & was not only gut wrenching but made my blood boil. Hounding & the horrific training of hounds is just a form of legalized dog fighting, which is animal abuse and should be made illegal. The practice is cruel to both hounds & wolves and any other poor animal used in training. Finally in regards to cattle, & on the basis of wolf protection the emphasis should now encompass non lethal management. Thank You! Debra Jurey
Scott Coulthurst	Y	Feb232023	16:34:07	Support for the Draft Wolf Management Plan	Dear Randy Johnson, As a lifetime hunter myself, I have seen what a well managed plan can do for a species. When I started hunting, the opportunity to hunt bear did not exist. Now I have had the thrill of harvesting a bear in the Northwoods and bear numbers are increasing and even being harvested in the central part of the state. I don't know if I will apply to hunt wolves but I do know the presence of wolves in our state is something we need defend and perpetuate. The sound of wolves or the precious chance to view a wolf is the essence of the wild. I also know the hunting community is an important ally in sustaining a species. Creating a plan which addresses the views of all constituents, which this plans does, is the key to sustaining a viable wolf population. Thank you and your team for the effort developing the 2022 draft Wisconsin Wolf Management Overall, I support the draft plan. I am pleased that it is guided by best available science, public input, and Tribal engagement- the core tenets of the best way to protect, conserve, and sustain natural resources! Jennifer Valentine	Unknown	Feb232023	17:29:59	WI Draft WMP	What i like: i appreciate the efforts of all WDNR staff involved in updating the state's wolf management plan. Although we believe the current plan needs significant updating (see next section), we recognize the efforts and improvements made to the previous plan, including: ●⍰ Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. ●⍰ There is much greater recognition of the ecological role of wolves ●⍰ The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves ●⍰ The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed) What i don't like: ●⍰ The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on (see reference list below): ● wolf ethology, sentience, sapience, sociability, agency and wellbeing ● effectiveness of non-lethal interventions, especially relative to lethal ones ● the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution ●⍰ The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. ●⍰ The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ● A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings. ● Hounding or hound training, which are akin to allowing legalized dogfighting, should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public. ●⍰ The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. ● Despite Act 169, which mandates a wolf hunting season, the department can still restrict the implementation of lethal methods by setting minimal quotas, including a quota of '0' wolves, restricting timing and methods. ● Several studies have proven a proactive non-lethal approach leads to better conflict mitigation. ● Lethal management often fails to provide a long-term solution to wolf predation and has the least consistent success rates when compared to non-lethal practices. In addition, there is significant evidence showing that lethal wolf management may be less functionally effective at mitigating subsequent livestock losses than non-lethal deterrents. ●⍰ The plan should require the implementation of abatement measures as well as the use of non-lethal conflict minimization techniques by domestic animal owners for the latter to receive compensation for confirmed predation. ●⍰ The plan also runs contrary to public values towards wolves (and omits mention of such majority values from the plan), despite department surveys evidencing that the broad public cares about wolves as individuals (and not just for the viability of the population). Given the recent liberalization of killing wolves by the state, it would be incredibly informative to note majority support of the following reasons for opposing a regulated wolf hunting/trapping season (which are all omitted from the plan): opposition to specific methods of harvest like hounds (64%) or traps (70%), feelings that hunting wolves is unnecessary (62%) or culturally offensive to Native American tribes (57%). ● All such reasons convey majority disagreement with practices currently promoted and endorsed by the legislature and the WDNR, and such a conflict between managers and the public should not only be acknowledged, but foregrounded and carefully considered in policy (instead of dismissed). ● Such decisions to omit literature or downplay evidence (e.g., such as majority opposition to killing wolves and their reasons) are contrary to principles of scientific integrity (e.g., present all relevant scientific evidence to the public) as well as ethics (e.g., disguising ethical decisions, such as recreational wolf killing, as robustly supported by science). ●⍰ Conflicting agency objectives (e.g., optimizing public hunting and conflict mitigation) are not only not acknowledged, but even misunderstood as harmonious, against the body of scientific evidence. That culminates in the prioritization of consumptive values and policies; e.g., according to the body of scientific literature, use of lethal methods, and 2 especially public hunts, are contrary to most objectives relevant to: harm mitigation, the wellbeing of wolves, their ecological roles, and their non-exploitative enjoyment (i.e., Objectives A, B, D and F). ●⍰ There is a stark lack of consideration for individual wolves, wolf population health (including wellbeing), and measurable indicators for assessing any harms barring disease prevalence (e.g., accounting for cortisol levels or other stress hormones, measures of pair/pack persistence) ●⍰ There is an inappropriate understanding and consideration of tribal worldviews about wolves. Tribal worldviews of wolves are misconstrued as 'cultural benefits' tribes receive from the existence of a wolf population, when in fact tribal worldviews consider each individual wolf as a person and relative. Cultural respect and sensitivity towards such views, shared by many non-tribal members, demand the strict mitigation of lethal measures, especially recreational killing, as opposed to their current promotion in the plan. ●⍰ In general, all omissions of scientific literature, the arbitrary prioritization of policy objectives, the rhetoric of the plan and the dismissal of public values and concerns for wolves point towards a biased, unscientific and instrumental view of wolves that promotes values contrary to broad public perspectives on wolves. ●⍰ 'SOM' wolf estimation methodology “ From a recent critique: The new methods sacrifice precision, but are believed to retain adequate accuracy and sensitivity to changing conditions for reliable decision-making. We review evidence for the accuracy, precision, and sensitivity of the new 'scaled occupancy model' (SOM) applied in Wisconsin. i conclude that the Wisconsin method would systematically overestimate wolf abundance by large (but currently incalculable) margins. Because Wisconsin, similar to other states, not only changed to unverified methods but also implemented widespread wolf killing, shortcomings in their estimates of wolf abundance may have far-reaching consequences for population viability and confidence in state wildlife managers. We discuss findings from Wisconsin alongside similar findings for other states' occupancy models being insensitive to human causes of mortality that have recently increased. Overall, Wisconsin's proposed method for estimating wolf abundance shows significant departures from best practices in scientific measurement. Verification will require independent replication and unbiased tests at multiple scales in multiple habitats under different human-induced mortality rates, and peer review before the new methods are considered reliable.⍰ (Treves & Santiago-Ã⍰vila, 2023) thank you- jennifer vaentine
Megan Scott	Y	Feb232023	17:46:38	Support for the Draft Wolf	Dear Randy Johnson, Wolves are part of our natural ecosystem. Humans, Cattle, sheep, pigs, and the potential farm animals that wolves may go after are not part of our natural ecosystem. Wolves need to be protected and allow to live in balance family packs as they were meant to be. The humans who have issues with them need to deal with them and not kill them because

Name	Resident	Date	Time	Subject	Email Body
				Management Plan	they live in wolf country! STOP the Wolf slaughter. The only individuals who should be hunting wolves are people from that state and not from every other state in the nation and it cannot be a contest. Lastly, hunting wolves, as well as bears with dogs should be outlawed. That is not a true hunter. That is not true. Hunting abilities. Hunting with dogs is horrific for the wild animal as well as for the poor dogs, that these owners abuse, leave behind to die, or shoot them, because they?re of no worth to them if they get injured. Thank you for the opportunity to express my opinions and hopes for the beautiful wolves! Thank you and your team for the effort developing the 2022 draft Wisconsin Wolf Management Overall, I support the draft plan. I am pleased that it is guided by best available science, public input, and Tribal engagement- the core tenets of the best way to protect, conserve, and sustain natural resources! I also applaud the Department for conducting a very extensive and inclusive survey on the "public opinions regarding wolves in Wisconsin?. Things I support about the plan as written: ? The plan removes a numeric population goal, allowing for an adaptable population: I support the goal of a self-sustaining, self-regulating, and genetically diverse wolf population that maintains connectivity with wolf populations in neighboring states and fulfills their ecological roles. ? The plan creates low limit zones around Tribal lands where the Tribes requested it: These lands are treaty-protected with documented wolf packs. Making this update is an important and welcome addition to the plan. Ideally, the plan would expand these zones beyond just the few that are listed and further reduce the limit to one wolf per subzone. ? The plan is reflective of the public opinions survey that finds opinions toward wolves have grown significantly more favorable. ? There is expressed commitment to science and continued research with partners and acknowledgement that ?keystone species such as wolves are an important component of a healthy ecosystem?. ? The plan outlines the strategies related to increasing public education related to the implementation of non-lethal conflict deterrent techniques. ? I support the plan?s recommendations to pursue more administrative rules, including the reduction of the window to report wolf kills to 8 hours or less and making the purposeful destruction of occupied wolf dens illegal Things I would like to see added or reviewed before plan is finalized: ? The plan should outline the concerns with ACT 169 and recommend legislative changes so that the DNR is able to make decisions on wolf stewardship in alignment with the goals of the wolf plan. ? A recommendation that the department issues wolf hunting licenses which are valid only in the specific wolf management zone(s) specified on the license. ? The DNR should better regulate hound training on wolves. The DNR should close wolf-focused hound training activities as each wolf hunting zone closes. The plan currently would allow hounds to chase wolves for training purposes during the wolf hunting season, across the entire state, until the very last wolf zone is closed. This could go on for months and would interfere with the wolf breeding season and population tracking of which both occur in late winter. ? There is currently no guidance in plan for next review or update ? Ideally, the plan should include a provision to update every 5-7 years rather than simply being ?valid until it is replaced.? ? There should be permanent, ongoing oversight by a stakeholder group AND a science committee to oversee wolf stewardship in Wisconsin. The stakeholder group must be inclusive and recognize the importance of Tribal oversight. ? I recommend identifying specific metrics that will define successful wolf management in Wisconsin. Examples should include metrics include pack integrity, average pack size, distribution of CWD in wolf range, the relative distribution of wolves across the state, and genetic connectivity and flow between packs across the state. ? The plan acknowledges that there are responsible farming practices and other non-lethal options to reduce wolf and livestock conflicts but should recommend that the DNR prioritizes these opportunities. Bottom line: Please continue to push for more science-based research in our state as well as wolf co-existence education across Wisconsin. Thank you for your consideration and careful work involving the on-going wolf stewardship of wolves in our state. There should be permanent, ongoing oversight by a stakeholder group AND a science committee to oversee wolf stewardship in Wisconsin. The stakeholder group must be inclusive and recognize the importance of Tribal oversight. ? I recommend identifying specific metrics that will define successful wolf management in Wisconsin. Examples should include metrics include pack integrity, average pack size, distribution of CWD in wolf range, the relative distribution of wolves across the state, and genetic connectivity and flow between packs across the state. ? The plan acknowledges that there are responsible farming practices and other non-lethal options to reduce wolf and livestock conflicts but should recommend that the DNR prioritizes these opportunities. Bottom line: Please continue to push for more science-based research in our state as well as wolf co-existence education across Wisconsin. Thank you for your consideration and careful work involving the on-going wolf stewardship of wolves in our state. Sincerely, Jean Scoon [redacted] Stoughton, WI [redacted] This message was sent by KnowWho, as a service provider, on behalf of an individual associated with Sierra Club. dagmar mclaughlin	N	Feb232023	19:12:07	Support for the Draft Wolf Management Plan	Dear Randy Johnson, don't understand why our wildlife is subject to hunting.....humans have proven how inadequate they have been, historically, in attempting to manage wildlife.....which does not need to be managed.....we rather need to manage the testosterone driven hunters....killing to kill is not normal, nor healthy.....wildlife is precious and needs to be protected especiallly with climate change making their survival much more difficult..... Thank you and your team for the effort developing the 2022 draft Wisconsin Wolf Management Overall, I support the draft plan. I am pleased that it is guided by best available science, public input, and Tribal engagement- the core tenets of the best way to protect, conserve, and sustain natural resources! I also applaud the Department for conducting a very extensive and inclusive survey on the "public opinions regarding wolves in Wisconsin?. Things I support about the plan as written: ? The plan removes a numeric population goal, allowing for an adaptable population: I support the goal of a self-sustaining, self-regulating, and genetically diverse wolf population that maintains connectivity with wolf populations in neighboring states and fulfills their ecological roles. ? The plan creates low limit zones around Tribal lands where the Tribes requested it: These lands are treaty-protected with documented wolf packs. Making this update is an important and welcome addition to the plan. Ideally, the plan would expand these zones beyond just the few that are listed and further reduce the limit to one wolf per subzone. ? The plan is reflective of the public opinions survey that finds opinions toward wolves have grown significantly more favorable. ? There is expressed commitment to science and continued research with partners and acknowledgement that ?keystone species such as wolves are an important component of a healthy ecosystem?. ? The plan outlines the strategies related to increasing public education related to the implementation of non-lethal conflict deterrent techniques. ? I support the plan?s recommendations to pursue more administrative rules, including the reduction of the window to report wolf kills to 8 hours or less and making the purposeful destruction of occupied wolf dens illegal Things I would like to see added or reviewed before plan is finalized: ? The plan should outline the concerns with ACT 169 and recommend legislative changes so that the DNR is able to make decisions on wolf stewardship in alignment with the goals of the wolf plan. ? A recommendation that the department issues wolf hunting licenses which are valid only in the specific wolf management zone(s) specified on the license. ? The DNR should better regulate hound training on wolves. The DNR should close wolf-focused hound training activities as each wolf hunting zone closes. The plan currently would allow hounds to chase wolves for training purposes during the wolf hunting season, across the entire state, until the very last wolf zone is closed. This could go on for months and would interfere with the wolf breeding season and population tracking of which both occur in late winter. ? There is currently no guidance in plan for next review or update ? Ideally, the plan should include a provision to update every 5-7 years rather than simply being ?valid until it is replaced.? ? There should be permanent, ongoing oversight by a stakeholder group AND a science committee to oversee wolf stewardship in Wisconsin. The stakeholder group must be inclusive and recognize the importance of Tribal oversight. ? I recommend identifying specific metrics that will define successful wolf management in Wisconsin. Examples should include metrics include pack integrity, average pack size, distribution of CWD in wolf range, the relative distribution of wolves across the state, and genetic connectivity and flow between packs across the state. ? kurt Robinson	Y	Feb232023	19:40:12	Support for the Draft Wolf Management Plan	Dear Randy Johnson, the profileration of cwd is due to an unnatural balance with not enough not natural predators to keep herd in check. The CWD problem roots back to a much expanded population of the deer herd. As their natural feed gets scarce they end up gathering in mass and one animal has a virus or disease is going to the infect those in close proximity.If you are on this committee I am sure you know this, but you never know. The general public is never made aware of this critical issue regarding the wolf Thank you and your team for the effort developing the 2022 draft Wisconsin Wolf Management Overall, I support the draft plan. I am pleased that it is guided by best available science, public input, and Tribal engagement- the core tenets of the best way to protect, conserve, and sustain natural resources! Erika Reise	Y	Feb232023	19:42:47	Support for the Draft Wolf Management Plan	Dear Randy Johnson, Wolves have proven to be essential, and there needs to be more evidence of the necessity for these wolf hunts before moving forward with something that in the recent past has been poorly managed and poorly executed. Thank you and your team for the effort developing the 2022 draft Wisconsin Wolf Management Overall, I support the draft plan. I am pleased that it is guided by best available science, public input, and Tribal engagement- the core tenets of the best way to protect, conserve, and sustain natural resources! I also applaud the Department for conducting a very extensive and inclusive survey on the "public opinions regarding wolves in Wisconsin?. Things I support about the plan as written: ? The plan removes a numeric population goal, allowing for an adaptable population: I support the goal of a self-sustaining, self-regulating, and genetically diverse wolf population that maintains connectivity with wolf populations in neighboring states and fulfills their ecological roles. ? The plan creates low limit zones around Tribal lands where the Tribes requested it: These lands are treaty-protected with documented wolf packs. Making this update is an important and welcome addition to the plan. Ideally, the plan would expand these zones beyond just the few that are listed and further reduce the limit to one wolf per subzone. ? The plan is reflective of the public opinions survey that finds opinions toward wolves have grown significantly more favorable. ? There is expressed commitment to science and continued research with partners and acknowledgement that ?keystone species such as wolves are an important component of a healthy ecosystem?. ? The plan outlines the strategies related to increasing public education related to the implementation of non-lethal conflict deterrent techniques. ? I support the plan?s recommendations to pursue more administrative rules, including the reduction of the window to report wolf kills to 8 hours or less and making the purposeful destruction of occupied wolf dens illegal Things I would like to see added or reviewed before plan is finalized: ? The plan should outline the concerns with ACT 169 and recommend legislative changes so that the DNR is able to make decisions on wolf stewardship in alignment with the goals of the wolf plan. ? A recommendation that the department issues wolf hunting licenses which are valid only in the specific wolf management zone(s) specified on the license. ? The DNR should better regulate hound training on wolves. The DNR should close wolf-focused hound training activities as each wolf hunting zone closes. The plan currently would allow hounds to chase wolves for training purposes during the wolf hunting season, across the entire state, until the very last wolf zone is closed. This could go on for months and would interfere with the wolf breeding season and population tracking of which both occur in late winter. ? There is currently no guidance in plan for next review or update ? Ideally, the plan should include a provision to update every 5-7 years rather than simply being ?valid until it is replaced.? ? There should be permanent, ongoing oversight by a stakeholder group AND a science committee to oversee wolf stewardship in Wisconsin. The stakeholder group must be inclusive and recognize the importance of Tribal oversight. ? I recommend identifying specific metrics that will define successful wolf management in Wisconsin. Examples should include metrics include pack integrity, average pack size, distribution of CWD in wolf range, the relative distribution of wolves across the state, and genetic connectivity and flow between packs across the state. ? The plan acknowledges that there are responsible farming practices and other non-lethal options to reduce wolf and livestock conflicts but should recommend that the DNR prioritizes these opportunities. Bottom line: Please continue to push for more science-based research in our state as well as wolf co-existence education across Wisconsin. Thank you for your consideration and careful work involving the on-going wolf stewardship of wolves in our state. Sincerely, Erika Reise [redacted] McFarland , WI 53558 [redacted] This message was sent by KnowWho, as a service provider, on behalf of an individual associated with Sierra Club. Mary Weeden	Y	Feb232023	21:12:32	Support for the Draft Wolf Management Plan	Dear Randy Johnson, From a cost/benefit approach, Wisconsin has spent millions reintroducing the wolf population. Wolves help to maintain the sensitive ecological balance needed to promote a healthy, sustainable, environment for the State of Wisconsin. The current plan is woefully outdated, failing to account for the science that supports the proposed plan. Thank you and your team for the effort developing the 2022 draft Wisconsin Wolf Management Overall, I support the draft plan. I am pleased that it is guided by best available science, public input, and Tribal engagement- the core tenets of the best way to protect, conserve, and sustain natural resources! Jean Roach	Y	Feb232023	21:17:38	Support for the Draft Wolf Management Plan	Dear Randy Johnson, Wolves are native to our area and protecting them is important. The draft management plan is correctly focused on the the ecological benefits of wolves. Thank you and your team for the effort developing the 2022 draft Wisconsin Wolf Management Overall, I support the draft plan. I am pleased that it is guided by best available science, public input, and Tribal engagement- the core tenets of the best way to protect, conserve, and sustain natural resources! I also applaud the Department for conducting a very extensive and inclusive survey on the "public opinions regarding wolves in Wisconsin?. Things I support about the plan as written: ? The plan removes a numeric population goal, allowing for an adaptable population: I support the goal of a self-sustaining, self-regulating, and genetically diverse wolf population that maintains connectivity with wolf populations in neighboring states and fulfills their ecological roles. ? The plan creates low limit zones around Tribal lands where the Tribes requested it: These lands are treaty-protected with documented wolf packs. Making this update is an important and welcome addition to the plan. Ideally, the plan would expand these zones beyond just the few that are listed and further reduce the limit to one wolf per subzone. ? The plan is reflective of the public opinions survey that finds opinions toward wolves have grown significantly more favorable. ? There is expressed commitment to science and continued research with partners and acknowledgement that ?keystone species such as wolves are an important component of a healthy ecosystem?. ? The plan outlines the strategies related to increasing public education related to the implementation of non-lethal conflict deterrent techniques. ? I support the plan?s recommendations to pursue more administrative rules, including the reduction of the window to report wolf kills to 8 hours or less and making the purposeful destruction of occupied wolf dens illegal Things I would like to see added or reviewed before plan is finalized: ? The plan should outline the concerns with ACT 169 and recommend legislative changes so that the DNR is able to make decisions on wolf stewardship in

Name	Resident	Date	Time	Subject	Email Body
					alignment with the goals of the wolf plan. ? A recommendation that the department issues wolf hunting licenses which are valid only in the specific wolf management zone(s) specified on the license. ? The DNR should better regulate hound training on wolves. The DNR should close wolf-focused hound training activities as each wolf hunting zone closes. The plan currently would allow hounds to chase wolves for training purposes during the wolf hunting season, across the entire state, until the very last wolf zone is closed. This could go on for months and would interfere with the wolf breeding season and population tracking of which both occur in late winter. ? There is currently no guidance in plan for next review or update ? Ideally, the plan should include a provision to update every 5-7 years rather than simply being ?valid until it is replaced.? ? There should be permanent, ongoing oversight by a stakeholder group AND a science committee to oversee wolf stewardship in Wisconsin. The stakeholder group must be inclusive and recognize the importance of Tribal oversight. ? I recommend identifying specific metrics that will define successful wolf management in Wisconsin. Examples should include metrics include pack integrity, average pack size, distribution of CWD in wolf range, the relative distribution of wolves across the state, and genetic connectivity and flow between packs across the state. ? The plan acknowledges that there are responsible farming practices and other non-lethal options to reduce wolf and livestock conflicts but should recommend that the DNR prioritizes these opportunities. Bottom line: Please continue to push for more science-based research in our state as well as wolf co-existence education across Wisconsin. Thank you for your consideration and careful work involving the on-going wolf stewardship of wolves in our state. Sincerely, Jean Roach [redacted] Pelican Lake, WI 54463 [redacted] This message was sent by KnowWho, as a service provider, on behalf of an individual associated with Sierra Club. Charles Roth	Unknown	Feb232023	21:25:11	Wisconsin Wolves....	It's your wolves, and those of every other state and country that need to be protected. NOT just for THEIRl sake, but for THE SAKE of every human being on this earth, AND not just for human beings, but for every single member of the family of wild lives on the earth. Wolves are important to the balance of nature. They cull the sick and dying animals, and keep the populations at a safe level. This has been their responsibility for thousands of years. Before we human beings were on earth. Before our ignorant mismanagement of life on earth. They were ALL far better off without our interference in their lives. BECOME INFORMED AND INSTRUMENTAL in the wellbeing of ALL animal and human life on earth. DO YOUR PART....NOW!

Timothy Daley	Y	Feb232023	22:20:34	Support for the Draft Wolf Management Plan	Dear Randy Johnson, A wolf population must be fluid, no set number, and let nature determine the actual population that can be sustained in Wisconsin, focusing on the benefits of wolves. Also, review the use of dogs for bear and wolf hunting to provide for the more humane protection of the dogs. Thank you and your team for the effort developing the 2022 draft Wisconsin Wolf Management Overall, I support the draft plan. I am pleased that it is guided by best available science, public input, and Tribal engagement- the core tenets of the best way to protect, conserve, and sustain natural resources! I also applaud the Department for conducting a very extensive and inclusive survey on the "public opinions regarding wolves in Wisconsin?. Things I support about the plan as written: ? The plan removes a numeric population goal, allowing for an adaptable population: I support the goal of a self-sustaining, self-regulating, and genetically diverse wolf population that maintains connectivity with wolf populations in neighboring states and fulfills their ecological roles. ? The plan creates low limit zones around Tribal lands where the Tribes requested it: These lands are treaty-protected with documented wolf packs. Making this update is an important and welcome addition to the plan. Ideally, the plan would expand these zones beyond just the few that are listed and further reduce the limit to one wolf per subzone. ? The plan is reflective of the public opinions survey that finds opinions toward wolves have grown significantly more favorable. ? There is expressed commitment to science and continued research with partners and acknowledgement that ?keystone species such as wolves are an important component of a healthy ecosystem?. ? The plan outlines the strategies related to increasing public education related to the implementation of non-lethal conflict deterrent techniques. ? I support the plan?s recommendations to pursue more administrative rules, including the reduction of the window to report wolf kills to 8 hours or less and making the purposeful destruction of occupied wolf dens illegal Things I would like to see added or reviewed before plan is finalized: ? The plan should outline the concerns with ACT 169 and recommend legislative changes so that the DNR is able to make decisions on wolf stewardship in alignment with the goals of the wolf plan. ? A recommendation that the department issues wolf hunting licenses which are valid only in the specific wolf management zone(s) specified on the license. ? The DNR should better regulate hound training on wolves. The DNR should close wolf-focused hound training activities as each wolf hunting zone closes. The plan currently would allow hounds to chase wolves for training purposes during the wolf hunting season, across the entire state, until the very last wolf zone is closed. This could go on for months and would interfere with the wolf breeding season and population tracking of which both occur in late winter. ? There is currently no guidance in plan for next review or update ? Ideally, the plan should include a provision to update every 5-7 years rather than simply being ?valid until it is replaced.? ? There should be permanent, ongoing oversight by a stakeholder group AND a science committee to oversee wolf stewardship in Wisconsin. The stakeholder group must be inclusive and recognize the importance of Tribal oversight. ? I recommend identifying specific metrics that will define successful wolf management in Wisconsin. Examples should include metrics include pack integrity, average pack size, distribution of CWD in wolf range, the relative distribution of wolves across the state, and genetic connectivity and flow between packs across the state. ? The plan acknowledges that there are responsible farming practices and other non-lethal options to reduce wolf and livestock conflicts but should recommend that the DNR prioritizes these opportunities. Bottom line: Please continue to push for more science-based research in our state as well as wolf co-existence education across Wisconsin. Thank you for your consideration and careful work involving the on-going wolf stewardship of wolves in our state. Sincerely, Timothy Daley [redacted] Union Grove, WI 53182 [redacted] This message was sent by KnowWho, as a service provider, on behalf of an individual associated with Sierra Club. David Henning	Y	Feb232023	23:27:05	Support for the Draft Wolf Management Plan	Dear Randy Johnson, Wisconsin has a great chance to show other States how to address their wolf situation. The reason that wolves still need endangered species protection is the various wolf containing States cannot seem to write a responsible management plan. Killing as many wolves as possible is not a management plan--it just lands the wolf back under ESA protection. Thank you and your team for the effort developing the 2022 draft Wisconsin Wolf Management Overall, I support the draft plan. I am pleased that it is guided by best available science, public input, and Tribal engagement- the core tenets of the best way to protect, conserve, and sustain natural resources! I also applaud the Department for conducting a very extensive and inclusive survey on the "public opinions regarding wolves in Wisconsin?. Things I support about the plan as written: ? The plan removes a numeric population goal, allowing for an adaptable population: I support the goal of a self-sustaining, self-regulating, and genetically diverse wolf population that maintains connectivity with wolf populations in neighboring states and fulfills their ecological roles. ? The plan creates low limit zones around Tribal lands where the Tribes requested it: These lands are treaty-protected with documented wolf packs. Making this update is an important and welcome addition to the plan. Ideally, the plan would expand these zones beyond just the few that are listed and further reduce the limit to one wolf per subzone. ? The plan is reflective of the public opinions survey that finds opinions toward wolves have grown significantly more favorable. ? There is expressed commitment to science and continued research with partners and acknowledgement that ?keystone species such as wolves are an important component of a healthy ecosystem?. I believe that wolves can be helpful in fighting CWD by removing the weakened infected deer before they infect other deer. ? The plan outlines the strategies related to increasing public education related to the implementation of non-lethal conflict deterrent techniques. ? I support the plan?s recommendations to pursue more administrative rules, including the reduction of the window to report wolf kills to 8 hours or less and making the purposeful destruction of occupied wolf dens illegal Things I would like to see added or reviewed before plan is finalized: ? The plan should outline the concerns with ACT 169 and recommend legislative changes so that the DNR is able to make decisions on wolf stewardship in alignment with the goals of the wolf plan. ? A recommendation that the department issues wolf hunting licenses which are valid only in the specific wolf management zone(s) specified on the license. ? I am against the use of dogs in wolf hunting. If it is continued, the DNR should better regulate hound training on wolves. The DNR should close wolf-focused hound training activities as each wolf hunting zone closes. The plan currently would allow hounds to chase wolves for training purposes during the wolf hunting season, across the entire state, until the very last wolf zone is closed. This could go on for months and would interfere with the wolf breeding season and population tracking of which both occur in late winter. ? Ideally, the plan would expand these zones beyond just the few that are listed and further reduce the limit to one wolf per subzone. ? The plan is reflective of the public opinions survey that finds opinions toward wolves have grown significantly more favorable. ? There is expressed commitment to science and continued research with partners and acknowledgement that ?keystone species such as wolves are an important component of a healthy ecosystem?. ? The plan outlines the strategies related to increasing public education related to the implementation of non-lethal conflict deterrent techniques. ? I support the plan?s recommendations to pursue more administrative rules, including the reduction of the window to report wolf kills to 8 hours or less and making the purposeful destruction of occupied wolf dens illegal Things I would like to see added or reviewed before plan is finalized: ? The plan should outline the concerns with ACT 169 and recommend legislative changes so that the DNR is able to make decisions on wolf stewardship in alignment with the goals of the wolf plan. ? A recommendation that the department issues wolf hunting licenses which are valid only in the specific wolf management zone(s) specified on the license. ? The DNR should better regulate hound training on wolves. The DNR should close wolf-focused hound training activities as each wolf hunting zone closes. The plan currently would allow hounds to chase wolves for training purposes during the wolf hunting season, across the entire state, until the very last wolf zone is closed. This could go on for months and would interfere with the wolf breeding season and population tracking of which both occur in late winter. ? There is currently no guidance in plan for next review or update ? Ideally, the plan should include a provision to update every 5-7 years rather than simply being ?valid until it is replaced.? ? There should be permanent, ongoing oversight by a stakeholder group AND a science committee to oversee wolf stewardship in Wisconsin. The stakeholder group must be inclusive and recognize the importance of Tribal oversight. ? I recommend identifying specific metrics that will define successful wolf management in Wisconsin. Examples should include metrics include pack integrity, average pack size, distribution of CWD in wolf range, the relative distribution of wolves across the state, and genetic connectivity and flow between packs across the state. ? The plan acknowledges that there are responsible farming practices and other non-lethal options to reduce wolf and livestock conflicts but should recommend that the DNR prioritizes these opportunities. Bottom line: Please continue to push for more science-based research in our state as well as wolf co-existence education across Wisconsin. Thank you for your consideration and careful work involving the on-going wolf stewardship of wolves in our state. Kathleen Fitzgibbon	Y	Feb242023	7:37:25	Support for the Draft Wolf Management Plan	Dear Randy Johnson, Thank you and your team for the effort developing the 2022 draft Wisconsin Wolf Management Overall, I support the draft plan. I am pleased that it is guided by best available science, public input, and Tribal engagement- the core tenets of the best way to protect, conserve, and sustain natural resources! I also applaud the Department for conducting a very extensive and inclusive survey on the "public opinions regarding wolves in Wisconsin?. Things I support about the plan as written: ? The plan removes a numeric population goal, allowing for an adaptable population: I support the goal of a self-sustaining, self-regulating, and genetically diverse wolf population that maintains connectivity with wolf populations in neighboring states and fulfills their ecological roles. ? The plan creates low limit zones around Tribal lands where the Tribes requested it: These lands are treaty-protected with documented wolf packs. Making this update is an important and welcome addition to the plan. Ideally, the plan would expand these zones beyond just the few that are listed and further reduce the limit to one wolf per subzone. ? The plan is reflective of the public opinions survey that finds opinions toward wolves have grown significantly more favorable. ? There is expressed commitment to science and continued research with partners and acknowledgement that ?keystone species such as wolves are an important component of a healthy ecosystem?. ? Laura Wall	Y	Feb242023	8:19:45	Support for the Draft Wolf Management Plan	Dear Randy Johnson, Hello, I?m writing to urge you to stop any wolf hunting. They are incredibly important to our ecosystem. Like all of us, they deserve to live. I made my first documentary about Timerland wolves, where I learned how they create so many processes that support the lane and other animals. I strongly urge you to support their innate God given right to be here. Thank you. Thank you and your team for the effort developing the 2022 draft Wisconsin Wolf Management Overall, I support the draft plan. I am pleased that it is guided by best available science, public input, and Tribal engagement- the core tenets of the best way to protect, conserve, and sustain natural resources! There is expressed commitment to science and continued research with partners and acknowledgement that ?keystone species such as wolves are an important component of a healthy ecosystem?. ? The plan outlines the strategies related to increasing public education related to the implementation of non-lethal conflict deterrent techniques. ? I support the plan?s recommendations to pursue more administrative rules, including the reduction of the window to report wolf kills to 8 hours or less and making the purposeful destruction of occupied wolf dens illegal Things I would like to see added or reviewed before plan is finalized: ? The plan should outline the concerns with ACT 169 and recommend legislative changes so that the DNR is able to make decisions on wolf stewardship in alignment with the goals of the wolf plan. ? A recommendation that the department issues wolf hunting licenses which are valid only in the specific wolf management zone(s) specified on the license. ? The DNR should better regulate hound training on wolves. The DNR should close wolf-focused hound training activities as each wolf hunting zone closes. The plan currently would allow hounds to chase wolves for training purposes during the wolf hunting season, across the entire state, until the very last wolf zone is closed. This could go on for months and would interfere with the wolf breeding season and population tracking of which both occur in late winter. ? There is currently no guidance in plan for next review or update ? Ideally, the plan should include a provision to update every 5-7 years rather than simply being ?valid until it is replaced.? ? There should be permanent, ongoing oversight by a stakeholder group AND a science committee to oversee wolf stewardship in Wisconsin. The stakeholder group must be inclusive and recognize the importance of Tribal oversight. ? I recommend identifying specific metrics that will define successful wolf management in Wisconsin. Examples should include metrics include pack integrity, average pack size, distribution of CWD in wolf range, the relative distribution of wolves across the state, and genetic connectivity and flow between packs across the state. ? The plan acknowledges that there are responsible farming practices and other non-lethal options to reduce wolf and livestock conflicts but should recommend that the DNR prioritizes these opportunities. Bottom line: Please continue to push for more science-based research in our state as well as wolf co-existence education across Wisconsin. Thank you for your consideration and careful work involving the on-going wolf stewardship of wolves in our state. Sincerely, Tesla Philipson

Michael	Unknown	Feb242023	9:51:15	In Support of a better Plan for Wolves	The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on (see reference list below): ● wolf ethology, sentience, sapience, sociability, agency and wellbeing ● effectiveness of non-lethal interventions, especially relative to lethal ones ● the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. The plan should strictly inhibit any lethal management of wolves except in extremely rare circumstances of immediate defense of life. Thank you, M -- -Michael
Cindy A Carter	Y	Feb242023	10:07:58	Support for the Draft Wolf Management Plan	Dear Randy Johnson, NO MORE WOLF SLAUGHTERS, Wolves are VITAL to the eco system. ANd studies had found that the more you allow an animal to be slaughtered the more HATRED people have for them. WE ALSO NEED TO BAN WILDLIFE KILLING CONTESTS. THESE ARE MY WILDLIFE TOO!!!!!!! Thank you and your team for the effort developing the 2022 draft Wisconsin Wolf Management Overall, I support the draft plan. I am pleased that it is guided by best available science, public input, and Tribal engagement- the core tenets of the best way to protect, conserve, and sustain natural resources! I also applaud the Department for conducting a very extensive and inclusive survey on the "public opinions regarding wolves in Wisconsin?. Things I support about the plan as written: ? The plan removes a numeric population goal, allowing for an adaptable population: I support the goal of a self-sustaining, self-regulating, and genetically diverse wolf population that maintains connectivity with wolf populations in neighboring states and fulfills their ecological roles. ? The plan creates low limit zones around Tribal lands where the Tribes requested it: These lands are treaty-protected with documented wolf packs. Making this update is an important and welcome addition to the plan. Ideally, the plan would expand these zones beyond just the few that are listed and further reduce the limit to one wolf per subzone. ? The plan is reflective of the public opinions survey that finds opinions toward wolves have grown significantly more favorable. ? There is expressed commitment to science and continued research with partners and acknowledgement that ?keystone species such as wolves are an important component of a healthy ecosystem?. ? The plan outlines the strategies related to increasing public education related to the implementation of non-lethal conflict deterrent techniques. ? I support the plan?s recommendations to pursue more administrative rules, including the reduction of the window to report wolf kills to 8 hours or less and making the purposeful destruction of occupied wolf dens illegal Things I would like to see added or reviewed before plan is finalized: ? Will Huspek	Unknown	Feb242023	10:08:47	Wolf	We need to control the wolf population by hunting
Michael Cole	Y	Feb242023	10:10:07	WOLF MANAGEMENT	We simply don't need the wolves. They are not threatened by extinction, they are not a tourist attraction, they are a threat to domestic animals, they are a threat to you and your dogs/pets if you walk in the woods and uses DNR money to manage them. This is a lawyer created situation for billings and an elitist "feel good" creation. If we are going to be forced to accept these wolves, and people who have to live with them won't, then keep the numbers at the original 350. You can't manage something without a stated goal. That should be the original goal number of 350. I'm sure the originators of this plan had no intention of keeping the numbers at 350. Michael Cole [redacted] Crandon WI 54520 [redacted]
Nicolas Humphrey, PhD	Y	Feb242023	10:11:09	Support for the Draft Wolf Management Plan	Dear Randy Johnson, Wolves are an integral part of Wisconsin's ecosystem. They must be protected at all costs! Thank you and your team for the effort developing the 2022 draft Wisconsin Wolf Management Overall, I support the draft plan. Brad Olson	Y	Feb242023	10:12:51	wolf plan comments	Dear Wis. DNR It is inconceivable that the agency in charge of the States wildlife would make a plan with no management over the wolf population. This is not a management plan but rather an expansion plan, with no numerical number set it is impossible to say when harvest should and would be considered. What has changed that now allows for approximately 50% of Wisconsin land mass to be considered wolf habitat of some source? I encourage you to follow science on this issue. We as a State have harvest seasons to keep all other wildlife in check, why not the wolf? Any wildlife left unchecked will over populate and become a problem, this is already the case with the wolf in northern Wis. I urge you to do what is right, know one is advocating for getting rid of the wolf, but a wolf population left unchecked will destroy deer populations, cause economic hardship to our agriculture community as well. If the wolf population does not need harvest management than we must ask the question, why does any wildlife need management? Thank you, Brad Olson [redacted] Frederic WI 54837
Paul Delveaux	Unknown	Feb242023	10:29:27	Wolf situation	I believe wolf population is sky high...i also believe wolves need to be physically registered in order to get an accurate count like bobcats and bears. Also have never seen so many dogs and livestock killed by them. There is no mistaking a wolf for a coyote. Coyote eat small mamals and even berries at time. Wolves only eat large mamals like deer and livestock. Upper counties have huge deer losses because of this. This is a huge loss to bussiness. Nothing in between summer vistors and snowmobiling in winter. Huge loss of hunters. People are not going to come if deer populations are this low
Sandra Rohde	Y	Feb242023	10:33:00	Support for the Draft Wolf Management Plan	Dear Randy Johnson, We are all connected - what we do to one will impact us all. Jim Bredahl	Y	Feb242023	10:40:46	Wolf management plan	We need to try to get back closer to the original goal of 350 animals. The impact up north had been felt for a decade now. When I retired from the military in 2006, I had 8 decent bucks on my trail camera. Nope I'm lucky if I see 1. I've had wolves kill deer in my yard and hayfield. Between the wolves, bear, bobcat, coyote and yes mountain lions the deer stand little chance. The winter is hard enough on them in Ashland county without all the predators they might stand a chance. Thank You Sincerely Jim Bredahl Butternut
Timothy Bauer	Y	Feb242023	10:42:20	Support for the Draft Wolf Management Plan	Dear Randy Johnson, We need wolves in our woods. They are as much a part of the landscape as sturgeon are to our waters. They are a part of the ecosystem as well as our ethos. We do not need to continually punish them for centuries of misrepresentation, folklore, and pseudo-science. Whether we are indigenous or came from other parts of the world, the wolf is our ancestor simply by our stewardship in North America. May our policies and attitudes be guided by reverence and sensibility, not prejudice or greed. Thank you and your team for the effort developing the 2022 draft Wisconsin Wolf Management Overall, I support the draft plan. I am pleased that it is guided by best available science, public input, and Tribal engagement- the core tenets of the best way to protect, conserve, and sustain natural resources! Jerod Stamper	Unknown	Feb242023	11:03:20	Wolf management plan	Good morning I was reading about the proposed wolf management plan. I am in full support of opening a harvest season. I live in rural Douglas County and I think the wolves definitely are a cool animal but the population is at the point of needing a harvest season. Thank you Jerod Stamper
Kerstin LaPorte	Y	Feb242023	11:09:46	Wolves	I live in northern Wisconsin and we have wolves taking over our landscape. I looked forward to retiring and hunting deer, grouse, rabbits etc and it is getting to be a Dead Sea up here. I am not the best hunter and tracker around, but in the winter when I drive around on my snowmobile and can't find a track of any kind, well like I always say anyone can find tracks in the snow, they don't fly . I don't understand why the DNR is trying to make Wisconsin a predator state only, most of the people and a lot of paying residents hunt deer etc and you keep the big three unobtainable. I waited ten years for a bear kill tag and I don't remember how long it was before I had my last bobcat tag and you won't fight to get a wolf season.Coyote season is

Name	Resident	Date	Time	Subject	Email Body
					24 hours a day, 365 days of the year and they are thriving (except where the wolves are).Might be something to consider, yes if you opened season on wolves year round they might drop in population for a while but I believe they would bounce back.The wolves have proven they can tolerate humans time and time again for example they killed a buck within 15 feet of my shed last fall and stole the deer rib cage I hang for the birds that was hanging between my house and shed. My wife and I have our grandkids up to make Xmas cookies, and when we are done the kids and I go play around outside. This particular year they wanted me to pull them on a sled behind the 4 wheeler so, as I pulled a couple at a time around the others built a fort. The next day they wanted to do this again and as I was pulling the first ones, the others came running as they had found where wolves had killed a doe and a fawn, another reason my wife and I don't walk in the woods without a pistol. Other states (Wyoming for example) let you hunt wolves year round and you don't even have to register them when you shoot them, and guess what their wolves are not on the endangered list! The idea of not having a number to keep wolf population at is ridiculous, you have already ruined my hunting retirement but please don't ruin my kids' and grandkids'. We agreed years ago to 350 wolves in Wisconsin and I think you should abide by that. Let's get things back under control and control the population of wolves PERMANENTLY!! If we get that number down anywhere around the 350 number then we have a chance at rebuilding a deer herd and restore the balance in northern Wisconsin.
Scott Jansen	Y	Feb242023	11:23:23	Wolf Harvest	To Whom it May Concern, As a land owner on the north edge of the Willow Flowage, I am in favor of a managed wolf harvest in Wisconsin. We have a managed harvest for many animals in Wisconsin and wolves should be included in that list. Coyote season is 24/7/365. I see no shortage of coyotes. A managed harvest will help the deer population around the Willow Flowage and help the Elk get better established in the northern part of Wisconsin. Sincerely, Scott A. Jansen
Jim Low	Y	Feb242023	11:31:12	Wolf killing plan	To whom it may concern, I have just found out about this process, so this is last minute. I live on the south shore of lake superior on bark point road in Herbster, WI. I've lived here since 2001. Prior to that lived on my farm in South Range, just se of Superior. Prior to that I lived on the Lac du Flambeau Reservation and before that moving to Eagle River in 1983; so I've lived in WI for about 40 yrs now. Wow, that's more than I thought. Anyway, I moved up here from n. Illinois to live in the northwoods surrounded by all the predators, raptors, wildlife that I didn't see much of in Illinois. I'm a birder and do my own spring hawk count here, this'll be my 6th season doing the count. I did do lots of birding in the Eagle River and Jim Baughman was my neighbor, a birder also. Think he worked for the forest service. I absolutely abhor what the government is doing to our predators here. I have questioned coyote hunters when their dogs are running through my back woods and last april I believe it was heard hounds off in the woods and soon after 3 shots rang out as i was out shoveling my drive. So I got in the car and drove a short ways and found his vehicle and waited for him to come out of the woods w/a dead coyote attached to the rope he had wrapped around his chest w/his dogs running around. He ignored my requests, one of which was if he had permission to be on this property. He didn't answer. I talked w/my neighbors who told me whose property it was and I let her know what occurred. She wasn't too please. Late July I was on my daily walk and right in front of this same women's house there appeared a wolf broadside right in the middle of the road maybe 50' right in front of me. I keep track of the predators I observe and they're high points in my life. I'm up to about 36 wolves or so now not counting all those I see in March in Yellowstone where I used to go to observe them. That's gotten too popular a thing now and there are people guiding folks there, and van's from Ely and U-Washington students etc and so I haven't been going. I've tracked w/a trained tracker in Douglas Co and loved that day w/Rachel Tillich. I do NOT support any hunting of wolves in the name of science. By the way I've read Predatory Bureaucracy and have detailed notes. What an absolute century long debacle that was and actually continues. I believe the assault/slaughter by the government of the predators, eagles and everything else that fed on the poisoned targeted animals was done in the name of science. The DNR etc are suspect agencies in my opinion. IF by chance the government determines that the population of a species is too large, first I'd recommend you take a good look at the population of the sapiens. Then and only then, I'd suggest the animals are captured and removed to areas that may need to refurbish their packs etc... This was done to reintroduce the bald eagles as I've been to a few hacking sites where this was done and attended a few International Bald Eagle days in Chicago, Rochester, NY and Winnipeg Canada and met many of those involved in the captures and running these hack sites. Along the N Shore of L Superior there were hack boxes there and actually are done in the cities like Duluth and I've seen them in La Crosse because when Cornel U tried releasing them in the Maine woods they were preyed on by the GH Owls, so they went to hacking. IT'S TIME THE GOVERNMENT STOP WHAT THEY'RE DOING. "When you find yourself in a hole. STOP DIGGING" was the poster I put on my classroom wall every year. STOP. STOP. I haven't read your plan. I have NO PATIENCE for ignorance. So I'll do what I can if I see it happening here. If the dogs are running around my place I'd KILL THEM if I can. However, I don't believe in hunting and don't have any guns but I don't know how much longer I can hold to my values. STOP [redacted] killing our predators. Jim Low Herbster, Wi
Sherrie Wiegand	Y	Feb242023	11:43:11	Wolf plan	Please ban hunting wolves using dogs. It is harmful to both of the animals. Sherrie Wiegand Spooner Wi
j green	Y	Feb242023	11:46:38	Wolf Management	I would like to suggest no out of state licensing. WI residents only also no hounds or trapping. Let WI be proud of how we treat our environment. Thank you, James and Judith Green Hudson WI.
Sandra Berg	Y	Feb242023	11:48:05	Support for the Draft Wolf Management Plan	Dear Randy Johnson, As a charter member of the Timber Wolf Alliance I was horrified with the wolf slaughter instigated by out-of-state trophy hunters. This can't happen again. I totally agree with WI Sierra Club's comments regarding the Wolf Management Plan. (I actually read most of the Plan). Wolves are beautiful animals adding to the biodiversity of our State. They must be thoughtfully managed and protected. Thank you and your team for the effort developing the 2022 draft Wisconsin Wolf Management Overall, I support the draft plan. I am pleased that it is guided by best available science, public input, and Tribal engagement- the core tenets of the best way to protect, conserve, and sustain natural resources! I also applaud the Department for conducting a very extensive and inclusive survey on the "public opinions regarding wolves in Wisconsin?. Things I support about the plan as written: ? The plan removes a numeric population goal, allowing for an adaptable population: I support the goal of a self-sustaining, self-regulating, and genetically diverse wolf population that maintains connectivity with wolf populations in neighboring states and fulfills their ecological roles. ? The plan creates low limit zones around Tribal lands where the Tribes requested it: These lands are treaty-protected with documented wolf packs. Making this update is an important and welcome addition to the plan. Ideally, the plan would expand these zones beyond just the few that are listed and further reduce the limit to one wolf per subzone. ? The plan is reflective of the public opinions survey that finds opinions toward wolves have grown significantly more favorable. ? There is expressed commitment to science and continued research with partners and acknowledgement that ?keystone species such as wolves are an important component of a healthy ecosystem?. ? The plan outlines the strategies related to increasing public education related to the implementation of non-lethal conflict deterrent techniques. ? I support the plan?s recommendations to pursue more administrative rules, including the reduction of the window to report wolf kills to 8 hours or less and making the purposeful destruction of occupied wolf dens illegal Things I would like to see added or reviewed before plan is finalized: ? The plan should outline the concerns with ACT 169 and recommend legislative changes so that the DNR is able to make decisions on wolf stewardship in alignment with the goals of the wolf plan. ? A recommendation that the department issues wolf hunting licenses which are

Name	Resident	Date	Time	Subject	Email Body
					valid only in the specific wolf management zone(s) specified on the license. ? The DNR should better regulate hound training on wolves. The DNR should close wolf-focused hound training activities as each wolf hunting zone closes. The plan currently would allow hounds to chase wolves for training purposes during the wolf hunting season, across the entire state, until the very last wolf zone is closed. This could go on for months and would interfere with the wolf breeding season and population tracking of which both occur in late winter. ? There is currently no guidance in plan for next review or update ? Ideally, the plan should include a provision to update every 5-7 years rather than simply being ?valid until it is replaced.? ? There should be permanent, ongoing oversight by a stakeholder group AND a science committee to oversee wolf stewardship in Wisconsin. The stakeholder group must be inclusive and recognize the importance of Tribal oversight. ? I recommend identifying specific metrics that will define successful wolf management in Wisconsin. Examples should include metrics include pack integrity, average pack size, distribution of CWD in wolf range, the relative distribution of wolves across the state, and genetic connectivity and flow between packs across the state. ? The plan acknowledges that there are responsible farming practices and other non-lethal options to reduce wolf and livestock conflicts but should recommend that the DNR prioritizes these opportunities. Bottom line: Please continue to push for more science-based research in our state as well as wolf co-existence education across Wisconsin. Thank you for your consideration and careful work involving the on-going wolf stewardship of wolves in our state. Sincerely, Sandra Berg [redacted] Manitowoc, WI 54220 [redacted] This message was sent by KnowWho, as a service provider, on behalf of an individual associated with Sierra Club. Frank B	Unknown	Feb242023	12:02:08	Wolf zones	How do u think u can manage with all the closed areas. I hunt in northern Wisconsin west of hwy 51 north of hwy 47, around camp lake,deer population like zero. Around trout lake it's 85 percent less then it was ten years back. the people just no long hunt in that area like in the past. all this land is open to hunting. So reading the draft the science takes the back set again to special group interest not what is good for all are land all the people of Wisconsin. with out fences wolfs will move. go on the reservation see how many deer u see (none) that see how the tribe's manage there lands. If science shows 350 wolf will maintain a good health population this is for the entire state. With Closed land for no hunting. So much for common sense. I have been hunting and fishing this area from 1975. I seen the high and lows. The best thing of all the years hunting was harvesting of the mature forest. The worst is mis management that goes on for special interest groups.
David Elavsky	Y	Feb242023	12:07:02	Support for the Draft Wolf Management Plan	Dear Randy Johnson, I own a cabin in northern WI. I no longer hear wolves howling. The recent wolf hunt has decimated the local wolf packs. Hound hunters seem to be taking over the woods. The constant sounds of hounds has wrecked the northwoods experience for me. Wolves are an important part of the environment. They can play a large part in keeping the deer and elk herds healthy. They are crucial in helping to stop the spread of CWD. Thank you and your team for the effort developing the 2022 draft Wisconsin Wolf Management Overall, I support the draft plan. I am pleased that it is guided by best available science, public input, and Tribal engagement- the core tenets of the best way to protect, conserve, and sustain natural resources! Mark Reinhardt	Y	Feb242023	12:29:07	Wolves	Hello, I would just like to comment and say that I am beyond tired of trying to enjoy the outdoors but have to make sure, as best we can, that there are no wolves in the area where we are hunting, trout fishing or just hiking in the woods with family and pets. The wolves have taken over many areas in northern Wisconsin and are out of control. Something needs to be done to control the wolf population!
Mary Anderson	Y	Feb242023	13:12:15	Support for the Draft Wolf Management Plan	Dear Randy Johnson, Humans are the problem not wolves. I have livestock in wolf territory. Never been a menace but hunters sure are, hounders in particular. Stop paying those cretins scofflaw payments. Their dogs are not worth $2500 only their equipment is worth that much. They very deliberately run their dogs in wolf hazard zones, it's a good way to cull dogs and get more money than if you sold. Or they just drop them off. There are 2 hounds in our community shelter right now that no one claimed. Catering to the very worst of humanity is offensive to the rest of us. Do better when you know better. Thank you and your team for the effort developing the 2022 draft Wisconsin Wolf Management Overall, I support the draft plan. I am pleased that it is guided by best available science, public input, and Tribal engagement- the core tenets of the best way to protect, conserve, and sustain natural resources! Joy Fricke	Y	Feb242023	13:46:56	Wolves!	We need to protect wolves in Wisconsin. These animals have started to make a comeback and deserve protection..not kills in the name of hunting! Thank you, Joy Fricke 6172 s 36th St Greenfield, WI 53221
Donna Selquist	Y	Feb242023	14:05:37	Wolf Management	First off, a State Law that mandates a wolf hunt is totally ridiculous! The law should be revoked immediately! Beyond that, however, I have several objections to DNR's proposed Wolf Management. 1. Artificially set kill quotas do not even consider the positive benefits which wolves contribute to healthy ecosystems, including managing the number of deer, and filling an ecological niche which Nature intended for them. 2. Wolves have cultural significance to many of our Native American neighbors, whose traditions should be respected. 3. "Managing" wolf numbers is not the same as "slaughtering" them - there are many non-lethal methods available for dealing with human-wolf conflicts, even in agricultural and ranching areas. 4. Most hunting methods, including trapping, baiting, bow hunting, denning, and hounding are unsportsmanlike in the extreme. Hunter, especially the young ones, need to be taught human compassion and respect for other sentient creatures with whom we share our habitat. Other than as trophies, people have very little if any use for dead wolves. This is a shameful waste of precious life. 5. As proven by last year's hunt, it is obvious that DNR nas no idea what a toll even a theoretically controlled hunt will have on wolf numbers and species survival. You need to stop pretending you know what you're doing. I sincerely hope you will take my concerns seriously. As a WI resident, I want my home to be a place of peace, kindness, and natural splendor which includes all of the species who share it with us. Thank you. Donna Selquist Florence 54121
Diana Kromraj	Unknown	Feb242023	14:50:25	please get rid of the wolves.	the wolves NEED to be moved/ killed whatever it takes they ARE a problem my Mother lives between GALLOWAY AND ELDERON WISCONSIN and I spent time up there and the wolves howl many of them . 10 12 in packs . my mother is 85 yrs old and lives alone. my uncle also lives near by and he was swarmed by many all around him at dusk. i took some breaks outside and was terrified hearing them near by.i was scared for sure . if anyone feels they should stay than [redacted] it go out side at night and hear and see what I am talking about. get rid of the wolves. they are you gonna wait till they kill people? all of you are talking about something you don't know anything about them...get rid of this problem dont feed it..there are way to many of them.and NEVER should have brought them in that area they were not needed.please look into this matter.or wait till something BAD happens .than will have to have take action on this matter.
Lisa Douglas	Unknown	Feb242023	15:09:03		1. We recommend that the DNR continue to not include a numeric goal, as these can and have been used against the species. 2. We encourage the DNR to place less emphasis on lethal management and more on the value of the wolf to the ecosystem, indigenous culture, and to non-consumptive users. The reliance on USDA Wildlife Services is concerning as lethal options seem to take priority over non-lethal as shown by the numbers. 3. We encourage the DNR to have separate committees for science and for stakeholders. This provides a buffer between the science and the politics and special interest agendas. 4. We also recommend far more restriction on the use of hounds against wolves for hunting and training. We understand that the use of hounds is allowed under state law, but rules are almost nonexistent and their use should be minimized.
	Unknown	Feb242023	15:24:57	Wolf management	The open door policy involving wolves being controlled by the environmentalists is so fractured for what the value is, is heinous to say the least. How wolves were imported from Canada without being subject to any enforcement was illegal beyond reason. Compare what Florida is now facing with the control of pythons is not much different. These do gooder environmentalists who think the removal of wolves was such bad thing should then also support removal of all pest controls in any of this country's cities. Let rats return to spread diseases that history will vouch for. Let's not be selective and use any practical sense of why wolves were removed. Previous history should be ignored of what destruction wolves can do to the entire wildlife status. Overlook whatever the numbers might be that say they are no longer endangered. Give them full protection as the environmentalists tout. The craziness that even opened the doors to allow wolves to be reintroduced and worse yet go uncontrolled is not an act of any defining wisdom. How the environmentalists got an upper hand with this country's top courts should never have occurred. The management of all wildlife should have been and forever in the future only subject to the decisions of the individual states wildlife programs. Why are there programs to control the numbers of feral pigs? Should there be a difference between the feral pigs and the wolves? It's ok to decimate a herd of wild cattle because they are destroying habitat of property and they might be a safety factor. Again, not the decisions for this country's high courts but that for state agencies. Bottom line, if state decisions are not the controller and not that of this country's high courts, then any of this is a waste of time.

This could go on for months and would interfere with the wolf breeding season and population tracking of which both occur in late winter. ? There is currently no guidance in plan for next review or update ? Ideally, the plan should include a provision to update every 5-7 years rather than simply being ?valid until it is replaced.? ? There should be permanent, ongoing oversight by a stakeholder group AND a science committee to oversee wolf stewardship in Wisconsin. The stakeholder group must be inclusive and recognize the importance of Tribal oversight. ? I recommend identifying specific metrics that will define successful wolf management in Wisconsin. Examples should include metrics include pack integrity, average pack size, distribution of CWD in wolf range, the relative distribution of wolves across the state, and genetic connectivity and flow between packs across the state. ? The plan acknowledges that there are responsible farming practices and other non-lethal options to reduce wolf and livestock conflicts but should recommend that the DNR prioritizes these opportunities. Bottom line: Please continue to push for more science-based research in our state as well as wolf co-existence education across Wisconsin. Thank you for your consideration and careful work involving the on-going wolf stewardship of wolves in our state. Sincerely, Pamela Weindling [redacted] Milwaukee, WI 53217 [redacted] This message was

Tom & Bonnie Garbers	Unknown	Feb242023	17:36:28	Fwd: NEWS RELEASE: Last Call For Comments: DNR Seeking Input On Proposed Wolf Management Plan Through Feb. 28	It appears to me that this subject and its conflicts will never end. My opinion is to let the tribal nations have as many wolves as they would like. Put the rest of the state at the 350 number as promised in the beginning of accepting the wolves to Wis. When tourists and big city people wish to see wolves on the landscape they can pay the tribal nations to view them. The tribal nations profit, and none of the wolves are hurt, that stay on the reservations. It's also not fair to land owners that live close to reservations to block a 10 mile radius on all sides. How about changing that figure to about 1,000 yards. Put the hunting and trapping at numbers that will sustain the 350 number as was promised. So simple to do, to make the most residents of Wis. come together on the wolves. Thank you for listening to me. Thomas Garbers
Melvin Gall	Unknown	Feb242023	17:53:56	Wolfs	Leave the wolfs alone.they should be protected unless on a individual basis,then the farmer and only the farmer can shot one.otherways they should be protected.
Lance Kammerud	Unknown	Feb242023	18:07:32	Wolves!!!	STOP THE NEEDLESS, UNNECESSARY TRAUMATIZING KILLING OF GRAY WOLVES IN THE GREAT LAKES REGION AND THROUGHOUT THE U.S. WOLVES KILL FOR NEED¦HUMANS KILL FOR GREED. SAVE THE ANIMALS¦KILL THE HUNTERS!!! [cid:18685e30b32b26aaf7a1]
Jeff Olson	Unknown	Feb242023	19:20:25	Wolf population goal	why ask hunters you dont listen to us anyway
Ahnna	Unknown	Feb242023	19:23:36	Wolf Killing/Management	1. We recommend that the DNR continue to not include a numeric goal, as these can and have been used against the species. 2. We encourage the DNR to place less emphasis on lethal management and more on the value of the wolf to the ecosystem, indigenous culture, and to non-consumptive users. The reliance on USDA Wildlife Services is concerning as lethal options seem to take priority over non-lethal as shown by the numbers. 3. We encourage the DNR to have separate committees for science and for stakeholders. This provides a buffer between the science and the politics and special interest agendas. 4. We also recommend far more restriction on the use of hounds against wolves for hunting and training. We understand that the use of hounds is allowed under state law, but rules are almost nonexistent and their use should be minimized. Thank you, Ahnna [redacted]
Thomas Ries	N	Feb242023	19:24:27	Wolf management plan	Wolves are necessary and essential to our ecosystem and a I am requesting that they be allowed to be protected in your state. There are states to your south including Iowa, Illinois , and Indiana that have no wolves in them. Many from these states would love to see wolves return to our states . You have a beautiful state with many animal species that have disappeared from your southern states. Which I am sure draw many tourists to your state. Please allow these animals to migrate to your southern states safely without hunting pressure
Chak Dantuluri	N	Feb242023	19:49:18	Save Wisconsin Wolves	Hello, I am an Illinois resident and deeply appreciate the state of Wisconsin for the natural beauty and kindness of the people. Congratulations on hosting a large wolf population, a precious set of wildlife that is increasingly rare in our country. I respectfully urge you to save these beautiful creatures from hunting. We already lost a lot of our wildlife, please save the remaining wolves. Thank you, Chak Dantluri [redacted] Naperville IL
Lucinda Grinvalsky	Unknown	Feb242023	19:50:41	Wolves	Wolves are essential. They will continue to exist as long as there is a food source so any attempts to reduce or remove them are pointless. Let them live their best carnivorous life.
Debby Roegner	Y	Feb242023	19:55:13	Support for the Draft Wolf Management Plan	Dear Randy Johnson, Thank you and your team for the effort developing the 2022 draft Wisconsin Wolf Management Overall, I support the draft plan. I am pleased that it is guided by best available science, public input, and Tribal engagement- the core tenets of the best way to protect, conserve, and sustain natural resources! I also applaud the Department for conducting a very extensive and inclusive survey on the "public opinions regarding wolves in Wisconsin?. Things I support about the plan as written: ? The plan removes a numeric population goal, allowing for an adaptable population: I support the goal of a self-sustaining, self-regulating, and genetically diverse wolf population that maintains connectivity with wolf populations in neighboring states and fulfills their ecological roles. ? The plan creates low limit zones around Tribal lands where the Tribes requested it: These lands are treaty-protected with documented wolf packs. Making this update is an important and welcome addition to the plan. Ideally, the plan would expand these zones beyond just the few that are listed and further reduce the limit to one wolf per subzone. ? The plan is reflective of the public opinions survey that finds opinions toward wolves have grown significantly more favorable. ? There is expressed commitment to science and continued research with partners and acknowledgement that ?keystone species such as wolves are an important component of a healthy ecosystem?. ? The plan outlines the strategies related to increasing public education related to the implementation of non-lethal conflict deterrent techniques. ? I support the plan?s recommendations to pursue more administrative rules, including the reduction of the window to report wolf kills to 8 hours or less and making the purposeful destruction of occupied wolf dens illegal Things I would like to see added or reviewed before plan is finalized: ? The plan should outline the concerns with ACT 169 and recommend legislative changes so that the DNR is able to make decisions on wolf stewardship in alignment with the goals of the wolf plan. ? A recommendation that the department issues wolf hunting licenses which are valid only in the specific wolf management zone(s) specified on the license. ? The DNR should better regulate hound training on wolves. The DNR should close wolf-focused hound training activities as each wolf hunting zone closes. The plan currently would allow hounds to chase wolves for training purposes during the wolf hunting season, across the entire state, until the very last wolf zone is closed. This could go on for months and would interfere with the wolf breeding season and population tracking of which both occur in late winter. ? There is currently no guidance in plan for next review or update ? Ideally, the plan should include a provision to update every 5-7 years rather than simply being ?valid until it is replaced.? ? There should be permanent, ongoing oversight by a stakeholder group AND a science committee to oversee wolf stewardship in Wisconsin. The stakeholder group must be inclusive and recognize the importance of Tribal oversight. ? I recommend identifying specific metrics that will define successful wolf management in Wisconsin. Dave Hochtritt	Y	Feb242023	20:34:35	Wisconsin Wolves	Wolves play a vital role in the ecosystem in the State of Wisconsin; this is a proven fact. Wolves are capable of managing themselves in every aspect and have proven this many times over. It is the trophy hunters, trappers and hounders who wish to see these creatures back on the "kill list." Idaho, Wyoming, Montana and Wisconsin have shown what can happen when wolves are the target of these sportsmen." Killing is not managing as many would have you believe. Wisconsin's reputation was badly tarnished with the February 2021 wolf "hunt" which showed what can happen when rules and regulations are cast aside to appease a special, small group who believe that nature's bounty belongs to them exclusively. Hopefully the wishes of wolf haters like Tiffany will be put to rest and Wisconsin can take its rightful place among what is really important in the scheme of things. Dave Hochtritt Professor Emeritus UW Oshkosh
Mark M Giese	Y	Feb242023	20:43:11	Wolf Management Plan Comments	1. I recommend that the DNR continue to not include a numeric goal, as these can and have been used against the species. 2. I encourage the DNR to place less emphasis on lethal management and more on the value of the wolf to the ecosystem, indigenous culture, and to non-consumptive users. Julie Begalke	Y	Feb242023	21:55:44	wolf hunt	Hello, I am for wolf management hunts. Too many wolves will destroy the deer and elk herds. Wolves also are a danger to farmers. If a wolf is attacking a farmers livestock then they should have every right to protect their animals and they can shoot and kill the wolf. As far as I am concerned a wolf is no different then a coyote. The only good coyote or wolf is a dead one. A few years ago Wisconsin had a wolf hunt and they allowed only 200 to be harvested. It took only 2 ½ days to go over the limit. That should tell you right there how big the wolf packs are in Wisconsin. I am in favor of wolf hunts. Sincerely Julie Begalke
Manuel Lopez	Unknown	Feb252023	0:07:15		My name is Manuel Lopez I believe wolves are eco system guardians where wolves are present it shows natures at its best when wolves hunt they target the weak or sick animals keeping heards strong they keep deer and elk on the move giving a chance to let plants and vegetation grow wolves also never let themselves over populate they will regulate there numbers on there own hunting wolves doesn't work is unethical and will weaken a pack causing more wolf livestock conflict there are many non lethal methods
Kyle Froehlich	Unknown	Feb252023	5:11:35	Wolves	Get rid of these useless things. Or lock em up on the rez. Pit more barricades up and keep the spearing wolf lovers on their own land and how about the dnr work for the people that pay for their wages.
Rebecca Billey	Y	Feb252023	6:52:57	Support for the Draft Wolf Management Plan	Dear Randy Johnson, I commend your efforts to make the stewardship of wolves an inclusive process. When we work in conjunction with others, we expand our knowledge. Please consider the recommended additions. Together we can achieve a healthy wolf population, without the drama of the past. Thank you and your team for the effort developing the 2022 draft Wisconsin Wolf Management Overall, I support the draft plan. I am pleased that it is guided by best available science, public input, and Tribal engagement- the core tenets of the best way to protect, conserve, and sustain natural resources! Julie Miller	Y	Feb252023	9:59:54	Wolf management	To whom it may concern, I would like to recommend that the DNR continue to not include a numeric goal, as these can and have been used against the species. I also encourage the DNR to place less emphasis on lethal management and more on the value of the wolf to the ecosystem, indigenous culture, and to non-consumptive users. The reliance on USDA Wildlife Services is concerning as lethal options seem to take priority over non-lethal as shown by the numbers. I would also like to encourage the DNR to have separate committees for science and for stakeholders. This provides a buffer between the science and the politics and special interest agendas. I also recommend far more restriction on the use of hounds against wolves for hunting and training. We understand that the use of hounds is allowed under state law, but rules are almost nonexistent and their use should be minimized. Trophy hunting is cruel and senseless and I am fighting to get it prohibited. Also to outlaw the use of snares and traps. Thank You, Julie Miller Animal rights advocate [redacted] Monroe, WI 53566
Todd Steffes	Y	Feb252023	10:15:12	WOLF MANAGEMENT	I believe the time to start managing the wolf population in Wisconsin is past due. There is no way to manage or grow the deer herd in northern Wisconsin without reducing the wolf population. One wolf harvest season in the last 10 years or more is no way to manage the resource. Wisconsin estimates of 1100 or more wolves is more than 3 times the population goal(350) or threshhold to allow a hunting/trapping season for this predator. Deer populations have suffered for more than 2 decades in northern Wisconsin. The number of hunters and camps have diminished due to the lack of deer sightings and the realistic opportunities of filling a deer tag or even seeing deer on a daily basis. This is a measurable loss to the economy of

Name	Resident	Date	Time	Subject	Email Body
					many northern counties. The "Wisconsin Outdoor News" paper reported in their Dec16, 2022 edition that northern counties Douglas and Price saw a 13.5% increase in deer harvest(2021) after the 3 day wolf season in 2021. Clark and Forest counties deer harvest increased more than 35%. Douglas county has 44 wolves killed for depredation alone. That's 4 per month for 11 months! The DNR is constantly talking about recruiting more hunters. Deer hunting and small game hunting is where you will get more people, young and old, to continue and join the great sport of hunting. The loss of opportunities to be successful in northern Wisconsin is a shame. It is a large amount of forest space with few game animals and fewer hunters every year. More hunters head to more populated areas in southern Wisconsin to be successful. Here is the nutshell of the DNR plan The draft plan aims to effectively balance the tradeoffs between three main objectives: * Ensuring a healthy and sustainable wolf population to fulfill its ecological role. * Addressing and reducing wolf-related conflicts. * Providing multiple benefits associated with the wolf population, including hunting, trapping and sightseeing. It's time to get a handle on the out of control wolf population. If the wolf harvest does not MEET OR EXCEED the number of offspring the following spring, you are growing the wolf population. Wolf-related conflicts will not be reduced(point number 2). An annual season will address point number 3. Sightseeing is a mystery to me. As a weekend hunter in Florence county since the 70's, I have heard wolves and seen tracks but have never seen a wolf. My friends that spend more time in Ashland county do see the wolves. The first point sounds good on paper but provides no measurement for success of failure. It's time for Wisconsin to manage its own wolf population!! Do not allow the federal government to interfere with the citizens who have to live with the wolves on a daily basis. Todd Steffes Malone, Wi
susan McMurray	Y	Feb252023	11:26:20	Support for the Draft Wolf Management Plan	Dear Randy Johnson, I am concerned about the wolf population of Wisconsin. 2011 Act 169 goes against decades of sound management practices and brought inappropriate legislative involvement into this arena. The Feb 2021 wolf "hunt" was an abomination. I am aware that the DNR cannot change the law, but I am supportive of the proposed Wolf Management Plan. It is perhaps the best outcome that could be achieved. It removes a specific population number, and instead focuses on science. The plan was developed with extensive public input, and with consideration of involvement of the Tribes, as it should. Thank you and your team for the effort developing the 2022 draft Wisconsin Wolf Management Overall, I support the draft plan. I am pleased that it is guided by best available science, public input, and Tribal engagement- the core tenets of the best way to protect, conserve, and sustain natural resources! I also applaud the Department for conducting a very extensive and inclusive survey on the "public opinions regarding wolves in Wisconsin?. Things I support about the plan as written: ? The plan removes a numeric population goal, allowing for an adaptable population: I support the goal of a self-sustaining, self-regulating, and genetically diverse wolf population that maintains connectivity with wolf populations in neighboring states and fulfills their ecological roles. ? The plan creates low limit zones around Tribal lands where the Tribes requested it: These lands are treaty-protected with documented wolf packs. Making this update is an important and welcome addition to the plan. Ideally, the plan would expand these zones beyond just the few that are listed and further reduce the limit to one wolf per subzone. ? The plan is reflective of the public opinions survey that finds opinions toward wolves have grown significantly more favorable. ? There is expressed commitment to science and continued research with partners and acknowledgement that ?keystone species such as wolves are an important component of a healthy ecosystem?. ? The plan outlines the strategies related to increasing public education related to the implementation of non-lethal conflict deterrent techniques. ? I support the plan?s recommendations to pursue more administrative rules, including the reduction of the window to report wolf kills to 8 hours or less and making the purposeful destruction of occupied wolf dens illegal Things I would like to see added or reviewed before plan is finalized: ? The plan should outline the concerns with ACT 169 and recommend legislative changes so that the DNR is able to make decisions on wolf stewardship in alignment with the goals of the wolf plan. ? A recommendation that the department issues wolf hunting licenses which are valid only in the specific wolf management zone(s) specified on the license. ? The DNR should better regulate hound training on wolves. The DNR should close wolf-focused hound training activities as each wolf hunting zone closes. The plan currently would allow hounds to chase wolves for training purposes during the wolf hunting season, across the entire state, until the very last wolf zone is closed. This could go on for months and would interfere with the wolf breeding season and population tracking of which both occur in late winter. ? There is currently no guidance in plan for next review or update ? Ideally, the plan should include a provision to update every 5-7 years rather than simply being ?valid until it is replaced.? ? There should be permanent, ongoing oversight by a stakeholder group AND a science committee to oversee wolf stewardship in Wisconsin. The stakeholder group must be inclusive and recognize the importance of Tribal oversight. ? I recommend identifying specific metrics that will define successful wolf management in Wisconsin. Examples should include metrics include pack integrity, average pack size, distribution of CWD in wolf range, the relative distribution of wolves across the state, and genetic connectivity and flow between packs across the state. ? The plan acknowledges that there are responsible farming practices and other non-lethal options to reduce wolf and livestock conflicts but should recommend that the DNR prioritizes these opportunities. Bottom line: Please continue to push for more science-based research in our state as well as wolf co-existence education across Wisconsin. Thank you for your consideration and careful work involving the on-going wolf stewardship of wolves in our state. Sincerely, susan McMurray [redacted] MADISON, WI 53704 [redacted] This message was sent by KnowWho, as a service provider, on behalf of an individual associated with Sierra Club. Karolyn Beebe	Y	Feb252023	13:29:42	My comment on the WI. Wolf Management Plan	Thank you for the new plan. It's a happy improvement over past plans. This plan almost appreciates the supreme land managers that families of wolves are. I wish the WI-DNR would adopt the wolf as their stewardship mascot and guide. The wolf's role in North America's ecology is key -- they keep prey populations like deer in check while redistributing nutrients through hunting and movement patterns. They also provide some of the only sources of food for scavengers that do not or cannot hunt. It's impossible to know the extent of the web of life that originates with wolves, but one thing is for sure -- we need them. Karolyn Beebe [redacted] Madison, WI. 53704
Gordon Dukerschein	Y	Feb252023	15:07:47	Wolf Plan	I am a life long resident of Rusk County and have fished and hunted since I was a small boy. Next week I will turn 68 years old so I have experienced many changes in our wildlife populations in my lifetime, some as a result of habitat changing and some by human intervention. I clearly remember when wolves were being introduced and the goal was to be 350. I appreciate wolves as part of the wildlife diversity and they should continue to be a part of the mix. I am concerned that we now have 2 to 3 times that number and northern Wisconsin is out of balance due to their strong predication skills. Without a managed hunt we will certainly be guaranteed further loss of whitetail deer and other wildlife. Hunting has changed due to their over population as you are hearing from up north. We have way too many and as man is their only population control it will not be brought under control until they are managed. In speaking with the head of elk management, of the elk lost in the northern herd, of those found and investigated, over 42% are due to wolves. It's no wonder why the elk herd is so slow to grow. I thought the DNR was supposed to manage our wildlife for the benefit of each species and for outdoors men and women to enjoy by watching and/or hunting and fishing. The wolves are out of control, please manage them as originally planned to the benefit of all the wildlife population. I am not against having 350 wolves in our state but let's quit changing the goal, listen to those who are living up north and understand what is really happening. Respectfully, Gordon Dukerschein [redacted] Glen Flora, WI [redacted]
Janet M. Wall	Y	Feb252023	15:40:35	Support for the Draft Wolf	Dear Randy Johnson, I was born and raised on a ranch in Montana. My family and I have always loved and protected wildlife, including coyotes and wolves. I learned from the wonderful example of my Father and my Mother that respecting wildlife, protecting them, and in general maintaining an attitude that they share the Mother Earth with us. I am deeply interested in protecting them now and in seeing that we live in harmony with them. I do not believe in the cruelty of trapping them. Thank you and your team for the effort developing the 2022 draft

Steve Betchkal	Y	Feb252023	15:41:37	Support for the Draft Wolf Management Plan	Dear Randy Johnson, Wolves are a natural component of Wisconsin's ecosystem, and an important key predator. For our natural systems to function correctly, we need a healthy wolf population in the state. The WDNR plays a critical role in monitoring, and conserving our wolf population, and input from citizens is integral to any functional and reasonable long-tern planning. The recent "wolf hunt exploitations" dominated by pro-hunting groups is out of whack with the diverse range of opinions of Wisconsin's citizenry. My hope is that the DNR considers what's best for the resource, not a fraction of the human population. Thank you and your team for the effort developing the 2022 draft Wisconsin Wolf Management Overall, I support the draft plan. I am pleased that it is guided by best available science, public input, and Tribal engagement- the core tenets of the best way to protect, conserve, and sustain natural resources! Karen Jacques	N	Feb252023	16:17:05	Wisconsin Wolf Management Plan	I am writing in response to Wisconsin's efforts to develop a new wolf management plan. I have been appalled by the cruelty with which Wisconsin has treated wolves in the past and the relentless killing to which they have been subjected. It appears that the attitude of Wisconsin residents toward wolves is increasingly positive and I am grateful for that. All decisions about wolf management in Wisconsin should be based on the best science available and in consultation with qualified wolf biologists. Your proposed plan does not reflect what is currently known about wolf sentience and pack social structure. Failure to seek consultation and expertise will result in a plan that is less than adequate. It is critical that Wisconsin develop a wolf conservation plan that recognizes the value of wolves as an apex predator have in deterring the health of the ecosystems of which they are a part. Wolves are viewed as relatives in the world view of many indigenous tribes in the US, including in Wisconsin and your wolf plan should be developed and finalized in respectful consultation with them. I am opposed to any numeric cap on the number of wolves that Wisconsin will allow to exist and I certainly oppose your arbitrary cap of 350. I do not believe that wolf hunting should be allowed. There should be no wolf quota. Wolf hunting is unnecessary, cruel and extremely disruptive of the social structure of wolf packs. Wolves are not a food animal. Allowing their hunting is allowing killing for the sake of killing, killing in order to brag about killing or killing in order to put the stuffed head or skin of what was once a living being up on a wall. Such killing is unethical and should not be allowed in any state. It denies the value of the lives of individual wolves and cheapens the lives of all living beings. If any hunting is allowed, it should be extremely limited and methods of extreme cruelty such as hunting with hounds, trapping and killing wolves in their dens should be strictly banned. If hunting is allowed, Wisconsin should at least show respect for tribal beliefs by mandating a wide buffer zone around tribal land. Ranchers should be required to use non-lethal methods of managing wolves. Most live stock deaths in this country are not caused by wolves and non lethal methods have been show to work extremely well. Knowledgeable animal advocacy groups like Project Coyote should be consulted for help in setting up an appropriate educational program. There should also be a public education program for the general public about how people can coexist with roles and other predators. The world is facing an extinction crisis, much of it caused by the relentless expansion of human populations into lands inhabited by wildlife and by senseless attempts to exterminate some species. The only hope of maintaining the biodiversity that is needed for our own survival as humans is to learn to coexist with other species, including predators. instead of killing them. It is heartening to see the the public attitude toward wolves and other apex predators is changing to recognize the value of these species and the need to conserve them. Polls in Wisconsin show this shift in attitude. Thank-you for this opportunity to comment. I look forward to Wisconsin getting the expert consultation about wolves that it needs and moving forward with a wolf plan that respects their inherent and ecological value. I hope I never again have to read about horrible episodes of wolf slaughter in Wisconsin (or elsewhere). Karen Jacques, California
Andrew Reske	Y	Feb252023	17:33:02	Support for the Draft Wolf Management Plan	Dear Randy Johnson, Thank you and your team for the effort developing the 2022 draft Wisconsin Wolf Management Overall, I support the draft plan. A Cavell	N	Feb252023	18:00:06	Wisconsin wolves	Your state makes the USA look bad WORLDWIDE and thats a statement!making a species extinct is backward and insane, you dont realise social media users worldwide ðŸŒ ðŸŒŽðŸŒ ðŸ—£ðŸ“±ðŸ“² know what you do and you are watched ðŸ‘€ in Wisconsin ðŸ‘€ WE WON'T GIVE UP! Your psychopathy will kill you, trying to genocide a species wont end well for you! Its got legal proof to that you can't make a species extinct if you try you bring a zoonotic(passes between species) pandemic on you im in n.e.england !
barbara resheske	Y	Feb252023	19:22:56	Wolf Management Plan	I have read your Wolf Management Plan in it's entirety. Please do no use wolf numbers to decide how many wolves to kill.There is no proof, but only rough guesses as to how many wolves actually reside in given areas.These numbers endanger the future of wolves by implying their existence. Listen to the Indian Tribes who have co existed with wolves from time immemorial.We have stolen land from the Indians, we have no right to steal their right to live in harmony with wolves. Wolves have never killed humans and to take a poll from a group of propagandized strangers who have been conditioned to fear wolves is an unethical attempt at justifying vilifying and thus killing wolves. Non lethal methods such as electrical fencing, mules, large dogs, booms etc. have proven to be effective against wolve predation.Lethal methods are not necessary for wolf control. Mixing science and hunting/special interest group research and committees is hypocrisy.Keep the two separate so data isn't skewed and research is unbiased...it's the only way to the truth...facts and opinions are not the same.To protect

					our wildlife we need critical thinking not groupthink. Hounds are used for harassing raccoons, fox, bears, and it's time it stop.Dogs carry ticks, mange,viruses,rabies,parvo,lymes disease, heartworm and more.These are all transmittable to wolves.Even worse, separating the pack by chasing pups, juveniles and pack leaders can cause pup mortality and loss of their family unit.Justifying the training of dogs by harassing wolves is unethical. Wolve's provide a balance of nature by selection.CWD is on the rise and wolves cull the sick whitetails.Wolves eat berries and disperse berry seeds as they browse and hunt.Wolves help control beaver as part of their diet. Poaching, wolf/vehicular deaths,disease,pup mortality,toxins, poisoning all contribute to wolve's unaccounted for demise.Guns, hounds,and traps are devices that allow the worst predators on earth to decimate the wolf population.Those predators are humans. Barbara Resheske [redacted] Lake Nebagamon, Wi 54849 [redacted] CARPE'DIEM
Jayne Belsky	Y	Feb252023	19:37:12	Support for the Draft Wolf Management Plan	Dear Randy Johnson, This draft plan is a great start in taking control back from the hounders and it puts wildlife management back in the hands of biologists and scientist. Thank you. For the last 10 years they (hounders) have been in complete control of the DNR Board and have controlled your work of managing our wolf population. I understand that hunting wolves with hounds is permitted by law. But it doesn't state that hounds can / or should be used for the whole season. Give them 24 hours to run hounds and then return to normal hunting without hounds for the remainder of the season. Thank you and your team for the effort developing the 2022 draft Wisconsin Wolf Management Overall, I support the draft plan. I am pleased that it is guided by best available science, public input, and Tribal engagement- the core tenets of the best way to protect, conserve, and sustain natural resources! I also applaud the Department for conducting a very extensive and inclusive survey on the "public opinions regarding wolves in Wisconsin?. Things I support about the plan as written: ? The plan removes a numeric population goal, allowing for an adaptable population: I support the goal of a self-sustaining, self-regulating, and genetically diverse wolf population that maintains connectivity with wolf populations in neighboring states and fulfills their ecological roles. ? The plan creates low limit zones around Tribal lands where the Tribes requested it: These lands are treaty-protected with documented wolf packs. Making this update is an important and welcome addition to the plan. Ideally, the plan would expand these zones beyond just the few that are listed and further reduce the limit to one wolf per subzone. ? The plan is reflective of the public opinions survey that finds opinions toward wolves have grown significantly more favorable. ? There is expressed commitment to science and continued research with partners and acknowledgement that ?keystone species such as wolves are an important component of a healthy ecosystem?. ? The plan outlines the strategies related to increasing public education related to the implementation of non-lethal conflict deterrent techniques. ? I support the plan?s recommendations to pursue more administrative rules, including the reduction of the window to report wolf kills to 8 hours or less and making the purposeful destruction of occupied wolf dens illegal Things I would like to see added or reviewed before plan is finalized: ? The plan should outline the concerns with ACT 169 and recommend legislative changes so that the DNR is able to make decisions on wolf stewardship in alignment with the goals of the wolf plan. ? A recommendation that the department issues wolf hunting licenses which are valid only in the specific wolf management zone(s) specified on the license. ? The DNR should better regulate hound training on wolves. The DNR should close wolf-focused hound training activities as each wolf hunting zone closes. The plan currently would allow hounds to chase wolves for training purposes during the wolf hunting season, across the entire state, until the very last wolf zone is closed. This could go on for months and would interfere with the wolf breeding season and population tracking of which both occur in late winter. ? There is currently no guidance in plan for next review or update ? Ideally, the plan should include a provision to update every 5-7 years rather than simply being ?valid until it is replaced.? ? There should be permanent, ongoing oversight by a stakeholder group AND a science committee to oversee wolf stewardship in Wisconsin. The stakeholder group must be inclusive and recognize the importance of Tribal oversight. ? I recommend identifying specific metrics that will define successful wolf management in Wisconsin. Examples should include metrics include pack integrity, average pack size, distribution of CWD in wolf range, the relative distribution of wolves across the state, and genetic connectivity and flow between packs across the state. ? The plan acknowledges that there are responsible farming practices and other non-lethal options to reduce wolf and livestock conflicts but should recommend that the DNR prioritizes these opportunities. Bottom line: Please continue to push for more science-based research in our state as well as wolf co-existence education across Wisconsin. Thank you for your consideration and careful work involving the on-going wolf stewardship of wolves in our state. Sincerely, Jayne Belsky [redacted] Necedah, WI 54646 [redacted] This message was sent by KnowWho, as a service provider, on behalf of an individual associated with Sierra Club. Cooper Stringer	Unknown	Feb252023	20:28:37	objection to the wolf management plan	To whom it may concern, Despite Act 169, which mandates a wolf hunting season, your department can still restrict the implementation of lethal methods by setting minimal quotas, including a quota of '0' wolves, restricting timing and methods. Several research studies have proven a proactive non-lethal approach leads to better conflict mitigation. Lethal management often fails to provide a long-term solution to wolf predation and has the least consistent success rates when compared to non-lethal practices. In addition, there is significant evidence showing that lethal wolf management may be less functionally effective at mitigating subsequent livestock losses than non-lethal deterrents. Cooper
Alan Wegner	Unknown	Feb252023	20:55:18	Wolf plan	I believe that Wisconsin should have a limit of how many wolf we have on the landscape. We need to control the numbers of wolves throughout the state. I believe there are more wolves than the DNR are reporting. Alan Wegner
Phyllis Hasbrouck	Y	Feb252023	22:15:28	Support for the Draft Wolf Management Plan	Dear Randy Johnson, The Wisconsin wolf population needs protection. They are a keystone species that ensures the health of many other species and the entire eco-system. Also, they are extremely important to native people. The Anishinaabe believe that if the wolves will be wiped out, they will be too. This by itself is reason enough to protect wolves. Why would would traumatize people who have been traumatized ever since Europeans arrives on this continent? Thank you and your team for the effort developing the 2022 draft Wisconsin Wolf Management Overall, I support the draft plan. I am pleased that it is guided by best available science, public input, and Tribal engagement- the core tenets of the best way to protect, conserve, and sustain natural resources! I also applaud the Department for conducting a very extensive and inclusive survey on the "public opinions regarding wolves in Wisconsin?. Things I support about the plan as written: ? The plan removes a numeric population goal, allowing for an adaptable population: I support the goal of a self-sustaining, self-regulating, and genetically diverse wolf population that maintains connectivity with wolf populations in neighboring states and fulfills their ecological roles. ? Meghan Pierce	Y	Feb252023	23:55:56	Support for the Draft Wolf Management Plan	Dear Randy Johnson, Dear Meghan, Wolves are really important to our ecosystems and are considered 'keystone' species or an animal that other animals rely on and, if removed, could have major impacts to the ecosystem. Wolves also hold a cultural significance for many of Wisconsin's 11-federally recognized Tribes. These reasons, along with many others, are why it's so important that Wisconsin is careful and thoughtful about how we manage our wolves. This is all governed by Wisconsin's Wolf Managementt plan, please move it forward Thank you and your team for the effort developing the 2022 draft Wisconsin Wolf Management Overall, I support the draft plan. I am pleased that it is guided by best available science, public input, and Tribal engagement- the core tenets of the best way to protect, conserve, and sustain natural resources! Mark Richard	Unknown	Feb262023	10:19:23	Wolf	I do not agree with the new wolf plane. We need to do a better job of management. and cannot interfere with privet land owners rights to harvest animals.
Alexander Michael Hakam	Unknown	Feb262023	10:24:16	Wolves	Dear staff, Wolves existed before humans. We have infringed on and destroyed their habitat, then we try to solve any so-called conflict by killing them through various means which are all cruel and egregious. Wolves help maintain the balance that nature intended. Any interference by us, humans, contributes to causing further ecological imbalances that would entail dire consequences. Let nature keep its balance without our interference. Nature knows best! Thank you for reading my comment and taking it into consideration. Best regards, Dr. Alexander Michael Hakam, Ph.D. P.E., S.E.
Carrie Little Owl	Unknown	Feb262023	10:27:09	Wolf Management Plan	Dear, Wisconsin Department of Natural Resources, Wolves need to be protected in all 48 states. They deserve to live and roam in the territories they were born. As a keystone species-they are necessary for the health and ecological balance of the environment. Killing wolves for fun because they wander outside of a protected boundary is insidious. Killing wolves for any reason is unconscionable. Under no circumstances should this type of 'disturbed' behavior be tolerated or accepted as a valid wolf management practice. We, the good people of this earth ðŸŒ recommend that you change your policies in favor of protecting the sanctity of life. With Kindness-Carrie Little Owl

Pat Porter	Unknown	Feb262023	10:28:54	Wolf "management"	Your proposed plan has too many negative aspects to list. Wolves are a keystone animal, exerting great influence on the environment. Humans would do better by leaving nature alone, to the maximum possible. That includes discontinuing hunting and culling. Wolves have complex social structure within their packs, and removing members is detrimental to the whole group. If you determine (I can't imagine how!) that wolves are overpopulating, look for non-lethal means of achieving your goals. Thank you for your attention. Patricia S Porter
L. Joy Schroeder	Y	Feb262023	10:58:58	Support for the Draft Wolf Management Plan	Dear Randy Johnson, Every creature is important to the balance of Nature. Wolves may be scary to encounter and may take some livestock to eat, but not one should be killed by other than natural forces. Humans can live in harmony with wolves if we consider what their needs are and how they contribute to balancing the wildlife food chain. We humans are the ones that should be controlling our numbers and the way our machines and pollution affect ecosystems. Thank you and your team for the effort developing the 2022 draft Wisconsin Wolf Management Overall, I support the draft plan. I am pleased that it is guided by best available science, public input, and Tribal engagement- the core tenets of the best way to protect, conserve, and sustain natural resources! I also applaud the Department for conducting a very extensive and inclusive survey on the "public opinions regarding wolves in Wisconsin?. Things I support about the plan as written: ? ecmuell@aol.com	Unknown	Feb262023	11:22:42	WOLVES ARE NOT NECESSARY IN WISCONSIN	3 We do not need Wolves, "MAN" can be the predator for all predation needs if necessary! If you want a wolf, build a fence in your backyard and feed it. Wolf Management is not wildlife management.
Dave Samuel	Y	Feb262023	11:29:24	Wolf Proposal Plan	I am opposed to the unlimited population and the extension of the buffer zones to protect the wolves. We should set a goal of 350 and maintain it to protect all people who utilize the northern portion of the state. We all know that using a minimal count as in the past there would be at least double that amount in the state. We own a lot of acreage in Sawyer County and no matter where you go there are signs of wolves. No matter who you speak with they are opposed to the number of wolves. There have been a lot of incidents where wolves have followed people as they hike the trails in the area. SO far no attacks have happened but eventually it will happen. We have way too many wolves in our area already. The 350 goal has

Name	Resident	Date	Time	Subject	Email Body
					been surpassed by over three-fold utilizing the minimal count. I believe there are closer to 3000 wolves in Wisconsin versus your minimal count system. It is unsafe to have our grandchildren play outside with out adults' supervision due to the potential of issues with the wolves. We have to carry sidearms to make sure when we are in the woods our grandchildren and dogs are safe. We can't even let our house dog out without being in constant visible sight of him. Wolves have come right into our yard and we have had to chase them away. The wolf committee that put this together do not have to deal with the day-to-day issues with wolves. Those of us that do, realize the constant danger they present when the numbers are not kept in check. Regarding the buffer zones by reservations, from landowners I have spoken with in the buffer zones, I can assure you and if wolf tags are issued the rights of the private property owners within the buffer zone will be addressed in court. Dave J. Samuel
Deborah Crouse	Unknown	Feb262023	12:41:36	Wolf Management Plan Feedback please	Hi and thank you for taking into consideration this feedback on the wolf management plan. Please use the authority you have been entrusted with responsibly. When you're gone and only your legacy remains, don't have your family look at what you did versus what you could have done. Be the ones who made the often difficult decisions to stand up for THE RIGHT THINGS. No longer accept arcane policies that destroy precious nature and NATIVE species because it was wrongly accepted for far too many years. Be the ones who leave an undeniably POSITIVE future for every living being. As far as the wolf management plan is concerned, please take into consideration that wolves were on the land in question THOUSANDS of years prior to European settlement. Wolves COEXISTED; the environment was healthy and in tact. Our ancestors came, felt threatened by these large carnivores that they didn't understand and thought they had the right to extirpate an entire species. The arrogance, the inhumanity, the cruelty, the ignorance is astonishing. There is NO place in this century for the tolerance of this destructive and unnecessary behaviour. There is a PLETHORA of accurate studies of wolves from every country where they exist and we know their nature and their role. Every scientific study on the planet is in agreement: wolves are vital to a healthy ecosystem and increased biodiversity. We do NOT need to manage wolves. It is a FACT that wolves naturally limit their own populations; it's referred to as CARRYING CAPACITY. Easy examples of this can be seen today in Minnesota where the population hovers in and around 2,700 and Yellowstone at 100 etc. In captivity wolves live up to 15 years and in the wild less than 6 years; they will die from disease, starvation, and from injuries sustained trying to take down prey and fending off other rival wolves. They will not increase in numbers if there is not sufficient prey. To reiterate, we do not need to intervene and manage wolves. Please BAN trophy hunting/ trapping of wolves FOREVER. It is 2023 and it's utterly embarrassing and unacceptable that it's tolerated. There's enough violence and destruction in this world; we do not need to condone and encourage unnecessary killing of any kind. Psychologists know that deriving joy from killing an innocent being who feels pain, hunger, sense of loyalty to its family like a human does is NOT healthy human behaviour. It's highly unlikely that the trophy hunters could tell you many scientific FACTS about the animals you're allowing them to kill for fun. Those hunters can get their jollies somewhere else; they have zero right to use their UNETHICAL means to kill our dogs' ancestors. It should not even be a debate. We are a civilized nation. NO TROPHY hunting and NO TRAPPING ever. 100 countries around the world have banned trapping, but arguably the most advanced country in the world tolerates and has a season to torture animals? Wolves are hunting to feed their families and keeping ungulate populations HEALTHY so ETHICAL hunters have years and years of non disease ridden animals to kill and eat. Look at the data on the reduced rates of chronic wasting disease where wolves are present; they are our allies in stopping the disease from running rampant. They detect when an animal is sick years before humans can. Reimbursing a hunter for a hunting dog getting killed? Wolves gave us the domestic dogs we know and love, yet we're using them to kill their own ancestors?This is not only illogical, but also extremely cruel. Wolves gave us the bomb sniffing, cancer smelling, seeing guide dogs that we use to better our lives and, in return, we have a season where it's okay to slaughter them? It never was okay and it will never be okay. As far as livestock producers and potential conflicts with wolves, they have a responsibility to protect the animals who could be preyed upon. It should be mandatory to show that NON LETHAL measures have been implemented: fladry, high fences and guard dogs can be used. It's proven everywhere where wolves are present that non lethal measures are more effective and LONG TERM than lethal measures. People in every walk of life need to be responsible for their own actions or, lack there of, that impact their livelihood. Thank you for using this information to reduce the unnecessary negative, and to increase the positive aspects of the wolf management plan. Now let's work together to educate so we can co exist in relative harmony. Sincerely, Deborah Crouse [Attachment.png]
Zach DeVoe	Unknown	Feb262023	12:56:07	WOLF PLAN public comment	To whom it may concern. Please take into account the gross miscount of wolves in the NW part of the state. I don't care what any model suggests there is for numbers but it is terribly inaccurate compared to what everyone sees while in the woods. We need to manage these animals like everything else in the state. I run 30+ trail cameras across Douglas County public lang yearly for deer. I cover 1000's of acres of land in many areas of the County and average 100+ wolf pictures a year. I'm not alone in this. I have a handful of friends that have the same thing happen to them. It's rare to see them in person either. I don't do a lot of driving outside checking my cameras yearly but I average seeing 6-12 per year between driving and walking in the woods. I rarely see a coyote in contrast. Please do what you can to bring the numbers down to an acceptable level. 50% of current levels would be wonderful and they would still be plentiful. Zach DeVoe
Cindy Carter	Y	Feb262023	13:29:18	Re: Support for the Draft Wolf Management Plan	YES I am VERY concerned about our wildlife. Could care less about the over population of humanity. Dear Randy Johnson, NO MORE WOLF SLAUGHTERS, Wolves are VITAL to the eco system. ANd studies had found that the more you allow an animal to be slaughtered the more HATRED people have for them. WE ALSO NEED TO BAN WILDLIFE KILLING CONTESTS. THESE ARE MY WILDLIFE TOO!!!!!!! Thank you and your team for the effort developing the 2022 draft Wisconsin Wolf Management Overall, I support the draft plan. I am pleased that it is guided by best available science, public input, and Tribal engagement- the core tenets of the best way to protect, conserve, and sustain natural resources! I also applaud the Department for conducting a very extensive and inclusive survey on the "public opinions regarding wolves in Wisconsin?. Things I support about the plan as written: ? The plan removes a numeric population goal, allowing for an adaptable population: I support the goal of a self-sustaining, self-regulating, and genetically diverse wolf population that maintains connectivity with wolf populations in neighboring states and fulfills their ecological roles. ? The plan creates low limit zones around Tribal lands where the Tribes requested it: These lands are treaty-protected with documented wolf packs. Making this update is an important and welcome addition to the plan. Ideally, the plan would expand these zones beyond just the few that are listed and further reduce the limit to one wolf per subzone. ? The plan is reflective of the public opinions survey that finds opinions toward wolves have grown significantly more favorable. ? There is expressed commitment to science and continued research with partners and acknowledgement that ?keystone species such as wolves are an important component of a healthy ecosystem?. ? The plan outlines the strategies related to increasing public education related to the implementation of non-lethal conflict deterrent techniques. ? I support the plan?s recommendations to pursue more administrative rules, including the reduction of the window to report wolf kills to 8 hours or less and making the purposeful destruction of occupied wolf dens illegal Things I would like to see added or reviewed before plan is finalized: ? The plan should outline the concerns with ACT 169 and recommend legislative changes so that the DNR is able to make decisions on wolf stewardship in alignment with the goals of the wolf plan. ? A recommendation that the department issues wolf hunting licenses which are valid only in the specific wolf management zone(s) specified on the license. ? The DNR should better regulate hound training on wolves. The DNR should close wolf-focused hound training activities as each

Name	Resident	Date	Time	Subject	Email Body
					wolf hunting zone closes. The plan currently would allow hounds to chase wolves for training purposes during the wolf hunting season, across the entire state, until the very last wolf zone is closed. This could go on for months and would interfere with the wolf breeding season and population tracking of which both occur in late winter. ? There is currently no guidance in plan for next review or update ? Ideally, the plan should include a provision to update every 5-7 years rather than simply being ?valid until it is replaced.? ? There should be permanent, ongoing oversight by a stakeholder group AND a science committee to oversee wolf stewardship in Wisconsin. The stakeholder group must be inclusive and recognize the importance of Tribal oversight. ? I recommend identifying specific metrics that will define successful wolf management in Wisconsin. Examples should include metrics include pack integrity, average pack size, distribution of CWD in wolf range, the relative distribution of wolves across the state, and genetic connectivity and flow between packs across the state. ? The plan acknowledges that there are responsible farming practices and other non-lethal options to reduce wolf and livestock conflicts but should recommend that the DNR prioritizes these opportunities. Bottom line: Please continue to push for more science-based research in our state as well as wolf co-existence education across Wisconsin. Thank you for your consideration and careful work involving the on-going wolf stewardship of wolves in our state. Bob Behnke	Unknown	Feb262023	16:04:34	Wolf Plan	Do not understand where the DNR geniuses came up with a Wolf Plan without the use of numbers. There is absolutely no way to set goals, survey counties or make reasonable recommendations without any kind of numbers. From my own experience, I will say that I, and a group of 7-9 hunters have been deer hunting Washburn County for the past 40+ years. We use to see and harvest many deer over the years. The past 10-15 years have been very lean. We do not see many deer, hear much shooting and have been totally skunked 4-5 years. Also, the majority of us see more wolf tracks than deer tracks. Unfortunately, our group of hunters have had it with northern Wisconsin deer hunting and will begin hunting in central Wisconsin come November. We hunted the same area in Washburn County every year. It is County Forest and is managed very diligently, with clear cuts, select cuts shelterwood cuts etc. The County has done their job in renewing their forests for the benefit of wildlife and forest management. Unfortunately, the DNR does not know how to manage the over population of wolves. The original plan for the wolf reintroduction was, I think a cap of 350 or even lower. But now with the wolf population well over 1,000 and no plan to control their growth I'm afraid the sportsmen and women of this state have lost their ability to have input into the process. All because the DNR has been aligning their philosophy with that of the protectionist groups for the past few years. Its high time the DNR realize that the hunters, fisherman and trappers are the ones paying the freight here, not the protectionists!
Pam Brocious	N	Feb262023	17:51:45	Wolf conservation science	I appreciate the efforts of all WDNR staff involved in updating the state's wolf management plan. Although we believe the current plan needs significant updating it is a huge improvement from the last endeavor. I was glad to see: Updating the actual wolf count from a goal of 350; recognizing the positive view of wolves in the public eye and opposition to the motives and methods for killing them; a greater recognition of the ecological role of wolves; and adopting a proposed buffer zones around tribal reservations (where previously no buffer zones existed). The new plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. Despite Act 169, which mandates a wolf hunting season, the department can still restrict the implementation of lethal methods by setting minimal quotas, including a quota of '0' wolves, restricting timing and methods. Several studies have proven a proactive non-lethal approach leads to better conflict mitigation. ● Lethal management often fails to provide a long-term solution to wolf predation and has the least consistent success rates when compared to non-lethal practices. In addition, there is significant evidence showing that lethal wolf management may be less functionally effective at mitigating subsequent livestock losses than non-lethal deterrents. The new plan also runs contrary to public values towards wolves (and omits mention

Name	Resident	Date	Time	Subject	Email Body
					of such majority values from the plan), despite department surveys evidencing that the broad public cares about wolves as individuals (and not just for the viability of the population). Given the recent liberalization of killing wolves by the state, it would be incredibly informative to note majority support of the following reasons for opposing a regulated wolf hunting/trapping season (which are all omitted from the plan): opposition to specific methods of harvest like hounds (64%) or traps (70%), feelings that hunting wolves is unnecessary (62%) or culturally offensive to Native American tribes (57%). All such reasons convey majority disagreement with practices currently promoted and endorsed by the legislature and the WDNR, and such a conflict between managers and the public should not only be acknowledged, but foregrounded and carefully considered in policy (instead of dismissed). Such decisions to omit literature or downplay evidence (e.g., such as majority opposition to killing wolves and their reasons) are contrary to principles of scientific integrity (e.g., present all relevant scientific evidence to the public) as well as ethics (e.g., disguising ethical decisions, such as recreational wolf killing, as robustly supported by science). In short, please go back to the drawing board and take wolves off as a main target of hunters, who cannot even be called sportspeople. There are better and more effective ways of managing the wolf population. Thanks for listening, Pam Brocious Pam Brocious | Founding Partner CitiStaffing, LLC | since 2001[redacted] New York, NY 10016 T:
Chad Wenzel	Y	Feb262023	17:53:36	Support for the Draft Wolf Management Plan	Dear Randy Johnson, Wolves are important to Wisconsin as a keystone species as well as a symbolic animal to many people who call this state home. Please consider carefully how to manage their population going forward to protect and respect this essential species. Thank you and your team for the effort developing the 2022 draft Wisconsin Wolf Management Overall, I support the draft plan. I am pleased that it is guided by best available science, public input, and Tribal engagement- the core tenets of the best way to protect, conserve, and sustain natural resources! Mary McGuire	Y	Feb262023	21:53:10	Support for the Draft Wolf Management Plan	Dear Randy Johnson, Wolves have very complex social, family units which are vital to the survival of the species. Killing a nursing female will result in the likely danger of losing the next generation of wolves. Killing the dominant male will also jeopardize the health and future of the pack. All species are impacted when a dominant keystone animal like wolves are jeopardized. I would definitely not want to see a wolf hunt to primarily benefit the recreational hunter! The science which addresses the best practices is going to serve both the wolves and proper management, if needed Thank you and your team for the effort developing the 2022 draft Wisconsin Wolf Management Overall, I support the draft plan. I am pleased that it is guided by best available science, public input, and Tribal engagement- the core tenets of the best way to protect, conserve, and sustain natural resources! I also applaud the Department for conducting a very extensive and inclusive survey on the "public opinions regarding wolves in Wisconsin?. Things I support about the plan as written: ? There is currently no guidance in plan for next review or update ? Ideally, the plan should include a provision to update every 5-7 years rather than simply being ?valid until it is replaced.? ? There should be permanent, ongoing oversight by a stakeholder group AND a science committee to oversee wolf stewardship in Wisconsin. The stakeholder group must be inclusive and recognize the importance of Tribal oversight. ? I recommend identifying specific metrics that will define successful wolf management in Wisconsin. Examples should include metrics include pack integrity, average pack size, distribution of CWD in wolf range, the relative distribution of wolves across the state, and genetic connectivity and flow between packs across the state. ? The plan acknowledges that there are responsible farming practices and other non-lethal options to reduce wolf and livestock conflicts but should recommend that the DNR prioritizes these opportunities. Bottom line: Please continue to push for more science-based research in our state as well as wolf co-existence education across Wisconsin. Thank you for your consideration and careful work involving the on-going wolf stewardship of wolves in our state. Sincerely, Mary McGuire [redacted] Suamico, WI 54313 [redacted] This message was sent by KnowWho, as a service provider, on behalf of an individual associated with Sierra Club. Jesse Shatto	Y	Feb262023	23:52:44	Support for the Draft Wolf Management Plan	Dear Randy Johnson, Because wolves deserve to live just like us happy,safe,and free. Thank you and your team for the effort developing the 2022 draft Wisconsin Wolf Management Overall, I support the draft plan. I am pleased that it is guided by best available science, public input, and Tribal engagement- the core tenets of the best way to protect, conserve, and sustain natural resources! I also applaud the Department for conducting a very extensive and inclusive survey on the "public opinions regarding wolves in Wisconsin?. Things I support about the plan as written: ? The plan removes a numeric population goal, allowing for an adaptable population: I support the goal of a self-sustaining, self-regulating, and genetically diverse wolf population that maintains connectivity with wolf populations in neighboring states and fulfills their ecological roles. ? The plan creates low limit zones around Tribal lands where the Tribes requested it: These lands are treaty-protected with documented wolf packs. Making this update is an important and welcome addition to the plan. Ideally, the plan would expand these zones beyond just the few that are listed and further reduce the limit to one wolf per subzone. ? The plan is reflective of the public opinions survey that finds opinions toward wolves have grown significantly more favorable. ? There is expressed commitment to science and continued research with partners and acknowledgement that ?keystone species such as wolves are an important component of a healthy ecosystem?. ? The plan outlines the strategies related to increasing public education related to the implementation of non-lethal conflict deterrent techniques. ? I support the plan?s recommendations to pursue more administrative rules, including the reduction of the window to report wolf kills to 8 hours or less and making the purposeful destruction of occupied wolf dens illegal Things I would like to see added or reviewed before plan is finalized: ? The plan should outline the concerns with ACT 169 and recommend legislative changes so that the DNR is able to make decisions on wolf stewardship in alignment with the goals of the wolf plan. ? A recommendation that the department issues wolf hunting licenses which are valid only in the specific wolf management zone(s) specified on the license. ? The DNR should better regulate hound training on wolves. The DNR should close wolf-focused hound training activities as each wolf hunting zone closes. The plan currently would allow hounds to chase wolves for training purposes during the wolf hunting season,

Name	Resident	Date	Time	Subject	Email Body
					across the entire state, until the very last wolf zone is closed. This could go on for months and would interfere with the wolf breeding season and population tracking of which both occur in late winter. ? There is currently no guidance in plan for next review or update ? Ideally, the plan should include a provision to update every 5-7 years rather than simply being ?valid until it is replaced.? ? jim Swanson	Y	Feb272023	7:28:56	Support for the Draft Wolf Management Plan	Dear Randy Johnson, I have hunted in northern WI for over 35 years. In that time, I realize that wolves and critical for the health of the north woods. When I am eating chili in my tent after a good day of hunting and the wolves begin to howl. Life is good. Research is beginning to indicate out that wolves may be critical to preventing CWD from spreading to the north woods. A wolf management plan that keeps wolves at the current population level, which seems to be at the biological carrying capacity is vitally important. Thank you and your team for the effort developing the 2022 draft Wisconsin Wolf Management Overall, I support the draft plan. I am pleased that it is guided by best available science, public input, and Tribal engagement- the core tenets of the best way to protect, conserve, and sustain natural resources! Mary Strasser	Y	Feb272023	8:34:29	FW: Wolf hunting	I am aware that wolf hunting is still being promoted in Wisconsin. I oppose wolf culling for most cases. Wolves are valuable in managing prey populations and keeping a balance in our ecosystem. I understand that some wolves do impact farmers' animals. In those instances it would be appropriate to permit farmers to kill or relocate the offending wolves. Thank you for allowing me to weigh in on this issue. Sincerely, Mary Strasser Colclough, La Crosse WI
Larry Horsfall	Unknown	Feb272023	9:30:26	Wolf management	My comment is simply that now that the idiot Prehn is gone the DNR has to be headed in the correct direction.

Joe Seis	Unknown	Feb272023	11:04:42	FW: Wolf Comment	I would like to express my concerns about the wolves in my area. These wolves are an absolute safety hazard. I grew up my whole life in the outdoors, hunting and fishing. As a young 12 year old I would wander through the woods every day after school with my BB gun and never worry about anything. Now, I have children about 12 years old and I will not let them play in the yard as I know wolves are watching them. We have wolf tracks close to our house and they are on trail cameras nearly daily. I personally will not walk into the woods without some protection. I know grown men that are afraid to walk into there bow dear stand because they have had encounters with wolves. These wolves are changing our lifestyle. It is ridiculous we cannot enjoy other hunting activities because of wolves. Wolves have distributed our fishing, coyote hunting, bear hunting, deer hunting, and even just a walk down the road. My kids cant do cross county running because of fear of wolves. I have not seen any benefit to these wolves AT ALL. Joe Seis
Heather Florian	Y	Feb272023	11:21:45	Support for the Draft Wolf Management Plan	Dear Randy Johnson, Thank you and your team for the effort developing the 2022 draft Wisconsin Wolf Management Overall, I support the draft plan. Amy Delaney	Unknown	Feb272023	13:22:09	wolf management plan	To Whom it May Concern, I appreciate the efforts of all WDNR staff involved in updating the state's wolf management plan. Although I believe the current plan needs significant updating, I recognize the efforts and improvements made to the previous plan, including: ●⍰ Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. ●⍰ There is much greater recognition of the ecological role of wolves ●⍰ The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves ●⍰ The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed) There are still many issues however. ●⍰ The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on: ● wolf ethology, sentience, sapience, sociability, agency and wellbeing ● effectiveness of non-lethal interventions, especially relative to lethal ones ● the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution ●⍰ The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. ●⍰ The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ● A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings.● Hounding or hound training, which are akin to allowing legalized dogfighting, should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public. ●⍰ The plan should prioritize wolf protections and

Name	Resident	Date	Time	Subject	Email Body
					concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. ● Despite Act 169, which mandates a wolf hunting season, the department can still restrict the implementation of lethal methods by setting minimal quotas, including a quota of '0' wolves, restricting timing and methods. ● Several studies have proven a proactive non-lethal approach leads to better conflict mitigation. ● Lethal management often fails to provide a long-term solution to wolf predation and has the least consistent success rates when compared to non-lethal practices. In addition, there is significant evidence showing that lethal wolf management may be less functionally effective at mitigating subsequent livestock losses than non-lethal deterrents. ● The plan should require the implementation of abatement measures as well as the use of non-lethal conflict minimization techniques by domestic animal owners for the latter to receive compensation for confirmed predation. ● The plan also runs contrary to public values towards wolves (and omits mention of such majority values from the plan), despite department surveys evidencing that the broad public cares about wolves as individuals (and not just for the viability of the population). Given the recent liberalization of killing wolves by the state, it would be incredibly informative to note majority support of the following reasons for opposing a regulated wolf hunting/trapping season (which are all omitted from the plan): opposition to specific methods of harvest like hounds (64%) or traps (70%), feelings that hunting wolves is unnecessary (62%) or culturally offensive to Native American tribes (57%). ● All such reasons convey majority disagreement with practices currently promoted and endorsed by the legislature and the WDNR, and such a conflict between managers and the public should not only be acknowledged, but foregrounded and carefully considered in policy (instead of dismissed). ● Such decisions to omit literature or downplay evidence (e.g., such as majority opposition to killing wolves and their reasons) are contrary to principles of scientific integrity (e.g., present all relevant scientific evidence to the public) as well as ethics (e.g., disguising ethical decisions, such as recreational wolf killing, as robustly supported by science). ● Conflicting agency objectives (e.g., optimizing public hunting and conflict mitigation) are not only not acknowledged, but even misunderstood as harmonious, against the body of scientific evidence. That culminates in the prioritization of consumptive values and policies; e.g., according to the body of scientific literature, use of lethal methods, and 2especially public hunts, are contrary to most objectives relevant to: harm mitigation, the wellbeing of wolves, their ecological roles, and their non-exploitative enjoyment (i.e., Objectives A, B, D and F). ● There is a stark lack of consideration for individual wolves, wolf population health (including wellbeing), and measurable indicators for assessing any harms barring disease prevalence (e.g., accounting for cortisol levels or other stress hormones, measures of pair/pack persistence) ● There is an inappropriate understanding and consideration of tribal worldviews about wolves. Tribal worldviews of wolves are misconstrued as 'cultural benefits' tribes receive from the existence of a wolf population, when in fact tribal worldviews consider each individual wolf as a person and relative. Cultural respect and sensitivity towards such views, shared by many non-tribal members, demand the strict mitigation of lethal measures, especially recreational killing, as opposed to their current promotion in the plan. ● In general, all omissions of scientific literature, the arbitrary prioritization of policy objectives, the rhetoric of the plan and the dismissal of public values and concerns for wolves point towards a biased, unscientific and instrumental view of wolves that promotes values contrary to broad public perspectives on wolves. ● 'SOM' wolf estimation methodology " From a recent critique: The new methods sacrifice precision, but are believed to retain adequate accuracy and sensitivity to changing conditions for reliable decision-making. We review evidence for the accuracy, precision, and sensitivity of the new 'scaled occupancy model' (SOM) applied in Wisconsin. We conclude that the Wisconsin method would systematically overestimate wolf abundance by large (but currently incalculable) margins. Because Wisconsin, similar to other states, not only changed to unverified methods but also implemented widespread wolf killing, shortcomings in their estimates of wolf abundance may have far-reaching consequences for population viability and confidence in state wildlife managers. We discuss findings from Wisconsin alongside similar findings for other states' occupancy models being insensitive to human causes of mortality that have recently increased. Overall, Wisconsin's proposed method for estimating wolf abundance shows significant departures from best practices in scientific measurement. Verification will require independent replication and unbiased tests at multiple scales in multiple habitats under different human-induced mortality rates, and peer review before the new methods are considered reliable. (Treves & Santiago-Ãvila, 2023). Please help rectify these issues so that wolves can get the protection they deserve on their own land and habitat. Anything else continues to be cruel and unjust. Thank you! -- Amy Delaney For every animal that is bought from a breeder, a beautiful, healthy, and loving animal dies in a shelter. Adopt from a shelter...save lives.
VICKI DOWNES	Y	Feb272023	14:17:35	Support for the Draft Wolf Management Plan	Dear Randy Johnson, Thank you for your consideration and careful work involving the on-going wolf stewardship of wolves in our state. Thank you and your team for the effort developing the 2022 draft Wisconsin Wolf Management Overall, I support the draft plan. I am pleased that it is guided by best available science, public input, and Tribal engagement- the core tenets of the best way to protect, conserve, and sustain natural resources! I also applaud the Department for conducting a very extensive and inclusive survey on the "public opinions regarding wolves in Wisconsin?. Things I support about the plan as written: ? The plan removes a numeric population goal, allowing for an adaptable population: I support the goal of a self-sustaining, self-regulating, and genetically diverse wolf population that maintains connectivity with wolf populations in neighboring states and fulfills their ecological roles. ? The plan creates low limit zones around Tribal lands where the Tribes requested it: These lands are treaty-protected with documented wolf packs. Making this update is an important and welcome addition to the plan. Ideally, the plan would expand these zones beyond just the few that are listed and further reduce the limit to one wolf per subzone. ? The plan is reflective of the public opinions survey that finds opinions toward wolves have grown significantly more favorable. ? There is expressed commitment to science and continued research with partners and acknowledgement that ?keystone species such as wolves are an important component of a healthy ecosystem?. ? The plan outlines the strategies related to increasing public education related to the implementation of non-lethal conflict deterrent techniques. ? I support the plan?s recommendations to pursue more administrative rules, including the reduction of the window to report wolf kills to 8 hours or less and making the purposeful destruction of occupied wolf dens illegal Things I would like to see added or reviewed before plan is finalized: ? The plan should outline the concerns with ACT 169 and recommend legislative changes so that the DNR is able to make decisions on wolf stewardship in alignment with the goals of the wolf plan. ? A recommendation that the department issues wolf hunting licenses which are valid only in the specific wolf management zone(s) specified on the license. ? The DNR should better regulate hound training on wolves. The DNR should close wolf-focused hound training activities as each wolf hunting zone closes. The plan currently would allow hounds to chase wolves for training purposes during the wolf hunting season, across the entire state, until the very last wolf zone is closed. This could go on for months and would interfere with the wolf breeding season and population tracking of which both occur in late winter. ? There is currently no guidance in plan for next review or update ? Ideally, the plan should include a provision to update every 5-7 years rather than simply being ?valid until it is replaced.? ? There should be permanent, ongoing oversight by a stakeholder group AND a science committee to oversee wolf stewardship in Wisconsin. The stakeholder group must be inclusive and recognize the importance of Tribal oversight. ? I recommend identifying specific metrics that will define successful wolf management in Wisconsin. Examples should include metrics include pack integrity, average pack size, distribution of CWD in wolf range, the relative distribution of wolves across the state, and genetic connectivity and flow between packs across the state. ? The plan acknowledges that there are responsible farming practices and other non-lethal options to reduce wolf and livestock conflicts but should recommend that the DNR prioritizes these opportunities. Bottom line: Please continue to push for more science-based research in our state as well as

James Patrick	Y	Feb272023	15:33:01	Wolf Management Plan	Some items of concern: YOU as used in the following points refers to the WI DNR Lack of a recommended population. This started out as 100-125 animals, then morphed to 350 with no public input. This number is greater than the total requirement for WI and MI combined. We are now at greater than 1200 and YOU decide to stop counting and reporting on said count. When the last season was finally declared it was apparently over YOUR dead body, as the law clearly stated, when possible, (without a court order declaring no harvest) there was to be a season beginning in November following the conclusion of the rifle season for deer, YOU had no intention of following the law and in spite of the time frame of several years passing YOU had deliberately not formulated a management plan. I am of the opinion the inclusion of the BUFFER zones around the reservation lands of the First Nation is another attempt to enhance the population of the wolves to satisfy WHO?? Why is this a necessary element of the plan? The plan, in its questionable wisdom, already ascribes 1/2 of the total recommended harvest to the tribes and those permits are not used by the members of the tribes. The effect of the additional BUFFER area is to additionally decrease the opportunity for harvest to the hunting public of the State of WI. How accurate is the count of the wolves in WI? During the previous seasons the time required to fill the allowed permits has always been significantly less than the time frame allowed. I believe any person, who suggests that the harvest of wolves which has taken place in a few hours of the allowed season time is devastating the population and threatening the survival of the wolf in WI, is extremely uninformed regarding the population of the WI wolf. How is it possible to harvest 216 animals across the state of WI in less than 60 hours (less than 3 days) and then continue to suggest the population in the state was 1195 wolves? Are the hunters in WI endowed with super powers? Are the wolves in WI super stupid and run around carrying signs saying "shoot me"? I cannot imagine how even the super hunter of WI managed to find 216 wolves in the roughly 16 million acres of wooded land in WI in about 60 hours. If we shrink the numbers of wooded acres by half, since not all of those acres are suitable wolf habitat, and divide by the suggested wolf population, (8,000,000 acres / 1195 wolves) and determine the acres for each wolf, the answer is 6,694 acres would hold 1 wolf if the wolves were equally spread across 1/2 of the available acres. What do you think your probability of finding a wolf in 6,694 acres might be? Then estimate the likelihood of harvesting that wolf with 6,694 acres to run and hide in. Do YOU still think people should believe that purported estimate? If WI had a deer population of 1195, how many deer sightings do YOU think there would be? My background, age 80, raised in WI, have lived in rural areas for nearly 70 of those years. I enjoy the wildlife that live here with me. I do not wish to see wolves extirpated in WI. I do however, insist on a management program that allows reasonable harvest. Seeing an occasional wolf or two once a month on my 400 acres is acceptable. Seeing 6-8 of them every other week is not. Being unable to walk with my dog in my woods unless being armed to protect my dog while bird hunting, is not my idea of reasonable. Having deer killed by wolves within 80 yards of the house where I and my dog live is not reasonable. The wolves are unafraid, and are quite bold. I have served on the CDAC committee of Wood County as the DMAP representative since inception, and was on the committee that developed the DMAP program. My wife and I have been involved in managing our property for wildlife enhancement for over 40 years. In 1993 we were awarded the Wildlife Habitat Development Award by the Wisconsin Land Conservation Association. Jim Patrick

Brittany Lampe	Unknown	Feb272023	15:58:51	Draft wolf management plan	Hello, Please see my comments below: 1. I encourage the DNR to place less emphasis on lethal management and more on the value of the wolf to the ecosystem, indigenous culture, and to non-consumptive users. The reliance on USDA Wildlife Services is concerning as lethal options seem to take priority over non-lethal as shown by the numbers. 2. I also recommend far more restriction on the use of hounds against wolves for hunting and training. We understand that the use of hounds is allowed under state law, but rules are almost nonexistent and their use should be minimized. Thank you, Brittany Lampe
Ros Nelson	Y	Feb272023	16:19:25	Support for the Draft Wolf Management Plan	Dear Randy Johnson, Wolves need our protection. Our forest worlds need to be managed with science, not guns. Time to get with current research and thoughtful thinking! Thank you and your team for the effort developing the 2022 draft Wisconsin Wolf Management Overall, I support the draft plan. John Soine	N	Feb272023	16:23:20	Wolf Management Plan	Dear Plan Managers, I have read your Wolf Management Plan update and would like to make the following recommendations. I applaud your commitment to using scientific research in making recommendations for wolf management. My personal opinion is to leave the wolves to manage themselves but I also realize this is not realistic. Your recent wolf hunt was a total disaster and I would hope none of that plan finds its way into the current plan. Wolves should not be managed with a specific number. If you are going to have hunts a limit should be considered based on scientific derived data. Open seasons with no limits or unrestricted seasons can wipe out entire packs and endanger the genetic integrity of the entire population. There should be no trapping, snaring, baiting, or hounding in your regulations. Hunting should not be allowed on public lands. Lethal control should be a last resort in cattle and sheep depredations. Farmers and ranchers should be encouraged to use fladry, carcass removal, lights and noise to discourage wolf depredation. Livestock payments should be realistic and not require excessive red tape. Wolves can and should be given every opportunity to coexist with us. They are a vital part of our environment and should be respected as such. Thank you for your interest in doing this right. Sincerely, John Soine [redacted] Surprise, AZ 85374
Melaina Solomon	N	Feb272023	16:57:44	Support for the Draft Wolf Management Plan	Dear Randy Johnson, I'm from Wisconsin and take a very active interest in matters that impact the state of my birth and all of my relatives still living there. Responsible wolf stewardship is so important to our shared ecosystem that even though I'm currently living out of state, I want to make sure my voice is heard in Support of the Draft Wolf Management Plan. Examples should include metrics include pack integrity, average pack size, distribution of CWD in wolf range, the relative distribution of wolves across the state, and genetic connectivity and flow between packs across the state. ? The plan acknowledges that there are responsible farming practices and other non-lethal options to reduce wolf and livestock conflicts but should recommend that the DNR prioritizes these opportunities. Bottom line: Please continue to push for more science-based research in our state as well as wolf co-existence education across Wisconsin. Thank you for your consideration and careful work involving the on-going wolf stewardship of wolves

Barbara Guy	N	Feb272023	17:22:16	Support for the Draft Wolf Management Plan	Dear Randy Johnson, Wolves are an important part of balancie in our environment. They hunt the weakest and genetically less healthy deer and also feed on rodants. They are a beautiful and shy animal who pose no threat to humans. They deserve our protection and our respect Thank you and your team for the effort developing the 2022 draft Wisconsin Wolf Management Overall, I support the draft plan. I am pleased that it is guided by best available science, public input, and Tribal engagement- the core tenets of the best way to protect, conserve, and sustain natural resources! I also applaud the Department for conducting a very extensive and inclusive survey on the "public opinions regarding wolves in Wisconsin?. Things I support about the plan as written: ? The plan removes a numeric population goal, allowing for an adaptable population: I support the goal of a self-sustaining, self-regulating, and genetically diverse wolf population that maintains connectivity with wolf populations in neighboring states and fulfills their ecological roles. ? The plan creates low limit zones around Tribal lands where the Tribes requested it: These lands are treaty-protected with documented wolf packs. Making this update is an important and welcome addition to the plan. Ideally, the plan would expand these zones beyond just the few that are listed and further reduce the limit to one wolf per subzone. ? The plan is reflective of the public opinions survey that finds opinions toward wolves have grown significantly more favorable. ? There is expressed commitment to science and continued research with partners and acknowledgement that ?keystone species such as wolves are an important component of a healthy ecosystem?. ? The plan outlines the strategies related to increasing public education related to the implementation of non-lethal conflict deterrent techniques. ? I support the plan?s recommendations to pursue more administrative rules, including the reduction of the window to report wolf kills to 8 hours or less and making the purposeful destruction of occupied wolf dens illegal Things I would like to see added or reviewed before plan is finalized: ? The plan should outline the concerns with ACT 169 and recommend legislative changes so that the DNR is able to make decisions on wolf stewardship in alignment with the goals of the wolf plan. ? A recommendation that the department issues wolf hunting licenses which are valid only in the specific wolf management zone(s) specified on the license. ? The DNR should better regulate hound training on wolves. The DNR should close wolf-focused hound training activities as each wolf hunting zone closes. The plan currently would allow hounds to chase wolves for training purposes during the wolf hunting season, across the entire state, until the very last wolf zone is closed. This could go on for months and would interfere with the wolf breeding season and population tracking of which both occur in late winter. ? There is currently no guidance in plan for next review or update ? Ideally, the plan should include a provision to update every 5-7 years rather than simply being ?valid until it is replaced.? ? There should be permanent, ongoing oversight by a stakeholder group AND a science committee to oversee wolf stewardship in Wisconsin. The stakeholder group must be inclusive and recognize the importance of Tribal oversight. ? I recommend identifying specific metrics that will define successful wolf management in Wisconsin. Examples should include metrics include pack integrity, average pack size, distribution of CWD in wolf range, the relative distribution of wolves across the state, and genetic connectivity and flow between packs across the state. ? The plan acknowledges that there are responsible farming practices and other non-lethal options to reduce wolf and livestock conflicts but should recommend that the DNR prioritizes these opportunities. Bottom line: Please continue to push for more science-based research in our state as well as wolf co-existence education across Wisconsin. Eileen Hennessy	N	Feb272023	19:39:30	Wolf Management Plans Comments	February 27, 2023 Wolf Management Plan Comments 101 S. Webster St. PO Box 7921 Madison, WI 53707 Subject: Wolf Management Plans Comments To whom it may concern: As an advocate for the protection and preservation of our nation's endangered wolves, I am submitting my Wolf Management Plans Comments. The positive updates to the 2022 wolf management plan are encouraging. It is important to not manage wolves at only 350 animals. Moreover, it is extremely necessary to recognize the essential role wolves play in the balance of nature in the ecosystem, as well as how their presence positively affects wildlife. I also support the adoption of around tribal reservations buffer zones. Last but not least, the long overdue recognition of the support of the majority of Americans for the reintroduction, protection, and preservation of these irreplaceable apex predators is a step in the right direction. However, there are negative aspects to this wolf management plan. The current draft fails to incorporate the best available science, including the omission of significant scientific literature such as data concerning wolf ethology, sentience, wisdom, sociability, agency, and wellbeing. The plan also omits data on the effectiveness of non-lethal interventions as opposed to lethal measures, as well as the negative impact of wholesale killing on wolves' physiology, behavior, wellbeing, social dynamics and ecological relationships. Failing to include such information along with the rigorous push to promote recreational killing and consumptive users as the preferred strategy for wolf management reveals a plan with an anti-wolf mindset that defies recent, widespread and strong scientific evidence that debunks such lethal practices. The non-exploitative enjoyment of wildlife enthusiasts seeking to view and experience wolves in the wild is conspicuously overlooked. I strongly oppose lethal management of endangered wild wolves. Wolves are an endangered keystone species whose contribution to maintaining a healthy ecosystem cannot be dismissed, including their regulation of other wildlife numbers, including the sick, genetically inferior and overgrazing from ungulates, which leads to increased biodiversity and the improvement of habitat. Promoting the liberal killing of wild wolves under the guise of management leads to increased illegal hunting of these animals, as has been witnessed in Wisconsin. There is myriad research documentation of human-caused mortality in wolves in North America. Wolf killing often includes the barbaric practice of hounding or hound training, which is tantamount to illegal dogfighting. Not to mention the extreme cruelty involved in such activities, for both wolves and hounds. Even the majority of hunters, in solidarity with overwhelming public sentiment, do not support these inhumane hunting practices. In incidents of wolf-livestock conflicts, the implementation of only non-lethal measures must be adopted to ensure the protection and preservation of endangered wolves. This should include prioritization of encouraging peaceful co-existence and proactive practices on the part of ranchers. Although Act 169 mandates a wolf hunting season, the WDNR may restrict the use of lethal management methods by setting minimal quotas, including a quota of '0' wolves, restricting timing and methods. Myriad studies prove that non-lethal methods lead to better conflict mitigation. The liberal use of lethal management more often than not fail to result in long-term solutions of wolf predation. Non-lethal management practices are far more successful than resorting to knee-jerk reactions that result in senseless wolf slaughter to appease special interests. The overwhelming majority of the American people, including myself, strongly support the protection and preservation of our nation's endangered wolves. I call on you to do everything in your power to ensure the future survival of this unique, highly beneficial, and irreplaceable species/ Thank you for your consideration of my comments on this most important issue that affects all Americans. And future generations. Sincerely, Eileen Hennessy [redacted] Melrose, MA

Gary Kohn	Unknown	Feb272023	20:25:54	Wolf management	Wolf management. To whom it may concern I was at the first DNR meetings when they were looking for support from farmers and the WFB . The plan presented to us with your numbers of 350 wolves would have given Wisconsin a sustainable population . Now with numbers well over 350 some farms are experiencing problems with no help insite . With the over population of wolves and no longer endangered in Wisconsin let's get back to your plan and get some help to these farmers in need . A plan with no population goals is no plan at all in any wildlife management system . We supported the DNR in bringing wolves back to Wisconsin now can you stick to your plan and help support the farmers in need of population control .
William Ebbott	Unknown	Feb272023	20:40:03	Wolf Management Plan	I tried to attach my brother's comments, which I agree with, to my online questionnaire, but was unable to. See below. William Ebbott
LWren Walraven	N	Feb272023	21:16:15	WI Draft WMP	I am a resident of New Mexico and care deeply about keeping wolves and predators on the landscape in our country. I would like to start with what I do like about the WI Draft: That wolves will no longer be managed by reference to the old goal of 350 individuals. I appreciate that there is a greater recognition of the ecological role of wolves. I like that a social survey is included which increases positive views of wolves and increased opposition to the motives and methods of killing wolves. I am very happy to see increased buffer zones around tribal reservations where there were none before. I do not like the following: That the current draft does not reflect the best available scientific data and is missing a substantial amount of scientific literature. The literature includes: ecological relationships and evolution, social dynamics, wolf ethology, sentience, effectiveness of non lethal interventions, and the impact of widespread killing of wolves on physiology, behavior and well being. By omitting this important scientific information and emphasizing and promoting sustainable recreational killing by consumptive users as a main management strategy is biased and is contrary to scientific evidence which is more current, and numerous and of stronger reference. Only in rare instances, should wolf management involve lethal management. As stated in a substantial body of research documenting human-caused mortality in North American wolves, including wolves of Wisconsin, policies allowing liberalized killing of wolves results in a direct increase in the hazard and incidence of illegal killings. Thank you, Wren LWren Walraven Wren Dreams Art [redacted]
Judith Buttala	N	Feb272023	21:59:17	Support for the Draft Wolf Management Plan	Dear Randy Johnson, Let science stand on its own. Thank you and your team for the effort developing the 2022 draft Wisconsin Wolf Management Overall, I support the draft plan. Ralph Fischer	Unknown	Feb272023	23:15:16	Wolf Management Plan Comment - Carolyn Forde	Please help: ooops I made an incorrect statement in my Plan comments. Here is the incorrect statement:" I disagree with the removal of reservation wolves when considering wolf hunt quotas." Please remove this comment. I meant to say that I agree with the removal of "reservation wolves" when determining quotas, Thank you very much! Carolyn Forde
Joan Arnold	Y	Feb272023	23:17:31	Wolf Management Draft Plan Comments	Thanks for all the hard work that was put into producing this draft Wolf Management plan. I appreciate that you have taken into account public input, Tribal concerns and incorporated science and education into the plan. Thank you for conducting a survey of public opinion of wolves in Wisconsin. Please continue to do this periodically. I am a farmer and live in central Wisconsin, in what you have listed as Zone 4a. I own 171 acres of mixture of woodland and farmland in this area. In general, I support the draft plan but I get the feeling it is geared mostly to lethal control measures for dealing with any conflict with wolves on the landscape. I wish there was a lot more emphasis on non-lethal measures used to deal with conflicts, especially dealing with farmers. I do not support the plan of having the greatest harvest goal in Zone 1a and 4a, in which I live. I have never seen wolf evidence where I live. Currently with hunters using dogs to hunt coyotes in this area they do not seem to care that they and their dogs trespass on my land and any neighbor's land where they do not allow hunters. Dogs are not controlled and they are able to run wherever they seem to want to go. Just this past weekend coyote hunters with their dogs ran through the area and the only thing they seemed to be chasing was a herd of about 12 deer. The last 3-5 years I've called the Sheriffs about trespassing hunters and their hounds running through my land. So I have to keep aware of whenever hunting season is and continue to worry about trespassers with their dogs ravaging the landscape and whatever and all animals that are in the area. Also, there are many farmers in the area that have too many deer that eat the field crops. Yet you want to reduce any wolf population in Zone 4a that could help control that population naturally. Why aren't you emphasizing non-lethal controls? I do agree with many of the items as written which are: - Doing away with a numeric goal and allowing for a adaptable population. I support the goal of a self-sustaining, self-regulating, and genetically diverse wolf population that maintains connectivity with wolf populations in neighboring states and fulfills their ecological roles. - Respecting the Tribal rights and lands and creation of the buffer zones and having low limit zones around Tribal lands. I wish they were no kill zones around these Tribal lands. Tribes were here long before us Europeans and have long lived with wolves and treat them differently so we should respect that. - I'm happy to see based on public surveys that the DNR has acknowledged that most people in the State want a healthy wolf population based on science and have tried to develop a plan reflective of this. - It briefly mentions and acknowledges that wolves are a keystone species that play a very important role in a healthy ecosystem. This should be emphasized in greater detail and should be researched and collaborated with other experts as mentioned. - There is a section dealing with public education regarding the importance of wolves and how they are scientifically important and about using non-lethal methods for reducing wolf related conflicts. - I definitely support the recommendation to changes to the administrative rules that decrease the required time to report wolf kills to not later than 8 hours, and making the destruction of occupied wolf dens illegal, which should never occur regardless of occupied or not. - Agree with issuing wolf harvesting licenses which are only valid in the specific zone specified on the license, instead of valid in all zones. - Agree and appreciate the public and farmer educational aspect of this plan. Emphasis on education of non-lethal controls to farmer community should be budgeted for and enhanced. - Concur with conducting studies on effects hunting with dogs has on the wolf and dog conflicts (product E3c) Maybe the issue of hunting with dogs is the issue. Should this even be allowed based on the scientific research? Maybe all hunting with dogs should be eliminated as wolves are still around when bears, etc are hunted with dogs. This conflict will never be eliminated and maybe dogs should not be used to hunt. Areas that I do NOT agree with or should be adjusted: - More emphasis on non-lethal controls for areas that tend to have wolf-related conflicts instead of raising the harvest goal, especially in Zone 1a and 4a. Subsidizing farmers to implement non-lethal controls should be pursued. If there are lethal controls used prior to the legal hunting season these numbers should be included when setting harvest goals as already harvested. Do studies show that disrupting the wolf family structure actually deters conflict? What does science indicate are better ways to deal with these conflicts? - Put emphasis on wolf viewing and eco-tourism for wolves. Put money or grants into setting this up in the future. - There is no mention of obtaining State money for implementing non-lethal controls. This plan should lay out plans for State budgeting for non-lethal controls to better reflect what your science is telling you that non-lethal controls work and may be a better deterrent for wolf related conflict than killing. - There should be no night hunting allowed. - Do not agree with CITES application. This could lead to extreme trophy hunters and lead to poaching and black market. We don't need to have our Wisconsin wildlife marketed worldwide. - The plan should review Act 169 and recommend legislative changes based on the science and the parameters of this plan in creating a healthy and sustainable wolf population for an overall healthy ecosystem for Wisconsin. The DNR should be able to better manage any wolf harvest based on the science instead of political interference. - The DNR should better regulate hound training on wolves. The DNR should close wolf-focused hound training activities as each wolf zone closes, instead of what is recommended in the plan of having state wide training till all zones are closed. This would interfere with breeding season and put dogs at risk. - There should be permanent, ongoing oversight by a stakeholder group and a science committee to oversee wolf stewardship in Wisconsin. The stakeholder group must be inclusive and recognize the importance of Tribal oversight. - Wolves should be encouraged in areas that have a CWD issue with the deer herd. Wolves are a better control for this devastating disease than any human control ever good be. If deer are putting pressure on agriculture fields maybe wolf population should be encouraged in that area. I appreciate the comprehensive plan as presented. Please do not cater to the trophy hunters and please stick with the science of wolf management as you progress to the final product. I appreciate the respect you show to the Tribes as they are the true owners of this land and its wildlife and they know better how to manage it than most. I appreciate the emphasis you place on education and hope that you are able to carry this out in the future. Emphasis on non-lethal controls should be made instead of lethal in dealing with wolf related conflicts. I believe science indicates non-lethal works better. I hope this plan can be continued on into the future regardless of who politically is running the State and Legislature. This should be non-partisan. Thanks for your work, Joan Arnold [redacted] Rudolph, WI 54475

Joan Waak	Unknown	Feb282023	7:13:56	Wolf harvest	Good morning DNR, We do not support the harvesting of wolves through hunting especially inhumane trapping and the use of dogs. With all of the complaining of different organizations of overpopulation of deer and other species we're dumbfounded at the reasoning behind eternal open season for coyotes as well. Long gone are the days of the majority of ethical hunters and the need to exterminate the wild canine population. The killing of Animals for fun or sport is contrary to a Christian and ethical society. Few hunters to today hold a reverence for the taking of wildlife and it simply is no longer needed as an economical food source to provide for oneself or family. Killing should not be for fun or entertainment. Time for us to evolve further. Kindest Regards, Joan & Dik Waak
Jeff	Unknown	Feb282023	7:57:30	wolf plan	I have read most but not all of the plan (i do plan on reading the whole thing as i get time) My only comment is this.... I spend most of my weekends in the winter hunting coyotes, i spend hours driving forest roads, back roads and logging roads looking for coyote tracks. The last 2 years there have been way less coyote tracks and many more wolf tracks. I believe the estimated population of wolves is too low. this is my experience and opinion i hunt in northern Marinette county . thanks, Jeff
Brigid O'Hagan	N	Feb282023	10:52:09	Support for the Draft Wolf Management Plan	Dear Randy Johnson, I lived in Wisconsin for many years and I have lots of family still living in Wisconsin and responsible wolf stewardship is important to me and my family! Decisions like these have wide ranging consequences, so thank you for working to develop a strong wolf management plan. Thank you and your team for the effort developing the 2022 draft Wisconsin Wolf Management Overall, I support the draft plan. I am pleased that it is guided by best available science, public input, and Tribal engagement- the core tenets of the best way to protect, conserve, and sustain natural resources! I also applaud the Department for conducting a very extensive and inclusive survey on the "public opinions regarding wolves in Wisconsin?. Things I support about the plan as written: ? The plan removes a numeric population goal, allowing for an adaptable population: I support the goal of a self-sustaining, self-regulating, and genetically diverse wolf population that maintains connectivity with wolf populations in neighboring states and fulfills their ecological roles. ? The plan creates low limit zones around Tribal lands where the Tribes requested it: These lands are treaty-protected with documented wolf packs. Making this update is an important and welcome addition to the plan. Ideally, the plan would expand these zones beyond just the few that are listed and further reduce the limit to one wolf per subzone. ? The plan is reflective of the public opinions survey that finds opinions toward wolves have grown significantly more favorable. ? There is expressed commitment to science and continued research with partners and acknowledgement that ?keystone species such as wolves are an important component of a healthy ecosystem?. ? The plan outlines the strategies related to increasing public education related to the implementation of non-lethal conflict deterrent techniques. ? I support the plan?s recommendations to pursue more administrative rules, including the reduction of the window to report wolf kills to 8 hours or less and making the purposeful destruction of occupied wolf dens illegal Things I would like to see added or reviewed before plan is finalized: ? The plan should outline the concerns with ACT 169 and recommend legislative changes so that the DNR is able to make decisions on wolf stewardship in alignment with the goals of the wolf plan. ? A recommendation that the department issues wolf hunting licenses which are valid only in the specific wolf management zone(s) specified on the license. ? The DNR should better regulate hound training on wolves. The DNR should close wolf-focused hound training activities as each wolf hunting zone closes. The plan currently would allow hounds to chase wolves for training purposes during the wolf hunting season, across the entire state, until the very last wolf zone is closed. This could go on for months and would interfere with the wolf breeding season and population tracking of which both occur in late winter. ? There is currently no guidance in plan for next review or update ? Ideally, the plan should include a provision to update every 5-7 years rather than simply being ?valid until it is replaced.? ? There should be permanent, ongoing oversight by a stakeholder group AND a science committee to oversee wolf stewardship in Wisconsin. The stakeholder group must be inclusive and recognize the importance of Tribal oversight. ? I recommend identifying specific metrics that will define successful wolf management in Wisconsin. Examples should include metrics include pack integrity, average pack size, distribution of CWD in wolf range, the relative distribution of wolves across the state, and genetic connectivity and flow between packs across the state. ? The plan acknowledges that there are responsible farming practices and other non-lethal options to reduce wolf and livestock conflicts but should recommend that the DNR prioritizes these opportunities. Bottom line: Please continue to push for more science-based research in our state as well as wolf co-existence education across Wisconsin. Thank you for your consideration and careful work involving the on-going wolf stewardship of wolves in our state. Sincerely, Brigid O'Hagan [redacted] Dallas, OR 97338 [redacted] This message was sent by KnowWho, as a service provider, on behalf of an individual associated with Sierra Club. If you need more information, please contact Lillian Miller at Sierra Club at [redacted]
Caleb Fransson	Unknown	Feb282023	10:52:23	Wolf Management Plan	The farmer can't stop the wolves from killing their livestock. The government should let the farmers put traps around their farm because then the wolves will have a harder time killing the livestock. According to the farmers Wolf predation has not only taken a toll on livestock farmers, owners of hunting dogs and family pets, the state also has paid out nearly $3 million in damage claims. In an attempt to build tolerance for the increased wolf population, the state established an income-tax checkoff in 1983, allowing residents to donate to support federally protected species. It earmarked 3%, or up to $100,000 a year, to pay for damage from wolves and other protected species.'' We need to do something about all the livestock being killed because if we just leave them be the wolves will think they can just go into farms and have a snack and then the government will just keep paying and paying so we need to do something fast. According to the farmers Although Ashleigh Calaway and her family have suffered significant losses to their sheep flock, she doesn't want to see the wolf population eliminated. "But I do want to see the population managed so we can coexist in harmony; I want to see the ecosystem reestablished so that wolves learn that humans are not on their easy-prey list, she said. Yes I think we need to coexist in harmony because if we just keep letting them hurt farmer livestock next they might think they can hurt people so we need to do something. The government should let the farmers put traps around their farm because then the wolves will have a harder time killing the livestock.
Larry Flyte	Y	Feb282023	10:56:57	DNR wolf plan	I was on the conservation congress when the dnr brought the plan to us asking for a 100 wolves in the state then some changed it to 350 like fools we thought that's not to bad. Well get busy and get the number down to 350. Larry Flyte waushara county
Avery Norin	Unknown	Feb282023	10:57:49	Gray Wolves in WI	Since the population is really the biggest issue in my mind, you should make a law to stop hunting the wolves in WI since the population has gotten so much lower than it naturally should be. Even though everyone has a say in this, it is important to know that the population is one of the most important things since, if it's gone, it's gone, and most people are really overlooking this.
Jaxson Wilcox	Unknown	Feb282023	11:20:20	The wisconsin wolf argument	The government should make a law that you can hunt wolves unless they cause damage because the wolves shouldn't just be hunted for no reason. The issue is that wolves are being hunted because they are killing livestock and causing property damage. The Wolf population was going down so they gave them a protection law so they can't hunt the wolves. The wolves should not be hunted unless they are causing damage to livestock or property damage because that's just lowering the population when it is already super low. Also hunting the wolves is bad for the environment because wolves kill animals with lyme disease.and they are a part of the food web and if the wolves were to be taken out of it the food web would crash. According to NBC 15 Hunters say that since there are 950 wolves and the cap is 350 they should still be able to hunt because there are 600 more than they need.Even though there are

Name	Resident	Date	Time	Subject	Email Body
					more than the cap doesn't mean we should hunt them because 950 isn't a lot especially compared to other species. And wolves cant have such a low population because they will die out faster and means another extinct species. Is the gray wolf actually endangered?<https://www.youtube.com/watch?v=6Ix2hRBf1V0> Video says that the gray is not endangered anymore because there are more of them. So they removed them from the endangered list. Also they say that the definition of endangered is: a species. I think that just because there are more doesn't mean they should not be on the endangered list because now hunters can hunt them and they have a higher chance of going extinct then they did with them on the endangered list. I also think that the hunters don't need to hunt the wolves unless they need to.I offer the solution of putting electric fences as some sort of device that shocks the wolves around the farms and livestock to prevent the wolves from killing the animals. In conclusion this is why I think that The government should make a law that you can hunt wolves unless they cause damage because the wolves shouldn't just be hunted for no reason.
Mike Kautz	Y	Feb282023	12:23:30	Wolf Management	I have numerous issues with the planned draft. Number 1 - No population goal, 350 was the goal when the plan was drafted, currently I can support that number and believe most outdoor people would also. Number 2 - A buffer zone around the native reservations would infringe on public and private land.. Number 3 - Population estimates, I spend over 100 days in the northern forest zone guiding bear hunters,trail camera pictures of numerous wolves at the bait sites. Upland hunting my bird dog had a very close encounter with wolves and am glad I was close by to interfere with there intentions of making a meal out of him. Predator population in the county I live in is high and is taking a toll on the deer herd. I chair the County Deer Advisory Council in the county I live in which is in the Northern Forest Zone. Read the minutes from the Councils meetings and the public on-line feedback. The economic impact of local business, lack of hunter satisfaction success, no deer sightings so we will no longer hunt the north due to not managing the predator load. Another bill introduced to delist wolves hope it passes, The Department of Natural Resources responsibilities is to manage the states wildlife, please do the right thing,
Marnie Wall	N	Feb282023	13:01:59	Support for the Draft Wolf Management Plan	Dear Randy Johnson, I am from Wisconsin and still have family who lives in the state. Responsible wolf management is important to me because wolves play a key role in keeping ecosystems healthy. A strong wolf management plan would reflect responsible stewardship of Wisconsin's natural resources. Thank you and your team for the effort developing the 2022 draft Wisconsin Wolf Management Overall, I support the draft plan. I am pleased that it is guided by best available science, public input, and Tribal engagement- the core tenets of the best way to protect, conserve, and sustain natural resources! I also applaud the Department for conducting a very extensive and inclusive survey on the "public opinions regarding wolves in Wisconsin?. Things I support about the plan as written: ? clelia taylor	Y	Feb282023	13:07:05	Comments on WI Wolf Management Plan 2022 Draft	Thank you for this opportunity. 1. Strongly support administrative rulemaking to make illegal purposeful destruction of occupied wolf dens with strong prison sentences in addition to fines. 2. Strenuously object to any and all trapping practices related to the "harvesting" of wolves. The DNR should issue wolf hunting licenses and discontinue issuing trapping licenses. The data in your proposed management plan indicates that in 2013, 52% of takes/harvesting were completed through use of foothold traps. That number increased to 70% in 2013. In my opinion, this is unacceptable. If a man wants to harvest a wolf then he should do it in the old fashioned way with a weapon, not a trap. Trapping wolves is inhumane and gives an unfair advantage to men. 3. In my opinion, the DNR is more interested in accommodating hunters than the wolves. Wolves don't have any say in the matter so they are at a distinct disadvantage. Truth is, your efforts are data collection in support of developing evidence-based practices. If evidence-based practices are available, they should be included in your final report. 4. The true spirit of 'hunting' as it applied 50 years ago has been lost and contemporary activities are better described as 'bunting.' Bunting is the use of assistive technology such as bait and traps to capture an animal. If a hunter wants to hunt, then hunt without dogs, or bait piles or any type of trap. I strongly support any and all legislation to make use of any type of wolf traps illegal. That would bring the DNR back to management of hunting practices, not harvesting. 5. The draft mentions "state of the art" practices in animal welfare and efficiency as well as increasing trapper efficiency. These are contradictory objectives. Please detail the animal welfare practices presented during wolf trapper education in your final report. Perhaps consider doing the same during public education events. 6. Wolves are majestic creatures that have every right to live according to the rules of mother nature. I strongly support strengthening the Wolf Depredation Program. 7. To prevent future overkill/harvesting of wolves (such as what happened last season), address the challenges & fix them so that it doesn't happen again. Again, thank you for this opportunity. C. Taylor [redacted] Tomah, WI 54660

Mona Carrillo	N	Feb282023	13:32:40	Wolf Management Plan Comments	This world belongs to the wolves too. They are trying to survive and thrive, just like the rest of us. The trophy hunting, the killing for sport and pleasure, and the unbelievably cruel methods of killing wolves are abhorrent. Where is the mercy is such practices? Where is the humanity in this day and age for a creature that lives in harmony with its environment? The people who are allowed to hunt and butcher wolves mercilessly certainly have the clout and influence to do so, and that is so distressing. Wolf conservation groups have so many excellent proposals on how to manage and live with wolves, without the barbarism and inhumane treatment of them. Please listen to these groups and work with them. Please have mercy on the wolves. Mona Carrillo [redacted] Alhambra, CA 91801
John quam	Y	Feb282023	14:12:29	Support for the Draft Wolf Management Plan	Dear Randy Johnson, WI. DNR, does a poor job on management of the wolfs.I?m Native American, I love wolfs. But there has to be balance. Wolfs kill dogs, Kill deer, young bears in den. Wolf?s kill just to kill., sometimes take few bits leave. We need to harvest more wolfs... Thank you and your team for the effort developing the 2022 draft Wisconsin Wolf Management Overall, I support the draft plan. Judith Walsh	N	Feb282023	14:14:10	Support for the Draft Wolf Management Plan	Dear Randy Johnson, The hatred and judgement on Wolves is based on fables and false information. Wolves are vital to every ecosystem and wilderness they inhabit. Protection from psychopaths that find pleasure in killing. Do not allow terrorism on wildlife. There is no justice in their behavior. Preventing crimes against nature is ethical on many levels. Wolves are not a trophy or commodity. Thank you and your team for the effort developing the 2022 draft Wisconsin Wolf Management Overall, I support the draft plan. Kelly Bratt	N	Feb282023	14:46:51	wolf management in WI	Hello, I am a teacher in the Oregon School District. My 6th grade students have been reading & learning about the wolf related issues in Wisconsin. Some students may have shared their writing with you about the issues that they are concerned about. I am also including one here in this email because the student wished to remain anonymous. Thank you! I think that we should keep the wolves in Wisconsin because the wolves are impacting their environment by keeping other animals' numbers under control, raising rivers, helping plants and increasing tourism in the national parks. Even though the wolves are killing livestock, if we can properly protect our livestock, the good impact outweighs the bad impact. It is not the wolves fault that the sheep are dead. It happens naturally and it is the farmer's fault that they did not protect their sheep or other livestock properly. There should be more laws to protect them because they impact their environment in such a beneficial and valuable way. 6th grade student -- Thank You, Kelly Bratt (she, her) 6th grade, Language Arts & Social Studies Rome Corners Intermediate School Week at a Glance Slides<https://docs.google.com/presentation/d/14T17aFXRGr3nphJHm1j5ATsP6Q_rPkebxo8wct_4lAE/edit?usp=sharing> [redacted] Yellow 2 website<https://sites.google.com/oregonsd.net/yellow-2/home?authuser=0>
DK Franson	Y	Feb282023	15:26:38	timber wolf	I'd like to see the hunting season on WI timber wolves cease and improved husbandry practices by farmers and landowners in wolf-habitat areas. What is considered management" of this species and other WI animals which have been on the Endangered Species List in the past needs refinement in my own view. Thank you./D.K. Franson Ferryville WI
Heidi Cassel	Y	Feb282023	16:02:41	Support for the Draft Wolf Management Plan	Dear Randy Johnson, I feel so strongly that wolves in Wisconsin need more support. I appreciate the time people have put into the new plan. Hounding is a real sticking point for me. I believe in ethical fair chase hunting for animals we plan to eat. Nobody eats wolf. Hounding puts wolves and hounds at risk in the same way that dog fighting does. I enjoy the woods. I do not feel safe when there are hounds training and hunting. I would love to see more focus on wolf education that dispels myths and incorrect Ideas about wolves. Many people hold the false belief that killing wolves lowers predation. I?d love to see an education center in the middle of the state similar to Ely, Michigan?s International Wolf Education Center. Thank you, Heidi Cassel Thank you and your team for the effort developing the 2022 draft Wisconsin Wolf Management Overall, I support the draft plan. Catherine Reske	Y	Feb282023	17:50:50	Support for the Draft Wolf Management Plan	Dear Randy Johnson, Thank you and your team for the effort developing the 2022 draft Wisconsin Wolf Management Overall, I support the draft plan. I am pleased that it is guided by best available science, public input, and Tribal engagement- the core tenets of the best way to protect, conserve, and sustain natural resources! I also applaud the Department for conducting a very extensive and inclusive survey on the "public opinions regarding wolves in Wisconsin?. Things I support about the plan as written: ? The plan removes a numeric population goal, allowing for an adaptable population: I support the goal of a self-sustaining, self-regulating, and genetically diverse wolf population that maintains connectivity with wolf populations in neighboring states and fulfills their ecological roles. ? The plan creates low limit zones around Tribal lands where the Tribes requested it: These lands are treaty-protected with documented wolf packs. Making this update is an important and welcome addition to the plan. Ideally, the plan would expand these zones beyond just the few that are listed and further reduce the limit to one wolf per subzone. ? The plan is reflective of the public opinions survey that finds opinions toward wolves have grown significantly more favorable. ? There is expressed commitment to science and continued research with partners and acknowledgement that ?keystone species such as wolves are an important component of a healthy ecosystem?. ? The plan outlines the strategies related to increasing public education related to the implementation of non-lethal conflict deterrent techniques. ? I support the plan?s recommendations to pursue more administrative rules, including the reduction of the window to report wolf kills to 8 hours or less and making the purposeful destruction of occupied wolf dens illegal Things I would like to see added or reviewed before plan is finalized: ? The plan should outline the concerns with ACT 169 and recommend legislative changes so that the DNR is able to make decisions on wolf stewardship in alignment with the goals of the wolf plan. ? A recommendation that the department issues wolf hunting licenses which are valid only in the specific wolf management zone(s) specified on the license. ? The DNR should better regulate hound training on wolves. The DNR should close wolf-focused hound training activities as each wolf hunting zone closes. The plan currently would allow hounds to chase wolves for training purposes during the wolf hunting season, across the entire state, until the very last wolf zone is closed. This could go on for months and would interfere with the wolf breeding season and population tracking of which both occur in late winter. ? There is currently no guidance in plan for next review or update ? Ideally, the plan should include a provision to update every 5-7 years rather than simply being ?valid until it is replaced.? ? There should be permanent, ongoing oversight by a stakeholder group AND a science committee to oversee wolf stewardship in Wisconsin. The stakeholder group must be inclusive and recognize the importance of Tribal oversight. ? I recommend identifying specific metrics that will define successful wolf management in Wisconsin. Examples should include metrics include pack integrity, average pack size, distribution of CWD in wolf range, the relative distribution of wolves across the state, and genetic connectivity and flow between packs across the state. ? The plan acknowledges that there are responsible farming practices and other non-lethal options to reduce wolf and livestock conflicts but should recommend that the DNR prioritizes these opportunities. Bottom line: Please continue to push for more science-based research in our state as well as wolf co-existence education across Wisconsin. Thank you for your consideration and careful work involving the on-going wolf stewardship of wolves in our state. Sincerely, Catherine Reske [redacted] Waukesha , WI 53189 [redacted] This message was sent by KnowWho, as a service provider, on behalf of an individual associated with Sierra Club. DIANE BOWEN	Y	Feb282023	18:56:20	Comments on Draft DNR Wolf Management Plan	To the DNR: Thank you for the opportunity to comment on the draft plan, which I have read. I appreciate the abundant information in the document. I learned a lot. I also realize that DNR is significantly constrained by politicians and legislation as to its approach to wolf stewardship (and many other activities). Examples of this are the designation of the gray wolf as a State Game Species and the requirements contained in Act 169 (2012). I offer several observations from my reading of the report, which have a bearing on the few comments I offer. Observations: ¢ Wolf populations in ecosystems, without human incursion an intervention, will be in equilibrium with the carrying capacity of the ecosystem. This is reflected in the letter in the draft plan submitted by LCO, which states that it is felt that this group (wolves) should be able to self-determine their numbers and distribution on the landscape. In other words, wolves can self-regulate their populations. ¢ Wolves in Wisconsin tend not to range in agricultural lands or in areas of high road density (which is associated with high human population). ¢ An attitude survey showed almost no public support for the inclusion of recreational hunting of wolves as an objective for the Wolf Management Plan. However, there was stronger support for hunting in regard to public safety. ¢ There are virtually no cases of human mortality and extremely low cases of injury from wolf attacks on humans. There is also a low rate of attacks on pets, other than those used as hunting dogs. Depredation in agriculture, while higher, is still relatively low, and under the ESA, must be compensated. However, public perception of the safety issue in regard to wolves, whether in or out of the wolf range, is higher than would be indicated from the data. ¢ Surveys indicate that there is public support for a wolf hunting season, but the studies do not indicate the reason for this support, nor does it address the contradictions of my previous three bullet points. Furthermore, hunting will be in the wolf territories, not in areas with high threats to public safety and agriculture. ¢ DNR is required by Act 169 to allow wolf traps, and tracking by dogs. The report refers to trapping using traps that afford animal welfare. Requests for Revisions to Draft Plan In light of the above observations, I recommend the follow revisions to the Draft Wolf Management Plan. ¢ The plan

Name	Resident	Date	Time	Subject	Email Body
					should reflect my first bullet point in general, and in particular when dealing with establishing so-called harvest quotas. In order for them to do so, the Plan should stress this as an objective and also prioritize the enforcement of illegal killing and other human degradations of wolf populations. ¢ With respect to the second, third, fourth and fifth bullet points above: The plan should pace a very high priority on public education about wolves and policy towards them in all their dimensions, and allocate funds proportionally. ¢ There is no such trap that affords animal welfare. All invoke fear and stress prior to death unless they instantaneously kill. The DNR is subject to mandates from Act 169, but should do everything possible to restrict trap via its regulatory mechanisms. Respectfully submitted, Diane Bowen Bayside, Wisconsin
John Brooks	Unknown	Feb282023	19:01:03	Wisconsin wolf management	I would like to have input into Wisconsin wolf management. I know there are different ideas as to what the ideal population should be, but I think that too many people want their population controlled to reduce or eliminate them. As a hunter, fisherman, and general outdoor enthusiast I feel like they are one of the most important species we have in Wisconsin. A keystone species which could be very beneficial if allowed to increase to the point where they actually fulfilled that position. Please allow them to increase. Thanks for listening.
Sarah Krause	Y	Feb282023	19:05:14	Support for the Draft Wolf Management Plan	Dear Randy Johnson, Thank you and your team for the effort developing the 2022 draft Wisconsin Wolf Management Overall, I support the draft plan. Jordan Longever	Unknown	Feb282023	19:07:34		I appreciate the efforts of all WDNR staff involved in updating the state's wolf management plan. Although I believe the current plan needs significant updating (see next section),I recognize the efforts and improvements made to the previous plan, including: ●? Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. ●? There is much greater recognition of the ecological role of wolves ●? The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves ●? The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed) What I don't like: ●? The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on (see reference list below): ● wolf ethology, sentience, sapience, sociability, agency and wellbeing ● effectiveness of non-lethal interventions, especially relative to lethal ones ● the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution ●? The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. ●? The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ● A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings. ● Hounding or hound training, which are akin to allowing legalized dogfighting, should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public. ●? The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. ● Despite Act 169, which mandates a wolf hunting season, the department can still restrict the implementation of lethal methods by setting minimal quotas, including a quota of '0' wolves, restricting timing and methods. ● Several studies have proven a proactive non-lethal approach leads to better conflict mitigation. ● Lethal management often fails to provide a long-term solution to wolf predation and has the least consistent success rates when compared to non-lethal practices. In addition, there is significant evidence showing that lethal wolf management may be less functionally effective at mitigating subsequent livestock losses than non-lethal deterrents. ●? The plan should require the implementation of abatement measures as well as the use of non-lethal conflict minimization techniques by domestic animal owners for the latter to receive compensation for confirmed predation. ●? The plan also runs contrary to public values towards wolves (and omits mention of such majority values from the plan), despite department surveys evidencing that the broad public cares about wolves as individuals (and not just for the viability of the population). Given the recent liberalization of killing wolves by the state, it would be incredibly informative to note majority support of the following reasons for opposing a regulated wolf hunting/trapping

Name	Resident	Date	Time	Subject	Email Body
					season (which are all omitted from the plan): opposition to specific methods of harvest like hounds (64%) or traps (70%), feelings that hunting wolves is unnecessary (62%) or culturally offensive to Native American tribes (57%). ● All such reasons convey majority disagreement with practices currently promoted and endorsed by the legislature and the WDNR, and such a conflict between managers and the public should not only be acknowledged, but foregrounded and carefully considered in policy (instead of dismissed). ● Such decisions to omit literature or downplay evidence (e.g., such as majority opposition to killing wolves and their reasons) are contrary to principles of scientific integrity (e.g., present all relevant scientific evidence to the public) as well as ethics (e.g., disguising ethical decisions, such as recreational wolf killing, as robustly supported by science). ● Conflicting agency objectives (e.g., optimizing public hunting and conflict mitigation) are not only not acknowledged, but even misunderstood as harmonious, against the body of scientific evidence. That culminates in the prioritization of consumptive values and policies; e.g., according to the body of scientific literature, use of lethal methods, and especially public hunts, are contrary to most objectives relevant to: harm mitigation, the wellbeing of wolves, their ecological roles, and their non-exploitative enjoyment (i.e., Objectives A, B, D and F). ● There is a stark lack of consideration for individual wolves, wolf population health (including wellbeing), and measurable indicators for assessing any harms barring disease prevalence (e.g., accounting for cortisol levels or other stress hormones, measures of pair/pack persistence) ● There is an inappropriate understanding and consideration of tribal worldviews about wolves. Tribal worldviews of wolves are misconstrued as 'cultural benefits' tribes receive from the existence of a wolf population, when in fact tribal worldviews consider each individual wolf as a person and relative. Cultural respect and sensitivity towards such views, shared by many non-tribal members, demand the strict mitigation of lethal measures, especially recreational killing, as opposed to their current promotion in the plan. ● In general, all omissions of scientific literature, the arbitrary prioritization of policy objectives, the rhetoric of the plan and the dismissal of public values and concerns for wolves point towards a biased, unscientific and instrumental view of wolves that promotes values contrary to broad public perspectives on wolves. ● 'SOM' wolf estimation methodology " From a recent critique: The new methods sacrifice precision, but are believed to retain adequate accuracy and sensitivity to changing conditions for reliable decision-making. We review evidence for the accuracy, precision, and sensitivity of the new 'scaled occupancy model' (SOM) applied in Wisconsin. We conclude that the Wisconsin method would systematically overestimate wolf abundance by large (but currently incalculable) margins. Because Wisconsin, similar to other states, not only changed to unverified methods but also implemented widespread wolf killing, shortcomings in their estimates of wolf abundance may have far-reaching consequences for population viability and confidence in state wildlife managers. We discuss findings from Wisconsin alongside similar findings for other states' occupancy models being insensitive to human causes of mortality that have recently increased. Overall, Wisconsin's proposed method for estimating wolf abundance shows significant departures from best practices in scientific measurement. Verification will require independent replication and unbiased tests at multiple scales in multiple habitats under different human-induced mortality rates, and peer review before the new methods are considered reliable. Mike Adler	Y	Feb282023	19:14:23	Support for the Draft Wolf Management Plan	Dear Randy Johnson, Over many years of being a Wisconsin outdoorsman , I have had a chance to witness DNR management first hand mostly with the Deer population in central Wisconsin and Far Northern , you handed out party tags / multiple doe tags / then no antlerless tags / ag shoots ? All for what to manage whats natural , Predation is life in the wild period , Wolves , Raptors , Cats , etc all are here to keep balance nature , Instead of having a Wolf season treat their predation on a case by case basis . If their is a legitimate issue Thank you and your team for the effort developing the 2022 draft Wisconsin Wolf Management Overall, I support the draft plan. I am pleased that it is guided by best available science, public input, and Tribal engagement- the core tenets of the best way to protect, conserve, and sustain natural resources! I also applaud the Department for conducting a very extensive and inclusive survey on the "public opinions regarding wolves in Wisconsin?. Things I support about the plan as written: ? The plan removes a numeric population goal, allowing for an adaptable population: I support the goal of a self-sustaining, self-regulating, and genetically diverse wolf population that maintains connectivity with wolf populations in neighboring states and fulfills their ecological roles. ? The plan creates low limit zones around Tribal lands where the Tribes requested it: These lands are treaty-protected with documented wolf packs. Making this update is an important and welcome addition to the plan. Ideally, the plan would expand these zones beyond just the few that are listed and further reduce the limit to one wolf per subzone. ? The plan is reflective of the public opinions survey that finds opinions toward wolves have grown significantly more favorable. ? There is expressed commitment to science and continued research with partners and acknowledgement that ?keystone species such as wolves are an important component of a healthy ecosystem?. ? The plan outlines the strategies related to increasing public education related to the implementation of non-lethal conflict deterrent techniques. ? I support the plan?s recommendations to pursue more administrative rules, including the reduction of the window to report wolf kills to 8 hours or less and making the purposeful destruction of occupied wolf dens illegal Things I would like to see added or reviewed before plan is finalized: ? The plan should outline the concerns with ACT 169 and recommend legislative changes so that the DNR is able to make decisions on wolf stewardship in alignment with the goals of the wolf plan. ? A recommendation that the department issues wolf hunting licenses which are valid only in the specific wolf management zone(s) specified on the license. ? The DNR should better regulate hound training on wolves. The DNR should close wolf-focused hound training activities as each wolf hunting zone closes. The plan currently would allow hounds to chase wolves for training purposes during the wolf hunting season, across the entire state, until the very last wolf zone is closed. This could go on for months and would interfere with the wolf breeding season and population tracking of which both occur in late winter. ? There is currently no guidance in plan for next review or update ? Ideally, the plan should include a provision to update every 5-7 years rather than simply being ?valid until it is replaced.? ? There should be permanent, ongoing oversight by a stakeholder group AND a science committee to oversee wolf stewardship in Wisconsin. The stakeholder group must be inclusive and recognize the importance of Tribal oversight. ? I recommend identifying specific metrics that will define successful wolf management in Wisconsin. Examples should include metrics include pack integrity, average pack size, distribution of CWD in wolf range, the relative distribution of wolves across the state, and genetic connectivity and flow between packs across the state. ? The plan acknowledges that there are responsible farming practices and other non-lethal options to reduce wolf and livestock conflicts but should recommend that the DNR prioritizes these opportunities. Bottom line: Please continue to push for more science-based research in our state as well as wolf co-existence education across Wisconsin. Thank you for your consideration and careful work involving the on-going wolf stewardship of wolves in our state. Sincerely, Mike Adler [redacted] Middleton, WI 53562 [redacted]This message was sent by KnowWho, as a service provider, on behalf of an individual associated with Sierra Club. Clementine Conrad	Y	Feb282023	19:23:28	Wisconsin wolf plan	Hello. My name is Clementine Conrad, I am an 11 year old from Verona, Wisconsin, and my classmates and I have been discussing this issue for some time. I have decided to do something about it. I viewed the problem from both sides, the animal rights activists as well as the farmers point of view. and i have decided to side with the farmers. You see, someone very close to me grew up on a farm and I couldn't help but realize that protecting the wolves at an extreme rate could not only hurt the ecosystem, but also our farmers. Even though the state could compensate the farmers for their lost livestock, that could not cover the costs of the possible milk, meat, and offspring (calves). and if people cannot hunt the wolves, it could make the wolves reproduce more, ultimately bringing down the native deer, rabbit, and other small animal population. And once the ecosystem is broken down, it can be very hard to put back into place. Plants would die, animals would suffer, and so would we. Maybe a small wolf hunt would be justified, or the states could provide electric fencing and pack dogs so the farmers would be more apt to feel safe ad keep their livestock. I wish you the best -Clementine
Margaret M Pratt	Y	Feb282023	19:26:02	Support for the Draft Wolf Management Plan	Dear Randy Johnson, The idea of hunting wolves with dogs sickens me. The hunters took advantage of their chance to kill as many wolves as possible during the last hunt where they killed many more than what the quota was with an attitude of "what are they going to do if we kill as many as we can? Was there even any repercussions? These hunters love adrenaline rush of having their dogs run down the wolf. They switch off their dogs with fresh ones who can continue the pursuit until the wolf can't go anymore. Then it's a fight for it's life. I've heard stories of them letting their dogs tear into the wolf, even maming the wolf so it can't fight back so their dogs can learn to be more aggressive and tear it up. It's legalized dog fighting only not a fair fight for the wolves. Hunter's should be "humanely dispatching an animal so as not to cause unnecessary suffering". These hunters hide the facts of what really goes on when the dogs catch up to the wolf. Why else are they not posting videos and pictures of it Thank you and your team for the effort developing the 2022 draft Wisconsin Wolf Management Overall, I support the draft plan. I am pleased that it is guided by best available science, public input, and Tribal engagement- the core tenets of the best way to protect, conserve, and sustain natural resources! I also applaud the Department for conducting a very extensive and inclusive survey on the "public opinions regarding wolves in Wisconsin?. Things I support about the plan as written: ? The plan removes a numeric population goal, allowing for an adaptable population: I support the goal of a self-sustaining, self-regulating, and genetically diverse wolf population that maintains connectivity with wolf populations in neighboring states and fulfills their ecological roles. ? The plan creates low limit zones around Tribal lands where the Tribes requested it: These lands are treaty-protected with documented wolf packs. Making this update is an important and welcome addition to the plan. Ideally, the plan would expand these zones beyond just the few that are listed and further reduce the limit to one wolf per subzone. ? The plan is reflective of the public opinions survey that finds opinions toward wolves have grown significantly more favorable. ? There is expressed commitment to science and continued research with partners and acknowledgement that ?keystone species such as wolves are an important component of a healthy ecosystem?. ? The plan outlines the strategies related to increasing public education related to the implementation of non-lethal conflict deterrent techniques. ? I support the plan?s recommendations to pursue more administrative rules, including the reduction of the window to report wolf kills to 8 hours or less and making the purposeful destruction of occupied wolf dens illegal Things I would like to see added or reviewed before plan is finalized: ? The plan should outline the concerns with ACT 169 and recommend legislative changes so that the DNR is able to make decisions on wolf stewardship in alignment with the goals of the wolf plan. ? A recommendation that the department issues wolf hunting licenses which are valid only in the specific wolf management zone(s) specified on the license. ? The DNR should better regulate hound training on wolves. The DNR should close wolf-focused hound training activities as each wolf hunting zone closes. The plan currently would allow hounds to chase wolves for training purposes during the wolf hunting season, across the entire state, until the very last wolf zone is closed. This could go on for months and would interfere with the wolf breeding season and population tracking of which both occur in late winter. ? There is currently no guidance in plan for next review or update ? Ideally, the plan should include a provision to update every 5-7 years rather than simply being ?valid until it is replaced.? ? There should be permanent, ongoing oversight by a stakeholder group AND a science committee to oversee wolf stewardship in Wisconsin. The stakeholder group must be inclusive and recognize the importance of Tribal oversight. ? I recommend identifying specific metrics that will define successful wolf management in Wisconsin. Examples should include metrics include pack integrity, average pack size, distribution of CWD in wolf range, the relative distribution of wolves across the state, and genetic connectivity and flow between packs across the state. ? The plan acknowledges that there are responsible farming practices and other non-lethal options to reduce wolf and livestock conflicts but should recommend that the DNR prioritizes these opportunities. Bottom line: Please continue to push for more science-based research in our state as well as wolf co-existence education across Wisconsin. Thank you for your consideration and careful work involving the on-going wolf stewardship of wolves in our state. Sincerely, Margaret M Pratt [redacted] Bayfield, WI 54814 [redacted] This message was sent by KnowWho, as a service provider, on behalf of an individual associated with Sierra Club. Diana Jonen	Y	Feb282023	19:48:45	Support for the Draft Wolf Management Plan	Dear Randy Johnson, As an important part of the intricate web of nature, wolves are needed. It's inherently important to keep a healthy and strong wolf population, which is currently just a small fraction of its levels before extermination began. Thank you and your team for the effort developing the 2022 draft Wisconsin Wolf Management Overall, I support the draft plan. I am pleased that it is guided by best available science, public input, and Tribal engagement- the core tenets of the best way to protect, conserve, and sustain natural resources! Jim Lynes	Y	Feb282023	19:57:09	Wolf Mgt.	DNR, A healthy wolf population is a part of Wisconsin that must be maintained. Prior to the Europeans eradicating the population, they roamed freely in the Badger State and everywhere else. Overpopulation may present negative results primarily to those raising livestock. Positive compensation plans should satisfy those most affected by what comes naturally to the wolf population. I believe there is a plan (s) currently used by the state and DNR. Likewise, a procedure of removing nuisance and "repeat offender" wolves should be in place if not already. Those many deer hunters have opinions adverse to the wolf population but, there are more than enough deer in the state to satisfy hunters and wolves alike. More often than not wolves select the weaker animals and aid in maintaining a healthy herd. On Wisconsin. Jim Lynes Mauston
Rita & Jim O'Sullivan Malone	Unknown	Feb282023	19:59:51	Wisconsin 2022 Wolf Management Plan	I appreciate the efforts of all WDNR staff involved in updating the state's wolf management plan. Although I believe the current plan needs significant updating (see next section), I recognize the efforts and improvements made to the previous plan, including: ●⍰ Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. ●⍰ There is much greater recognition of the ecological role of wolves ●⍰ The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves ●⍰ The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed) What we don't like: ●⍰ The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on (see reference list below): ● wolf ethology, sentience, sapience, sociability, agency and wellbeing ● effectiveness of non-lethal interventions, especially relative to lethal ones ● the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution ●⍰ The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. ●⍰ The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ● A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings. <https://www.sciencedirect.com/science/article/pii/S0006320713003418?via%3Dihub><https://www.nature.com/articles/s41598-020-70837-x> ● Hounding or hound training, which are akin to allowing legalized dogfighting, should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public. ●⍰ The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. ● Despite Act 169, which mandates a wolf hunting season, the department can still restrict the implementation of lethal methods by setting minimal quotas, including a quota of '0' wolves, restricting timing and methods. ● Several studies have proven a proactive non-lethal approach leads to better conflict mitigation. ● Lethal management often fails to provide a long-term solution to wolf predation and has the least consistent success rates when compared to non-lethal practices. In addition, there is significant evidence showing that lethal wolf management may be less functionally effective at mitigating subsequent livestock losses than non-lethal deterrents. ●⍰ The plan should require the implementation of abatement measures as well as the use of non-lethal conflict minimization techniques by domestic animal owners for the latter to receive compensation for confirmed predation. ●⍰ The plan also runs contrary to public values towards wolves (and omits mention of such majority values from the plan), despite department surveys evidencing that the broad public cares about wolves as individuals (and not just for the viability of the population). Given the recent liberalization of killing wolves by the state, it would be incredibly informative to note majority support of the following reasons for opposing a regulated wolf hunting/trapping season (which are all omitted from the plan): opposition to specific methods of harvest like hounds (64%) or traps (70%), feelings that hunting wolves is unnecessary (62%) or culturally offensive to Native American tribes (57%). ● All such reasons convey majority disagreement with practices currently promoted and endorsed by the legislature and the WDNR, and such a conflict between managers and the public should not only be acknowledged, but foregrounded and carefully considered in policy (instead of dismissed). ● Such decisions to omit literature or downplay evidence (e.g., such as majority opposition to killing wolves and their reasons) are contrary to principles of scientific integrity (e.g., present all relevant scientific evidence to the public) as well as ethics (e.g., disguising ethical decisions, such as recreational wolf killing, as robustly supported by science). ●⍰ Conflicting agency objectives (e.g., optimizing public hunting and conflict mitigation) are not only not acknowledged, but even misunderstood as harmonious, against the body of scientific evidence. That culminates in the prioritization of consumptive values and policies; e.g., according to the body of scientific literature, use of lethal methods, and 2 <https://docs.legis.wisconsin.gov/2011/related/acts/169><https://secure-web.cisco.com/1zHxgZYZtqWNS6T2R4sbO7y4j6U-fb-ou42w5yKg1T0c4gqWBOsqhtFKXAC64LQp88NN-FYEipX21onhfD_AeI2euedJjbGJ-e_hztXYceOWkR8P1QN1L6_oxc1PbHAGchmd7dokfbqfZMCkkn6t1BfF_SUUXh5f68kvO-xnSw_OjChlK6UGsojmh5wvP2RZwfd4uqzFm05nctEJSbCPXVzs4wvhYNV813h_9aT9VxzXhr0O6YNF1cM34gsV4j9UP-hv9W4mF5d5U4gRG0kUOlPofo4ZkLExF1IWBL5T9R52YbwgMvpjH9xvnqNBTTN83imbMeb2wN57jNNtH8n-HkQ/https%3A%2F%2Fjournals.plos.org%2Fplosbiology%2Farticle%3Fid%3D10.1371%2Fjournal.pbio.2005577><https://www.sciencedirect.com/science/article/pii/S2351989419306225?via%3Dihub><https://secure-web.cisco.com/1mhxipSwg8e8yV8_289gSUIINqjcHpEISQLwy2TIdNrWMWpKXbnsmSyGQsnvWNt3FLyXmuzu0dzuNScu8PcxsTPdb7t1rQu0n5qr-oFaffG2mHEitEK32pnEPYxCUc_P-1S7mtnja_dN_CUPLny7S2eLRXfzB7sOnkpUaMiZjJ0MoAie9NZY9Jh-aTjnGdVBGco3DxzzHkIo4ew-_qtkgbJo_SUQoDEF48mNUKhZOp96FSV0VAGXFjysAxH8JdK3XzGUa6CnQUjuUFzHCpn_N5oNFY5EvPaCBNqzKGN1dzS6xOQ8M7sXhGSl4PY7-C55qr34PHT7i84_6zUKFTnPc8w/https%3A%2F%2Fjournals.plos.org%2Fplosone%2Farticle%3Fid%3D10.1371%2Fjournal.pone.0209716><https://secure-web.cisco.com/1mhxipSwg8e8yV8_289gSUIINqjcHpEISQLwy2TIdNrWMWpKXbnsmSyGQsnvWNt3FLyXmuzu0dzuNScu8PcxsTPdb7t1rQu0n5qr-oFaffG2mHEitEK32pnEPYxCUc_P-

Tribal worldviews of wolves are misconstrued as 'cultural benefits' tribes receive from the existence of a wolf population, when in fact tribal worldviews consider each individual wolf as a person and relative. Cultural respect and sensitivity towards such views, shared by many non-tribal members, demand the strict mitigation of lethal measures, especially recreational killing, as opposed to their current promotion in the plan. ●⍰ In general, all omissions of scientific literature, the arbitrary prioritization of policy objectives, the rhetoric of the plan and the dismissal of public values and concerns for wolves point towards a biased, unscientific and instrumental view of wolves that promotes values contrary to broad public perspectives on wolves. ●⍰ 'SOM' wolf estimation methodology â€“ From a recent critique: â€œThe new methods sacrifice precision, but are believed to retain adequate accuracy and sensitivity to changing conditions for reliable decision-making. We review evidence for the accuracy, precision, and sensitivity of the new 'scaled occupancy model' (SOM) applied in Wisconsin. We conclude that the Wisconsin method would systematically overestimate wolf abundance by large (but currently incalculable) margins. Because Wisconsin, similar to other states, not only changed to unverified methods but also implemented widespread wolf killing, shortcomings in their estimates of wolf abundance may have far-reaching consequences for population viability and confidence in state wildlife managers. We discuss findings from Wisconsin alongside similar findings for other states' occupancy models being insensitive to human causes of mortality that have recently increased. Overall, Wisconsin's proposed method for estimating wolf abundance shows significant departures from best practices in scientific measurement. Verification will require independent replication and unbiased tests at multiple scales in multiple habitats under different human-induced mortality rates, and peer review before the new methods are considered reliable.â€⍰ (Treves & Santiago-Ãvila, 2023) Rating: 4-5 Reference list (studies not integrated into the current draft wolf plan) 3 <https://faculty.nelson.wisc.edu/treves/pubs/Inappropriate_consideration.pdf><https://www.nature.com/articles/s41598-022-09711-x><https://secure-web.cisco.com/1NTsYMUQWjAcv0Rhgz94pGby98Nci0lOF6KT7vsJ54OSRwiURbj04frRmj7eX2PNwmxtxyOmkQWuKGxSQp3V5N1tgmelalRmmuv0I1TSU6_gEO6kSrb5SZNnQrzli-6nUec2tZiOOoOFr6t3qIpMwaXFkRg67XOOdEBkvdR-U816-X6iDYVljwjApbqZga2XckBFzV_n58zUh0vhROYvSPDNjsbIJIP3ha6_qqxgKKL8mu4CMIne99BwAay1IZRQH7-A54tsHyyQWN1Yy3nOH_Q9xKln1Xw0VC5F-a5YfYheXWioDruuvSFN-gy0sJSIl3EceUxueH5q6gAMwc4edUA/https%3A%2F%2Fwolfwatcher.org%2Fwp-content%2Fuploads%2F2015%2F09%2FProtection-from-harvesting-restores-the-natural-social-structure-of-eastern-wolf-packs.pdf><https://secure-web.cisco.com/1NTsYMUQWjAcv0Rhgz94pGby98Nci0lOF6KT7vsJ54OSRwiURbj04frRmj7eX2PNwmxtxyOmkQWuKGxSQp3V5N1tgmelalRmmuv0I1TSU6_gEO6kSrb5SZNnQrzli-6nUec2tZiOOoOFr6t3qIpMwaXFkRg67XOOdEBkvdR-U816-X6iDYVljwjApbqZga2XckBFzV_n58zUh0vhROYvSPDNjsbIJIP3ha6_qqxgKKL8mu4CMIne99BwAay1IZRQH7-A54tsHyyQWN1Yy3nOH_Q9xKln1Xw0VC5F-a5YfYheXWioDruuvSFN-gy0sJSIl3EceUxueH5q6gAMwc4edUA/https%3A%2F%2Fwolfwatcher.org%2Fwp-content%2Fuploads%2F2015%2F09%2FProtection-from-harvesting-restores-the-natural-social-structure-of-eastern-wolf-packs.pdf><https://secure-web.cisco.com/1Qcy0-b670rrAOl_Yd-r6kFIrZUaUCu2-HsG7jYR65_7vgTrSrzYYNOCntGGLFxNjmqonbLeRp1sCqQ6_E4Tt4_sByDEPuxhEYJjfB9DXgrpkukUiYWetwSQFArTCw0xUwW_J1WU0S_KLuLmuAERtxFDVIo3q_Og0OcGpnB5YkWWrRDhPN5QzzR16wFrCTf4sH0feLUNf6iaI_uxE1WunzVDp8VnhisL2ccJPOCq8Jgt1rNGLv3D-X6nkuxgS8XN0PZKz0KQgNVbkup-1lgESJkQzkhlfUQxE-0HRYg3MkLUYLLMacYjJcj6ro3Zpfqnnf5Of0B07PZqd7qmCA0W2iA/https%3A%2F%2Fwww.frontiersin.org%2Farticles%2F10.3389%2Ffevo.2022.782840%2Ffull><https://secure-web.cisco.com/1Qcy0-b670rrAOl_Yd-r6kFIrZUaUCu2-HsG7jYR65_7vgTrSrzYYNOCntGGLFxNjmqonbLeRp1sCqQ6_E4Tt4_sByDEPuxhEYJjfB9DXgrpkukUiYWetwSQFArTCw0xUwW_J1WU0S_KLuLmuAERtxFDVIo3q_Og0OcGpnB5YkWWrRDhPN5QzzR16wFrCTf4sH0feLUNf6iaI_uxE1WunzVDp8VnhisL2ccJPOCq8Jgt1rNGLv3D-X6nkuxgS8XN0PZKz0KQgNVbkup-1lgESJkQzkhlfUQxE-0HRYg3MkLUYLLMacYjJcj6ro3Zpfqnnf5Of0B07PZqd7qmCA0W2iA/https%3A%2F%2Fwww.frontiersin.org%2Farticles%2F10.3389%2Ffevo.2022.782840%2Ffull><http://faculty.nelson.wisc.edu/treves/archive_BAS/Treves_Santiago-Avila_WDNR_2022_SOM_critique.pdf> Adams, L. Lin Jacobson	Y	Feb282023	20:20:34	Support for the Draft Wolf Management Plan	Dear Randy Johnson, Wolves are a part of our world. They deserve to live in it. To be fair, using dogs in training or in the actual hunt should be outlawed. Thank you and your team for the effort developing the 2022 draft Wisconsin Wolf Management Overall, I support the draft plan. I am pleased that it is guided by best available science, public input, and Tribal engagement- the core tenets of the best way to protect, conserve, and sustain natural resources! I also applaud the Department for conducting a very extensive and inclusive survey on the "public opinions regarding wolves in Wisconsin?. Things I support about the plan as written: ? The plan removes a numeric population goal, allowing for an adaptable population: I support the goal of a self-sustaining, self-regulating, and genetically diverse wolf population that maintains connectivity with wolf populations in neighboring states and fulfills their ecological roles. ? The plan creates low limit zones around Tribal lands where the Tribes requested it: These lands are treaty-protected with documented wolf packs. Making this update is an important and welcome addition to the plan. Ideally, the plan would expand these zones beyond just the few that are listed and further reduce the limit to one wolf per subzone. ? The plan is reflective of the public opinions survey that finds opinions toward wolves have grown significantly more favorable. ? There is expressed commitment to science and continued research with partners and acknowledgement that ?keystone species such as wolves are an important component of a healthy ecosystem?. ? The plan outlines the strategies related to increasing public education related to the implementation of non-lethal conflict deterrent techniques. ? I support the plan?s recommendations to pursue more administrative rules, including the reduction of the window to report wolf kills to 8 hours or less and making the purposeful destruction of occupied wolf dens illegal Things I would like to see added or reviewed before plan is finalized: ? The plan should outline the concerns with ACT 169 and recommend legislative changes so that the DNR is able to make decisions on wolf stewardship in alignment with the goals of the wolf plan. ? A recommendation that the department issues wolf hunting licenses which are valid only in the specific wolf management zone(s) specified on the license. ? The DNR should better regulate hound training on wolves. The DNR should close wolf-focused hound training activities as each wolf hunting zone closes. The plan currently would allow hounds to chase wolves for training purposes during the wolf hunting season, across the entire state, until the very last wolf zone is closed. This could go on for months and would interfere with the wolf breeding season and population tracking of which both occur in late winter. ? There is currently no guidance in plan for next review or update ? Ideally, the plan should include a provision to update every 5-7 years rather than simply being ?valid until it is replaced.? ? There should be permanent, ongoing oversight by a stakeholder group AND a science committee to oversee wolf stewardship in Wisconsin. The stakeholder group must be inclusive and recognize the importance of Tribal oversight. ? I recommend identifying specific metrics that will define successful wolf management in Wisconsin. Examples should include metrics include pack integrity, average pack size, distribution of CWD in wolf range, the relative distribution of wolves across the state, and genetic connectivity and flow between packs across the state. ? The plan acknowledges that there are responsible farming practices and other non-lethal options to reduce wolf and livestock conflicts but should recommend that the DNR prioritizes these opportunities. Bottom line: Please continue to push for more science-based research in our state as well as wolf co-existence education across Wisconsin. Thank you for your consideration and careful work involving the on-going wolf stewardship of wolves in our state. Sincerely, Lin Jacobson [redacted] Washburn, WI 54891 [redacted] This message was sent by KnowWho, as a service provider, on behalf of an individual associated with Sierra Club. If you need more information, please contact Lillian Miller at Sierra Club at [redacted]
Sue Krause	Unknown	Feb282023	20:25:43	Wolf plan	I fully support a wolf management plan that allows the animals to thrive in Wisconsin. Wolves may be a crucial part of the ecosystem to control our deer population. I oppose wolf hunting. Sue Krause.
Alexis Pegram-Piper	Unknown	Feb282023	21:17:33	Comments on Proposed Wolf Plan	Dear DNR Bureau of Wildlife Management: Thank you for all of the many hours of hard work that went into creating the "Wisconsin Wolf Management Plan." It is thorough and provides a rich, nuanced context that I appreciated. It's also readable, well organized, and accessible, which I also appreciate. However, I am incredibly concerned that ranching/farming and hunting interests are overrepresented and feature so prominently in the report. Let's be stronger as a government department that is supposed to represent the interests of ALL citizens (and I emphasize state actual Wisconsin citizens). Let the majority of citizens (who favor wolf protection and conservation, resoundingly), the sovereign tribal nations of Wisconsin, and the science lead--and NOT special interests who are out for blood and money. Relatedly, I am also concerned many out of state licenses were issued to "sports"/"trophy" hunters to come into Wisconsin with their sick culture of killing to murder wolves here. In addition and VERY significantly, the report does not take into enough account the disastrous, horrifying, shameful, abomination wolf slaughter of 2021, when (I don't think I need to tell you, but I want you to know that we Wisconsin populace hasn't forgotten) 216 wolves were slaughtered in a disgusting bloodlust, which was 83% over the quota. This is a blight on all of us, one that will stain and haunt us for decades to come--unless we do much better. This wholesale slaughter of a brother, magnificent species that has fought back from the brink of human-caused extinction and cruel bounty hunting needs to be accounted for and should consequently bring any lethal measures used to "manage" wolf populations to zero or very near zero. I am also concerned that farmers are not disposing of dead livestock in ethical, responsible, humane ways that help to protect wolves from slaughter, rather than setting them up for their own demise. How many different farmers reported livestock losses or was it the same farms? What kinds of behaviors on the part of the rancher/farmer contributed to the livestock loss and wolf encounter? The report and our future wolf plans also need to address the reprehensible use of hounds/dogs to hunt wolves. This kind of "hunting" (if we can call it hunting because the wolves stand no chance against guns, dogs, snowmobiles, and rage-fueled trophy hunters) so unethical for the dogs and their prey (wolves, coyotes, and bears) that its physically hard to stomach. For more on this, I would like to refer you to some excellent public radio reporting on the issue: https://www.wbur.org/onpoint/2022/01/26/newly-removed-from-the-endangered-species-list-whats-next-for-americas-gray-wolves Wisconsin is the only state that allows this repugnant, reprehensible method of "hunting" and we should all be ashamed of this. Any future reports and plans need to address this reality. And we all need to be aware of the inhumane, cruel treatment of animals every time a wolf hunt happens, and when it happens with hounds the cruelty is unthinkable and unbearable. I also know that this report does not fully consider the relatively "new" science on how integral wolves are to ecosystems. I would like to see this integrated and more fully considered in future versions of our state's wolf plans. I would also like to see information on wolf numbers BEFORE white, European settlers. Why don't we really know this and why aren't THESE pre-colonizer numbers considered? These numbers should be the target. In addition, I want the compilers of this report and the policy makers to know that you don't have to be an enrolled member of one of the two main tribes primarily mentioned in the report to know that wolves are a sacred species, our teachers and our brothers and sisters. I know for a fact that many more Wisconsinites feel and acknowledge this reality: our fates are intertwined with wolves and what we do to them is a reflection of how evil and reprehensible we humans can be. What we do to them will revisit all

Name	Resident	Date	Time	Subject	Email Body
					of us tenfold. This report is a start, but I know we can do better. We need to do better in the ways that I have outlined here. Thank you for your time and, again, for all your hard work. Lexi [Lakeland University
Christie Gustafson	Y	Feb282023	21:17:40	Support for the Draft Wolf Management Plan	Dear Randy Johnson, Understanding and protecting nature's balance...instead of reintroducing wolves and then when they hunt...which is what they are supposed to do many what them killed or even eradicated....leave them alone or relocate packs to other less populated areas.... Thank you and your team for the effort developing the 2022 draft Wisconsin Wolf Management Overall, I support the draft plan. I am pleased that it is guided by best available science, public input, and Tribal engagement- the core tenets of the best way to protect, conserve, and sustain natural resources! I also applaud the Department for conducting a very extensive and inclusive survey on the "public opinions regarding wolves in Wisconsin?. Things I support about the plan as written: ? The plan removes a numeric population goal, allowing for an adaptable population: I support the goal of a self-sustaining, self-regulating, and genetically diverse wolf population that maintains connectivity with wolf populations in neighboring states and fulfills their ecological roles. ? The plan creates low limit zones around Tribal lands where the Tribes requested it: These lands are treaty-protected with documented wolf packs. Making this update is an important and welcome addition to the plan. Ideally, the plan would expand these zones beyond just the few that are listed and further reduce the limit to one wolf per subzone. ? The plan is reflective of the public opinions survey that finds opinions toward wolves have grown significantly more favorable. ? There is expressed commitment to science and continued research with partners and acknowledgement that ?keystone species such as wolves are an important component of a healthy ecosystem?. ? The plan outlines the strategies related to increasing public education related to the implementation of non-lethal conflict deterrent techniques. ? I support the plan?s recommendations to pursue more administrative rules, including the reduction of the window to report wolf kills to 8 hours or less and making the purposeful destruction of occupied wolf dens illegal Things I would like to see added or reviewed before plan is finalized: ? The plan should outline the concerns with ACT 169 and recommend legislative changes so that the DNR is able to make decisions on wolf stewardship in alignment with the goals of the wolf plan. ? A recommendation that the department issues wolf hunting licenses which are valid only in the specific wolf management zone(s) specified on the license. ? The DNR should better regulate hound training on wolves. The DNR should close wolf-focused hound training activities as each wolf hunting zone closes. The plan currently would allow hounds to chase wolves for training purposes during the wolf hunting season, across the entire state, until the very last wolf zone is closed. This could go on for months and would interfere with the wolf breeding season and population tracking of which both occur in late winter. ? There is currently no guidance in plan for next review or update ? Ideally, the plan should include a provision to update every 5-7 years rather than simply being ?valid until it is replaced.? ? There should be permanent, ongoing oversight by a stakeholder group AND a science committee to oversee wolf stewardship in Wisconsin. The stakeholder group must be inclusive and recognize the importance of Tribal oversight. ? I recommend identifying specific metrics that will define successful wolf management in Wisconsin. Examples should include metrics include pack integrity, average pack size, distribution of CWD in wolf range, the relative distribution of wolves across the state, and genetic connectivity and flow between packs across the state. ? The plan acknowledges that there are responsible farming practices and other non-lethal options to reduce wolf and livestock conflicts but should recommend that the DNR prioritizes these opportunities. Bottom line: Please continue to push for more science-based research in our state as well as wolf co-existence education across Wisconsin. Thank you for your consideration and careful work involving the on-going wolf stewardship of wolves in our state. Courtland White	Unknown	Feb282023	21:47:10	Wolf Management Plan	To whom it may concern, My child and I have followed the debate over wolf management in Wisconsin for many years, particularly since the wolf hunt law was passed more than ten years ago. We each commented in person at public hearings and before the Natural Resources Board regarding the law. The recovery of the wolf in Wisconsin and in the Midwest has been a great success of The Endangered Species Act and DNR wildlife management. A carefully constructed and well managed wolf hunt might be appropriate given the significant recovery, although we thought it should be limited to wolves living in areas where livestock had been depredated, or where they were causing drastic problems for residents. Unfortunately, the law had been written to drive the population down to the politically determined and now irrelevant number of 350. As well, the barbaric means (with hounds; at night) allowed by the law for hunting wolves revealed the fear and hatred with which the law had been drafted. The greatest drawback of the Plan is that it is drawn in the context of responding to the terrible wolf hunt law. The greatest strength of the Plan is that it disposes with the obsolete number: 350, which was determined before any realistic view of how wolves might reintegrate to the landscape in Wisconsin had come into focus. Clearly, the environmental carrying capacity of the modern landscape of Wisconsin has been shown to be well in excess of 1000 individuals. The social carrying capacity is more debatable, but humans have been adapting more successfully to the presence of wolves as wolves have always had to adapt to the presence of humans. Choosing to manage populations regionally is a positive step forward. Any number at which one might arrive would necessarily be the result of a formula adding each regional population to the other regional populations. Evaluating and setting goals for each region, then resetting goals and reevaluating in a cycle of management (adaptive planning) is an excellent strategy which we strongly support. We support the new Wolf Management Plan. Without the stupidity with which the wolf hunt law was drawn, it might be possible for a wolf hunt to take place without triggering judges to reimpose the restrictions of the Endangered Species Act, but until a sane replacement wolf hunt law is drafted, we need to live within federal rules. If federal rules are relaxed, we feel comfortable with the new Wisconsin Wolf Management Plan. Sincerely, Corry White (Mikey (ZoÃ«) White referenced)
Robert Brandt	Y	Feb282023	21:47:39	Wolf Plan Comments	Hello, The following comments are submitted by: Robert Brandt [redacted] Phillips, WI 54555 DNR Customer # [redacted] I would like to comment on the DNR wolf plan for the state of Wisconsin. I feel it is a plan that is flawed because the plan does not want to list a number on the minimum wolf count goal and also is proposing to expand the territory in Wisconsin for prime wolf habitat. I strongly disagree with the DNR's plan. Instead, I strongly support all 33 proposals put together by the Wisconsin Wildlife Federation. I believe the 33 proposals address the wolf plan for Wisconsin to make it a fair and equitable plan for all parties involved. I strongly feel there should be a minimum number set on the wolf count at 350 animals. I feel this is a number we could all live with. I have always been interested in conservation of resources and diversity of species. My farm was chosen Wisconsin Conservation Farm of the year in 2004 by the WLWCA. My farm adjoins on to the Mead Wildlife area in north-central Wisconsin and is now operated by my son and daughter-in-law. I also worked with many farmers throughout Taylor, Clark, Rusk, Sawyer and Price counties writing rotational grazing plans from 2006 through 2016 while working for Pri-Ru-Ta Resourse Conservation & Development and the Taylor County LCD. With my experiences in the Mead and on my own livestock farm seeing wolf tracks many times and knowing neighbors that lost cattle due the wolf predatation and talking with many other livestock farmers in northcentral and northern Wisconsin, along with my vast outdoor and hunting experiences throughout my lifetime which also includes 25 years of hunting deer in the UP of Michigan, I feel strongly that the wolf population is growing too large and needs to be more tightly controlled. The 2 day wolf hunt that

Name	Resident	Date	Time	Subject	Email Body
					was held a couple years ago very clearly shows us all just how large the wolf population has become. In my opinion, there is no way that many wolves could have been harvested in those 2 days unless the wolf population was quite a bit larger than the DNR population estimates at that time. Sincerely, Robert Brandt
Jacqueline Kelley	Y	Feb282023	22:49:33	Support for the Draft Wolf Management Plan	Dear Randy Johnson, Hunting wolves has become a barbaric and unacceptable practice in Wisconsin. Hunting wolves and other animals with dogs is extremely inhumane. Wisconsin is one of the only states that allows this primitive practice which doesn?t benefit anyone. Hunting pregnant wolves and pups is equally barbaric. It is time to start treating animals with the dignity and respect they deserve?hunting with dogs should be discontinued. Thank you and your team for the effort developing the 2022 draft Wisconsin Wolf Management Overall, I support the draft plan. I am pleased that it is guided by best available science, public input, and Tribal engagement- the core tenets of the best way to protect, conserve, and sustain natural resources! I also applaud the Department for conducting a very extensive and inclusive survey on the "public opinions regarding wolves in Wisconsin?. Things I support about the plan as written: ? STEVE ANDERSON	Y	Feb282023	22:55:41	Comments on the 2022 Draft Wolf Management Plan	Greetings to the WDNR staff, Please find below my comments regarding the 2022 Draft Wolf Management Plan. I also completed the online Comments survey and hope my survey reached you as well. Thank you for this opportunity. 1. I support the philosophy of adaptive wildlife management proposed in the Draft WMP, in so much that it allows for an ongoing, fluid approach to addressing the ever evolving status of the wolf population and wolf issues themselves. A 10 year plan that remains rooted in hard and fast policies makes it difficult to respond to the often contested & volatile nature of wolf-human interactions. We saw the levels of disagreement spawned by the infamous 350 management goal that remained entrenched in the minds of many for nearly a quarter of a century once it found its way into the 1999 WMP. I do have concerns that this adaptive and flexible management strategy will mean the continuation of the often year-to-year, if not month-to-month, divisive and heated debates as we seek some semblance of compromise and agreement while engaging public input on all things wolf. 2) I both appreciate and align with the the philosophy toward the wolf expounded time and time again over the years and in the WMP by the native tribes and was pleased to see their thoughts and input in the plan. 3) Funding the continuing costs to the Department, in terms of both dollars and personnel time and effort, on behalf of this single species, is a concern. I am not sure the Draft plan fully addresses this concern. I support expenditures that help sustain a healthy and viable wolf population, but do recognize the price tag of this endeavor. 4) I do applaud the mention and intent to seek legal language & protection for den sites mentioned on page 113 (I believe) of the plan. The concepts of refuge areas and buffer zones around tribal lands, where wolves residing in areas experiencing low levels of human conflict receive little or no harvest pressure, are also to be applauded. I support refuge areas wherever warranted. 5) I think the WMP comes up short on addressing habitat management, a surprising shortfall given the fundamental importance of habitat as the linchpin to wildlife survival. Though the DNR only has primary responsibility for habitat management on state-owned lands, the department has considerable history and influence when it comes to seeking and attaining cooperation and agreement with both county and federal land managers on habitat plans and projects. Most of this plan centers on managing the hunting and trapping of wolves, but we all know wildlife management is more than that and habitat is key. Coupling the habitat management of white-tailed deer and grey wolves might go a long way to securing the future of both the wolf and the deer (and deer hunting, for that matter) in Wisconsin. As the plan admits, the management of deer is beyond its scope, but managing for diverse forest landscapes in various stages of succession would benefit both deer and wolves, in addition numerous other wildlife species, including hare, beaver, etc. (prey species also key to wolf survival). The recent attempt at placing an easement on the thousands of acres of working forest now labelled the Pelican River Forest serves as an example of the bold attempts required to secure habitat and ensure it is managed for a variety of forest stages. Seeking cooperation with both county and national forest officials will be key. Forest fragmentation threatens the future well being of many, many wildlife species. 6) Objectives E and F of the WMP stress collaboration and partnerships in wolf management. I suggest and support any efforts to work with neighboring states and provinces to manage wolves from a regional standpoint to the benefit of all of the Great Lakes region's greater population. This is the largest concentration of wolves in the lower 48 states and it would only seem prudent to work cooperatively with both neighboring states and Canada to the benefit of all. Our near neighbors share the same challenges we do when it comes to ensuring the coexistence between wolves and humans. 7) I would like to see the pack nature of wolves be made a priority going forward. Any research and special management considerations that can be directed toward this aspect of wolf ecology should be pursued. Unlike a lot of other predatory species, the wolf's social nature is an important factor in its survival and we need to be cautious when we apply any and all management strategies. Losses of individual wolves are magnified because of the structure of the pack, a consideration that must always be weighed by those making management decisions. The average Wisconsin wolf pack is small in number, compounding the importance of any decisions we make to harvest or control wolf numbers. 8) Clearly wolf conflicts fall into three categories”livestock loss, loss of pets and hunting dogs, and loss of deer to wolf predation. I sympathize most with livestock producers, especially those that have a long tradition on the land, possibly back to the dark days of wolf extirpation. I support any and all reasonable answers to mitigating livestock losses, including reimbursement for losses. I have less concern for the loss of hunting dogs that are knowingly introduced into wolf range for the purpose of recreational training and hunting. The owners of these dogs must assume both the risk and responsibility of their actions and I do not support funding their losses. Much like we all assume the risk of drowning while fishing or contracting Lyme disease while exploring the woods, hunting dog owners assume the risk of conflicts with wolves. Regarding losses of deer to wolves, we are all very aware that wolves must consume large game and in fact, for years, twentieth century deer hunters defended their hunts by claiming, in the absence of large predators in our state, humans needed to control deer numbers. Now that the wolf has returned, we are having a hard time accepting their role, the very role deer hunters used to champion their cause. As I mentioned earlier, in my point #5, I urge this adaptive management approach to make every effort to engage deer hunters and wolf advocates in the search for common ground, emphasizing that habitat management for one of these species benefits both. The prospect for the wolves to play a positive role in controlling CWD is one example where deer hunters and wolf supporters can find common ground. Maybe someday deer hunters and wolf supporters will become more or less synonymous! I am not anti-hunting..I hunt ruffed grouse myself, but I do not condemn the goshawk, the great horned owl, or the fox for their take of grouse to survive. 9) I am very pleased to see that there will be room on the Wolf Advisory Committee for individuals not necessarily affiliated with an organization or lobby-like group. I think this is a positive step toward some independent thinking making its presence known, as well as giving the general public one more assurance that their input can be heard at the regional and state level. 10) Despite the plan's obvious and active attempt to avoid the discussion of wolf numbers, the size of any population is a defining character that influences its survival and the behavior of its individuals. Clearly, the last several years have taught us that wolf numbers still matter to many of us. If we are to hunt and trap wolves in the future, harvest quotas need to be set, thus I share my current take on wolf numbers, italics below: In the current (1999) management plan, the statewide carrying capacity for wolves was estimated at 500, based on the presumed available habitat present in Wisconsin at the time. The 2021 estimate puts the population at a little over 1000 wolves and it looks like the wolf population did indeed grow as predicted on page 17 of the 1999 plan”in an S-shaped growth curve classic to populations exploiting new habitat or range. The only problem is it looks like carrying capacity for our wolves is over 1000, rather than 500, as the wolves proved more adaptable and able to occupy more areas than was originally thought. The 1999 population goal of 350 wolves appears to have been ascertained choosing a population level a bit above the midpoint in the exponential growth portion of the curve, thus keeping wolf numbers below carrying capacity, but well above lag phase where their low numbers would risk extirpation by perhaps a disease outbreak or their own lack of genetic diversity. If 350 was a population goal for 500 wolves, it would seem slightly over 700 would be the logical goal for a population of a little more than 1000 wolves. I fully realize not everyone agrees with me when I question the need to hunt and trap wolves at all, but I am guessing it would be hard to argue with the math and basic population biology employed to arrive at this population goal of 700, especially for the many that cling to the obsolete 1999 wolf management plan as if it were gospel. At a September NRB meeting a year or two ago, Board member (and now Chair!) Bill Smith commented that some of the best years for wolf management, from a state-level perspective and in terms of conflicts and complaints, occurred during the years of state-managed hunting and trapping, roughly 2012 to 2015. Winter wolf numbers in those years ranged in estimate from 660 to 815 and actual fall harvests during the three hunts ranged from about 120 to 250 wolves. One might argue Bill's comments and these numbers support a population management

Name	Resident	Date	Time	Subject	Email Body
					goal that is at least double the 350 value established in the 1999 plan. 700 lowers the current wolf population to what has proven before to reduce conflicts with human interests, but would also be more palatable to those that support the continued survival of the wolf as a viable part of the state's natural landscape. At the very least, a population goal of 700 wolves might serve as the starting point for compromise and any discussions of a management target for wolf numbers (if indeed any such targets still have merit, which I am not sure they do). 11) Regarding the 6 major management zones established and mapped in this Draft WMP, I appreciate the attempt to match the zones and their various management priorities to both land cover types and percent public lands present¦..the DNR staff efforts here were outstanding as far as I can tell. Where there is more forest and public land, emphasis on wolf sustainability and well being is prioritized (Zones, 1, 2, &5). Where there is less forest and public land, conflict resolution is prioritized (Zones 3 & 4). I would have liked to seen Zone 3 managed with similar objectives to Zones 1, 2, and 5, but understand the large amount of private forest ownership warranted compromise. 12) I urge the WDNR to heed and respect the thoughts and comments of Adrian Wydeven, (member of the WHAC, Green Fire rep, and former long-time WDNR wolf biologist) shared during the Listening Session held on February7, 2023. Adrian is on record as opposing the inclusion of the western half of Lincoln County in Zone 3, and advocated for its inclusion in either Zone 1 or 2. I think his concerns should carry a lot of weight and his thoughts and opinions deserve the respect of all those concerned with this WMP. I support his viewpoint as presented here. 13) I strongly support the Plan's call for continuing every effort to sharpen and hone both population estimation methods and modeling, to enhance both Department and public confidence in these processes. Please make every effort to educate the public on details of these methods and why they are the best available science at the time they are employed. 14) I strongly support the Plan's commitment to stay well above the outdated state and federal statewide population thresholds that once warranted management options that included hunting and trapping. These various thresholds range from 100 to 350 and were popular fodder for discussion from 1992 through 2007. Such thresholds are simply too low to deserve any serious consideration going forward. 15) With the proposed adaptive approach to wolf management, which seems to include the ability to target future hunting and trapping pressure into areas of high depredation, I support any and all efforts to closely examine the link between increased wolf harvest and reduced depredation, if one exists. There is disagreement on this topic and close study of this issue going forward would seem to be both warranted and immensely beneficial. 16) I support public hearings in each of the 6 Zones annually to allow for public information and input to be shared on any hunting and trapping quotas set by the Department and the Wolf Advisory Committee. 17) On page 97 I note that the ruffed grouse is included in a list of game species currently managed via the adaptive approach to wildlife management, as is the turkey, bear, and deer. Though this is a very lesser point on my part, I would argue that the ruffed grouse has been and is currently managed in a rather static, hands off, statewide approach and its harvest strategies and regulations lack the year-to-year review and adaptation of those that govern the harvest of the other species listed. There has been some recent movement toward the adaptive philosophy in regard to grouse management in the form of some minor emergency adjustments made to season length, but no significant annual review and modification of harvest goals and regulations occurs at this time nor have they occurred in a long time in primary grouse range. I would not include grouse in this list. A minor detail truly outside the scope of the WMP, but something I noticed. 18) Finally, it seems odd to me that a population of about 1000 animals can move back and forth between endangered and game species status as mercurially as the wolf population has over the past many years. Regardless of its status going forward, I don't think we will be able to hunt and trap our way out of all the issues facing wolf survival on a landscape dominated by human interests and activities. The management objectives in this plan dwell heavily on the killing of wolves, when it comes right down to it. I applaud the many points in the plan that appear to be put in place to safeguard against repeating the mistakes of the last century and to ensure we don't hunt and trap the wolves to anywhere near the point of extirpation ever again. Thank you very much for the opportunity to comment on the 2022 Draft Wolf Management Plan and best of luck to the WDNR going forward as you weave your way through this complex, contestable, and worthwhile issue. Janine Kadile	N	Feb282023	23:23:20	Support for the Draft Wolf Management Plan	Dear Randy Johnson, As a former WI resident and frequent visitor to WI, I support this wolf management plan to protect and conserve their role in the ecosystem. Thank you. Thank you and your team for the effort developing the 2022 draft Wisconsin Wolf Management Overall, I support the draft plan. I am pleased that it is guided by best available science, public input, and Tribal engagement- the core tenets of the best way to protect, conserve, and sustain natural resources! I also applaud the Department for conducting a very extensive and inclusive survey on the "public opinions regarding wolves in Wisconsin?. Things I support about the plan as written: ? The plan removes a numeric population goal, allowing for an adaptable population: I support the goal of a self-sustaining, self-regulating, and genetically diverse wolf population that maintains connectivity with wolf populations in neighboring states and fulfills their ecological roles. ? The plan creates low limit zones around Tribal lands where the Tribes requested it: These lands are treaty-protected with documented wolf packs. Making this update is an important and welcome addition to the plan. Ideally, the plan would expand these zones beyond just the few that are listed and further reduce the limit to one wolf per subzone. ? The plan is reflective of the public opinions survey that finds opinions toward wolves have grown significantly more favorable. ? There is expressed commitment to science and continued research with partners and acknowledgement that ?keystone species such as wolves are an important component of a healthy ecosystem?. ? The plan outlines the strategies related to increasing public education related to the implementation of non-lethal conflict deterrent techniques. ? I support the plan?s recommendations to pursue more administrative rules, including the reduction of the window to report wolf kills to 8 hours or less and making the purposeful destruction of occupied wolf dens illegal Things I would like to see added or reviewed before plan is finalized: ? The plan should outline the concerns with ACT 169 and recommend legislative changes so that the DNR is able to make decisions on wolf stewardship in alignment with the goals of the wolf plan. ? A recommendation that the department issues wolf hunting licenses which are valid only in the specific wolf management zone(s) specified on the license. ? The DNR should better regulate hound training on wolves. The DNR should close wolf-focused hound training activities as each wolf hunting zone closes. The plan currently would allow hounds to chase wolves for training purposes during the wolf hunting season, across the entire state, until the very last wolf zone is closed. This could go on for months and would interfere with the wolf breeding season and population tracking of which both occur in late winter. ? There is currently no guidance in plan for next review or update ? Ideally, the plan should include a provision to update every 5-7 years rather than simply being ?valid until it is replaced.? ? There should be permanent, ongoing oversight by a stakeholder group AND a science committee to oversee wolf stewardship in Wisconsin. The stakeholder group must be inclusive and recognize the importance of Tribal oversight. ? I recommend identifying specific metrics that will define successful wolf management in Wisconsin. Examples should include metrics include pack integrity, average pack size, distribution of CWD in wolf range, the relative distribution of wolves across the state, and genetic connectivity and flow between packs across the state. ? The plan acknowledges that there are responsible farming practices and

Name	Resident	Date	Time	Subject	Email Body
					other non-lethal options to reduce wolf and livestock conflicts but should recommend that the DNR prioritizes these opportunities. Bottom line: Please continue to push for more science-based research in our state as well as wolf co-existence education across Wisconsin. Thank you for your consideration and careful work involving the on-going wolf stewardship of wolves in our state. Sara Christiansen	Unknown	Feb282023	23:53:50	About Wolves	The State of Wisconsin needs wolves! They evolved for a reason and for humans to try to eradicate or limit their numbers harshly is an act against nature. It is cruel to the wolf pack structure and is detrimental for the sustainability of wolves in Wisconsin To only allow 340 wolves in a state that evolved with many more wolves in nature, is risking our fragile ecosystem. The ignorance of humans who think wolves do nothing positive is purely from fear. Your plan listed several positive things wolves do. More education is necessary for the people who don't understand. Also to hunt wolves out so the season can be better for elk hunters is terribly disheartening to me. I suggest the wolf hunts are purely for profit by people who don't even live in Wisconsin. They come up here and slaughter our resources leaving a bloodbath and then go home to other states. It sickens me as a nature lover and Wisconsinite. Wisconsin can make much more sustainable money from other uses of nature (tourism?). Please bring back, and more importantly protect, this vital and important species of our state! I hope you consider this before it is too late for them! Sara Christiansen
Mitchell Nussbaum	Y	Feb282023	23:56:10	Support for the Draft Wolf Management Plan	Dear Randy Johnson, I've learned from Aldo Leopold that wolves are necessary to make our ecosystem work properly. Thank you for creating this detailed management plan. Thank you and your team for the effort developing the 2022 draft Wisconsin Wolf Management Overall, I support the draft plan. I am pleased that it is guided by best available science, public input, and Tribal engagement- the core tenets of the best way to protect, conserve, and sustain natural resources! William Reynolds	St. Croix/ Chippewa Indians of Wisconsin	Yes	Webster, WI	I am glad to be part of this. I know it's a very touchy situation between the DNR and the local and, and the tribal identities, but, you know, I have a, just a couple questions, actually comments that, you know, weren't really touched on, you know, that I was thinking about. One is, what would be the tracking side of wolves throughout the year when this plan gets going. Is it gonna be, are you gonna use volunteers to help track or are you just gonna take the information from hunting and the local residents on where they're at, what they're doing in, in some of these regions. My next one is, what are the consequences going to be for individuals who get a license and hunt and that quota is over hunted. What are the consequences gonna be for that? My third one is, what would be the resolution on a DNR side, if the DNR is looking at resolutions, if hunting dogs get attacked while they're out with their dogs in those areas. Other than that, I'm just looking forward to getting this up and running and that's all the questions I have for today.
Doug Cox	Menominee Tribe	Yes	Kenosha, WI	Alright, thank you. Doug Cox, Menominee Tribe. I'm a seated tribal legislator. Also hold a position in our Land Mangement, Office as Director for the tribe. We're here in Keshena. So I'd just like to say on behalf of the tribe that, and we want to thank DNR for the precision that they put into developing this plan in relation to Menominee and in other tribal nations that have been able to participate in the approach it's taken. So it's been, tribal consultations have been productive. We've been at the table, we've been able to share our concerns, not only in hearings, but directly with staff in, in leadership that are developing this plan. We've also had the privilege of having a seat on a committee. Our biologist, Donald Rider, has filled that seat for us. He's our expert and has done a great job in interacting and has great feedback. So some of the specific stuff with the plan, we, we all through the process have indicated that we were pushing hard for a buffer around our reservation and of course, closing the reservation to harvest quotas as well. We certainly accomplished that. We know that the plan includes the buffers, although, good, not great, we would've preferred the closure of any harvest in those buffers. But, we understand the importance of this plan and how we are approaching it and being able to sit at the table together. Not a compromise, but a management tool. And, we can for today live with that. We also are happy with the adaptive Wildlife management approach and we hope DNR sticks with that. You know we would certainly like to add a mechanism to have traditional ecological knowledge built into that more specifically than the criteria that you're using now. Traditional ecological knowledge is important to tribes. We've used it for a long, long time. Organizations like Great Lakes Indian Fish and Wildlife Commission, we are all familiar with use that method and we hope that that's something we can build in moving forward. One concern that we do have is, is even with the buffers, our reservation being a closed unit and tribal lands, we worry about the dog hunting related to, to the activities when hunting does begin, and that dogs will enter into a tribal land unattended. And, and we need to be sure that if that happens, that our tribe is notified by any hunters that are hunting with dogs for wolves. And again, you may have heard this may have not, the significance of this animal to us, it's in the plan. There's reference to the importance in, in tribal culture of this animal, but for Menominee, we need to keep saying it. We need to keep educating DNR and our publics on why we feel this way. This animal is culturally significant. It's part of our creation story, it's part of our clans. We hold this animal in special regard and will continue to do that in the future. We'll continue to protect it within our boundaries. Our tribal laws currently do not allow harvest to this animal, and I don't see us changing that in the future. You know, we treat this animal for protective at highest level because it is our brother, it is our client within our tribal lands. And lastly, when hunting, if hunting becomes part of this plan in the future and a season opens, we certainly don't expect a repeat of the 2021 season where the massive over harvest occurred. But we want to be assured that this doesn't happen again. And through that, we hope that consultation and the communication and the partnership and the recognition of our government-to-government status as a sovereign nation continues into the future in that we remain embedded in, and part of management of this species as part of this plan. So, that's what I have for today. And again, thanks DNR. Thanks Drew. Thanks, Randy, for all your hard work and we appreciate it. Thank you.
Michelle Beaudin	Lac Courte Oreilles of Lake Superior Chippewa	Yes		Good afternoon. This is Michelle Beaudin from the Lac Courte Oreilles Tribe, and I want to thank you for having this opportunity to talk today. First off, going through your plan, I do have some comments that I wanted to make and it's, I think it's a very well thought out plan and a lot of the history there is very well written. I did want to make comment that you did identify in your plan that the wolves were re-listed on the federal endangered species list. And that's also in the plan. It mentioned that the state has always followed the federal endangered species. And I'm confused in terms of why we're even considering the hunts then if they're on the endangered species list, then we should respect that. But if that is not the case, I do want to make comments as to one of the things that is put in the plan, which I agree with, is the wolves are, are a very important part of our ecosystem, and one of the things that you mentioned in there was that the fact that CWD, other diseased and sick animals are the main prey that wolves go after. And this is something that we as native people have always known that they're there to help this ecosystem and keep it thriving. And only when humans interfere with that, like killing off all the wolves to begin with, and the buffalo and different species, that this is what throws our ecosystems off. It's not them doing it themselves. And as you say, they do become omnivores as well, so they can, and there's a lot of science that goes into them even being able to stop reproducing in times of starvation and famine for themselves. I just wanted to comment to that, that they are self-moderating their own population as well. In your comments or in your research that you had in there, there was a section in there that talked about deer hunting, because I think this is a part that they, that some people might say is like, well, they take all the deer, and in there you identified that what they consider a healthy ratio is one wolf within a one to 17 mile radius in deer, one to one mile, one deer per mile in an area. What you identified, what we have in ours is we have wolves, one wolf to 10 to 13 miles, but we also have 10 to 26 deer per mile. So I don't see that is an argument for having a hunting season for that purpose of taking all the deer, which we wanna prevent a lot of the spread of any of the diseases that are that.And I did want to talk about the over harvesting last year, and I don't believe that that should continue to happen in giving people 24 hour notice. With this day and age with technology I believe that, that should be a lot less timeframe than giving them a continued timeframe to overharvest. And that it extensively increased the amount of wolves that were taken. And I also, in my opinion, I don't believe that dogs should be used to hunt wolves or bear for that matter. I think the owners of these dogs have responsibility in any injuries or, fatalities of their animals. I do think that they are being well compensated for that. With the inventive technology and them using radio collars and GPS, there's not a whole lot of actual real hunting being done. It's sending out the dogs and then just following them when they've got a bear tree'd o a wolf trapped. So I believe that we as a tribe would consider, would also make the stance that we need to be involved in our ceded territory, and I personally would not be opposed to not having any harvest.

Melissa Lewis	Lac Courte Oreilles	Yes		My name is Melissa Lewis and I'm also an LCO Tribal member and I want to point out that, Michelle is one of our TGB, tribal governing board members. And I appreciate her also chiming in. I have a couple of notes, we felt that needed to be reiterated for the wolf management plan. The first one is that, Thank you to the Wisconsin DNR for the hard work that they put into the draft. And we appreciate the inclusion of sub zones and threshold harvest levels. LCO supports the goal of ensuring a sustainable wolf population to achieve its ecological role on our landscape. We also appreciate the adoption of the non-numeric population goal for [ma'iingan] wolf, which is more compatible with our tribal perspective as, our elders have already stated prior. we appreciate the plan following an adaptive management framework, but this requires monitoring, both the shortcomings and the accomplishments of the goals and objectives in the plan. And, in order to evaluate and adjust those accordingly, we hope that adequate resources are devoted to this aspect. Appropriate goals and objectives are included in the plan, but falsehoods and misunderstandings continue. We feel that education must be highest priority, and the implementation of that should be adequately funded and includes tribal perspectives. LCO opposes the harvest of ma'iingan and legislative changes should be pursued to revoke this practice. The establishment of tribal buffer zones, the positive move and the support of the zone specific permits, zone A as well as the shortening of the registration window. We hope that this is a good way to not repeat the overharvesting of the last wolf hunt, and hope that more measures are put in place so that this does not happen again. Because as said before, ma'iingan is a being that we have high regard for as a brother and a teacher. As Michelle said, LCO does not support hounds for hunting. If hounds are used, they should be limited to specific zones. The ecological role that wolves play in limiting the prevalence of CWD should be thoroughly researched and funded. We hope that partnerships are included in that plan to address this. One of the last things I should say, that the tribe feels that we need to handle any, that the plan should respect the quota allocations for harvests that the tribes have. And we also feel very strongly that any plan needs to have two committees. Needs to have a technical committee of experts from tribes, state and federal that understand the ecological importance and cultural importance of ma'iingan as well as the greater public committees. So, with that being said, we do appreciate the opportunity to state these comments and thank you for the time.
Amy Mueller	Public	Yes	Waukesha, WI	Thank you, drew. My name's Amy Mueller and I'm from Waukesha County. I'd like to thank you for the opportunity to speak today and the department for all the effort that went into this plan. Overall, I'm in strong support of the draft plan as it is written in that it is rightfully focused on the ecological benefits wolves provide. It's reflective of the re recent Wisconsin DNR public opinions survey that finds opinions towards wolves have grown significantly more favorable. It also includes critical tribal consultation. As mentioned in the speakers before me, it expresses commitment to science and continued research. It also outlines and strategizes on how to engage with the public for education as well as the implementation of non-lethal conflict deterrent techniques. Before the plan is finalized, I would ask that even more consideration be given to the connection between wolves and CWD as brought up with speakers before me as well. The plan does note the possibility that wolves can reduce CWD on the landscape. It also points out that studying the connection between wolves and CWD is difficult because finding the overlap of wolves and CWD seldom occurs. But wait, isn't that a glaring data point in and of itself? It seems unwise to disregard potentially one of our best biosecurity tools we have in our state to address this giant concern and to which we have no other viable solutions currently. I urge the department to go one step further by creating CWD zones on a temporary basis where there would be restriction on wolf quotas in those areas where new outbreaks beyond break-outbreaks occur beyond the current range like Shawano and Langlade counties. They would be similar to that of the low quota zones around tribal lands. The tri, the CWD zones would be annually evaluated just as the other management discussion. Certainly, these zones would be evaluated annually, and I also suggest that a deer research scientist focused on this connection have a guaranteed speed- spot within the Wolf Stakeholder Group going forward. Thank you for your time.
Mike Brust	Public	Yes	Wausau, WI	Good afternoon. My name is Mike Brust. I'm from Wausau. And I have to say it's disappointing when our DNR has to hold a pretend listening session because they won't hold public hearings. This isn't a listening session. A listening session is where you go and listen to the concerns of the people involved. There's actually a real listening session scheduled for February 28th in Douglas County where the citizens, citizens there are trying to deal with the wolf overpopulation, but it's not being held by our DNR. It's sponsored by groups actually trying to deal with the problems. This is just an extension of the public comments where large national animal rights organizations script their members to comment from the comfort of their couches about situations they aren't involved in. Ironically, these organizations don't really care about wolves, what they do care about is the millions of dollars they generate for themselves from kind-hearted individuals that have been duped into believing wolves are endangered and at risk, they are not. What isn't being said is it was sportsmen and hunting licensed dollars that brought wolves back to Wisconsin, but the sportsmen and women who actually fund the DNR are now being double crossed. The objective of the Wolf management plan from the start was to establish a sustainable wolf population in Wisconsin. According to the experts at US Fish and Wildlife service that was accomplished over 20 years ago. Then since then, thanks to countless lawsuits by well-funded groups like PETA and HSUS the wolf population has expanded out of control into many areas of the state considered agricultural or even suburban. The DNR often claim management was beyond their control, but now when we have their proposal to manage wolves or more correctly not manage them, it is clear that they have with PETA, the HSUS and other groups instead of our own citizens living in northern rural areas that have to deal with all the negative aspects of wolves. So now you understand whether DNR wants to listen to a vegetarian sitting on her couch in California as much as a farmer in northern Wisconsin, literally trying to save his farm. Thank you for your time.

Tyler Wenzlaff	Wisconsin Farm Bureau	Yes	Stoughton, WI	Hi, thank you. My name is Tyler Wenzlaff from Stoughton, Wisconsin. I am the director of National Affairs for the Wisconsin Farm Bureau. First, I want to thank the DNR for holding this virtual public listing session, even though we prefer this to be held in person. The Wisconsin Farm Bureau has a number of concerns associated with the draft version of the State Wolf Management plan. Our principal concern and one we advocated for as a member of the Wolf Management Plan Committee is the lack of a numeric population goal. The current plan has a numeric population goal, target, whatever you wanna call it, of 350 wolves. The draft plan instead favors an adaptive management approach in which, a set of ambiguous objectives are set. The lack of a set numeric goal makes setting consistent zone harvest quotas virtually impossible, as these objectives are broadly stated and can easily be redefined by the department. Additionally, WFBF takes issue with the expansion of zone four into Marathon County and central parts of the state previously designated as inappropriate habitat for wolves. This area of the state is now designated as secondary range for wolves, greatly expanding suitable habitat for wolves in the state and putting additional farms at risk of depredation. There is no scientific reason behind the zone change and was made simply because wolves had inhabited the area. In fact, the human population is increased in the area raising chances of wolf human interactions. This is in direct conflict of the draft plan's objective B, to reduce wolf related conflict. WFBF has additional issues with the plan and will be filing official comments with the department. We hope this is just a first step in an extensive public outreach plan that includes an in-person public listening sessions throughout the designated primary wolf habitat. An in-person hearing is the only way to ensure rural Wisconsin residents are allowed a voice in the process and not drowned out by out-of-state activists. I wanna thank you, the DNR for the opportunity to speak today, and thank you Randy Johnson for his work on the plan specifically, and we appreciate working with him. Thank you very much.
Christa Hoffman	Public	Yes	Shawano County	My name is Christa Hoffman, a resident, landowner, and dairy farmer in Shawano County. My home and family property are located in proposed zone 2B of the Wolf Management Plan. In the last 10 years, I have recognized an increase in wolf activity, which has altered our livestock pasturing protocols and overall outdoor recreational activities. We regularly see wolf tracks in our woods and are visible on our trail cameras year-round. This has prevented me and our two young children from taking hikes in our wooded areas alone after a close encounter last winter. We also pasture our cattle year-round and we've, while we've not had livestock depredation occur, the wolf pressure continues to increase and remains a threat to our herd. My overall concerns with the Wolf management plan are, first I oppose the creation of the buffer zones surrounding reservations. This takes away rights of private landowners. I also oppose giving away wildlife management authority in these areas as well. The department excludes reservation wolves from harvest considerations when developing harvest Wolf quotas, the creation of sub zones around tribal lands increases the wolves that can be excluded from the population estimates. This would limit or exclude our property from any future wolf hunts and the potential of being under-reporting, under-reporting wolf wolves in our area. I also have concerns around the lack of numerical goal of population goals and the resources that would need to be in place in order to, to effectively manage what's being proposed. And I also have concerns over the long-term solutions preventing wolf depredation beyond permanent fencing. My home is within the boundaries of the wolf habitat. I respect these animals and appreciate their cultural significance to my tribal neighbors. As a business and private property owner, ensuring those that live closest to these animals have a voice and how this plan is executed and enforced before overpopulation in our zone is critical. Thank you.
Chris Albert	Public	No	Mount Washington, Kentucky	I am Chris Albert. I am from Mount Washington, Kentucky. I'm a veterinarian, so I understand concerns of producers, but I also feel that wolves are very important. There are lots of good things I see in the updated Wolf management plan. I'm very glad the concept of a population cap on wolves has been dropped. I'm glad there is emphasis on non-lethal deterrents to minimize livestock conflict. A buffer zone around tribal lands is a good idea, as well as shortening reporting times and making hunting licenses zone specific. When there is a persistent problem from a particular animal, only that animal should be targeted. One of the things that has been repeatedly demonstrated is that general hunting and trapping season targets all wolves is not a useful or appropriate response and does not diminish livestock conflict. I would like to see more restriction on hounding. It is safe to assume that hounds running rampant for hours on end can cause enormous disturbance to all forms of wildlife and they're trespassing on private property with pets and livestock is most unwelcome. At a minimum hound hunting should be banned on our national forests. I would welcome an oversight committee consisting of biologists and other professionals. Thank you.
Laurie Groskosf	Public	Yes	Tomahawk, WI	Laurie Groskopf, I'm from Tomahawk. But I happen to be in, in a work session in Tomah today. And, um, my comments, can you hear me? My comments are that every scientist who knows his wolves, knows that wolves belong in areas where there's plenty of game for them to eat, very low human presence and very low agriculture presence. Unfortunately, the draft plan does not recognize two out of three of those parameters. We need to have wolves in Wisconsin in areas where they're appropriate and where their safety is assured, as well as human safety. And that happens to be areas without much human presence, definitely very low agricultural presence and plenty of game to eat that needs to be looked at in this plan. Thank you very much for allowing me to comment.

Name	Commenter Affiliation/Type	Wisconsin Resident	Location	Comment
Stephen Anderson	Public	Yes	Hartford, WI	My name is Stephen Anderson. I'm talking from Hartford, Wisconsin. I'm also a co property owner of some land in Oneida County. Can you hear me all right? I support the adaptive management approach proposed in this plan, though I do have some reservations. I'll save those for the written comments. A similar approach has been taken in Minnesota and Michigan, so we have neighbors doing the same thing. a new plan that provides some flexibility to respond and adjust policies, goals, and strategies year to year to reflect new knowledge of wolf ecology, resolve human conflicts in a timely fashion, and ensure the future of the wolf seems appealing to me. Like it or not, until state law changes, there will be numbers and quotas in our future if we return to state management and regulated hunting and trapping. I hope the now infamous and outdated target of 350 wolves is once and for all abandoned. This value might have had merit in 1999 when wolves carrying capacity was estimated at 500, but the wolves have shown us that the carrying capacity is in the vicinity of a thousand or more. The 350 number was a worthy projected target for a growing population displaying a sigmoid growth curve with the carrying capacity estimate of about 500. It reflected a somewhat optimum density below the stresses of being too crowded and above the threats to viability of being too scarce. This might be an oversimplification in light of the complexities of wolf biology but applying the math and logic from 1999 to current wolf numbers a more realistic population goal for today might be in the neighborhood of 700 or more wolves. Though I'm not an advocate for the hunting and trapping wolves, I do recognize that this adaptive approach to wolf management will require all interested parties regularly meet to be heard and compromise will play a role in insuring a healthy and acceptable number of wolves thrive in Wisconsin. Whatever annual kill quotas might be set in various wolves zones. I urge the powers that be to keep an eye on the total population and maintain wolf numbers that reflect an optimum density in light of the best estimated carrying capacity at the time. This plan allows that flexibility. Thanks for the DNR to hear our opinions.
Adrien Wydeven	Wisconsin Green Fire	Yes	Cable, WI	Hello, my name is Adrian Wydeven. I'm from Cable, Wisconsin. I represented Wisconsin's Green Fire on the Wisconsin Wolf, an advisory committee in 2021. Wisconsin Green Fire appreciates the opportunity to comment on the draft Wolf plan and offers these comments. Wisconsin's Green Fire congratulates the department on the tremendous work in preparing this draft plan, incorporating latest science, while also considering diverse opinions of stakeholders and sensitivity to cultural concerns. Green Fire supports these elements of the Wolf plan, removing the numeric goal as done for bears and deer, and focusing on fulfilling ecological roles. Green Fire especially appreciates efforts by the department to move beyond the 350 goal of the 1990 plan, which is based on earlier knowledge of carrying capacity and viability analysis. Managing toward a 350 goal would require eliminating wolves from two-thirds of current Wolf Range in Wisconsin. We support redrawing wolf zones to manage the wolf population more effectively, with exception of Western Lincoln County, which should be part of zone one. We support creation of buffer zones around Indian reservations to better protect reservation wolves. We support rigorous focus on wolf population monitoring using an occupancy modeling approach. Wisconsin Green Fire does have some concerns and recommends some of the following. We recommend that Western Lincoln County represent that which represents important core wolf habitat should be re-added to zone one. We have concerns that the plan should balance permits and license to avoid long extended hunting trapping seasons that extend into the winter tracking period or wolf breeding season. And we are recommending that any training period for dogs should be authorized only in zones that remain open to the public for public hunting and trapping when those zones are open. we thank the department for the opportunity to comment and encourage folks to look at our Green Fire website for more details on some of our comments. We feel the return of wolves is a conservation success story. Our Wisconsin wolf population is currently secure, and wolves now occupy the majority of favorable habitat. Future management action should maintain viable population of wolves in Wisconsin while encouraging greater understanding and acceptance of wolves in the state. Thank you.
Megan Nicholson	Humane Society of the United States	Yes	Madison, WI	my name is Megan Nicholson. I'm, I'm calling in from Madison, Wisconsin on behalf of the Humane Society of the United States and our supporters. Thank you for this opportunity to speak. Again, my name is Megan Nicholson, Wisconsin, director for HSUS. I'm sorry, I'm hearing some background. First thank you for your efforts to update the Wolf plan. While we have some concerns, we appreciate many of the changes made, including the removal of the numerical population goal. We support the recommendations to reduce some of the harms caused by trophy hunting and trapping wolves, including pursuing administrative rules to reduce registration times, limiting wolf licenses to a specific zone to more effectively, and the creation of sub zones one B and two B. The quota in these sub zones should be set at zero to more effectively provide a buffer area for wolves who primarily live on or adjacent to reservations. With that said, we do have some concerns with the plan. We are especially concerned by the establishment of a hound training season and the plan's overall emphasis on trophy hunting and trapping of wolves when they're not federally protected, including in response to conflicts with livestock. A higher emphasis should be placed on non-lethal conflict prevention methods. Scientific studies demonstrate that killing wolves, particularly through trophy hunting and trapping, can lead to increased conflicts while non-lethal deterrents can be highly effective. Using trophy hunting and trapping to address conflicts as prescribed by product B1F goes against sound science and should be removed. Additionally, product C2H to establish a home training season for wolves is irresponsible and amounts to state sanctioned dog fighting. As the season will undoubtedly increase conflict and lead to increased harassment of non-target wildlife and cross path issues with landowners. The plan also places an alarming emphasis on trophy hunting and trapping wolves. Indeed, most of the strategies under object C provide multiple benefits associated with wolf population are related to the killing of wolves. Wolves provide many services that benefit all Wisconsinites, including increasing biodiversity and ecosystem services, disease reduction and preventing deadly deer vehicle collisions. There is little discussion with the potential consequences of killing wolves, including pack disillusion, increased poaching, and increased conflicts with livestock. Thank you again for this opportunity to speak and we'll also provide written comment.

Wendel Johnson	Public	Yes	Marinette, WI	Yes. My name, my name is Wendel Johnson from Marinette. I'm an emeritus professor of biological sciences at the University of Wisconsin, Green Bay Marinette campus. Part of my graduate work included working with Wolf Biologists on Isle Royal National Park. I'm also a deer hunter. I have read this excellent science-based draft of the Wolf Management Plan in its entirety. It is important to understand that wolves are a state resource, not just of local concern. This plan appropriately removes the flawed, dated idea of numeric statewide population goal, thus giving DNR Wildlife managers greater regional options. This plan also wisely, focuses on the many ecological benefits of wolves. In addition to this draft, I should include the following important points. There should be no night hunting of wolves just as we ethically behave with deer hunting, there should be limits. Secondly, on the size of hound packs in the use at any one time. And thirdly, wolves are a respected apex predator and should be classified as a trophy game animal. And hunters should have an opportunity by a zone specific lottery, lottery for hunting. And finally, wolves serve many functions such as reducing deer, overpopulation, and their dangers and damage to motorists and agricultural production. Statewide public opinion surveys show strong support and tolerance of wolves as part of Wisconsin's biodiversity. This draft is an excellent result of thorough survey of scientific literature and reasoned balance thought by trained wildlife biologists. We are fortunate to have these workers and wolves in Wisconsin. Thank you.
Francisco Santiago-Avila	Project Coyote and the Rewilding Institute	Yes	Madison, WI	My name is Francisco Santiago-Avila. I am a resident of Madison, Wisconsin. I'm also the Science and Conservation manager for Project Coyote and the Rewilding Institute. And I want to thank you for the opportunity to comment and I want to thank the DNR staff involved in updating the plan. That said we are very concerned about the plan's bias towards lethal methods and wolf killing. And to begin the draft really is far from reflecting the best available science on wolf pathology and wellbeing on the effectiveness of non-lethal interventions, especially relative to lethal ones, and on the impact of widespread killing on wolf's dynamics, ecology, and even evolution. Now, dozens of recent studies in each of those topics are emitted from the plan, and most, if not all of them present robust evidence against lethal methods and recreational killing and in favor of stricter protections for wolves and the use of non-lethal methods for conflicts. Now, when you combine those emissions with the explicit promotion of sustainable recreational killing as a main management strategy, you're inevitably going to get a bias in an unscientific plan. In addition, the plan also runs contrary to public values towards wolves obtained by the department's survey. For example the plan never mentions that most Wisconsinites oppose hounding, trapping, and feel that hunting wolves is unnecessary and culturally offensive to tribes. That's pretty much what the plan seems to prioritize, again, with very little and unreliable science. Now, lastly, there are agency objectives like public hunting and conflict mitigation that are not only not acknowledged as conflicting, but even misunderstood, as harmonious against scientific evidence and public values. So in general, we think this plan misinforms and promotes an unscientific and instrumental view of wolves that is contrary to public values. And we hope this is addressed in the final draft. Thank you.
Valerie Gibbons	Public	Yes	Monona, WI	My name is Valerie Gibbons in Monona. I appreciate many of the new goals the DNR has proposed, especially removing an arbitrary wolf population of 350. I'd like to see two points reviewed. The plan acknowledges there are non-lethal options to reduce wolf and livestock conflicts, but stops short of prioritizing them. The focus should be on prevention, not the unsustainable practice of payment for livestock loss. The plan should prioritize funding for abatement measures and non-lethal controls in order for someone to receive compensation for confirmed predation. Saying it's too expensive is helping promote a culture of kill rather than a culture of coexistence. My understanding is wolves take less than 1% of Wisconsin's livestock and do not threaten the state's deer population. A wolf human attack has never been recorded in the lower 48. Rather than using fears or some losses as justification for wolf hunting, the DNR must focus on providing myth busting public education. Second, killing these sentient, sapient, social beings should not be quote, an outdoor opportunity. The plan should outline concerns with Act 169, which mandates a wolf hunting season and recommend legislative changes be made to further the plan's goals. While in the meantime, strictly curtailing quotas even to zero and banning the cruel use of hounds on wolves resulting in compensation, which results in compensation for an individual's hobby sport And not supported by the majority of hunters or the public. Thank you
Diane Cain	Public	Yes	Hixon, WI	Thank you. Uh, my name is Diane Cain. I'm from Hixon, Wisconsin. I support the 2022 Wolf Management Plan, and I believe the DNR captured the commentary of the 29 Group Wolf Management Plan Committee very well. In the unforeseen event, the great lakes wolves were to lose their current federal protection and face a wolf hunt as mandated by Act 169. I would encourage the term zone specific selective cull, instead of wolf harvest. Recreational hunting or wolf harvest, tacitly normalizes killing wolves for fun and trophy while leading hunters and trappers to have an assumption there will be a sizable number of wolf tags available at their disposal. Zone specific selective cull describes aptly, the mechanism by which the quota of wolves will be determined in each zone, lowering expectations of large quotas with a rampant slaughter. The February 2021 wolf hunt showcased the need for Wisconsin wolf, hunters, trappers, and hounds' men to be held to a higher standard. Perhaps this change in verbiage would elevate the intrinsic value of wolves in the mind's eye of the recreational hunter while advancing the awareness wolves serve as a keystone species with substantial evidence indicating wolves self-regulate their populations. Thank you
Paul Collins	Animal Wellness Action	Yes	Madison, WI	Good afternoon. I'm Paul Collins, the State Director for Animal Wellness Action. A lifelong Wisconsin resident and vegan calling in from Madison while on break from work and not from my couch in California. Today you are going to hear or have already heard from folks that love, respect, and sadly despise wolves. You are also likely going to hear the usual lies in propaganda about wolves eating grandchildren and the incessant fear mongering that the same over amplified voices have been parroting for years. From me, you're going to hear a simple message. Wolves belong here and across the country contrary to the culture war-based narrative. Neither myself nor our organization will ever support, encourage, or condone the recreational killing of wolves in Wisconsin or anywhere else. That being said, we are realists, and I will address the proposed management plan on its merits. While not perfect, this plan is light years better than the archaic plan currently in place. It's ridiculous numeric goal of 350 wolves that somehow became a population cap for the anti-Wolf factions. It was never to be a maximum number, but those folks will clearly never accept that. We like that there are no set-in stone numeric elements in the updated plan. We also like that tribal considerations are being listened to for once, and that there has been much more of an attempt to include non-killing stakeholders in the committees related to the species. We do however, think that there should be separate scientific and stakeholder committees so that there is a clear separation between the politics and the science. We also feel that there needs to be more emphasis on non-lethal deterrents and less emphasis on using the contracted USDA Wildlife services to lethally resolve conflicts. The 65 wolves

				killed by the feds and landowners in 2021 seem to be more for revenge rather than for deterrence or mitigation. That being said, my written comments will go into greater detail on the pros and cons of this plan. However, our stance leans towards support with caveats. Thank you for your time.
Cynthia Samels	Public	Yes	Bayfield County	My name's Cynthia Samels. I am from Bayfield County Zone 1A at the top of the list for wolf populations. And kind of a depredation, hot hotspot. I guess I'm speaking for those of us living in this county, farmers. Hunters, just friends, people that I live with, that I communicate with on a daily basis. I have yet to meet someone who has spoken adamantly negatively about having wolves on the landscape. The only people that seem to be voicing some of these 350 populations, please keep those et cetera, are sadly the only people, I don't know them, but they are the wolf hunters, and they are the bear people who use hounds to chase wolves. I'm very pleased with some of the things that have done especially the removal of the numeric population goal, the low quota zones around the tribal lands. The plan is very rightly focused on ecological benefit of wolves, and the education component is something that is truly important and missing. I'm excited to see that implemented. The plan is reflective of the public opinion and it has expressed commitment to science, which, you know, the science is clear about the 350 number and it's really time that science play a much bigger, bigger role in the way that wolves are viewed that they are welcomed on this landscape and that we learn to coexist. The farmers where I live, Many that I drive by have guardian dogs. They have donkeys, they have great fencing. I just am going to encourage non-lethal, uh, methods for those who need help with fencing
Jeffrey Brown	Public	Yes	Madison, WI	My name is Jeffrey Brown. I live in Madison. I'm a climate and renewable energy investor in the state and a proud Sierra Club volunteer. I moved to Wisconsin from New York two years ago, and I wanna say you have a beautiful state full of kind people. I wanna say that I do believe that the DNR plan is rightly focused on the ecological benefits of the wolves. The plan acknowledges that there are responsible farming practices and other non-lethal options to reduce wolf and livestock conflicts. But unfortunately, stop short at recommending that the DNR prioritizes these opportunities. And with that, here are some key points. The best way to stop loss is to prevent it altogether. The focus should be on prevention, not payment for livestock loss. Scientific studies demonstrate that killing wolves, particularly through recreational hunting and trapping, can lead to increased conflicts while non-lethal deterrents can be highly effective at deterrent conflicts when used correctly. The first two sub zones one A and four A would be used to reserve the ability to direct greater harvest pressure into those areas which have been historically, historical areas of wolf and livestock conflict. Now again, research has shown that wolf hunting tends to not consistently harvest animals involved in livestock conflict anyway. Using the best available science, rather than prioritizing a wolf harvest to help with livestock conflicts, the plan should focus on non-lethal methods, creating a win-win. The plan outlines the strategies related to increasing public education related to the implementation of non-lethal conflict deterrent techniques. There is a growth in the marketplace of non-lethal innovative technologies in the space of biodiversity protection. The DNR should be looking at all monitoring, soundscape capture, and tracking tools for implementation. Lastly, I especially support the collaborative efforts with natural resource educators to develop classroom engagement strategies with lesson plans focused on Wisconsin's native wildlife, including the wolves. Thank you.
Kelli Villis	Public	Yes	Waukesha, WI	Hi, I'm Kelly Villis. I'm a lifelong Wisconsin resident and I live in Waukesha County. Just wanna start off by saying, Wolves do not need management. The land has a carrying capacity and they will self-regulate. They don't need us to go in there and kill them to manage them. They do need safe corridors to travel and that is an issue and that is something leaders need to be looking at. the plan that you have emphasizes and promotes recreational killing, I don't support that. Um, the plan should end all lethal management of wolves. It should also, I'd like to just point out there's farmers and ranchers in Wisconsin using non-lethal management successfully. the plan should ban night vision traps, snares, and killing contests especially. The plan should require abatement, measures and non-lethal conflict minimization techniques by livestock owners in order to receive confirmed accreditation compensation. And there should be zero compensation for people who choose to put their hounds in harm's way. hounding hunting wolves and bears. The plan does not reflect public values as mentioned earlier. The public is against hounding, trapping and in general hunting of wolves. It should, the final draft should emphasize public values and not dismiss them. The scientific community has expressed some concern that the model used systematically overestimates the wolf population. That's the occupancy model. That's a concern and more needs to be done to stop poaching and address it. And then finally, I understand that the Minnesota plan is a much better plan than what we have here in Wisconsin. And I ask you to please benchmark their plan and make ours better. Use it as a challenge, use it as a guide to make our plan better in Wisconsin. Thank you.
Drew Martin	Public	No	Florida	my name is Drew Martin. And I'm a Sierra Club volunteer from Florida. But I'm a strong advocate of wolves, and I'm currently reading a book about the wolves of Yellowstone. It is my belief that wolves are beneficial to the environment and that we should encourage the wolf population in Wisconsin from what I understand of wolf culture, actually killing wolves throws off the family. And so, it's better to let wolves manage their own populations rather than having those populations managed by agencies. Further, hunting of wolves will kill the most successful dominant wolves, which are the ones that control the family. Wolves that are controlled by their own species are much less likely to cause harm. I also think that wolves are healthy for the environment and do not harm game, and so that people who suggest that wolves need to be killed to make more game available, I think are incorrect. Wolves themselves kill the weakest and actually make the species healthier. So my feeling if that, if you want to have a healthy wolf population, that you should not encourage the killing of wolves through trophy hunting or other types of hunting, but you should allow wolves to manage their own population. Thank you for allowing me to make comment, but I appreciate it very much.

Name	Commenter Affiliation/Type	Wisconsin Resident	Location	Comment
Elizabeth Ward	Sierra Club Wisconsin Chapter	Yes	Fitchburg, WI	Thanks Elizabeth Ward, I'm calling right now from Fitchburg and I'm here to testify on behalf of the Sierra Club Wisconsin chapter. We will submit long, more in depth written comments later. So I'm just gonna mention a few high level points today and speak as fast as I can with the limited time. First and foremost, we wanna thank the department for listening to the call for a plan that puts science over politics, centers tribal engagement and comments, and considers public input and public opinion. These are the core tenets to natural resource management and they're especially important as we're experiencing a growing biodiversity crisis. Overall, we think the plan is well written and responsive to the things I mentioned above. We'd rate it a nine. the things we would like to see maintained in the plan and we support in the plan as you move forward is the removal of the numeric population goal. Arbitrary goals can't conform and adapt to ecological changes and best available science. Numeric population goals ignore both pack dynamics and biology, so there should not be a population number added into the plan. the low quota zones around tribal lands where requested is a fair compromise that recognize tribal authority and treaty rights, both of which supersede Wisconsin law. If it's true that the plan can't be amended once finalized, we'd encourage the department to continue to do extensive outreach and make sure all federally recognized Wisconsin tribes have their demands and requests granted to the extent possible. The plan outline strategies related to increasing public education around the implementation of non-lethal conflicted deterrent technologies. We're especially supportive of this, given that it's a win-win win for everyone with an interest in Wisconsin's wolves. while again, we support the plan, there are a few things we'd like added or changed to make it even better. Those include, your recommendations, the department's recommendations for changes to Wisconsin Act 169. Though the plan must follow the current law, DNR's voice on these issues will be important throughout the life of the plan. The plan should also outline a way to regulate updated and a provision for one. As I said, we'll follow up in more writing. Thanks for hosting this hearing and listening to all of us.
Saundra Holloway	Public	No	El Cajon, CA	Thank you so much. My name is Saundra Holloway and I live in El Cajon, California. Thank you for the opportunity to provide testimony in favor of increasing protections for wolves, requiring non-lethal [01:48:00] conflict interventions and banning recreational killing. The current draft does not reflect the best available science and is missing a substantial amount of scientific literature on wolf ethology, sentient, sapience, sociability, agency, and wellbeing. It is missing literature on the effectiveness of non-lethal interventions, especially relative to the lethal ones, and it is missing scientific literature on the impact of widespread killing on wolves, physiology, behavior, wellbeing, their social dynamics, ecological relationships and evolution. These scientific omissions combined with the emphasis on and promotion of sustainable recreational killing and a and consumptive users as a main management strategy result in a bias plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous, and of stronger inference. The plan should strictly curtail an illegal management of wolves, except an extremely rare circumstances of immediate defense of life. Research has shown that policies allowing liberalized killing of wolves has shown results in a direct increase in the hazard and incidents of illegal killings. Hounding, or hound training should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public. The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. Several studies have proven a proactive, non-lethal approach leads to better conflict mitigation. In general, all omissions of scientific literature, the arbitrary prioritization of policy objectives, the rhetoric of the plan, and the dismissal of public values and concerns towards wolves points towards a biased, unscientific and instrumental view of wolves that promotes values contrary to broad public perspectives on wolves. Thank you for letting me speak for the wolves today.
Steve Suchomel	Public	Yes	Medford, WI	The draft- Wolf management plan- unacceptable. The population of wolves goals would to be 350 with the draft proposal is a wolf expansion social analysis, three. Human slash wolf [indiscernible] must be up to a minimum public opinion from those people living- with wolves dramatically supports this. Four. There's no scientific rationale for expansion of the buffer zones, only political. Five. The plan does not address the economic impact of the wolf expansion plan in those expanded areas. Six. The plan the quality of wolf life- in northern Wisconsin is predominantly- owned with an existence-presence. Seven. The draft Wolf management plan is not the product of the committee involved. Eight. There are minimal-existing wolf programs in other states and nine without proper management tools and Wolf, human safety is an issue. Thank you for letting me have my, uh, two minutes.
Allyson Dallmann	Public	Yes	Cambria, WI	Okay, thank you. Hi. I appreciate the removal of the numerical goal for wolves, but I'm deeply concerned about the lack of best available science on their suffering and family dynamic when one family member is killed. It also lacks evidence-based highly efficacious, non-lethal methods to reduce conflicts. As a veterinarian, I have witnessed non-human animal suffering their sensitivity concern for others, care for their young playfulness, personalities and affection. Just because humans don't understand wolf speak body language and other nonverbal forms of communication does not mean they don't do and feel it. We have documented that cortisol, heart and respiratory rates, blood pressure, all increase under duress. But do you really need to see a heart monitor to know that if your foot is in a trap or you are being chased by dogs, see your son or spouse screaming in pain to know that you and they will feel great pain? Do you need your spouse to die to know that you and your children will suffer and your lives be forever diminished? The majority of the public don't want wolves hunted, trapped, or hounded. So protecting them allows wolves to maintain their families, which then benefit ecosystems. It reduces poaching, it respects their inherent right to live, encourages non-lethal management, aiding all species and demonstrates our growth as a society choosing to step away from barbaric behaviors such as hounding, trapping, and hunting this keystone apex icon who thinks, feels, loves and cares for family just as we do. Broadly, protecting wolves demonstrates the capacity to be more accepting of others which we need greatly. Thank you so much for your time. Bye-bye.

Name	Commenter Affiliation/Type	Wisconsin Resident	Location	Comment
Anne Edwardson	Public	Yes	Madison, WI	Okay. Anne Edwardson from Madison, Wisconsin, and a lifelong Wisconsin resident. Thanks for this opportunity to speak and for the thoroughness of the draft plan. Um, we must never again have a hunt that is a national disgrace. And I'm concerned that if the wolf is no longer listed as endangered, the mandated wolf hunt seems contrary to this plan. Somehow through either legislative action, administrative rule or something, the provision of the mandated hunt needs to be modified, if not eliminated. Maybe something like if three or more stakeholder groups determine that a hunt is not advisable or is not likely to be well regulated, then a hunt shall not be held. I'm also concerned about the non-resident licenses. I understand they permit, they generate revenue, allow for reciprocal hunting, but they should be limited to a percentage of resident licenses, I feel. Say maybe for every five resident licenses given out, maybe one non-resident license maybe issued. And it should be well communicated that non-residents are guests and do not have rights that precede residents rights. The Animal Legal Defense Fund has a bill of rights for animals. One is the right of animals in the wild to self-determination and an environment that allows them to engage in behavior natural to their species. Now it's not to dismiss or minimize the impact of wolf predation. Yet, wolves have a role in the balance of nature, which may not always be apparent, and some attribute as a factor in the increase of Lyme disease, the extinction of the passenger pigeon, for example. We each enjoy the Wisconsin woods for a variety of reasons, and we need to find a way for all of us to share nature with respect for each other and the people and wildlife who live here. Thank you.
Barbra Voigtman	Public	Yes	Forest County	Sure. Thank you. This is Barb Voigtman. I live in Forest County. I wanna thank you for the opportunity to speak today, and thank you to the DNR and the Wolf Management Committee for putting this plan together with the focus on ecology, stewardship, and science, however, I encourage additional focus on the following four areas. The first is education. I live in Wolf Range in a wooded rural area, and sadly, I hear countless inaccurate comments from members in my own community related to wolves. I feel that the DNR is in an ideal position to promote positive PR for wolves, and I would encourage more funding and emphasis on education in this plan. Secondly, the use of non-lethal methods. I grew up in a farming community and know how important each farm animal is to the farmer. Where wolf attacks on livestock are rare, research has shown that the use of non-lethal methods to prevent a predator attack are many times superior to the use of lethal methods. As, as you've heard today, at the other, needs to be more emphasis on education and funding for non-lethal protection of live stock in this plan. Thirdly, ecohealth and ecotourism. With the decreased interest in hunting overall, having a healthy wolf population is key to the ecological health of our wildlife. As a keystone species, wolves provide a balance in nature that humans are not able to obtain. In addition, we in Wisconsin have a unique opportunity to create an industry around ecotourism. Similar to what has happened in Yellowstone since the reintroduction of wolves there. This ecotourism industry could potentially make up for lost revenue from declining hunting and could support the overall ecological health of Wisconsin's Wildlife. And finally, the tribal perspective of wolves. As one learns more about wolves, it becomes clear why the indigenous tribes of Wisconsin have such a deep cultural connection and high regard for wolves. The tribes have centuries of experience of living in harmony with wolves, and as a result, tribal experience and perspectives should be more heavily considered in the Wolf plan. Thank you.
Melissa Smith	Great Lakes Wildlife Alliance	Yes	Madison, WI	So my first comment is, I'm sad there's not video. Cause I had a whole interpretive dance set to recreational hunting does not reduce conflict. I guess we won't see that tonight. My first comment is, I appreciate you putting the tribal representatives first on this call, right? Like you respect them and give them preference, but you don't do that in policy. While I like what you've done in the plan, moreover, as a white girl for Madison, you haven't done enough, you haven't done enough in this plan to restore indigenous rights. We're still working on a Eurocentric plan and don't get rid of me, but if I had come out and said what Mike Brust said in the beginning, I would've been kicked out of this meeting. I would, I guarantee it. That kind of negative speak towards the agency who's hosting this meeting, which I thank you for hosting that wouldn't have, that wouldn't have been okay for me to say. No, we're not PETA eating, tree hugging, celery eating people we're Wisconsinites. It doesn't matter if I live in Madison, we pay for up north. Now I understand those effects matter up north. What my comment is, I would've liked to see value studied in the social, the social survey because, and I understand that the agency, you're traditionalists, that's how you view it. But the public views wildlife is mutualists. We don't see this the same way. So I really do appreciate the social survey being done before this. But I do have to say, you have to think about this. It's not that we're, I'm here for wolves. Wolves aren't more important than a squirrel or the Alvin and the chipmunks we heard earlier, they're not more important. But the culture has changed, the culture has shifted. And I'd like to see the agency overall shift and wolves are a symptom of this problem. I do not think you can guarantee what happened in the wolf hunt over a quota with dogs. I don't see in this plan how you can prevent that because you told us you could prevent that in the first place and you didn't. And it was, as I'll quote the DNR in the Milwaukee Journal Sentinel, it was an f'ing abomination. That was from the higher ups. So please consider this with the plan and consider being conservative. A thousand wolves. I mean, that's nothing. Think about 8 billion people. A thousand wolves. Nope. A million deer, a thousand wolves. Please be conservative in this study with your model that hasn't been tested.
Megan Swearingen	Public	No	Alaska	Thanks so much. My name is Megan. I'm actually calling from Alaska. I am doing a career change to wildlife conservation and I'm very concerned about wolves in Alaska as well as wolves in the general US on the continental US as well. And I just wanna say I do not support lethal management of wolves. I do believe that coexistence is possible and we should above other methods that are lethal, we should encourage coexistence as much as possible. like many other speakers have said, wolves are very similar to us. They rely heavily on their, their family connections. They are very vulnerable to being over harvested and depleted. And we have populations out here in Alaska that have been severely depleted, in the interests of people. And it's about time that we consider other species as worthy, just like we do our own. And I really appreciate the chance to be able to speak all the way from Alaska and thanks so much for letting me speak.

Name	Commenter Affiliation/Type	Wisconsin Resident	Location	Comment
Kathleen Presnell	Public	Yes	Bayfield County	my name is Kathleen Presnell. I reside in Bayfield County. just as a sidebar, I am also a delegate to the Wisconsin Conservation Congress. I do not speak for them. Um, just a [02:08:00] another sidebar. Um, I do not support the policy that was put forward by the district leadership council at their last meeting. that was made in support of the erroneous number of 350 wolves in Wisconsin. I think that the plan is actually really amazing considering how much had to be put together, how many people had be pulled into a circle to try and get some kind of, not necessarily consensus, but at least direction. So, kudos to all of you and thank you for this listening session. I also understand that the DNR cannot do anything about hounding. It is a part of state law. so there's no way to really argue that point. It is something that the legislation has to be changed. However, after reviewing the plan, my sense is that product C2H, that allows dog owners to train hounds for the wolf hunt after the deer hunt is redundant and disruptive to wildlife and it is not directed by state law. You don't have to do this. It doesn't have to be in there. I think it was kind of something that was given to the hounding community to make them feel a little bit better about losing their 350 wolf limit. Um, like again, I wanna say thank you very much for all of your efforts. I will look forward to the final draft and we'll support you always. Thank you.
John Ulferts	Public	No	Rockford, IL	Hello, my name is John Ulferts and I'm calling from Rockford, Illinois. Although my family owned land in Sawyer County in Hayward for 60 years, and I started teaching in Milwaukee. I'd like to recognize the WDNR staff and thank them for updating this wolf management plan, which is a significant improvement over the old one. As many people commented, like many Wisconsinite's concern with conservation, I'm particularly concerned about some of the cruel inhumane methods that have been legalized to hunt wolves. The use of dogs is not just cruel to wolves, it is also cruel to the dogs. And trapping should not be allowed, nor should night hunting and wolf contests. Wolf hunting contest are particularly repugnant. It is imperative that a healthy wolf population be maintained. Wolves are highly intelligent social animals, and the widespread killing of wolves can have a profound impact on their social dynamics and wellbeing. Much like the culling effects of behavior of elephant herds, wolves are a keystone species in North America. It's hard to imagine the North woods being truly wild without them. It would be like visiting the Serengeti without lions or hyenas. Much like Africa, the WDNR should consider the tourist money that can be brought into the state if wolf populations are allowed to grow. Tourists from around the world would pay top dollar to see wolves in the wild, much as they do at Yellowstone. The WDNR plan needs to give more consideration to how repugnant wolf hunting is to the Native American tribes who consider wolves to be their spiritual brothers. Wolves play an important role in Native American religion. How can we say we promote religious tolerance and freedom if we're allowed to desecrate one of the central animals to their religion? I applaud the WDNR for introducing buffer zones to reservations in this plan. I also fear that the liberal hunting plans will result in illegal poaching of wolves. Research has documented that this has happened in many states, including Wisconsin. In conclusion, we've worked so hard to reintroduce wolves in the wild. Nobody eats wolf meat. Trophy hunting of such a magnificent keystone species should be discouraged, not promoted. Wisconsin has much more to gain by keeping a healthy wolf population both ecologically and in tourist dollars than in promoting their slaughter by hunters. While Act 169 mandates a wolf hunting season, the WDNR must regulate it with an eye to preservation of a species, ensuring that inhumane techniques are that, that timing methods and quotas do not adversely impact the continuation of a sustainable population. Wisconsin will benefit far more from tourists like my family, anxious to explore your beautiful north woods, populated with a majestic wolf. Thank you.
Caleb Tydrick	Public	Yes	Milwaukee, WI	My name is Caleb Tydrick. I'm in Milwaukee County and I'd like to start by saying thank you to Randy and his team for drafting this great plan, and also to you, Ryan, for hosting this session. so I'd like to start off by saying Wolf conflict between both, especially humans and also livestock is smaller than many times made by the media, and it's also funded by state sponsored plans like the Wolf Degradation Fund. many times that takes precedent over non-consumptive measures like wildlife viewing by people like me who actually, unlike some people in this chat, do live in the state and have always lived here and recreated here. I'd also like to thank the tribal leaders for viewing, for stating their issues with the plan, as I believe they have an important place and are important stakeholders in our society. And I'd also like to state that as a resident of the state, the wolf holds a special place in my heart as well. And I think we can all agree that 2021 season was a pretty awful debacle and was not a good display from both the DNR and everybody involved. I think this plan will help prevent that in the future. I would like to see more effective buffer zones, ideally a functional DNR board, which I believe with the recent developments can happen. I think the ecological impact of having too many deer on the landscape can be seen in lots of parts of the state, especially parts of the state that I live in, in southern Wisconsin where some plant species have essentially been extirpated off of the landscape by deer. I'd also like to say that lethal measures are always, made most vocal by those who favor them. But many times non-lethal measures can be more effective in the long term. So I think that covers it. Thank you guys.
Linda Hiller Deppe	Public	Yes	Pewaukee, WI	It's Linda Hiller Deppe. I'm from Pewaukee, Wisconsin. I've lived in Wisconsin my whole life. I'd like to thank the DNR for this opportunity, for this meeting on the plan is very encouraging, very comprehensive, great improvement. so much work went into it is very thorough. with that, I did have a couple of thoughts. I do some writing, freelance writing, and so I do think that terminology matters. And because we have a new plan, a better plan, I wonder if it would be appropriate to have another name for it, such as Wolf Sustainability Plan, Wolf Inclusion Plan, Wolf Stewardship Plan, or Wolf Ecology Plan. Those are just some suggestions. the other terminology that continues to be troubling is the use of the euphemistic apologetic metaphorical word harvest. I think we should call it what it is. it's a wolf hunting season and there are take or kill rates. I think that's just more accurate and, and more transparent and more sensible. I'm wondering about the wolf caution areas, how the people could be incentivized not to enter those caution areas. maybe there could be some kind of tiered compensation for varying between family pets, bird dogs versus hunting hounds that are, that are put into the situation when it's a known conflict area. And, finally in the plan, under the section of costs and benefits. I was really impressed by this sentence. The wolf is viewed by many as a symbol of wildness and ecological integrity, and its recovery provides certain psychological benefits and spiritual wellbeing. I think that really holds true for a lot of people. I'm just glad that that was included and it is very meaningful for a lot of us. Thank you.

Judy Aughey	Public	Yes	Madison, WI	My name is Judy Aughey, and I'm from Madison, Wisconsin. And I too have been a lifelong Wisconsin resident. Um, I want to thank Randy for the opportunity to share our thoughts on the Wolf Management plan. I hope that you will all take this. I'm sorry. I hope that you will take all of our concerns and comments to heart. I was glad to see that the new plan acknowledged the positive ecological benefit of wolves on the landscape. However, there are still concerns that need to be addressed. I feel that the population of our Wisconsin wolves cannot be accurately estimated. Hound hunting and training in Wisconsin takes an unaccountable toll on our wolf population. Wolves move their spring pups to the rendezvous sites in mid-June. Pups at this time are only six to eight weeks old. Bear Hound training starts July 1st and runs through August 31st, and then the actual bear hunt starts shortly after. When hounds are run through the rendezvous sites, fights occur between the hounds and wolves while trying to protect their pups. How many wolves and pups are killed during this time that aren't reported? The same holds true during the bear hunting season. There isn't a wolf mortality count taken into consideration during this time. Hunters complain that their hounds are harmed or killed by wolves, yet they put them out there in harm's way. If they lose a hound to wolf or bear, they are compensated $2,500. Yet the wolf or bear's life is worth nothing. I say hound hunting and hound hunting training needs to stop. It should be illegal to run dogs on our wildlife to confront and kill them for a sport. How many wolves are being killed by hounds or their owners who will shoot them for attacking their dogs? Stop hounding in Wisconsin. It's barbaric and results in the killing of our wildlife. I say no to any wolf hunt in the future. And to quote the DNR mission statement, to protect and enhance our natural resources, our air, land, and water, our wildlife fish and forests, and the ecosystems that sustain all life. Thank you.
Neil Messerschmidt	Public	Yes	Edgerton, WI	My name is Neil Messerschmidt. I'm from Edgerton, Wisconsin. Keep this under two minutes unlike most. We are never going to know what the sustainable wolf harvest is until we have a regular season, which are based on the rise and fall of animals taken from year to year. That system worked for deer management. With that said, if over 600,000 deer hunters across all the seasons spanning four months only harvest approximately 25% of the 1.5 million deer in the state, how can anyone realistically think hunters took out 25% of the wolf population in two days during the 2022 hunt? Either wolves are the dumbest animal on four legs, or there are far more wolves than we are led to believe. It would seem that money is no object with the DNR when it comes to wolf management. So as an avid hunter, I would like to see the state actively pursuing the de-listing of wolves in the courts as opposed to waiting for the federal government to move on it. Once de-listing happens, schedule hunting and trapping seasons with a balanced allocation of harvest tags made available to accommodate callers, trappers, and hound hunters. Set the harvest goal at 29% of the estimated fall population of wolves yearly until the over winter population estimate nears the 350 animals, which was the social carrying capacity numbers sold to the public when the wolf free introduction got started. Lastly, I'd like to say that while hunting is considered cruel by many who don't, the harvesting of game by hunters rarely approaches the brutality which takes place when wolves kill deer. Once a deer is brought down the pack begins to devour it savagely. One bite at a time until it expires, which can range from several minutes to several hours or more. I challenge any wolf supporter to go online and after watching 30 minutes of videos of wolves taking down deer, see if you come away still feeling the same towards that animal. Thank you.
Bethany Holmes	Public	No	Ohio	Hello, my name is Bethany. I'm calling from Ohio, and I'm very concerned about the wolves in Wisconsin. The thing I will acknowledge in this speech is the lack of consideration for individual wolves and the health of the wolf population. There's a reason why the quote for the strength of the wolf is the pack and the strength of the pack is the wolf exists. If this plan does not consider wolves as individuals, the wolf population will not be healthy. This is where the amount of wolves killed is important. Sure, killing one wolf can be recorded as one wolf dead in terms of the wolf population, but that one wolf can affect how the pack functions. That one wolf's death could lead to more deaths in the wolf pack. And that was just one wolf. Imagine what it would be like if multiple wolves were killed. That would not be a healthy wolf population. So to maintain a healthy wolf population, you need healthy wolves. And to have healthy wolves, it is a wise idea to not kill the wolves and coexist with them instead. Not every problem needs to be solved with a bullet. That's all I have for my speech. Thank you for listening.
Steve Pearson	Public	Yes	Danbury, WI	I've lived in Wolf Country on wooded acreage for the past 44 years, and I've watched the wolf population grow as a result of the protections of the Endangered Species Act. I raised two children here and now I have two grandchildren living nearby. It's a good day when I see evidence of wolves, which I often do when winter camping on the St. Croix River near my home and on occasion on our property. It should be noted that not one human life has been lost to a wild wolf in the lower 48 states in the last 50 years compared to the 44 people killed by dogs in the US in a recent year alone. The new draft plan, for the most part, does what I hoped it would. It's science-based. It's allowed for considerable public input, and it's the result of a collaborative process with the tribes. I appreciate the hard work of all involved. Some of the things I like include the removal of the numeric population goal, which was arbitrary, not based on the best available science. I like that the plan creates low quota zones around tribal lands where the tribes requested it. It's good to see that the plan reflects public opinion and was released along with a plan that showed opinions toward wolves have grown significantly more favorable toward wolves. And I like the strong commitment to science and continued research on wolves. Things I would change. Hounds chasing wolves for months is inhumane to both species as well as other species they encounter. I'm against using dogs to hunt wolves. The plan currently would allow hounds to chase wolves for training purposes during the wolf hunting season across the entire state until the very last wolf zone is closed. This could go on for months and would interfere with the wolf breeding season in late winter and break up well-established packs. The plan acknowledges that there are responsible farming practices and other non-lethal options to reduce wolf and livestock conflicts. But I do recognize that sometimes lethal means must be employed. Farmers should be able to protect their farm animals using lethal means if necessary, and should be compensated for their losses. Having said that, I hope we never see a repeat of the wolf slaughter of 2021. Thank you very much for your time.

Name	Commenter Affiliation/Type	Wisconsin Resident	Location	Comment
Gloriann Klein	Public	Yes	Milwauke, WI	My name is Gloriann Klein. I'm from Milwaukee County. I have worked with wolves and observed wolves since 1988 for hundreds of hours so I speak from experience. I've also been a Wisconsin Wolf stakeholder and I have been involved in wolf issues for the last few decades. I, first of all, would like to compliment the DNR on the current draft wolf management plan. It has come a long way, and it has showed the willingness to grow since the 1999 plan. I'd also like to commend them on eliminating the numeric goal of 350. Again, wolf, we have learned a lot about wolves, and we have also learned that wolves can exist beyond just wilderness areas. We have learned that we need to adapt, and wolves can also adapt to not only wilderness areas, but rural areas and as they're coming and growing their population. So the focus on sustainability is a good thing. I also wanna commend them on the inclusion of tribal perspectives and cultural, the necessity of including that is with the Native American. We have 11 tribes and they've been consulted with and they're being included, and that's important. it's imperative that we continue to use the best available science and also sound biological principles. Regarding some of the more specific issues with the hound hunting, I've been a vocal opponent of hound hunting, because it has been proven to alter wolf behavior. Hound hunting is not necessary. And so we've been proven that it's not needed to meet the quota. I also just wanted to say I echo the Wisconsin Green Fire recommendations and thank you for letting me speak tonight.
Jean Voss	Public	Yes	Pleasant Springs, WI	Okay. Thank you. My name is Jean Voss. I'm calling from the town of Pleasant Springs in Wisconsin. Thank you for the opportunity to comment. The Wolf Management draft acknowledges that wolves are attracted to bear baits. That is a problem. Wisconsin law states that baits toxic to wolves, are illegal when used during a wolf hunt, yet the DNR does not prohibit the use of bear bait toxic tools, during the off season. This is an extreme contradiction and should be seriously addressed in the finalized wolf management plan. No bait toxic to wolves in our state's forest during any time of the year should be allowed. Please incorporate a ban on chocolate and xylitol products year round to prevent unnecessary toxicosis in wolves and other wildlife. Thank you.
Lois Lehmann	Public	Yes	Madison, WI	Yes, thank you. I am Lois Lehmann, lifelong resident of Madison, Wisconsin. And the work that I have done around wolves and other wildlife was not sitting on a sofa. Pardon me for that, but I had to say it. I want to quote Jim Brandenburg. “The cornerstone of ecology is that all creatures are dependent on each other. A deer, for example, has died in the fall. Ravens, eagles, coyotes, fishers, martins, chickadees, and the wolves have eaten. The long winter sets in and spring arrives. The mice, voles, insects and microbes turn what is left of the carcass into new life. The enriched soil pushes up new growth that will one day be eaten by the deer, which will itself be eaten.” Page 129 of Jim Brandon Berg's book. All species matter and I couldn't help but note there is no want and waste as in killing contests. Thank you very much for the plan developers. I very much appreciate it and read all. I want to commend them for their courage to hang onto maintain the non-numerical population goal even after the Wisconsin Conservation Congress Leadership Council- I do not support the current law 169 and I want to see legislative changes, um, and also to remove dogs or hounds from national forest land, which creates pressure on not only the wolves, but other wildlife as well. Thank you very much for the opportunity to speak, and I will send my comments in to the plan developers for further consideration.
Logan Huse	Public	Yes	Portage County	Sure thing. Good evening. Uh, my name is Logan Huse from Portage County. Uh, but currently I'm on the beach in California. I'm only joking, first off, I just wanna say, yeah, great job to all the DNR folks that worked on this plan. like many people said, it's a significant improvement from 1999 plan by adopting the current scientific evidence, but there are a few things that I would like added into the plan. one being, since a common misconception with wolves is that they decimate the deer herds, we need a clear outline of what the deer carrying capacity is in each county or region based off forest health, browse availability and average adult deer weight, because according to Donald Waller, who is a botany professor from the University of Wisconsin Madison, who published a paper in 2015, found that the forest health in northern Wisconsin has been severely degraded by the overabundance of deer. So having that just clearly outlined, perhaps like in the appendices of the plan would be great just to have that data available. two. the wolf hunt should really only be concentrated in areas where livestock depredation events have exceeded acceptable levels rather than a general statewide hunt. Why are we killing wolves in areas where they're not causing a problem? I don't think that's really proper management. in regards to the overhunting and poaching, if over harvest occurs, the number of wolves that exceeded the quota should be removed from the following hunt season. Same goes for poaching. Any wolf that's discovered throughout the year that was deemed poached shall be removed from the following quota. For example, if the quota is a hundred wolves this year and we kill 120, while an additional 20 wolves were found to be poached throughout the year, and the following hunt quota is a hundred, we should subtract the 20 over harvest and the 20 poached from the next season, giving us 60 tags rather than the full hundred again. That's all I have. Thank you

Patricia Pesko	Public	Yes	Rice Lake, WI	My name is Patricia Pesko and I live in Rice Lake, Wisconsin. this plan has many components that are much appreciated and I feel needed. I appreciate the fact that this plan is focused on the ecological benefits of wolves, namely, keeping ecosystems healthy. They're a keystone species. They keep deer, elk populations in check, which can benefit many other animals species. I also thought it was great to include low quota zones around tribal lands. These lands are treaty protected with documented wolf packs. I feel the plan should expand these zones beyond the few listed, I support a plan to remove the numeric population goals, which ensures the numbers of wolves are adaptable so they can be based on the best available science and ecological changes. I feel that the population, the wolf population, you mentioned public opinion. I feel that the public opinion is positive towards the wolves and talking to people in my area, there are many, many who I feel appreciate them and value them as opposed to hunting them. There are things that I'd like to have changed. the plan needs to prioritize opportunities for responsible farming practices and other non-lethal options to reduce wolf and livestock conflicts. There should be no dollars paid for hound loss. I also would like to see added if there is going to be hound hunting, then the DNR should better regulate hound training on wolves. They should close wolf focused hound training activities as each wolf hunting zone closes rather than until the very last wolf zone is closed. Um, I noticed there's no plan for the next review, and that's really important. There should be a plan to regularly update, including a science committee. And then one final thing. I am in favor of increasing protections for wolves. I very much oppose the hunting with dogs. I oppose night hunting and trapping. So, thank you.
Chuck Raykovich	Public	Yes	Chippewa County	Chuck Raykovich, Chippewa County, Wisconsin. 70 years old, I grew up in Wisconsin. As a kid ran through the woods whenever we wanted to. We never had such a thing as a Wolf Depredation report. And all of all, I'd like to ask everybody that's on this forum, everybody that's watching, listening or whatever, please go and look at the DNR's Wolf Depredation report and don't, just go back to this year. Go back for 10, 12 years. And I, the other thing I would like to see, I'd like to see the DNR make that depredation report a lot more I guess, friendly to people that aren't real good on computers to find. You have to work to find it, but I think if, people would take a look at the Wolf Depredation report going back a dozen years, I think there'd be some eyes opened up. And that's all I gotta say. Thank you guys.
Jessica	Public	No	Connecticut	Okay. So I am definitely a calf searching wolf activist from Connecticut. I'm gonna focus on the wolf hounding. If the state's gonna hand out $2,500, in my opinion, of misappropriated funds, which is equaling up to 2.3 million to date, to irresponsible wolf hounders, they might as well pass out participation awards to hunters who use household pets for all the hard work. I'm gonna focus on two fundamental facts. Dog fighting is a felony in all 50 states. This also falls under the Animal Welfare Act, which includes abuse for profit. Allowing untrained household pets to partake in such deadly activities is no different, and the state is allowing brutal, glorified dog fighting. Number two, humans have killed humans for much less than $2,500. So it's no surprise that the same human species will exploit domesticated dogs for the same means, especially when there's a possibility of financial gain. Hound hunting is animal abuse. The pet owners of these hounds are the abusers. Thank you for taking my comments.
Garrett Laskowski	Public	Yes	Chippewa County	Hi, this is Garrett Laskowski and I'm calling from Chippewa County. this plan and the methods and studies, it is based upon as full of holes and contradictions, the largest of them being that wolves don't affect the deer population. The plan suggests there are remarkable cost savings of having wolves because it reduces the amount of car collisions. Yet the study proves the relationship. The wolves can be used as a population control tool. How can that work? 34% of elk mortalities in the northern herd were due to wolf kills, particularly in 2009 to 2015, yet they don't impact the deer herd? The plan cited a study that said wolves were not identified as a predator in any fawn mortality. In the northern area, unidentified predators were 37% of mortalities, and in the Eastern zone that 60% were due to coyotes. Coyotes prefer fawns, but wolves don't? We know they consume 17 to 25 deer per year. What is sad about all this is that the DNR is using narrow, misleading information and adhering to people uneducated on this topic that don't live in wolf territory. To simply summarize the survey as most citizens want wolves in Wisconsin is a gross mischaracterization of those results. Those on the call that live in Wolf Range and are outdoors men and women already know this, and it is clearly represented in the survey. But those that don't live in the territory rely on the DNR to give them accurate information in which the DNR has failed miserably. The studies cited are not thorough and don't address all the variables. The DNR needs to rectify this by giving more weight to those that live in wolf territory. This affects their livelihood, whether it's directly through depredation or the indirect costs like the loss of small businesses and tourism due to the diminished deer herd. Someone from Kentucky or from their office in Madison should not have a say like land owners in wolf territory. Perhaps as a good non-lethal method of control, we should transport these wolves to Madison, Kentucky, California, Ohio, or Illinois, where they all want them. Our northern citizens' livelihood should not be jeopardized by others who don't live there and by an agency that does not provide quality information. This plan is a sham and a joke.
Dan Laskowski	Public	Yes	Pulaski, WI	Okay. I do not support the Wolf plan as there are many flaws in it. What we need to do is start working together as a team instead of ignoring the issues with, of the ever increasing wolf population in order for a wolf management plan to be successful. All elected officials who include our legislators need to be involved and should be pushing for a sound wolf management plan. Wisconsin should seize the opportunity to be an example for all of the wolf inhabited states by having a plan that has a wolf population that is grounded in reality and not as not at the expense of the citizens. Wisconsin has well surpassed the federal requirements to have them delisted as an endangered species. So the state should be focusing their effort on getting them delisted so that they can manage them appropriately. If you were to ask me what I think the number of wolves should be in the state, I would tell you zero. Because I have been an avid deer hunter in the northern most part of Wisconsin and have been a landowner in Bayfield County for the past 28 years. My opinion is one extreme and is very selfish and irresponsible one at that. And if you were to talk to the anti hunters, which is the majority speaking tonight, you would get that no wolves should be harmed, which is the other extreme and also a very selfish and irresponsible opinion. The difference is I get and understand that there is a need for the wolf, but it needs to be managed like all other natural resources, which the antis will never agree with. The wolf and the deer are both a natural resource and the DNR cannot continue to sacrifice one natural resource for another. For the DNR to say that they do not want to have a wolf population goal is very irresponsible and goes against every natural resource they currently manage. DNR uses population goals to manage fish, deer, bear, et cetera. How can they throw that out the window for wolf management. That is ridiculous. I hope that with the new DNR Secretary, we'll see a change in how Wolf management program progresses so that the public does not get biased data from the agency or other special interest groups trying to sway the public, especially for those who did not hunt, or not aware of truly how many wolves are out there. I have learned one thing over the years. Figures lie and liars figure. So let's do

Name	Commenter Affiliation/Type	Wisconsin Resident	Location	Comment
				what's right and become a leader and manage this national resource properly and responsibly. It's not surprising that majority of the wolf lovers is commenting tonight, live in the southern part of the state where there are no wolves. The amount of surveys sent to each area should be proportional to where the wolves reside. Thank you.
Elaine Swanson	Public	Yes	Pickett, WI	Sure. we live in rural Pickett east Central Wisconsin. thank you for allowing additional discussion about the Wolf plan. I speak from the viewpoint, not of a scientist or a carnivore specialist, but as a naturalist and I strongly object to hunting practices that inflict fear and pain under the name of sporting heritage. I am very concerned about the in recent news of shootings at a high school in the Midwest revealed the shooter had a history of torturing wildlife. Children learn from a young age maybe sharing space with pets or creating habitat for wild species. They learn that non-human animals experience fear and pain just as we do. Studies have shown that cruelty to animals is often a warning of more violence to come. I'd like to see the updated wolf plan reflect not merely tolerance, but respect and reverence for wolves, and a recognition of their superior ability to regulate their own numbers. I support only non-lethal management of wolves in response to livestock conflicts. I'd like to see greater wolf protections, not biased privileges for hunters. I feel that experts in the field and peer-reviewed research should be the overwhelming guide for a model wolf plan. Mental health within our society should be everyone's responsibility. Thank you for considering these comments.
Rick Shroyer	Public	Yes	Abrams, WI	Rick Schroer from Abrams, Wisconsin. several things that I don't agree with the new wolf plan here. Just gonna go down as a bullet point, with the two minutes that we have. let's start with the buffer zone. You know, I personally, I don't believe in the buffer zone. I think it's ridiculous if I own land right outside the reservation line, what's good for someone 10 miles away should be good for me as well. I personally wish all the wolves lived on the reservation, but you know, they don't understand the boundary lines either. the population goal, how do we not have a population number? How do we manage to something with no goal or no number as a goal? Every other animal that we manage has a population goal but the wolf is just special. I hear a lot of comments on here tonight about the wolf's feelings. Well, how about the other animal's feelings? You know, I hear that the wolf is the spiritual brother of some people. Well, maybe the whitetail deer is my spiritual brother, and the wolves are eating my brothers. We have to get out of this ridiculous mindset and look at it as a realistic thing. It every animal needs to be managed. I question the economic impact. You know, more wolves in Northern Wisconsin equals more, less deer. Less deer equals less hunters. If people aren't coming up and spending their money in these small towns, I think that that's really gonna, have an impact. And I guess lastly, I'd like to just mention my own personal opinion. I could care less what somebody from California, Utah, Illinois, whatever thinks about this, I think the marriage should put, be put on the people who live in the wolf zones and have to deal with it. The wolf is a beautiful animal. There is a place for it, but like everything, it needs to be managed. Thank you for your time. That's all I got.
Mark Silverman	Wisconsin Animal Protection Society	Yes	Milwaukee, WI	Thank you very much. this is Mark Silverman from Milwaukee. I'm the president of the Wisconsin Animal Protection Society. We're a nonprofit organization that's been around since the early nineties, and I didn't know about the star six way to unmute on my phone before, and so I've switched over to a different device that worked. So thank you very much and thank you for spending a considerable time and effort to create such a comprehensive plan. As the Humane Society of United States suggests in their comments, we feel the plan should include a provision that it be updated at least every five to 10 years. Initially, we must point out that the Wisconsin Animal Protection Society opposes the intentional killing of wildlife by humans. Population control is no more justification for killing wolves than it would be for killing humans. We're concerned with the use of the word harvest, not just by DNR, but we see that that's become very popular as a way to refer to the killing of wild animals. we wish that the plan would be ethics driven, in addition to its being science driven, and that the DNR would recommend that the state law be changed so it does not require a wolf hunting season when gray wolves are delisted from the endangered Species Act. With regard to trapping. Trapping is an inherently violent practice. Traps that are used, including body gripping traps, are inhumane devices that inflict great pain and suffering. In a letter to Congress, Dr. Colin Wolf, who is a board-certified veterinary surgeon, quote, the undeniable truth is that these bone crushing devices are inherently indiscriminate and inhumane. We encourage the DNR'S exploration of additional funding options as the plan suggests in product B four D to prevent the need to prorate wolf damage claims. Additionally, the DNR should explore the request for donations from conservationists who oppose hunting. This could be similar to the sale of endangered resources license plate. Alternative funding option could lessen the reliance upon funding from the sale of wolf hunting licenses and permits. In other words, instead of a license to kill, will be a licensed to save. While we appreciate the plan to reference to the pursuit of administrative rules to limit the time period within which dogs may be trained for wolf hunting activities. My last sentence is that we wish the department would pursue regulations, rules prohibiting the use of dogs to hunt wolves. Again, thank you very much and we really like the long-term stewardship and sustainable management approach. And thank you very much for your time.

Scott McAuley	Public	Yes	Wisconsin Rapids, WI	Okay. Scott McCarley, Wisconsin Rapids. with this plan, I agree with the Wildlife Federation, the Bow Hunters, and the Wisconsin Trappers Board of Directors, that there's more, more needed to be done. But myself, I don't like the 350 number going away. We don't think the public is ready for that when you're only trying to manage a thousand, 2000 animals. it's just not good enough. I mean, with the CDAC stuff, with the county deer committees, I mean, we're working with thousands of deer and nobody ever agrees whether we should go up or down with the goals anyway. But, with wolves, some of the comments have been, I just don't think trying to manage that small of a population with the adaptive management goal is gonna work. but they're always saying that you shoot some wolves, you chase some wolves, and the pack is, goes to heck. Well, they did a, what was her name? Ellen Hyhickler? Hiheckler? grad student years ago, did a study on pups survival in Wisconsin. Half the pups out every pack that year died before they reached one year old. And one of the comments was a third of the adults die every year. So those, the packs are in the constant flux, you know, they're never stable. So that's about all I have. Thank you very much for letting me talk and finding a way to get me in here. Thank you.
Mike Robers	Public	Yes	Exeland, WI	Okay, thank you. my name's Mike Robers. I'm from Sawyer County. Exeland, Wisconsin. I'd like to talk about, about the depredation. I'm kind of disappointed in the lack of the fact that we're not going after a number goal. How do you know where you're headed if you don't have some kind of a goal out there? Our particular farm in 2021 had a cow killed not more than 30 feet from our dairy barn. And there's tracks just outside our calf hutches, had wolves on our silage bags four different times during that year. And to see wolf tracks almost every day within a hundred yards of our barn is getting to be a little bit nerve wracking. Also, in the last two years, we've had two beef cows and three calves confirmed, a numerous killed suspect by wolves within a 20 mile radius of our farm. Another farmer has also had wolves tearing into his feed bags as well. I also sit on the CDAC committee, and probably the biggest complaint on that is the deer herd. The biggest complaint on the CDAC committee is that the deer herd is in depredation by wolves and bear. It's nothing to, for us to find at least a dozen deer carcasses in our fields every spring. The next biggest complaint in Sawyer County is the lack of deer and the wolves. I think a person's way of making a living should rate high on the list of the priorities on wolves. I also don't think, or I also don't know how it's physically and financially possible to fence all the grazing and pasturing areas that cattle are in and keep the wolves out. And that's extent of my comments. Thank you very much.

Name	Commenter Affiliation/Type	Wisconsin Resident	Location	Commenter
Pat Quaintance	President Wisconsin Wildlife Federation	Yes	Bayfield Co.	Pat - I live by the Echo Valley Pack on [redacted] and so far the Echo Valley pack has split down into three different packs. There's a pack east of [redacted] then there's the Echo Valley pack, and then there's another pack it runs all the way over, so there's three different packs or, but they're kind of cool, man. The way it looks. They're all kind of one, but they're supposedly separate. So I don't know how to relate to that. I got tons of pictures where the wolves are within 50 yards. My house, my son's house. I'm constantly getting them coming through. Within a hundred yards of the house. West of me, there's a guy that's got horses. Last year, not just last year, the year before he lost five horses. farm to the south of me, two years ago they lost five horses. And this last year they can't account for two calves. Place to the north of me. The farm there, they lost five calves two years ago, and this last year they lost three. So there's quite a bit of depredation right in and amongst my house. But then if you go even further to the east, there's been some problems there also. I don't know exactly how many, animals they've lost there. But they've had quite a bit of problems. The Echo Valley pack did kill one hound here a couple years ago. Why I'm kind of referring to this is because this whole area is considered a subzone. Put this in the wolf management plan. Um, at one time it was supposed to be a six mile buffer zone. Well, this buffer zone extends, I would say probably almost 17 to 18 miles from the reservation. The one that's in the wolf management plan, the one that's coming out. So I explained a little bit about this buffer zone. And what happens with this buffer zone is that there's a total of four reservations that have this buffer zone that they're gonna be putting, that they wanna implement. They're gonna issue five tags for all five of those buffer zones. When those five wolves are killed, shuts down the season for those buffer zones. Okay? If they have problems with depredation, then Wildlife Services can come in and take care of the problem. That's how they're gonna work this. But once they shut down that season, I own 200 acres, right amongst this is buffer. So they're not gonna allow me to hunt a trap wolves from my land. It's gonna be shut down. Cause those five tags, doesn't matter what reservation or where those wolves are killed. Once those five are dead, that's it. Okay? So unless they have depredation, they're gonna call in Wildlife services and take care of the wolves. I disagree with that in a lot of ways cause it's, you know, they're taking my private property rights away or they're not allowing for me to hunt or trap a wolf. They're gonna allow Wildlife Services to take care of this and I disagree with that. We gotta end up for that too. So there's some discrepancies among this. but this is part of, we've had Randy Johnson came to one of our board directors gave us the spill on wolves, I definitely express my dissatisfaction about the subzones. and it is it's kinda and iffy type thing. So I don't know what's gonna happen with this. All we could do is we have until February 28th. Go ahead. Go ahead and express our concerns with this wolf management plan. also, they're not gonna have no numberic numbers like we've all talked about for years. The 350 or less, they're not gonna have that with this management plan. So there's a lot of concerns with this, but right now the biggest thing that we're trying to do, Tom Tiffany's got a bill to try to eliminate the judicial process, the pro-expansionist took us to court to put wolves back on the endangered species list. And we wanna end that so we can have a season be managed by the state. So, that's some of the things that are happening right now. That's gonna go, God only knows. But in the meantime, I heard this, that the new Wolf National Plan is not gonna be coming in front of the Natural, Resources Board until May of '24. According to Randy Johnson, they gotta look at all the comments, periods and cypher through all all this, and hopefully some things change, but god only knows if that's gonna happen. But I know I'm not gonna sit back and, and just, you know, allow them to take my property rights away from the end and not be able to hunt and trap my own land. You know, right now the tribes, the Red Cliff band is we trying to trap wolves 365 days outta the year. And they got a number of collared wolves. In fact, we got more wolves collared on in my area there than they do the whole state. I know they had, they just obtained number eight collars put 'em on these GPS collars so you can sit on your computer and watch where they so on. I'm. I'm not standing up here saying I want all the wolves to be eradicated. I don't want that at all. And everybody that I've talked to, everybody doesn't wanna see that happen either. But we need to, we need to get the, wolves managed. we need to do it in a way that everybody's more content about what this wold management plan is.
Unknown	Unknown	Unknown	Unknown	When it comes to these judges that are stopping this process of the species, is there any way that could be regulated? The point where only judges from the state that they're like, we've got a California judge, we've had Michigan Judge a stop. Is that correct?
Laurie Groskopf	Wisconsin Wildlife Federation	Yes	Lincoln Co.	I think, the shame if we put that in our statement from the Wisconsin Wildlife Federation, that they should rely more on collar wolves for data. I feel as a tracker. You know, I go out and track 30, 60 miles and I don't see a wolf track anywhere. That doesn't mean they aren't there. Anybody who's a hound hunter knows exactly what that's all about. So that's how that happened. The count too, keep in mind that we're, we're measuring this at the lowest point of its population. This does not include lone wolves and dispersers and it does not include the young that are gonna be born in another month or two each year. So that raises the population quite a bit, Thats also not pups that were born last spring. Cause I got into an argument with, and I proved using their numbers, they want go to 350, that we actually had 700 on ground at that time. And I asked Adrian the number of questions about all the study and how they come up with that number that was on the ground at that time
Unknown	Unknown	Unknown	Unknown	Using DNR numbers, putting it together, we proved right in that meeting that there were 700 wolves on the ground not coming the pups born the year of, that's how bad the DNR is at counting. When we've had guys, Walk and actually track for 'em, they discounted all the tracks. I've called Adrian on that. Jeff, you're as known about it. They did the same thing as if we don't know what Wolf tracks are.I'm not gonna talk anymore about this, but I just wanted to get that clear that they lie about that number because they say it's a minimal count and that's how they get by with it. Thank you.
Mike	N/A	Yes	Douglas Co.	So not necessarily looking for questions. This is just some of my feelings about this. The draft management plan, so read through it again. It's 178 pages. It really feels like expansion plan. Nothing in there really talks about population control. Its open-ended, no numerical goal.

Name	Commenter Affiliation/Type	Wisconsin Resident	Location	Commenter
				The Wolf Advisory Committee that met on this, last realm you know, pretty much every, outdoor, hunting, fishing group, agriculture group requested, demanded, a numeric population 350 to be back. back on the tribes and the, the expansionist groups. They fought, matter of fact you know, they asked for. You know, the top three issues are important to every organization in many 350 Wildlife Federation are right off the bat choose another top three or try to find ways to get us to move off of that stance. So that's a big concern. Mine mentioned earlier about sub zones. you know its really unequal treatment. You know, everybody deserves opportunity to harvest the wolf off their own property if their tags available. And limiting the amount tags there, I feel it's unequal treatment, unequal opportunities and, personally that's illegal. Some, the survey data in there, it really felt biased. You know, they didn't come to Solon Springs and ask these questions. They mailed it out all over the place. And, you know, just cause a person has a piece of property or a PO box or mailbox up in the territory doesn't mean, they're necessarily affected by wolves. If they're, you know, driving back and forth from S. Wi or, they keep themselves out the woods. I mean, they're not gonna experience it. Tracking was talked about, tracking you at the tracking zones. The entire area isn't track and the areas that are clearly under tracked. You and I understand together the minimum over winter count. It's just that it's, it's minimal. We know it's much, much higher. You know, talking to, the DNR themselves, they understand that as well. But the minimums is the number tracks get right percentage on that or, try to get some sort of realistic number off of there. But I haven't had success with that. Conflict management, so reading through plan, they talk about, you know, contract, like payment methods and, and they really focus on cattle, which is great. There's nothing in there that, that I find really for conflict management on hunting dogs, I run hounds. You know, we've had hounds murdered, I dunno else to say, I mean, just murdered by wolves. There's nothing in there addressing that. I'm a landowner. I should be able to use public land in any, you know, legal hunting method, and be able to do without, you know, fear of, of losing or having a dog injured. So there's really nothing I saw in there that addressed, you know, management or conflict management in there. Or even, you know, packs that are habitual murders. Taking care of those problems. Depredation alerts; so I'm not sure how many get the alerts. I get'em, you knows they put a 4mi buffer around hound depredations. We primarily have private properties around farmland. We've got great network of landowners and, you know, lot of ideal farms. I don't understand why there's not similar alerts out there and when cattle are killed or harassed be available for all of us. Cause you know, I don't wanna put my dog where there's been livestock killed. I don't wanna put one near where cows been killed. So, I really, that whole process needs to be improved. That's pretty much all we know. So, you encourage everybody, make sure you check out the new zone maps. They're in the back leave on the side of the room here. You'll see those little sub zones and you know, but you know of 'em around private areas. Feels like, management in those areas given to the tribes not property. So thank you.
Corky Meyer	Past Wisconsin Wildlife Federation President	Yes	Douglas Co.	I'm Corky, past president of the federation. I've got something they call the central Tremors, so I'm not afraid to talk to people. I encourage you to talk. I made a trip, 5 hours plus to get here. I'm thrilled to see that this group of people, and I'm gonna say you're mostly locals I've been to wolf meetings since the eighties. They used to be called wolf stakeholders meetings. No I didn't hold the stakes. So, I encourage you, please tell your stories. I've been telling stories. I live in Washington Co. I was told that, oh that's Milwaukee. No it aint. I got 20 acres next to the Kettle Marine, Northern State Forest. I'm surrounded by farms. And guess what the said? The DNR said they no wolves out there. Well, I'm sorry. I called, I seen it. I've got coyote buddies that have seen wolves. People aren't calling in down there. Why? Because they say wolves don't exist down there. It's not the territory. There's wolves in Jefferson County, Manitowoc County, Ozakee County, Shaboygan County. They're around me. I can almost reach and touch Sheboygan and Fond Du Lac from where I live, but there's no wolves down there. Were told that no, its coyotes. No, it's, I'm sorry. I've been in the woods for, I'd say a couple years. My pa started me when I was about this big. I'm up here to listen to you. I've listened to enough stories. That's the politest way I can say it. I can say from people in Milwaukee that have the Disneyland dream, that the, pbs, that wolves should be everywhere so we can go and see them. You ever see the pictures of the tourists that go to Yellowstone and wanna pet the buffalo? Okay. We have, and by the chuckled. We're of a different group. What I see here today, I haven't seen in one place. It's a trip for you all to go to some of these. You've got cattle to feed, you've got business up here, and like I said, it's a five and half hour trip for me, but I can make it. Glad to, glad come up here just to see you and to let you know we're in it with you. Were here to support you. A lady ive know today that I've known since she was this big, she lives in an area that's not wolf country, but she sees em too. and these are the stories that we're looking for from you. Yeah, I got stories as my granddaughters and friends say, get a campfire going in court you'll talk all night old. This is your opportunity, I guarantee you. And if I can get up front and sound like a great school kid, afraid that the class laugh, there's nobody gonna laugh. We want your input, the Departments got that microscope look. They budget concerns, they got all the excuses, but as I heard the math don't work. You can get a grade school kid to say 250 packs. Okay? Four pups per pack. Okay, that's a thousand. So why did the population only go up by a hundred? A hundred? What's the answer you get? Well, some of them will die. That's true. Some of them will die. They worry about us and our dogs not being vaccinated. Dogs have to be vaccinated by law. Well wait a minute. Dogs is a canine right? Wolves are a canine. The law says I have to vaccinate. But all these wild wolves that aren't vaccinated don't spread disease. There's a lot of misinformation. What we came here for today is to get your first hand stories. Now I'm gonna hand out the mic and go hide in the corner and shake some more. So do you feel vibrations, don't worry its not an earthquake.
Hazel McClaire	N/A	Yes	Mellen, WI	Hi, I'm Hazel McCalire, Mellen, Wisconsin. So, we have a bit of a trek up here today too. Um, not as far as he came, thank God. We used to raise, I say used to, because our pack was killed off. We went to our grandson's football game. The dogs all safely in the kennel and when we came home, the pack was gone. The wolf had come in and dug under the kennel. And chased all the dogs into woods. We hunted for days and days and days and days.

Name	Commenter Affiliation/Type	Wisconsin Resident	Location	Commenter
				Fortunately, three of the females got to a home somewhere near where they had been chased, but the leader of our pack was killed and never seen or heard from again. I'm sure he bet the young. They were pets, but they also were taken to no-kill hunts around the area, to chase rabbits. And they got, points for how well they tracked the rabbit without losing them and how well they would stay on that track and so forth. It was a great time to go with them. They enjoyed it. We enjoyed it. We traveled all over the Midwest to these hunts. We went to, some/one out east, and to come home and find our kennel just totally decimated. Just not only heartbreaking, but it really made me angry. And our pack leader never came back. Like I said, fortunately, some of 'em did get to a neighbor's house and they were rescued there, and he brought them back the next day in the back of his truck. But without the pack leader, you don't have a pack. You got a bunch of dogs, but you don't have a pack. So I took one of the dogs with me and we went out to look for our pack leader because we didn't know if he was dead or if he was somewhere in woods yet or where. And while I was out with one, one of the other dogs, suddenly this huge animal came and started circling us. There was no question in my mind what it was. It was a wolf. And he was certainly mean. He was certainly mean. I sang every song I could think of from grade school through high school and into college to keep that wolf far enough away from me knowing that I was a human and not another critter, that he was going to take down easily. Finally my husband came in the woods and found me and the dog I had with me trying to track the other one. But we never ever found the pack leader. Rudy (pack leader) was a hero. He saved the rest of the pack, but they never, ever hunted again. Never. Thank you.
Unknown	Unknown	Unknown	Unknown	I want to bring up a few things before I talk. At the end of the season in Feb. I think the quota was hundred, right around a hundred? In around hundred 36 hours. They doubled the quota killed 219 wolves. Anybody here who has any mathematical ability at all, which I know what percentage of the entire estimated population is that, of the whole state that they killed in 36 hours? That'll show you how far off the numbers are. I got a letter, I think it was about a year ago from the DNR. Some of you probably got it. It said 52 wolves have been found dead in Wisconsin, they knew 36 had been killed by humans. Eight or nine there was no known cause of death. There was two road kills. I've asked a lot of people that come into my taxidermy shop, what percentage of wolves that get killed in this state, do you think they would actually end up finding? Nobody thinks they could find even 10%. They found 52 dead. If that was 10%, that means 500 got killed. You know what this country is like? What are the odds you're gonna find in that wolf that somebody killed? Not very high. So, there's something wrong with, those numbers. Anyway, I've been taxidermist in Douglas Co. for 40 years and I started hunting here in 73. In 73, 4 people had to apply for party tag and you're lucky to get it. We had way more deer in our area than we do now. For the last 11 years, you haven't been able to shoot a doe with a bow, far as I know this the first time in the history of the state of Wisconsin, 11 years ago, you couldn't take a doe with a bow. Why? Wolves are the only reason why, unless you have applied for and got a doe permit. So, in my business, I would average 65 deer a year that I would do, bucks. Almost all of them came from Douglas County. The biggest one I ever did was 204 inches. Quite a few, 180s, 170s, lots of 160s inch deer. Fantastic genetics here. Now most of the deer that I get in are not from Douglas County. I'm getting old, 68 years old this spring, and I've turned away a lot of work. But I did take in 63, two falls ago. I'll never do that again. Most of them are from Missouri and Kansas and Iowa and Southern Wisconsin counties. The bucks I get in from up here now, are quite young. I haven't had, I used to get in a lot of old bucks every year. I always age 'em so people know what age is. I very seldom have old deer anymore. Most of the deer that from this area I'm in, are small deer people would've never wanted a years ago. 24 years ago, I saw my first wolf tracks behind where I lived, which was unbelievable deer hunting land, it was paradise. I'd never seen Wolf tracks before, but I knew what they were, right away. I trapped all my life. Well, they happened in impact. They're two miles behind my house. By the third year where it had been in Paradise in deer hunting it was gone. And I asked Greg Kessler about it. I told him, he said, if you live in an area where wolves are in, he said, you're pretty much screwed. They clean out. By the third year, they clean up 12 square mile area and then they moved now. A federal Trapper told me, well, don’t no worry. He said, when your deer started coming back, they'll move back in. And they did move back in and they wiped them out again. Since then, we have never had what we had. It's just, it's just, and now, this year my neighbor behind me has 145 acres of the best deer hunting land A lot of it is, oak we had a mammoth oak crop last year. Him and two of his kids hunted every day of the season. They never saw one deer. Now his relatives own 240 across the road. They never saw any deer there, there’s hardly any tracks. I own some land in Bennett and every year I would get pictures of record book bucks, so 11 falls ago, I had five bucks that were the best year I ever had for bucks. I dunno where they all came from. The next year, they were all gone. I haven't had one record book buck picture in 11 years, and I run 18 cameras on 80 acres with four acres of the only fields are out every year that comes in there. And I don’t get any pictures anymore. When I was in my business, I would have customers come in, with the same story that I have that we would see two, three and half year olds that survived to the late bow season, those are gonna be, you know, pope and young, beautiful bucks next year. Every year they're gone. Those three-and-a-half-year old’s aren't there. I have so many people who tell me that three-and-a-half-year-old, that's his home turf. He should be there the next year. They're being killed. One of our managers told me one year, if hunters knew how many trophy bucks that, wolves killed in the rut, they’d kill every wolf they see. Here's, a few statistics that worry me. If I remember right, Idaho, Montana and Wyoming had a total estimate of 1600 wolves when they delisted them and started managing. That could be off, but I think it's 1600. Right now, Idaho has a $2,500 bounty area. A $2000 Bounty area, a $1000 Bounty area and a $500 bounty area on wolves. Idaho is a fantastic example of what good, successful Wildlife game management could accomplish. Wiped out Northern Idaho is wiped out of Elk and Mule Deer. Outfitters had to leave the area. But here's the thing. Today, Wyoming has 314 estimated wolves in 40 packs. Montana has an estimated 1,100. Idaho has an estimated 1,270. That's 2,684 estimated wolves. How long have they been hunting them? They have bounty areas in Idaho. The population is a thousand more than when it started. What's gonna happen to us here? It takes an incredible effort to control a wolf population. These estimates, in Minnesota, they're estimating, I think it's 2,700 wolves, and they don't count wolves in

Name	Commenter Affiliation/Type	Wisconsin Resident	Location	Commenter
				Minnesota until they make, until their second year. They're not counting juveniles. I had a guy come in, they hunt up in Minnesota. There's two groups up north of two harbors. Between the two of them, they own 500 acres. Land one's 300 and some, ones 200 and some. 12 guys hunting, none of them saw a deer there this year. I had a buddy and they had a lease up by Cook. They let it go about four years ago. There's no deer there. Two game wardens wrote letters in the newspapers up there. They were talking to hunters, they said they've never seen the moral so low. The hunters are saying they're just not seeing deer. They see more wolves and wolf sign everywhere, hardly any deer. They're not shooting any deer. I was watching a TV show, on wolves and the wolf biologist, they're a Wildlife biologist. He said, wolves are sanitizers. They kill everything until nothing is left. And then they starve to death or they move on somewhere else. That's the history of wolves in Alaska. There would be, you know, they used to drop poisons from airplanes, and then they outlawed that. The reason they did that was because it's a huge wilderness area. And outfitting is what kept most, a lot of those areas alive. How can you outfit when there's no animals? So, what happened is the wolves, you know, reaching peak, wipe out all the game, and then they starve to death. Then the game comes back. There's a book called the Alaska Wolfman; Jack Glazer. It's a true story, about Jack's life, he came to Alaska in 1915 and, it's his life in Alaska from 1915 to 1955. And when he first came there, there were Moose and Caribou wherever you were, there weren't very many wolves. Then the wolves started populating, and then they, he just tells the story. Tell the stories of scenes. The the wolves were ripping the calves out of pregnant caribou, cows, just for the fun of it. They don't need 'em. This is one thing people, the wolf lovers need to realize the lies about how they killed the sick and the old. And they keep the herds healthy. If you watch discovery, you'll see a lone wolf take down a healthy cow by itself. I watched it right on discovery and on animal plant, they run up the hamstring and ground by the throat. It's effortless for them to do it. Well, in Montana, it's been maybe seven years now, I don't know, by the time was single biggest documented joy killing a wolves. In one day they killed 100 sheep. They didn't need/eat a one, just for the she joy of it. And the other thing is now you, probably are aware. I remember a couple years ago in Adams County; the ex-military guy shot that wolf. The three of em were coming at him. He shot at point blank coming, take a chunk on him, out of his leg. The DNR called them. They came, they founded blood. They couldn't find a wolf. Later on in Adams County that same winter, five wolves came in on a guy and his son. They took warning shots, as they said, they took warning shots. There was an article in the newspaper, the Duluth Tribune about a guy that whacked the wolf over the head with the barrel because it was coming at him. That's not the true story. I got a friend who knows him. He shot that wolf in self-defense coming at point blank. But he was afraid to tell the truth. But he wanted people to know wolves are dangerous. I'm gonna ask you this question. Anybody here know which country had the most human fatalities documented by being killed by wolves, Russia? That's what I would've thought, by far France. 7,000 documented human fatalities by wolves. And it's fun to watch these wolf lovers today try to, how they try to explain a way that that's, that really would happen. This is between a five and a 600 year period of time. I was watching TV and that they said, never in the history of North America has a human been killed by a wolf. And the 22 year old in Canada just a few years ago that got killed, couple years after that, that 39 year old teacher in Alaska got killed. So we have two recent, you know, deaths. My sister-in-law was out walking with her dog and the wolf came, it was a lone wolf came and it came right up within about six feet of her. She's just screaming at the top of her lungs. You know, maybe that wouldn't have happened if her dog wasn't there. I don't know. When I had a customer one time when five wolves that kept circling in when he was on, he was walking out, they came in, he kept backing away, they kept closing in. He went back to his tree where his stand was and he went up and the circled around his for 45min. That's another aspect that isn't gonna gain a lot of traction. Cause people are just don't bunch of bologna. I'll tell you what Hunting's no fun here anymore. A lot of the guy, my customers, they don't hunt here anymore. I'm buy a bow license, I'm not buying anymore rifle license here. There's nothing to hunt. I'm gonna tell you this. We are just at the tip of the iceberg. We're headed for a desert. And all you have to do is go look at the history of wolves and what they've done, the real history. They're sanitizers, they will kill everything. And you know, the one thing. One other letter I got, I'm assuming a bunch of you got it, Last year, the DNR said that wolves in Douglas County, Douglas County, we have the most packs by far in all state. I think it said wolves are killing an equal number of deer as the hunters in Douglass County, but that's based on their low estimate number at 20 deer a year per wolf. How many you remember Buck Folows, the old federal trapper. He said they killed way more deer than they say because the kill is so enormous in the spring. He said all that. Every bit of wolf scat, you see all springs full of fawn hair. But, that estimate and was, years ago in Michigan, they had an estimate of 35 to 50 deer per year per a wolf. A wolf feeds 20 pounds of meat in one meal. How much meat is there? And wolf feeds everything on a doe he is gonna get more than, we'll get like 40 pounds out a good doe that'll feed two wolves. If the number is 30 deer per wolf, which it is minimum, and then you add the real number of wolves, wolves are killing double the deer of hunters. You cannot sustain a deer population with that. We're not gonna be able to hunt anymore. Eventually we'll be like North Dakota. You're gonna have to apply for a permit to hunt a buck, if something isn't done about this deer, about this wolf population. And, and some of the DNR guys are gonna laugh at that and say, oh, that's not true. Then you tell me why I can hardly find a deer track in my area. And Kessler, you all know him, he told me. Well, if you live in a Bennett/Hawthorn area, that's a really bad area. Well, one thing I'd like for him to do for me, quit making me have to pay property taxes, if I have to support your wolf population. Because it's whipping out everything I love
Gary	N/A	Yes	Douglas Co.	Gary – I've got a picture. Here's 50 yards off my edge of my yard and I live only two miles from the Minnesota border. I've been hunting in this country for 60 years. I've never seen anything like this and I've seen quite a few wolf kills but this one was on 50 yards on the edge of my yard. And my dog I've got, got a big area and I let her out and she was gone. I thought she never usually leave the yard and I call her and she came from a certain direction and let her out

Name	Commenter Affiliation/Type	Wisconsin Resident	Location	Commenter
				again. Same thing, she came from the same direction and I thought, I gotta follow where she's going. And I got 50 yards from the edge of my yard and a wolf. I don't know. I think there was probably two took a huge doe and from where the blood track, where the blood started. Cause it was just a blood smear for 20 yards and her guts were laying in the snow and she still wasn't dead, another 20 yards and she laid there. That's about how far she made it after she was attacked. And we hear wolves. My, I can't hear very well. I don't have very good hearing, but my girlfriend does. And we can have our windows in our house completely closed at night and hear timber wolves and they don't sound like they're very far away, and there's an awful lot. And I don't know if anybody here knows about, well, Douglas County for sure. There's a road called Summit and it starts off of kingsdale. Does anybody know where the Kingsdale road is? Walked that every day, used to. Yeah. I've even got a picture on this phone showing 150 Mountain lion in a tree, three miles north of us. There's so many preditors now. And I got a picture on this phone also show my girlfriend's, grandson hunted, the last week of the cat season. And there's a bobcat on this phone that is big enough to kill a human being by itself. So, I got the picture here to show that. And there is a hell of a lot of bobcats now. Also, when we first started having the wolves come back into this country, it didn't take too long and there weren't very many coyotes. But now all these coyotes have learned, evidently evolution have learned to live on the outer edges of the wolf packs. We also hear the coyotes howling all the time too, and we've got wolves around the yard, all the time along with the coyotes. So, all I'm saying is that I hunted this country for, I've got two cabins here, and I hunted this country for 60 years. And like I said, this country used to be fun to hunt and we used to be able to hunt and always see bucks. All the cabins had one or two or three bucks on pole during rifle season. And I think what's happening now is that once the bucks come into rut, they stink, and I think those wolves can run those bucks down because we just are not seeing any bucks in the woods at all. I mean it's a sad deal. Rubs, Qe do a lot of scouting all the time, lot of preseason scouting and walking and are in the woods all the time. And when I'm talking about this one road down the summit. Everybody from Minnesota used to go over and get a Wisconsin license and tow campers over to in hunt Wisconsin along the Summit Road. And it's 17 miles with no cabins on. Now you can drive that road and if you see two, three deer tracks in 17 miles, you'll [redacted]lucky. And it's nothing but wolves. But there's no deer tracks there now I'm here to tell you. Correct. And also there's a bunch of hunters. Mike Edwards. He's a trapper and a hunter, and hell, a hunter, a nice guy. And now they hunt the bobcats up off the summit and off the moose road simply because there's no deer up there and all they, they run cats without having trouble with the dogs. The wolves killing their dogs very much up there. Cause there's hardly any wolves up there. They're south now. Don't probably, maybe the next 10, 12 miles. We got some deer. But that's what they're doing. And they're gonna kill all these deer because you could just look in these different areas. We went, took a ride around the other day looking for coyotes because uh, they were, they were supposedly supposed to be mating at that time of the year. We drove quite a few other roads and hardly seen any deer. Jackson box. Anybody hear about that? Anybody hear about the empire? I did find some deer on the northern end of the empire. There was a few, but you could drive those roads and they're big roads and they're big sections and there's no deer, not worth hunting for it. So that if, I mean, if we wanna have a deer herd again, have deer again, what we're getting, we're getting a snow job and [redacted]job big time from the DNR. And there's time everybody says something about it. So, if anybody wants to look at this kill here. It happened 50 yards off the edge of my yard and picture of a Mountain lion three miles north, and 42/43 lb bobcats. They're never remember to, vote for knowledge. 6, 8 years to get a Bobcat thing. And bobcats just up the kazoo, and some of are just giants. So, when you take the bobcats and they're killing a lot of deer now, and you got the coyotes and you got the timbers wolves, We aint going to have deer herd, and we aint going to have a hunting seasion. It'd be nice if everybody would really stand up. And it is nice to see this many people here. What we could use a lot. It's room full, and we need more if you wanna have a hunting season up here. So many more people we could use.
Steve	N/A	Yes	N. Wi	Steve - I wish I had a lot of notes, but I don't. So I wanna talk about the management plan and I want talk about northern economics and I wanna talk about the human-wolf conflict. And I'm mentioning those three things. So if I forget 'em, you can remind me before I sit down. My Steve Solenol (Spp?), I came up with Medford Wisconsin today and I represented the Wisconsin Wolf Facts on the Advisory Committee for management plan. I'm not going to meet the drone cause you've heard it all. My comment on the management plan is twofold, One, they did not listen to all the parties represented. They did their best, in my opinion of downplaying the hunting groups that were represented and really built up the expansionist or the PETA groups that were represented. Firstly, we did not get a fair shake out of it at all. Second important thing, in my opinion, they call it a management plan. It is not a management plan because they steadfastly refuse to hear the scientific work that has been done by the Western states. I think all of us, if we got a project, will listen to other people that have done that project before. The western states have decades of good Wildlife management wolf experience. They refused, in my opinion, they refused. They did not enter any of that into the wolf management plan. As a member of the committee, it's an expansionist plan, not a management plan. Second thing, northern economy, the DNR, in my opinion, seems to work off revenue rather than management. I wish that we were like the western states that sell licenses by area. I'm not advocating we do it, but there is a benefit. If they saw how licensed sales in northern Wisconsin was going down. They might have an idea why is it going down? They might ask a question. In addition to that, the townships up here, they're losing their property value. They're losing their tax base. Deer camps are relocating, and I don't blame the deer camps that are relocating. Hunting's fun and productive. You can't have a good meal out of a virtual deer hunt. You still need animals to hunt. The last thing is the human wolf interaction. They did not value the opinion of people in wolf territory. They should have valued it higher, personal opinion. Someone from the southern part of Wisconsin or even from out state, the wolf is an apex predator. They just do not get along with people. They're the height of the food chain and we're less than them. They should value the opinion of people who have to live here more so than someone from out of the area or even out of the country.

Name	Commenter Affiliation/Type	Wisconsin Resident	Location	Commenter
				And I guess the last thing is, I'm gonna go back to the economics. The management plan has no good compensation for hounds or cattle. They do not take into effect the number of years of genetics that are in those animals. Hounds, cattle primarily, and they don't take into account for cattle, the loss that a wolf pack in the area is going to have. Those animals don't eat as good. They're nervous, they're looking over their shoulder. As compared to other beef herds in non-wolf areas, and they give no compensation factor for that in this expansion plan that they have. So, as a member of Wisconsin Wolf Facts representing them, I do not advocate or endorse this management plan in the lease. It does not represent our interest. Thank you.
Jack Johnson	N/A	Yes	Taylor Co.	My name is Jack Johnson. I've got a farm in Taylor County. I'm a member of the Farm Bureau, The North Central Wisconsin Cattlemens Association and Wisconsin Cattle. I have had on my farm, a depredation a few years ago. Our farm sits about a mile and a half from Chequamegon Forest and the Wolf Pack. There are some wolf packs, I guess they say within about 20 miles of us. But as you know, they all travel. I've lost a calf. I've had one area where it was kinda wooded around where the cattle were pasture. We use low stress Cattle. We keep our cattle as calm as we can. That year along the fence there were wolf tracks along the fence. And if you would come anywhere near those cattle were run in the other direction. And that took about a year and a half to get those cattle settled down enough to where, it was easier to handle and safer to handle them. The year that we had the depredation, we moved the cattle over close to the buildings. They were there for a while and, and it was in the spring of the year. And, you know, the ground isn't very stable, and they had that all tore up. The US Wildlife Services came out. They put up the fladry, the flags and the electric wire around about 40 acres. And, that worked you know, well the wolves were moved away at that time anyway, but, after a while there was nothing left of those cattle though there, so we had to move 'em out of there. We do rotational grazing. There's certain areas now that we cannot graze on the cattle. If they're there, they don't stay there very long. They're back out of there. It has really changed the way, the way we have the farm and we can't do it the way we need to. I did represent the Wisconsin's Cattleman's Association on the Wolf Management Advisory Committee. And as it was stated earlier, I don't feel they listened to us very much. We didn't get you look at the way the plan is set all now. They're not concerned about us. They're concerned about the people that want more wolves in the area. See, I got a question for you before you leave. Uh question, does the DNR take compensation calves that cows abort due to an attack? No, they don't. No, they don't. You can't. No, I don't. I don't know how you could, but I know there's problems with that. Oh, absolutely. Your breeding cycles are disturbed. Your weight loss isn't there and you've got fence problems, you got things you gotta fix. Things that we don't need to put up with. There's no compensation for that at all. Who are these people that make up this group you're talking about? Where are they? Which group? This Wolf Management group? Just the Wolf advisory plan. Yeah. Who are these people? Well, when they were setting up the plan. I know whether we have about 26, 30 people on the, on that committee. I'll let Laurie describe that a little more. Thank you.
Laurie Groskopf	Wisconsin Wildlife Federation	Yes	Lincoln Co.	Laurie - A number of us were on the committee. Steve Supno, (sp?) was on it representing Wisconsin Wolf Facts. Pat was on it as an alternate. Matt R was on it representing the Wildlife Federation. I was on it representing the Wisconsin Farmers Union and there was 29 members; of those eight were tribal representatives. And the tribal representatives are pretty united in not wanting any harvest of wolves or any management. Then as far as the farm groups, there would've only been two on Cattlemen's and Farm Bureau, but I was working with Randy Johnson and Wisconsin Wolf Facts is a conversation group and we also sponsored some activities and that is a farm and Wildlife group. And we do a lot of talking to each other and I get all of the depredation reports and send them out to our people. If anyone wants to get on the list, I'd be glad to add. The other group was Wisconsin Farmers Union. The only reason they got in was because I was a member and I volunteered to be the representative. And there was no fee for the organization. So, they selected me. And I think, farmers are really being left out of this in a big way. So who, who wants to speak next? Laurie safe to say that over half the people on the advisory committee were non-ag, non-hunter, pro-wolf people. Fair statement? Yeah. I'd easily say it was much more than that because just under 30% were tribal representatives. So well over 50% were what I like to call the wolf expansionist people who think that this is a good way to manage Wildlife at their peak capacity. And certainly, they'll be breeding and finding new places to live in Wisconsin I'm sure of that they already have. Let's go back to the list here so we can get people to speak.
Dave Samuel	N/A	Yes	Washburn Co.	Dave Samuel - I wasn't planning on speaking, but I'm, I'm going to, hopefully I can control temper. I've had wolves kill dogs. Right on, within two miles of my property. At that time, I contacted the course of APHIS and was rewarded the $2500, which didn't cover anywhere near with the dog's worth. I turned down $10,000 for that dog. But the point I want to make on this is following year, I believe it was, they trapped nine wolves, APHIS did, less than a mile south of my house that would, they pulled the traps on Friday. I know the trapper; he lives less than a mile from me that did the trapping and they destroyed those nine wolves thank God. But the following Thursday, I've got 400 acres there. The following Thursday, I proved that I had 11 wolves on my property and I brought it to the wolf Committee. They absolutely ignored it. They said there was a convergence point of all three packs. Okay, so what does that mean? That that's the only place that converge. So, you cannot believe the thing that committee tells you. A good friend of mine was one of the head biologists in the state, Bill. He told me the biggest problem, and it goes to just what Laurie and everybody was talking about, is the biggest problem on the committees with the biologists and all those committees is they've fallen in love with the game they're supposed to be managing. They no longer manage it because they love it. They don't think it's a renewable resource. The other thing I wanna mention is they talk about the packs and when we had our season, and I don't remember the numbers, you mentioned them when we killed them. We have grown so much since then that it's unbelievable that we don't have a reasonable season to harvest them and to keep 'em under control. We're still gonna have wolves. We're never gonna get rid of them right now. And there's no way around it. I mean, you can trap, you can poison, you can do anything you want. And

Name	Commenter Affiliation/Type	Wisconsin Resident	Location	Commenter
				we've got so many wolves in this state, there's no way you're gonna get rid of 'em. But we have to keep 'em under control. Wolves were living on my property and I had 'em coming within 40 to 50 yards of my house when they were coming in and I had to keep 'em. We couldn't even take our dog outside and walking because the wolves are there. So when they start talking about this, and I'm also in one of the sub zones, I've got 400 acres in the sub zone just about in Couderay. And I'm gonna tell you right now, and I'm gonna tell the DNR right now, if the wolves kill on my property, they're dead. I'm not gonna pay any attention. I'm not gonna sit here and put up with it, even though it's against the law.
Neil Schmidt	N/A	Yes	Edgerton	Neil Schmidt - I'm from Edgerton area, but I'm retired now. I cabin on 20 acres right off the northwest corner of the Chemaquegon forest. I fell in love area 1976 and it was a deer hunters paradise up until about 18 years ago and now its getting to be a deer desert, and it's not because the trees are away from the deer and the habitat isn't there. We've got better habitat than we had back then. It should be in paradise today, but it's not because wolves cleared things out. The Flag rivers start to pick up again with deer, but the, wolves will be back. They used to, that was their home territory and they've centered right around the Flag River. But they've had to move cause they can't survive in the numbers of wolves that are there. There aren't enough deer for them now they're moving outside of there. So the property I had that was on the fringe that was pretty good has gone steadily downhill every year. Reintroduction of wolves has turned out to be a Pandora's box. Originally it was dishonesty sold to people of Wisconsin on the premise that after their numbers would reach 350, there would be regular hunting seasons to hold them around that number. The number was surpassed in 2004, but the first season wasn't held in 2012. By then, we were told the estimate was over 800. The situation spiraled out control from there, with lawsuits filed outside of our state, resulting in returning the wolf to endangered species list. That has brought us to where we are today. If mounting pressure by state residents outside of wolf habitat to keep the expansion going while preventing hunters slowing it, the DNR in the media always depict wolves in the most favorable light. You have to search YouTube for the darker side of that existence to see videos of playing the prey. It's disgustingly savage and painfully long in duration. Without that part of the equation, it's natural for people to support more wolves. That's why the surveys will continue to be slanted into the wolf's favor unless the DNR establishes facts throughout southern Wisconsin. So, the wolf lovers there realize there is that dark side to having them around The draft plan mentioned in a 2015 study that said, without hunting the wolves would reach their biological carrying capacity in the state of 1,242 wolves. In 50 years, they probably reached that number by 2020. When the DNR estimated there were 316 packs, their claim of 4 to a pack would make it 1,264, at that point. Most hunters and numerous studies that weren't mentioned in the, that the average number in a pack is eight, which means we have over 2,400 wolves in 2020. By the DNR's figures, it costs the state over $200 for every out there for depredation losses as compared to just $2 for, deer damage. I would like to see the DNR's suggest. That the state pursued court action to delist the wolves and put their control back in our hands. Once delisted hold regular hunting and trapping season. So a quota of 29% of the estimated fall population until the over winter population is reduced to around the 350 that was promised that 29% is what a study cited as page 19 of their plan that said could be safely removed without causing the population to go into decline and get real if you insist on allowing half the harvest to try anyway, then double the harvest goal, by the way, establishing buffer zones, the reservation is an infringement, landowner rights and should not be done. Their treated should be honored but not arbitrarily expanded upon. Lastly, this is Wisconsin and non-taxpayers and groups from other states should not have a voice regarding wolves in the state.
Mike Miller	N/A	Yes	N. Wi	Mike Miller - I retired 2012. I thought it would be a good time to buy 40 acres of land so that my daughter, my grandson, and I could hunt on a place called our own. There was some deer on it at that time. Four years later the deer herd declined very badly. The first year I owned the property, I had pictures of eight wolves in one picture. This went on where we're fortunate to see one buck. Maybe four or five deer and 6 years deer season between two or three of us. So couple years ago, my grandson and I were in our elevated blinds, he twas over and heard the wolves. All went off howling probably about a mile away. Oh, my grandson, we didn't see any here. Of course, wolves are the are in the area. You're not gonna see any deer. When my grandson in the morning you go and I'm gonna take a walk over to the east and I'm gonna see if there's deer over there. Cause they sure aren't here. So I walked approximately two and half miles that day. It quit snowing at three in the afternoon the day before, I did not see one fresh deer track and very few old ones, lots of bear track, coyote tracks. Can't say I saw any wolf tracks right there, but I heard 'em all of a mile away. So the wolves basically have cleaned the area out. There's hardly any deer left. I'm paying the bank every month on the 40 acres. I'm paying taxes at the end of the year for what? To go there and watch popple trees In Wisconsin Outdoor News approximately three months. There was an article in there, DNR is gonna quit giving their minimal wolf count and they're going to give an estimate of the wolf population. Great. They should have been doing that all along their estimate, their minimal wolf count wolf population was 1100. They gotta at least put it somewhere around 2000. I continue reading the article. They estimated the wolf population in 970. How can you have less than what the minimum wolf count was? I just shook my head in my house. I thought, what a joke. They do not want us to know how many wolves are out there. Personally, I would be surprised if we have less than 3,500 wolves in the state. I would be shocked. There are wolves everywhere you go in the on the Douglas County property, you look around, you try and look for a few deer tracks. I did it after season. I found so many wolf tracks out there was ridiculous. Every deer had to have left. Yeah, they'll probably come back, until the wolves kill a few of them. It's just ridiculous to try and hunt it. I mean, it's not worth even going hunt in the area. There's people that own land here, a lot of land. They won't even hunt in this county anymore. They wanna shoot a big but but will hunt southern part of the state to go to Iowa. They're not even hunting this area. It's a joke, and our DNR's did this to us. This, population needs to be taken down. It needs to be taken down and hurry. It's gonna take a long time. There's so many out there. Thank you.

Name	Commenter Affiliation/Type	Wisconsin Resident	Location	Commenter
Unknown	Unknown	Unknown	Unknown	Question if this is such an important meeting, why isn't a Warden or Biologist or whatever else that we could bitch at every one of us. And is there any way that we can do a community lawsuit to save us? They ain't gonna help us. They ain't gonna do anything for us. We're gonna all have to get together and put out something, something so that everybody that lives up here, and likes to hunt and put enough pressure on those politicians so that they know that we mean business. And there should have been somebody here, wardens and somebody from the DNR on a meeting like this, and have more, more meetings like this. Up here, in the northern part of the state. Every one of us are here. Now You have one over here, over here, more will come.
Unknown	Unknown	Unknown	Unknown	So you guys were probably in the thick of it for how many years? 25, 30 years can come and tell the DNR or something. I, forwarded an extensive list of DNR staff to our office. They were issued an invitation. The Secretary elected reach out to by phone and asked them some questions about this session. And then the decision was made by the DNR, not to allow any staff to attend. Should be a communicative thing in this northern front of state that paying taxes. Has anybody ever to, management plan of any public hearing? I know I have plenty of them. They always have a public hearing. When this plan came out and they were not gonna have any public hearings, I contacted Randy Johnson, the large carnivore manager, and Eric Loaner, who's in the head of the Wildlife thing and said, Hey, why aren't you having any public hearings? Well, it's Christmas time and hunting season, and we think people are too busy. I said, believe me, people aren't too busy to talk about this subject. And then Eric said, well, you know, nobody comes to those public hearings anyway. I think this makes that not true. So I'm very disappointed and I think we need to make a bigger deal. So, this is something that we need to hold their feet to the fire. Keep in mind, this management plan has been worked on since 2009. They had one completely written, I have a copy of it from April, 2010 that wait, might have been did with his two, committees that he worked with, science committee and stakeholders. They had another one. I was on this committee 2012 to 2014 that was also completely written. And both times for political reasons, those just dropped off the face of the Earth. That's, that's what's gonna happen. Now we have to wait now gonna tell to wait till 2024 before we, why? That's incompetence. There's nothing short of incompetence. This is the third attempt since 2009. And now we're supposed to wait another year to get the plan. No. It's been 13 years since we've had a wolf management plan completed. I take that, I forgot it's important.
Dan Johnson	N/A	Yes	N. Wi	Dan Johnson - I don't have a planned speech. There are some good speeches out there. There're too many wolves out there, someone said up to the gazoo. That was a good say. I like that. Anyway, what hasn't been addressed? I sold my place. I lived in out of town for years. I moved to town, I hunted just out outside the village. In fact, when it got dark, I could see people's yard lights and I was hunting legally. And I had a camera up, and guess what came through; A wolf. So I don't think we should wait until the wolf takes somebody's little kid. We shouldn't wait. The other day I was ice fishing, I seen a wolf cross the St. Croix. Cause there was deer out there. Someday somebody's gonna leave their little toddler out on a swing or something and they're gonna come out and it's gonna be gone. So we should be concerned about the human life. This other thing about, wolves. I don't mind wolves. Just there's too many of them. They're up the gazoo right anyway, but they should be regulated. Man was put on this earth to take care of this planet and to regulate even Wildlife. And we're allowing politics to make rules for us that just don't make sense. Anyway, the human aspect, that's what we should be concerned about. Simple as that.
Jim Soyring	N/A	Yes	Douglas Co.	Jim Soyring - I got a beef farm in, Douglas up there, got 200 cows. Every year, We have 15 calves, 20, 30 killed from wolves. And the compensation is only 70% of what the calf is valued at. I think, people who want wolves around should pay the bill for lost animals, problems with fences, bad health. Farmers shouldn't have to pay to feed their animals. We should make them accountable for this. That's all I have to say.
Jake Anderson	N/A	Yes	N. Wi	Jake Anderson. - Thanks everybody for talking. This is going on with all of us. Im sure ill repeat everything; I'm a hunter and I'm sure as every hundred had issues with wolves, every time we bring the dogs out, they get run out, we've lost many. There's just no good way to do it. These depredation areas, there's nowhere in the whole state that isn't a depredation area up here north of 29, there's nowhere to go. I didn't get time to read this plan unless somebody says a lot of pages. I haven't heard anybody but Jim talk about accountability. Who do we hold accountable for all this? Been going on for 30 years? They set a number. They keep changing the goalpost. They keep moving the goalposts, and then they listen to the squeaky wheels, the wolf lovers. They're the only ones that talk. well they're all down in madison, they're all not in listening to all the squeaks. We have to do these meetings. We have to be vocal. We have to start squeaking more. We have to be more of a force to the government and hold them accountable for all of us. This isn't gonna go away. We're never gonna get rid of these wolves in this state. Not as it says. To have them under the federal endangered list is absolutely ridiculous. They set a goal of 350. Once it gets over that number, how is it even possible that they can get 'em put on an endangered list? The numbers are way too high. And who do we hold accountable for allowing it to happen? The DNR, the Natural Resources Board for not doing their job proper. We gotta come up with these plans and we have to stick to 'em, and we have to be able to hold the government and these boards and committees that make these choices accountable. And without having something in this wolf plan about who we can hold accountable and at what point, what good is the plan Anyway? They'll accomplish nothing other than piss everybody off. I guess that's all I have to say, but thank you.
Jennifer	N/A	Yes	Shawano Co.	Jennifer - So this is a whole new ballpark for me. I just got two hounds about two years ago from up here. I have a six-year-old grandchild three years ago, I took her out in the woods with me hunting, shot a doe husband went, to the four wheeler to drag the deer out. I walked in there, my husband yelled at me, stop. Don't move. Yelled at my granddaughter not to get off the four wheeler. There was a wolf coming at me. I had this three-year-old granddaughter out there. If I would've went in there by myself. That would've been catastrophic. I live in Shawano county. You don't hear many people talk about the wolves in Shawano County. They're there, trust me, they're there. She's six years old, this year I took her on the youth hunt. Two weeks later, my husband's uncle said that Wolf was back. He's big, he's black, but there's no problem. Tigertons just a little rinky dink town. On Facebook the other day somebody was lying was, they weren't lying. They were telling people hey, watch your kids watch dogs. These wolves are on the edge town

Name	Commenter Affiliation/Type	Wisconsin Resident	Location	Commenter
				and people's backyards right in town. Yes, there is a problem, but the DNR's is telling us, no there's not. How can there not be a problem? I wanna take my granddaughter, uncle Woods, I wanna hunt with the hounds. That's why have my dog's home. But how can I take my six year-old granddaughter out in the woods and make sure she's safe if all these wolves are out there? I can't. So yes, as the gentleman in the red sweatshirt said this isn't, this is a concern for the human population, not just the cattle or hounds, but the wolves can go grab them small kids right off the right outta your yards, right off the street. Oconto Falls has coyotes running through the streets by their schools. What's next? Wolves? I didn't know where to look for it, but yes, I'm here. I'm gonna back up all you guys up because I want teach my granddaughter what I love and did when I sit with her.
Mark	Douglas County Board Chairman, Farmer's Union	Yes	Douglas Co.	Mark. - I wear three hats that I came here today. All of, I've been involved in this for a long time. I'm the Douglas County Board Chairman. Our Douglas County board passed resolutions demanding that the DNR enforce, their management plan immediately. That was kind of a thing that I was a little worried about. Cause over half of the Douglas Co Board of supervisors lived in the city, Superior. I thought, oh, we're gonna have a real problem with that. We only had one person who was, had any opposition to that. And I didn't even have to hardly talk. Cause almost every member who lived in the country had a wolf tail that they wanted to tell how their dog was chased home, that they were followed up their driveway. How he cattle had been lost. Everybody had that. I'm also the County Farmer's Union president. And at one of our annual meetings, we were trying to get state farmers Union to start being serious about managing the helpless, manage the DNR, to managing wolves. Um, they were up here and I think at our annual meeting we had nine families. Well, maybe it was more than nine families. Cause there was about 40 people there. Of these families, every member of that group were beef farmers. Every member had a wolf kill that year; this is big Jim Soyring. He's probably one of our, bigger losers as far as farmers. He's losing 25. We had a lot of farmers who aren't here today because they have given up asking the Natural Resources Board, asking the DNR to do anything. And some of them are being forced to take matters in their own hands. So they're trying to make sure nobody even knows they got a problem. That's too bad that that's where we're at. The other one is, I am a farmer. And I myself have had problems for years. I thought I was doing a really good job doing rotational grazing in my beef herds. There's 50 animals on an acre and then the next acre somewhere else. And I thought the way I managed; I would never have a problem with the wolves. I was mistaken. What had happened is that I was in the middle of two different packs. For some reason they were leaving the me alone. Getting the farmers on this side, the farmer on that side, I went around and see if you knew what I knew, they won't have problems. And then all of a sudden a new pack moved in the middle, and started attacking my cattle. My family's been on that farm over 120 years. I was this close to stop farming. It was that stressful. I have a job. I'm also county board chair. I've had the farm. Not that farmers don't work hard enough as it is, but to be woken up at three o'clock in the morning, the neighbors calling. You better go out here. They're chasing your cattle again. I mean, I use electric once strand, barb wire fence. And when cattle are chased, they can tend to run through that. It changed how my docile cattle, when somebody talked about it was Jack talked about all cattles behavior. I sell direct market beef meat and one person handles it and I got our old corral and the first year the wolves moved in. When I went to, group up my cattle in the corral to sort, they destroyed the corral. They're that they were that panicky. My dog can't go out with me anymore because the cows will chase the dog. Sometimes my dog won't go out with me because he knows the wolves are there. I was lucky because the pack that was bothering me, used Highway 2 and 53 junction as one their Crosspoint, and a couple of them got run over too bad that doesn’t happen. That's what happened, the pack busted up and I haven't had problems since. I see some wolf wounds coming through there, but I lucky right now I do not have wolves that are attacked by cattle. My neighbors still have that. I was involved when the wolf management plan that started when Adrian, started with the management plan and I listened to a USDA, person from Minnesota. At that time, Minnesota was claiming they had a thousand wolves, only a thousand wolves. They were killing, legally removing 250 wolves a year. And that was when they were claiming there was a thousand. So I said, you're killing 25% wolves a year, and you're still killing 25% and then 25% and 25%, you're still having all these people with issues. But I sold a bull in Minnesota and when I went up there in June to deliver the bull, the guy had 50 cows in feed lot. In a farm yards. And I said, well, you put the bull right in. No, I can't let the cows out for another month until the calves are bigger. Im having so many problems with wolves. He had gun in and capable, have the, the DNR to shoot the wolves that he could see, which is a hard job to try to have done available when the wolves are following animals. So I asked Adrian when the plant came out, I said, in your plan, the original wolf management plant at 350 had nothing in there for lethal control. And he said, well, we don't think we're gonna have the same problems they had in Minnesota. I said, well wait a minute. You're not gonna have the same problem with kills. And he said, well, we don't think so. And I said, we're gonna have more cause we have agricultural property mixed in smaller amounts of woods. We are going have more problem than Minnesota does. And he said well no I don’t think so. That should show you how naive they were when they came up with the plan. How mistaken. So a few years back I saw Adrian over in, I forget which another management meeting and conversation where I reminded that he said they would've actually followed the plan, and kept the numbers at 350, wouldn't we having the problems we're having today. So even the maker of the plan admitted that the plan hasn't been followed. If it would've, we might saw a different result. A good example this, and again, Douglas County is Wolf Central. If you go up the road here, the last wolf in Wisconsin, that was kille, was killed in Douglas County not far from there. I forget the year, sixties or seventies. You up the road here you'll see the three-way, separates and, equally part separated. That was because the DNR in their wisdom thought that the only, the first wolf plant, which was again just a few miles down the road, probably couldn't figure out how to cross four lanes of traffic that would restrict their movement and thus they would be inhibited.

Name	Commenter Affiliation/Type	Wisconsin Resident	Location	Commenter
				So they had to change the road plan, which cost millions dollars for us taxpayers, somebody died in traffic while they were trying to figure out what they were gonna do there and they built that road because they didn't think wolves were smart enough to cross four lanes and that they wouldn't do that. So stop there area. We now have wolves in Duluth. In the city of Superior wolves are not a wilderness animal. The reason they were living in the wilderness when we started this is because they don't make good neighbors and farmers looking out for their own wellbeing. Hunters looking out for their land prosecuted them wolves pretty hard and eliminated from we could catch up. The only thing they had left was the wilderness. Now they're coming in and remember they do not make good neighbors. And the problem is that nobody is addressing this. We have a tolerance was based on how many wolves you have to deal with. And Madison, they got great wolf tolerance. We, Douglas County, we're done. We're tired of it. I don't run into very many people anymore that say wolves are really cute, are nice. The reality is we have to take care of the problem. We need the DNR to do a wolf management plan and to actually have a way to eliminate wolves down to those numbers that are manageable. In Alberta Canada, I have a friend of mine's hunting up there, just to show you, somebody talked about it, was Mark talked about they're all out of control and we might not never get it back. I mean, I've killed coyotes all my life. There's always another one there. New one's come in the next day. I mean, it's just crazy. In Alberta, Canada, you can buy, I think it's two licenses to shoot two wolves. You can, my friend was hunting with a guy who part-time guides, and then in the winter he works for the DNR, USDA, whoever, or whatever their equivalent is. He flys in helicopters and shoots wolves from helicopters because they can't control the numbers with the two tags that they sell to hunters. And then he says that they get an area where there's actually really a problem. They use strychnine. Strychnine is still being used to control wolves. And its not working. He said, yeah. He says they only leave it on the carcass for about five days cause then it starts killing other things. But he said they can kill the whole pack of wolves if they poison that carcass. So that's what they're doing in other parts of the country and they're still not controlling the numbers. They're still too many, I think we went too here to get it back. And the temper of the DNR to actually do something about this does not seem to be there. We need to change that. I think that's probably all I gotta say, Thanks.
John	N/A	Yes	Douglas Co.	John - Lived here all my life. Live west of town now, but I think the DNR been pretty much in denial since the seventies with the wolves. My dad got one in a trap the late seventies and they said, are you sure it's a wolf, he said yup. He turned it in, said he didn't want any trouble, they read him his rights and Everything else and let the wolf out of the trap. But my thing is I think they've been in denial for a long time and it's just gotten worse, we've hunted west of town here for some time, and we got a lot to prove everything that we see every year, start of year quality and quantity goes and it's dominantly nothing. I mean my girlfriend hunts with us. Some people you don't even see a deer, you know, but we're still hunting all day there and it's like what? Is there nothing that's beyond point of proving anything anymore? And as far as the people in the room here, most, I don't know. And I do know a few, but unfortunately people I talked about coming said, why bother. Because nothing's been getting done, nothing. They've got the way they want it. And unfortunately, we're a small part of the people and until the bigger part of the people join it, nothing will probably get done. I don't see it happening when the majority rules, it's a no-brainer. And the majority is gonna rule. And if the majority is, tree huggers and wolf lovers and people in big cities where it can't happen to them, you know, what are you gonna do? You know, and until it affects them, then it's a different story. But you know, and they run bears off. I seen it with my own eyes. We were baiting, me and my girlfriend put your bait out, the bears will come in, knock over your bait and the wolves will come in and push the bears off. Well, we've seen it. We've watched it, but they don't care. You know what I mean? So you want everybody to give up on cause they have nothing left on and hope that all people up their big money from a big cities are gonna support the rest of what happens up here. Why lose what we all tried so hard to have, you know? And that's basically all I gotta say. But one more thing, I don't think this was publicized s well enough. I mean, you look around on Solon Springs Community Center site, there's nothing about this meeting. Um, I found about it through Gary and my sister last wekend. Otherwise I wouldn't be here. I, you know, I don't know. I didn't even look when I came in. If there's anything on the information sign outside here, you know, they've put all this other stuff on their signs that they're having, but conveniently or inconveniently, it wasn't advertised very well. Sure. You know, and I'm glad the people are here that are here. And just my last thing, it's really, ironic this morning I got up usually ahead my girlfriend anyways and I'm sitting on the couch and as you can tell, I can't hear very well. And I'm sitting seven o'clock, what the hell? I woke up and there's two or three different wolves howling here over there. So they're communicating, you know, and were only four miles out town. So now you got a dog and horses and chickens and possibly more farm animals. And like the one guy said, if it comes down to it. [redacted] aside. And I think most people wouldn't do it. I would take care of the problem myself if they come on my land, you know, that's just the way it is, that's all I got.
Crystal	N/A	Yes	Douglas Co.	Crystal – Ive lived here all my life, I followed my dad in the woods since I probably, since I could walk. I've never been afraid to be in the woods. The reason why I bought a gun was because I ride horses and I spend a lot of time hunting in the woods and I take my dog out in the woods with me and I actually bought a gun to take out with me so something attacked my horse or the dog. It'll be shot I mean, it's bad when you can't go out in the woods anymore because you think that your dog is gonna get attacked or your horse is gonna get attacked. My grandkids ask me all the time, well, grandma, what about the wolves out there? And yeah, and as my boyfriend said, I've always had a wolf where I live now, and it's always been him and just him. Well now, like he said this morning there was at least three howling. So is that a new pack? But then there's a pack on the town, green Road. Then there's a pack down here by the street Old Deer Farm. Well then there's a pack on the other side of the river. So I did the map and Google. It says Douglas County's 4180 acres. That's me including the water. So you take the water out there, that's less. So then I said earlier today, that's 36 miles per a pack range that comes to 41 packs in Douglas County. I believe there's probably a 41 packs in Douglas County minus Lakes. So there're gonna be a lot. I mean, I seen them. I sit out in the woods. I have bear they're afraid when they smell you. I've had bobcats come by me, They're afraid. When you smell you This year, season, I had wolf come by me. He walked right behind me.

Name	Commenter Affiliation/Type	Wisconsin Resident	Location	Commenter
				Smelled where I was. You think he ran? No, he just walked up my trail where I went. Just walked away. So you gotta learn there is no fear. We're supposed to be on the top of the food chain, we're not anymore.
Mr. Brown	N/A	Yes	N. Wi	Mr. Brown? - I got a comment on what this gal just said about wolves not being afraid of you. She's 1000% right? I'm on the woods quite often, see quite a few wolves. And to this day I have not one wolf, not a one bolt run from me. Out trapping I've have one from here, to the wall from you. They stand there, look at you like what are you doing here? They show no fear and they show aggression. That bother is the [redacted] out me. I carry a gun wherever I go because for one reason I don't wanna miss the opportunity to shoot one of them, the law is not taken care of em. Its time for us to take care of em because the law isn't. I make sure I tell every warden than that. I blame all this [redacted] on the biologist, the warden, I respect the hell outta law enforcement. They enforcement laws, they don't believe in. The biologists and idiots put these studies out there how our laws are created they're the ones fault and they're lying us. I went to a wolf deal out Montana on how to kill wolves, they get certified, for killing wolves. loved it. Anyway, it was a three. We had the Alaskan Trackers association teach us that and now these boys know wolves way better than you and I down here. They just laughed. They call this America down here. I told some of the stuff our biologists were telling us, they just shook their head and laughs. He said, you know, you guys down here in America, they call us America down here, your biologists are pulling your eyes. And it is pathetic, its the truth. Back in 96, whenever they reintroduced them wolves to Yellowstone. There was like three females that bred out one pack. All the environmentalist, tree huggers were just ecstatic old gods. And after God, They laugh when they read that in papers. We've known that for years, and more than one female will breed out the pack. I mean, they're a freaking canine. They come and eat, they go and screw. Simple as that. It is, lets use some common sense. I was over in Hayward, when they wanted to increase it from, 348 or no, 350 was magic number. They wanted to increase it to 500. And there was a fellow from Old Lithy there. He'd had a cow and calf preyed on by wolves, DNR said they'd take care of ya, reimburse ya, had farmers and ranches having a problem. We'll be there to take care of the problem. Well, that was like three months prior to that. Three weeks prior to this meeting, he faced on another wolf there. This is way down by Old Lithy with me. And he, they hadn't seen anybody. And I asked, I said why. And remember the whole meeting was on how to raise from 350 to 500 men. Remember? I said, why wasn't that farmer taken care of? He said, Mr. Brown were just so overwhelmed with calls and can't keep up. and you wanna raise it for 500. Ya knotheads. I mean, don't take rocket science to figure how badly these boys are lying to if you cannot leave. The original plan was 80 wolves, not 80 Pairs, 80 wolves. That was the original plan. Them son of a guns there. Just like I say, we gotta take it into our own hands. The hell with the law. Tell ya one thing on my land. I take care of my own, I mean, it's simple as that. I've had it, we've had it right here, to our eyeballs with the bs.
John Romans	N/A	Yes	N. Wi	John Romans - Got a couple quick comments to make. I was lucky to recently retired, saved all my bobcat points for 13 years. A neighbor has the dogs. The problem was, I didn't know how it all works. So I'm a bow hunter, gun hunter, and now I'm a dog hunter. So Drive in the truck. Find bobcat tracks. Make sure it's Bobcat. See wolf tracks, and he'd say 'not hunting here, were not losing our hounds.' Well this happened time and time again. Bobcat hunt turned out to be, let's look for Wolf to make sure we don't go get it. Well that's kinda [redacted] So then I'm thinking just some more and all wolves were seeing are up north and I'm hunting over a county as well, Dunam. Wild wolves there too. So I have a couples sons in the thirties, one son stopped hunting with us. Why didn't you come up? Deer Camp? Oh, I haven't been telling you guys this is, but I shoot deer, you're lucky if you even see a deer. The other son, bow hunts and gun hunts with me. Well, pretty soon my grandson is gonna be of age to come hunting with us. I was excited to show him the things I do. I want my son to have hunt. As one person said, sitting in the woods staring at popal trees. Well, that'll break your heart. Remember this land, we might own it, but we only preserve it for our grandchildren. So all this land ignored is gonna be our grandkids. Let's look at some numbers, I have buck kills. And I have doe kills and I have muzzleloader kills and I have winter kills, but I'd rather bow and muzzleloader over kills all these others. Jam them together there's all the deer numbers from the state. Same department and they won't give us a wolf number. What do they protect again? Madison, Milwaukee. All the squeaky wheels down there. Well, up here where we live, we see it every day. We've heard from lot you, but yet they send a tag or let's say a letter or form fill out. And I might look at Madison. I live on a lake where I'll never step foot in a woods ever. I'm gonna say I love this. Well, yeah, we all wanna see wolves I guess. But those people will never see a wolf from the wild. Cause they're not gonna walk over land. You walk to your tree stand, you walk across those trails where we used to have deer yards and stuff in the winter, there's no deer anymore drive around Douglas County on the snowmobile trail, trying to get back in there. Those are deer are gone. Those are century old deer yards. They're gone. So like I said, we can talk what we want until people in Madison and the DNR, Natural Resources Board start to take our word gospel. That this is what's happening. This is just old.
Trevor	N/A	Yes	N. Wi	Trevor - I more have questions as far as the tribal buffer area you touched on earlier. his summer was unfortunate enough to have my first dog get attacked by wolves. Fortunate I was in there, I got him away. I seen it happen. I able to get the dog away. I lose her physically, but I lost her mentally. This dog, it's scared of every twig that snaps. It's scared of every dog that runs by it. This is a dog that would previously stand toe to toe with 400lb Bear. No, it's scared of the Woods. If that doesn't say the power of a wolf right there. But come to find out when you sent us this packet to look at, we're in that zone, the buffer zone where this happened. Where do we push back to keep that from growing and growing and growing? They already get part of the quota. Why are we not allowed to go after these wolves in these areas? They're, they're part of the quota should count for that, and I'm hoping you can give us some insight on how tp pushback on that

Name	Commenter Affiliation/Type	Wisconsin Resident	Location	Commenter
Unknown	Unknown	Unknown	Unknown	I used to have more and so they have more or so moved. Moved by Jimmy Soyring's. Moved to the southern part of the county because we have less deer than we used to have. I look at a different perspective. So I have a farm, I'm working with farmers and various people around, but you know, we feed them; ducks, turkeys, we feed the ducks, we feed the animal that come across and feed the deer. We feed any animal that comes and grazes and then wolves come and graze our animals, you know, and it gets to be expensive. Not only is it expensive, but also the lost of the meat that the wolves take, but the time that we have to put in managing so we can keep the wolves away or keep 'em from doing that. But yet they have management plans, but they don't take the time to assess what is happening to you, the individual in the country. And right now, this management plan is affecting me less than another management plan on my farm that they've got going. Thank you.
Randy	N/A	Yes	Bayfield Co.	Randy - On the same page as everybody here 15 years ago had a wolf right next to my truck, the middle of the woods in Bayfield County. It's, we've all heard stories, myself included. I'm not walking outta the woods at night without a firearm. A hunter afraid to walk outta the woods at night. And same stories everybody else has got. There's too many.
Chanz Green	Member WI State Assmebly	Yes	Douglas Co.	Chanz Green - Ladies and gentlemen, I'm Representative Chanz Green. I represent this area. I, live in Grandview, Wisconsin, originally from Polk County where there are wolves. I've seen them. I wanna thank everybody for coming. Thank you guys for putting this on. This is how we get things started. A little bit more about me. Like I say, I live over by the cable area, Grandview area. I run hounds, I'm a Wisconsin Bear Hunter Association Member, Hunter Nation member. And, we need to speak up. This is how we get started. So, a little legislative update. We're working on this, of course. Congressman Tiffany is taking legal action at a congress level at a federal level. He's constantly taking legal action to delist the wolves. We need to show support. We need to support him. We need to write letters, you need to get out there. We need to be vocal about this stuff. At a state level, we had a meeting this week regarding the deer population. We had a lot of members of Price County, Taylor County, over in Vilas county come down and speak on the fact that there's no deer. What we learned from there is that deer hunting is a 2.3 billion industry, and we aren't taking any account Wolf depredations. We're not even taking, factoring them in. We are also not, putting people in the field to count deer. So if we are not putting people in the field to count our deer population, that brings in $2.3 billion. How many biologists outta Madison do you think are coming to Northern Wisconsin and counting wolves? When I put my dogs in the box or my coffee cup and start checking roads in the morning, I find wolf tracks within a quarter mile of my house. There's four to six in my five by six section. They've been there for two to three years. A few years ago I took part in the last wolf season we had, and that Wolf Rug now hangs in my office in Madison. So people know what I stand. The fight continues. We need to get them to be listed. I love the conversations we have about even just stepping them down. These are things we're working on. Me and Senator Rob Stashold, he's the head of the Senate, Sporting Heritage Committee. He and I are, are discussing including we want to see in part of this plan a number. We wanna see a goal. This plan has no direction without a goal. So we are drafting legislation to do that. Representative Rob Swearington and Mary Valswalski is a Senator to my east, they have already dropped the bill with all the recommendations that the Wisconsin Bear Hunters Association recommended. They drafted a nice analysis, if you have some free time, read it. They make a nice, synopsis, I guess you could say, of this plan. And they have made adjustments that they want to see in that bill. So, legislation is happening, but we need to be louder. We can't just meet the room in northern Wisconsin. You need to call your representatives. You need to call your senators. You need to be respectful. you know, kill with kindness. But, let 'em know that we need to manage our wolves. They're, they're decimating our deer populations and we manage everything from panfish and Lakes to our extremely expensive elk herd in Clam Lake. But we don't manage wolves. So we need to get on board, but we need to be louder. And I encourage everybody to reach out to representatives, to their senators and be bold. Write letters. The wolf comment on the 28th. I want to see 6,000 and 3,000 of us come from us. Those comments come from us. They need to hear our side because Madison, and Milwaukee doesn't care and they don't roll their head from their ass. So we need to make sure that we represent Northern Wisconsin and we need to tell them what's going on. Thank, I appreciate your time. Thank you. The question was, sorry. Um, if we have any hard numbers on what the effect of the wolves are on our elk, I don't know that we have that information. I haven't seen it myself, but I can definitely look into that. According to the Elk Manager, the greatest source of mortality for our elk is wolves. (Laurie) This 36 years, we've been Democrat led up here. I represent Wolf Country. This, we're sitting in my district right now and I represent all the way to the Michigan border. This is we Bayfield Ashland Price, iron County by Democrats who are in favor population. They love wolves. They haven't been out there to fight. Now we're here. Me, Senator Romaine Gwen. We do not like wolves. He has a cabin in Barnes and he goes deer hunting. That's a family cabin that they go to every year and they more or less play cards and watch trees, girls. So he, he's affected by the student. We are adamant about making this happen.
Paul	N/A	Yes	N. Wi	Paul - I've been a hound man since 1958. I still hunt them at 82, and I see a lot of what's going out there and its not good. It's all in Washington and Madison and someone that made comment who do we talked to. We are the silent majority. We've been silent too god [redacted] long. This is what we need. We need a lot of it. Now other comment that gentleman made about predation and the studies that go on with the DNR. I personally called some of 'em and asked them, well, we're still studying. If you go out to Montana, Wyoming, Utah, five or six other states, they've all done these studies. And if you read 'em, the one thing they come down to is every single Mountain lion and wolf needs the equivalent of a deer every five to seven days; divide that out. They won't listen to that here. I sent a copy of a study in Idaho, and I imagine one that's the problem. Were too quiet, make noise.
Bruce Brown	N/A	No	Houston, MN	Bruce Brown - I'm out Houston, Minnesota. You guys probably don't feel that I should have a say here, but I've been a member Wisconsin Bear Hunters for 35 years also been avid lobbyist at the state Minneapolis also introduced bills, and I see how things are done. A lot of times what a guy don't get to see is the stuff that when you have a bill in office and you have it in front of the subcommittee and full committee, all of a sudden you bring a

Name	Commenter Affiliation/Type	Wisconsin Resident	Location	Commenter
				bunch of people in to listen to that bill and you'll see the speaker, they'll wrap the gavel and then pull the whole bill off to the side. And it's heartbreaking to bring a lot of people together to listen to what's going to happen, when they don't put you on the agenda until at the end of the day. People that you from out of state to speak on your behalf, they gotta catch a plane and go back to California, or back out to Oregon and you spent a lot of money to have them guys there. So what I'm saying to you guys today, like you said, and all these guys are staying glad to see you guys are getting together, having town hall meetings and speaking. These gentlemen here, this lady over here, it helps. Now on a personal note, I've hunted here and outside of Solar Springs, about six miles out to the west and back in the nineties I had a hunting buddy. Had a real good young dog coming up and we were all standing off the of Road Tom Green. The dog was working a track through, all of a sudden he heard a yip. That was it. And he wasn't much more than 100 yards off the road. We started wondering, started looking at each other. Somebody went in and the wolves had it down, was able to take back the camp, was able to try to save the dog, but it wasn't able to be saved. Had another incident where we're standing on Tom Green, we're listening to the dogs and one of the guys in the group had a young son, got out the pickup truck, started walking to the east on Tom Green was walking down that way and all of sudden Wolf come out on the road. Dad says get back here. He just stood there. The kid did. Now the wolf started walking toward him. Then we knew what happened. We got the kid back. What would've happen if that kid would've stayed longer? That's question. Thirdly, I was at one of the wolf meetings they had here in Wisconsin, and had a gentleman there that was a biologist from out of Minnesota and he brung out several photographs. The photographs that he out was that they were doing an aerial search on bears and wolves and one pack wolves was by Covington, Kingsdale area the 17mi area. First pass they went by and they could see the wolves and that they were by a den. Second pass they made through there they could see that they had pulled out the bear cubs and killed the bear cubs, third pass when they came through, they pulled the sow and killed her. Now that's documented. So, like you guys are saying, doesn't state a lot help of bear, even us guys that bear hunt and I've been doing it ever since the seventies. That's not helping us out. It's not, and that's over here. We used to call the area outside of town here to the west; the ruber, because we had a lot of sows with cubs in there. Now in the last five years, I want to say personally I've seen our bear population drop in this area.
Rachel	N/A	Yes	Douglas Co.	My name is Rachel and, I am a tree hugger. But I am not pro this plan at all. Primarily because it does not reflect the reality of what we're living with. And it does not, I think honor the way that we live up here and the way that we, live and the way that we hunt and the way that we, whatever. And so I am mom. We live in, Douglas County. We have, we're living in basically whole country and we have, deer tracks in our driveway. And I have kids and I have a dog. And, I love being in the woods, but I'm often afraid to like, question the safety of being in the woods without a firearm. And the other thing, reading about the plan and reading part of the plan, I realized that they broke it down. Do you do, identify as a hunter or a enthusiast where you live, blah, blah, blah. And what I think the plan does not reflect is the fact that a lot of people from the city come up here and hike our trails. Hike and use our water and don't really understand the reality of what it is to be in the woods and what it is to hike a Trail without, protection, without safety. And I think it's not a good plan. It's not good for us. It's not good for the people that come to visit. And, it's a disappointment and I don't think it's, it's something that we wanna do.
Brian Johnson	N/A	Yes	Douglas Co.	Brian Johnson – Old family farm been in the family 130 years. I moved back about six and a half years ago. Used to hunt there a lot growing up and do so now again, but I've been able to look up in the fields years ago. And, between my field and the neighbors fields would be unusual to see a hundred deer. And now if you've seen maybe 10 or deer, even at the prime time, it's pretty rare. Last summer looking out, and I happened to see him, you know, several hundred yards out. I couldn't tell right away if it was a coyote or not, but then all of a sudden there's another one and another one. Now I know it's wolves, all of a sudden they disappeared in the woods. But about oh, 15 minutes later, I looked out the window and they're walking through my yard. And what really pissed me off, it's, I don't move as fast, getting my gun. I'm not advocating breaking the law, but I do advocate protecting your property, protecting your, your, cattle, your livestock, your livelihood. I'm glad that Chanz is here and I know Tom Tiffany too. And so the one thing that we can do is when it comes to election day, make decision heard at the ballot box, we get people like Chanz and Tom more of them. And then once they get in, twist their ears, hold their feet to the fire. Then start changing these things. So thank you
Pat	N/A	Yes	Douglas Co.	Pat - Rachel's, my wife. We have a few acres in Maple, you know, two plots, five acres each. Wolf tracks right down the driveway. I mean, we have farms around us. Jim Soyring is one of our neighbors. We get calls, you know, well, the cow got out the fence and there's a point that might replace the cost of the cattle if it's killed, but takes a lot of time in the community, you know, chasing cows, fix fences. Anybody who's built the fence, it's expensive piece of equipment. Those aren't being compensated like Rachel alluded to. You know, we live in the woods. This is where we live. It's natural resources. It's managing those resources. So that's good plans. Actually, having a plan. Now, there isn't one in place, 250 pages. Now what do you need to hide? That it has to take 250 pages to do something that know other states are doing. This isn't rocket science. Im a carpenter, I hire crews. If it took me 13 years to do a project. I'd be fired. 13 years, to come up with a policy. I write proposals for projects. You sometimes two or three a day for a project. Doesn't take that long. I mean, especially when you have feedback. This is, America, government. We're the Government, we are the people. So we need to participate like we've been saying, we definitely have to participate. An issue with the DNR little bit, they did listen to because there's public pushback. One of the comments that was made was, something about these resources was in referring to the deer. Well, these are the states deer. Well my brother said, whoa, whoa, hold on they're not the states deer. These are the people's deer, these are the people's wolves. People saying we definitely have to participate. We have old dog, 13 years old was still very healthy. We lost her, couldn't

Name	Commenter Affiliation/Type	Wisconsin Resident	Location	Commenter
				save her. Three days, three day talking to her. If I only have five acre piece of land, I think my dog should be able to be on the back of my five acre piece property with pastures all around, should be able to go out without being hit.
Unknown	Unknown	Unknown	Unknown	Im going to start off by thanking you. For all we do, were a small group. So see this? That's one hand, right? But it's got five fingers. I got another hand. Its got five fingers. And you're looking at me like duuuh. Understand the point im making, each one of you contact 10 people send something to the DNR. I heard this one thing, it wasn't well advertised. Well, we got this group now count for people, times 10 for each person. In each of them, times 10. We got to let the DNR, The Natural Resources Board know that this plan is bad. We haven't heard somebody saying, oh, go for it. It's a good idea. And they say, science based. My idea of science is a field that's got holes in it. They look in one hole to find the answer they want, but they never look in the rest of the holes. Were he rest of the holes, make more holes to spread it out. Contact the DNR, you don't need to write a book, just tell them. You oppose the plan as written. One line, one sentence. Tell then where you are from.
Bill Smith	Natural Resources Board, Chair	Yes	N. Wi	Bill Smith – Chair on Natural Resources Board. I Live Northern Wisconsin. I hunt in wolf country, and I wanna hear firsthand your stories. You talked a lot about the department and the board. This plan is coming to the board eventually. It's not there yet. It's got more work to be done. But this was an opportunity to come here firsthand, and hear your experiences, your ideas, and I appreciate your time and your energy very much. And this input will be very helpful as we look at future drafts of the plan and try and find something that's gonna be acceptable. I'd like to add one comment to this. One of the big difficulties that we've all faced is oftentimes the court system intervenes on this. Some people have mentioned it, there are court cases out of the state, around the country that have affected and limited our ability to manage wolves. The message I hear today, the most important one I hear is that wolf predation is big problem and we need to have the authority to deal with it. In order to get that it's going take federal delisting or down listing, and it's gonna take a management plan that we can defend successfully in the court system because throughout the years, this issue has been litigated time and time again. And I expect that that will continue from one side or the other. People have very strong opinions and sometimes we're not happy with the, the current management plan and the current litigation, but i ask you to think about, where we want to go with this. And if you're interested in having the full array of tools, including, tools that allow us to take wolves off the landscape. Tools that enable a hunting season. If you want those tools sustained in the future, we need to have a management plan that, we can defend, legally and retain state authority. And part of that plan is gonna have to be a sustainable wolf population. I'm not an expert. I'm not gonna argue for numbers. I'm just saying think long term. Think big picture about what you gonna want out this, and we can continue to argue. But if you wanna look for solutions, we gotta find something that's gonna be legally defendable or it's gonna be, wolf season this year and maybe nothing after we get litigated and, and some court intervenes and stops, whatever we're doing. I don't have the answer for that. And just raise it as an issue and ask for your thoughtful consideration as we work through this process. I have a question. So the DNR, they have regulations on the fish, all the other animals except for the wolves. How is anything never gonna get done at the DNR was supposed to be in charge. We have legislators that, you know, Chanz maybe, but we have people that are above him that drop that ball at anytime. How is anything get, get done. Like somebody said, we've been to all these meetings, been all these different, I've been the CDACs and stuff. Nobody listens. So can you listen? Can you get something done? I'm here to listen. I'm not mean, I'm not in the position to have direct authority over this until this plan hits the board as a recommended plan for voting and both, I, Sandy Naas are here today. We're both Northern Board members. We're here very early in the process. It's not in our hands right now. Okay. But as I said, we're here to listen and to hear firsthand your experiences with wolves and what you think needs to be done. And I appreciate very much your time and effort. Thank you. Thanks for being here. Thanks for being here. If this plan, which we're all in agreement isn't satisfactory or plan of some sort like this gets to the Natural Resources Board, what's the right Natural? Resources Board, it stands on this. Are you gonna reject it and send it back to the beginning? Again? As I said, we're very early in the process. The department has the lead on draft plan and they're working on it. They're still going through public input, they're still considering language in the draft, and the plan has not come to the board. As a board member, I need to be open-minded and receptive and non-committed until I hear full testimony, coming into the board. And I pledge to do that. I cannot speak for the other board members. there's seven of us. We each have a vote. We each have an opinion. And I think when the time is done and the draft is before us as a decision, and we've had a chance to hear and consider the full range of public input, each of us are gonna have to decide how to vote on that. And today will be influential. And how I look at the plan and some of the things that are gonna be important to advocate for. So I'm here to listen, not to answer questions I wish I had more answers for you, but it's too early for me to speak on that. I'm just in the learning mode right now. So thank you very much
Laurie Groskopf	Wisconsin Wildlife Federation	Yes	Lincoln Co.	Laurie - I just wanna clarify some stuff about the listing. I attended a meeting in Ashland way back in 2011 prior to the listing that happened in 2012. And the expert from US Mission Wildlife Service said there's never been a re-listing that's due to a biological reason. Wolves are recovered in these three states. And this is what happened with the California judge. Everybody likes to blame him, but the US Fish and Wildlife service forgot to put something in the plan that got us back on the list. And that was, they didn't address what would happen in areas where wolves are not recovered. Couple paragraphs would've done it. Wolves dispersed very readily. They have no problem occupying new territory and not all places are suitable to wolves. That probably would've covered it, but they didn't put that in there. This is not the same about by biology. This is about procedural issues and it always has been. So we don't have to defend our biological program. We've got a ton of wolves. They're connected to Canada, Minnesota, and Michigan. There's no problem. And they're ever evolving.

Name	Commenter Affiliation/Type	Wisconsin Resident	Location	Commenter
Sandra Naas	Natural Resources Board Member	Yes	Bayfield Co.	Sandra - Resource Board member. Thank you. I don't really have anything to add to what Bill said because he's so eloquent. But I did wanna introduce myself. My name is Sandra Naas. I'm from the Ashland Bay area. I live in Bayfield county. I've been here for about 34 years. I was appointed by Governor Evers to the board and just, began taking my seat, at the January meeting. I'm taking information in here and along with Bill, open minded, listening to people, I understand what you're saying. I have, I'm a hunter, a trapper, and I have about 80 acres in Bayfield County. And so we see wolves on the regular. And so I understand, um, everything that you've, talked about today. So I just wanted to, to share that. I've known Pat a long time. He's taught my daughter and took my daughter bobcat hunting, I believe, with dogs. So, I'm aware of the issues that are out there. We bird hunt too, and I have dogs and, my kid is growing up. But, but I do appreciate everything that I heard today and hope that you can trust us to take this information back. And I'm glad that it's going to be, turned into the DNR so that they can listen to your testimony, and trust us to take that information back and, do good things with it.
Stacy	Representative for Senator Quinn	Yes		Stacy - I represent, Senator Quinn. And just make your voice heard. We as employees and the elected officials and all the state and federal agencies, they work for you because you're the taxpayer. So just remember that.
Unknown	Unknown	Unknown	Unknown	I just wanna say this, this meeting is picking up for the DNR failed, right? So Wildlife Federation tried to coordinate this session to hear everybody, ultimately the DNR should have been doing this, they failed us. So please keep that in mind.
Jim Miller	Representative for Congressmen Tiffany	Yes		Jim Miller – Congressman Tiffany's office I don't mean to talk on anyone, but there's basically civics 1 0 1 lesson, right? So we've got some legislators here. I represent a legislator. We've got remains office, we've got county board legislators, marks on legislators, some degree. Uh, we've got executive branch, which is representative to those board appointments to the DNR. And so they're barrier. And then we've also, we've talked about a lot of the frustrations about the courts, both state and federal. And that's a big barrier. Those people aren't represented at the table. So what I, wanna remind you all of is that courts is always a problem, but that's a co-equal branch of government. One third co-equal branch. We have a primary coming up next Tuesday. We have another election this April. So, and it hasn't been brought up. I think you know, the balance of our state Supreme Court at least. And we talked about the problems with Madison and problems with Milwaukee. And if we get another representative from Madison or Milwaukee under this, posted to the state Supreme Court, they know where they're gonna be. So I can't tell you who to vote for, but I'm gonna remind you Tuesday to get on Vote and vote in April. And again, that 10 fingers, right?
Unknown	Unknown	Unknown	Unknown	At that time, they said 30% survival rate for wolves. And I'm gonna talk these guys up in Alaska, I said, what is survivor rate? He said, I'll guarantee you the survivor rate 80% if they've done good food and we got food.
Lauren Vrany	N/A	Yes	S. Wi	My name is Lauren Vrany and I haven't really prepared anything, but I'm a little bit different than anybody that has attended this meeting. And thank you to everybody that has showed up. First of all, I'm a new hunter. I have only been hunting for five years. And the reason I started hunting is because I adopted a Blue Tick Coonhound from the Humane Society in Milwaukee as a pet. And she actually taught me what hunting was. It's a beautiful bond that I have with my dogs. I'm actually looking at three of my female dogs inside right now. Basking in the sun in my bedroom. These dogs mean everything to me. I, hunt raccoons and I show my dogs in, big shows. And I also hunt bear. Another difference. There's not a whole lot of women here, so I'm happy to be a woman, kind of just supporting that demographic. And another difference, I don't live where y'all live. I hunt where you all live, but I don't live there. And one thing that kind of irked me along with the other same points that the Wildlife Federation made with the 32 points, is the whole counting with lone and dispersing wolves. Western states do it and we're not doing it. I used to train my puppies on public ground in a kettle marine forest down by me. And one night I was hunting with three other folks and we all had young dogs and I heard a wolf and we knew it wasn't a coyote. There's coyotes everywhere. I'm not scared of coyotes. I will go coon hunting and we will hear the coyotes going crazy and I've never had a problem. I knew that was a wolf and the hair stood up on the back of my neck and we ran to get our dogs. And I will not go back there, with adult dogs or most importantly puppies that are not confident. So wolves in the Kettle Marine, they're down here. There was a wolf hit probably two years ago on State Road 33 down the road from me, maybe 10 miles by the Horicon Marsh. There's wolves in the marsh. There was a wolf in Albany, Southern Wisconsin, south of Madison. So they're down there. I mean, we kind of wish we could put 'em right in the city of Madison or whatever, but they're down here. I pretty much now only hunt private ground when I'm hunting raccoon because I know what's there. That's kind of my story with wolves. Thankfully; bear hunting, knock on wood, I have not had a dog killed. I know quite a few people that have, keep in mind, and we do everything to try and protect our dogs from, from the wolves. But like many people have said, the whole northern half of Wisconsin is a depredation zone. And it, it's just not fair. Now here's one, one thing, um, kind of a unpopular opinion amongst, amongst houndsmen. And I'm gonna have the unpopular opinion. I'm okay with wolves being out there, and I'm okay with the depredation payment going away, IF Wolves are managed to an agreed upon level. And I would think that's around 350, what was agreed upon when this whole reintroduction happened or around that number. So, you know, there's a lot of people that don't like paying out to begin with. If we can get wolves down to a number, I'm okay with taking that responsibility and doing away with that payment. But that's just my opinion. I think that's all I have to share. I think there's been some really nice comments made by everybody. There was the story about the woman that told, about her whole kennel being demolished by wolves, that that made me cry. And I think that's an experience that we can all relate to. So thank you for your time.

Duane Harpster	N/A	Yes		Duane Harpster - If nothing else the Department should get this message from the meeting: there is a huge disconnect between the a large portion of their constituents and them. The Department has lost the one on one connection that they use to have. Field people are the core of a good relationship, once you move above that neighbor like relationship, you lose trust. Most people in Vilas County don't know their fish or game managers and techs and the same goes for the Game Wardens. You can't sell this plan from Madison. My old college professor told us "a good state conservation agency is a inverted pyramid. You live and die by the work of your front line people".

The following are comments collected via the online comment tool available on the department's wolf management plan webpage during the public comment period. They are provided below in reverse chronological order.

To make the columns fit, the actual questions asked in the comment tool have been replaced with a simple letter and summary. The following is a key to the column labels; these are the exact questions as asked in the comment tool.

- A. Your Name: (Optional)
- B. How much of the draft plan have you read before completing this survey?
- C. Are you a Wisconsin resident?
- D. Overall, what elements from the draft plan do you LIKE? Being specific is most useful to our team.
- E. Overall, what elements from the draft plan do you DISLIKE? Again, being specific is most useful to our team.
- F. On a scale from 1-10, how would you rate your overall support for the draft wolf management plan as written?<-- 1 Very little support; the plan reflects nothing of what I'd like to see--> 10: Very high support; the plan reflects everything I'd like to see
- G. Please provide any other comments related to the current draft wolf management plan here.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Stephanie Eastwood	Most of it	Yes	All of the ecological info is so valuable to have in one place. appreciated the summary of the human attitudes study. 59% reponse rate is hard to believe but makes me love Wisconsinites. The plan is really well written, well organized and the background info is so interesting. I had to skim it, but look forward to reading the final plan.	Didn't find anything in the mgmt plan I object to. Please do what you can to stop hunting with dogs. Also, snowmobile chasing of animals = awful. But I did not see this in plan.	9	
	Most of it	Yes		I am ashamed to be a WI resident due to this plan	0	leave the wolves alone to live and prosper in WI
	All of it	Yes	Thoughtful inclusion of many aspects and biewpoints	Stating that state statues donor influence plan, yet advocate for rules	5	
	Just the parts I am interested in	Yes		IT SUCKS	0	STOP KiLLING WOLVES especially with hunting dogs
	All of it	Yes	NOTHING	WHY can't the DNR do something for the environment? WHY cant the DRN protect wolves instead of subjecting them to hunters	0	The DNR should retitle its name and just admit it all about protecting the agency's own special interests - not about wildlife management
Pamela Saulnier	Most of it	Yes	I like the inclusion of Historic and Current Distribution of wolf range; Habitat Use Requirements; Wolf Social System, Communication, Reproduction, Den, and Dispersal information. I like the Ecological Influences and Trophic Cascade information, Predator/Prey dynamics, Wolf population dynamics, Media portrayals as "muddying the waters,"Public Attitudes and the inclusion of the 2014 Wolf Attitudes survey results. I also like (and feel it is very important to include) tribal statements regarding significance of the gray wolf. Also like the impact on livestock including non-depredation information, as well as the inclusion of abatement options that include non-lethal methods. Thorough and comprehensive document.	I do not feel there is any information that should be eliminated.	9	
cathy monahan	Most of it	Yes	I like the emphasis on monitoring the population using GPS satellite tracking on collared wolves. The emphasis on understanding the ecology of wolves in area with both timbered wilderness and agriculture I hope the plan addresses the effective regulation of a wolf hunt to acceptable limits.	I want to replace the word harvest with kill. Harvest is what you do with wheat or corn. Kill is what you do to something with a heart. Give the act the weight it deserves. Forbid trapping in all its forms. It has no place in modern use or treatment of animals. It cannot be defended	7	I live in an urban area but can appreciate the wolf as an efficient and beautiful animal. I appreciate the effort of the agency to allow wolves to exist in wisconsin and allow them to continue in their historic ecological role.
Frank G.	Most of it	Yes	Considerable background information was included. Especially appreciated the tribal input.	I would like to see the end to the dog training and hunting with dogs. And an end to payments for dogs injured or killed by wolves. Better yet, follow the tribal words and leave the wolves to manage for themselves.	7	
Karin Mahuna	Most of it	No	I am grateful that a numerical population objective was removed and transition was made to impact based management.I thought a good job was done in presenting the different perspectives people have on wolves and on the ecological importance of wolves as well as their importance to Native Americans and others. Thank you for including some type of buffer zone around tribal nations. In all it was a much more thoughtful plan than most I have read.	Despite all the acknowledgement of wolves ecological importance and people's desire to see the same number or more wolves in WIsconsin I am very disappointed to see that providing recreational opportunity so hunters and trappers can kill wolves for fun still has such a large role in management. I realize there are issues with the law and pressure from the commissioners but I do believe there must be ways to minimize those factors. I would like to especially see hound hunting eliminated and most certainly they should not be allowed to train hounds in areas already closed. Trapping is also barbaric and needs to be eliminated. Please prioritize the use of non lethal conflict minimization and use lethal control as a last resort.	7	
	All of it	Yes	That you don't set an arbitrary limit on Wisconsin's wolf population.	Nothing worth mentioning.	9	It amazes me how many people think that any wolf predation that affects their own hunting success is inherently bad. Do bluegill fisherpersons want to kill all Largemouth bass to increase their bluegill fishing? Do walleye fisherpersons want to kill all muskies to improve their successful walleye fishing? This twisted "thinking" that views wolves as a harmful species is biologically absurd and should be ignored and rejected by those managing the wolf population.
Liam M.	Most of it	Yes	Elimination of set number of wolf population, larger buffer zones around Tribal areas.	Lethal methods of culling, focus on economic factors over ecological ones, the actual harvest itself.	6	Larger buffer zones around Tribal lands, more non-lethal methods of depredation before lethal euthanasia measures are used, focus on ecological equilibrium. I want to see the healthiest wolf population currently achievable through pragmatic and realistic means.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
	All of it	Yes	The graph on page 101 seems reasonable, but the plan is to kill wolves under the guise of management of wolves	state government sanctioned killing of the gray wolf by Wisconsinites who are desperate to use their guns to take down an appex predator that we brought back to our state after making them nearly extinct.	0	I am saying a prayer tonight for the gray wolves that are about to be slaughtered so the DNR can keep hunters happy and secure their hunting fees. The wolves don't need human intervention and maangemnt -- we skrewed up enough with their populations and should just let them thrive in Wisconsin. American Family and other insurance agencies want to keep deer and wolves off the roads so they can limit payouts. This plan is nothing more than sanctioned killing of a beautiful creature to appease hunters and insurance companies and farmers. Leave Wisconsin wolves alone. Keep the hunting dogs out of the hunt as involving them is cruel and unethical to both the wolves and the dogs. This is no different that the unethical seal hunts in Canada and the unethical whale hunts in Japan.
	All of it	Yes	Adaptable management goals which can be altered when found necessary to change. The continuation of the advisory team. As such, I am under the impression I will have an ongoing opportunity for representation through my local DNR wildlife staff.	Failure to recognize additional social and economic effects of residents and landowners in the northern zones. Issues of existing deerless areas which do exist (Monico block east of HWY 45 in addition to others) which effect land values and use. Although briefly mentioned, it appears evident northern deer management and deer hunting is a lesser priority than than wolf management. Although the draft plan cites many studies, many appear outdated in relationship to environment and current increasing wolf populations. Many of the goals of the plan will require staff and money for implementation. However, recent history of DNR Wildlife staffing has been in decline towards 50% since the late 90's, especially in the North. Most staff are funded by hunters and sports people through licences and taxes, with deer hunting being a primary source. It has become evident the deer hunting tradition, especially in the north has changed significantly since CWD, elimination of the SAK and other mis-manangement since 2008, and the DNR's inability to accurately asses the winter kill index's (2013 - 2014). There is much work committed to be done, however, recent department history of funding staff and following through with enough properly trained staff has been lacking for sometime. (your technicians made less than Walmart stockers) GOOD Boots on the ground still means something when asking others to trust your decisions. Those boots are not there anymore. Question? why was is it stated potential future harvest goals in zones 1 and 2 would be less than others? This did not make sense to me a person who lives in there as the wolf population is established and will only continue to grow unchecked.	5	Wolves are here to stay in Wisconsin, and it is recognized the department is not going to set a specific population number, and will try it's best to dance the fine line to make everyone happy. However, your job is your mission as identified previously while trying to maintain a ecological balance and equilibrium which is nearly impossible. Wolves have value, and as we all are entrusted to be good stewards, management by harvest is a necessary tool to maintain this majestic animal's place on this earth. Wolves are cool animals, but they can do their share of damage to the environment if left uncontrolled. (Too much of something good will become a bad thing.) I live in the north, I hear and see too many too often, as my property on the edge of the northern forest has also seen a precipitous decline in deer, except the few who find safe refuge near a home or two. If it is believed we need an increasing wolf population, please encourage more migration and suitable habitat to the southern part of the state. I know yours is a difficult and thankless job, do your best, and thank you for the opportunity to comment.
Anna Niblack	All of it	Yes	I like that there is no cap.on the acceptable number of wolves. I like that the Native tribes concerns and rights are addressed. I like that there is a proposed buffer zone around tribal land.	Too much emphasis on the trophy hunters desires rather than scientific data. Trophy hunting is barbaric.	7	The DNR too quickly resorts to lethal means when there are conflicts. Most of the time the hounder or farmer has taken few steps to keep their animals protected through commons sense and basic tools like good fences and livestock protection dogs.
Edward Sternberg PhD	All of it	Yes	The fact that DNR is tracking these issues, the increasing acceptance of wolves across the state, findings about wolves recognizing and culling CWD-infected deer, and tribal perspectives on living with wolves.	Recent fudging of pretty clear data that wolves select against CWD-infected deer, while human hunters don't.	4	I've studied wildlife ecology with Aldo Leopold's successor, studied and been a wolf-tourist in Wisconsin, am a trip leader for the Natural Resources Foundation of Wisconsin, and greatly value proximity to wolves. There is a substantial and growing market for these values, perhaps larger than that of deer hunting and certainly larger than that of wolf hunting, that is ignored if not suppressed in this plan.
Katiya Fosdick	All of it	Yes		Hunting wolves is unethical. It feels like you are just pandering to hunters in the state while people are allowed to use dogs to hunt wolves in very high numbers. Since wolves play such an important role in controlling our deer populations and other prey animals, why are we allowing people to hunt them in the first place? Are the tribes in Wisconsin and other people besides hunters in favor of this, or do we just not get a say? It seems like the hunters shouldn't be part of this plan at all. What does our ecological wellbeing gain from them?	1	
	Most of it	Yes	clever use of language in covering up the plan to allow for the slaughter beautiful creatures just to keep hunters interested in and supportive of the DNR	government chasing a mission so they can continue to be relevant to the hicks who will be out hunting wolves once this is enacted.	0	How do DNR employees sleep soundly at night while "doing nothing right" / DNR for the beautiful wolves that are now gracing the lands of Wisconsin after being hunted to near extinction.
Lee Anderson	All of it	Yes	I like the ability to have different goals for different zones. I am surprised it's something I can tolerate. If I had my way there would be no hunting. But it seems you are looking out for the wolves best interests while obeying restrictions (laws) that exist.	I don't dislike any part of plan. I know it's not part of plan but I dislike killing wolves by trapping. It is cruel. I dislike using hunting dogs. it's cruel to the dogs and the wolves.	8	I feel more confident in your departments management of wolves in WI. A detailed and well considered plan. Decisions are based on science and research with the under pinning of respect and appreciation for the wolves.
	Most of it	Yes	The goal of this Wisconsin Wolf Management Plan is to effectively balance the tradeoffs between the following key objectives: • Ensure a healthy and sustainable wolf population to fulfill its ecological role (Objective A) • Address and reduce wolf-related conflict (Objective B) • Provide multiple benefits associated with the wolf population (Objective C) In support of these primary objectives, the plan also strives to: • Increase public	There is nothing in the euphemism-ladden overall goals cited above that speak to kiling wolves with vicious hunting practices which don't offer the wolves a chance, but which are meant to pander to the hunters.	0	Are we really to believe this is about anything other than 1) pandering to sportsmen who take pleasure in killing wolves and deer and to 2) the insurance industry who doesn't like too much wildlife that might run into cars traveling in areas where the wolves live/

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
			understanding of wolves in Wisconsin (Objective D) • Conduct scientific research to inform wolf management and stewardship (Objective E) • Provide leadership			
Rene Hersey	All of it	No	Thank you for this opportunity to comment on the draft plan. Firstly, this draft plan is extremely well written, I could read the entire draft and understand the proposal very easily. I for one am still recovering from the trauma I felt when I learned of the 2021 wolf hunt in Wisconsin. It's a positive to see that Wolves no longer have the number 350 hanging over the population. Wolves don't require a cap, they self regulate their populations, just give them the opportunity. The involvement of the Tribal Nations is a big plus, big step in the right direction because the the inter Tribal consultations w all 11 federally recognized Tribal Nations shows their deep regard and affiliation with wolves as family, as a relation and they have an ancient history of coexisting with wolves and all the wildlife. An example for us to follow. I applaud this inclusion, which was long over due. The social surveys are very encouraging, the broad public input by Wisconsinites was impressive. Your supportive numbers for wolves are ticking up from 2014 to 2022. Respect and wanting wolves on the landscape has become a dominant theme as is a recognition that wolves are ecologically primary to a healthy ecosystem. Objective D~to increase public understanding of wolves with consistent education, wolf summits, which will affirm your commitment to long term wolf "stewardship" to work collaboratively with WI citizens has to be a primary focus. That's a big plus to include this in the draft plan. Including the buffer zones around Tribal lands is a great step. The zone system and shortening reporting is a necessary step to have in place, but, I am opposed to any recreational wolf hunts and all mitigation should be non-lethal deterrents only. Page 140~Objective D~is great, increase public understanding of wolves. Please add their intrinsic value as sentient beings.	No to Strategy C1~NO WOLF HARVEST SEASON when wolves are not state protected or federally listed to ESL. Science has shown us that cryptic poaching increases when protections for wolves are decreased. The plan needs to bump up the non-lethal stewardship. Your draft even states the example that "over a 7 year period in Idaho that non-lethal methods were 3X as effective at reducing wolf predation vs lethal methods." No to hound training and using dogs EVER to chase wolves, this is just dog fighting, a terrible and destructive practice not to mention the infringement on private property, it's frightening to wolves, bears, and people. Page 135~No to trapping, it is not an activity, it is lethal torture & a practice which kills more than their intended targets. No to recreational hunting of wolves! The science is clear, a family pack can rebalance when one lower pack member is lost for any reason, but, when you begin to kill 2 or more in one family, the bounce back effect becomes less reliable, and fragmentation is a probability when you factor in other factors of mortality i.e. death from injury, automobile strikes, cryptic poaching and any mortalities from the DNR. Please read: (Kira Cassidy, et.al. "Human-caused mortality triggers pack instability in gray wolves" first published 17 January, 2023) Pages 30-32 are evidence that hunting and killing wolves will disrupt family structures which many family packs cannot recover from. The plan must avoid all lethal management of wolves. Wolves individual lives matter, their well being matters & considering them as co-inhabitants is paramount to changing public opinion and taking those census numbers even higher. The Committee lacked enough scientists from NGO's and advocates for wolves, I only saw the Sierra Club, but, beyond them, the Committee was heavy on trophy hunting groups along with government organizations. In the past 2 years a plethora of new U.S. science papers have been published which delve into the importance of pack dynamics, the pressure on the pack structure when loosing members, and the evolving understanding that wolves may help mitigate CWD, these research papers need to be read before a final draft plan is written. Wisconsin can become a true success story, there is much in the draft plan heading in that direction, but, tip the balance again toward hunting wolves and you'll loose all respect by the youth, and people who, in the majority, support a larger population of wolves living in WI.	7	I would like to see a lot more citizen scientists out on the landscape, particularly when snow is on the ground. Their presence discourages poachers. The PDM annual report should include how much education, on-going education and outreach to farmers, rural residents about increasing cohabitation & tolerance is completed each year. People need to be reminded and repetition is key. Thank you again for including my comments in the public record. Please don't go back to old policies, it is time with the growing positive feedback from youth and the public that wolves deserve protection and coexistence. Thank you.
Kara	All of it	Yes	Having researched wolves for over four decades (in my home state of MN and here in WI beginning in the late 80's) AND being a Psych. Researcher as well, I am uniquely positioned to speak with expertise about our wolves well-being. I found your document thorough, yet repetitive in many places. This causes most concerned citizens to give up due to its excessive length. I am very familiar with city/county/state documents, most of which are similar to this one. Unfortunately, if the DNR truly wants excellent feedback, I would highly recommend that you put out a brief Summary Document with links to the full copy. Especially when enacting such an important feedback survey. Thanks for listening! I liked the pertinent info. which began around page 102…quite helpful; good job. Studying wolf behaviors and what they realistically are and are Not doing to the state of WI is a key factor listed. Most people have NO true understanding of wolves…just heresay and stereotypes based on Fear.. it is long past time for Everyone to see wolves as they are: 1) They manage excessive populations (like deer/deer with wasting disease), 2) The alpha male and alpha female Mate For Life,	Well, it's getting late, so I'll cut to the chase of DNR actual practice over the past several years. To be clear,I DO like your proposed layout of all the ways you will study wolves now. Also, all the ways you will convey Factual Stats/Information to the public who desperately need it. As for Dislike, never again do I want to read about litters of pups being murdered in their dens. Reminds me of the harp seal clubbing. Your staff/hunters will need some serious mental health help, which is my field. Never again should WI, unlike MN, authorize annihilation numbers for its wolf hunt. After the past 2-3 years, our wolf numbers are approaching Extinction Status. Remember: this is not opinion, it's a researched Fact. I hope the WI DNR is sincere, as this document suggests, in changing its stance on these incredible wolves. I and others will be watching what is actually practiced. As a seasoned social worker and advocate, I can gather a large group in a heartbeat. The WI DNR should hopefully want to do the Right, Just, Humane thing in the treatment of wolves. If you wouldn't do it to your Beloved Dog, do Not do it to wolves (guideline).	7	Just that I am happy to work with the DNR regarding Any wolf plans. I am used to consensus planning at the city/county levels. I know my wolf knowledge base, longterm research, and psychology background could be both unique and invaluable to any further planning . Please feel free to contact me at my work cell: [redacted] if I can be helpful in any way. Like my GSDs, wolves are precious and priceless to me and I am committed to making sure they are understood accurately. Thank You, most sincerely, for taking the time to peruse my important feedback!

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
			keeping packs stable and definitely non-threatening to humans 3) Also, if wolves are allowed to do their jobs and hunters not given an horrific over-kill upon them, then ALL is in balance within our eco-system. Including no 'bothering' of any livestock, another falsehood about wolves. 4) Wolves live in family systems, caring for each other and caretaking for their precious cubs. Being a Family Therapist I can tell you withLots of research, that wolves take better care of their young then most people. Seriously! As the DNR, I certainly hope that you all understand by now that wolves (And All animals) Love just like we do; Grieve just like we do. 2023 is way past time to acknowledge the human qualities of wolf packs.			
	Most of it	Yes		it is appauling that Wisconsin is so driven by the desires of some to hunt and shoot, that it has a wolf harvesting plan that is put together under the guise of "A plan for stewardship, conservation, and management of the gray wolf in Wisconsin"	1	Its sad that there is such a focus on meeting the desires of hunters by the DNR that such a plan would be developed. Couldn't the wolves hunt the deer if WI had some management objective other than appeasing hunters and sportsmen who take pride in killing such magestic creatures.
Walt Christensen	Just the parts I am interested in	Yes	The recognition of the multiple ecological benefits of a healthy wolf population.		8	I favor increased reliance on wolves to improve ecological health and balance. The Plan is a great opportunity to educate the public away from the present high level of fear and even hatred of wolves. I would prefer the reduction or elimination of trapping wolves as an unnecessarily cruel practice. Thank you
Sandra Pella	All of it	No	- The previous plan referred to a specific wolf population goal. That population goal has been eliminated. - The ecological benefits of wolves (should be priority) which were understated previously and should be top priority. - Social survey which shows that the majority of people's opinions are now guided by science, ethics, and education resulting in positive support for the wolf population. - Increased acknowledgement and inclusion of tribal values - I am against any hunting of wolves, including recreational. While the zone system is important and the shortening of reporting periods a positive step, ultimately the goal must be NO hunting of wolves. - Non-lethal methods in conflict reduction.	- Hound training/hound hunting must be stopped. - Recreational hunting & trapping has no scientific basis whatsoever and must be banned. - Pro-hunting groups are clearly biased and fail the further advancement of a truly democratic and fair wolf plan. - Any committee / oversight committee should include a combination of biologists, scientists, professional, and I do see a need for relevant opinions from tribes and the public in protecting wolf recovery. - Absolutely NO HOUND HUNTERS. NO bounty hunters, no trapping.	6	This plan has made many advancements - I truly believe ethics must also play a crucial role when considering these wonderful sentient beings whom without the ecological places they belong to could not survive.
Linda Moore	All of it	Yes	Educate - important to inform public of benefits the wolves provide to the ecosystem and the negative results from previous wolf conflict mismanagement. Science based and working with tribes for planning.	I had limited time to read entire document. I may have missed it but would have found a condensed version covering overall basic planned strategy you are pursuing. Many examples of stewardship of others, not sure if those were some of the science based planning you are referring to.	7	End hunting. Use Non Lethal means only if science proves need for action.
	All of it	Yes				Wolves are dope
Genie Ogden	Most of it	Yes	It is very detailed. The data about the wolves,and whether they have an effect on CWD.		5	I was upset by the wolf hunt a couple of years ago. Many wolves were killed, more than the number called for. And this also happened when there were the annual wolf hunts, before the federal government outlawed them. Wolves kill the weakest and sickest deer and so the deer herd becomes more healthy. Aldo Leopard talked about this in his essay, Thinking Like a Mountain.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Concerned citizen	All of it	No	Recognizing the ecological benefits of wolves. Also, realizing and appreciating the cultural values of some of our Native American tribes who also consider wolves as a Sacred species by setting buffers around tribal lands. I am a Native American that considers them to be one of our most Sacred species. Acknowledging the importance of public input and the fact that the vast majority of Wisconsinites and the American people don't want wolves hunted.	Not acknowledging that wolves self-regulate their numbers. Self-regulation in large carnivores like wolves ensures that the largest and the fiercest do not overexploit their resources. According to a recent work published in OIKOS, population control is what distinguishes wolves and other "apex predators" from the rest. Wolves are highly social animals that live in well-organized family units called packs. Cooperative living gives wolf families a number of benefits. In addition to facilitating successful hunting, pup-rearing, and defending pack territory, cooperative living allows wolves to limit their own population – for example, they control the numbers within their group by only letting certain members breed. Using recreational wolf hunting as a conflict resolution tool doesn't work. On the contrary, killing wolves can break up packs, and smaller packs have a harder time successfully bringing down large prey. Smaller packs are often forced to find prey that's easier to kill, such as livestock. Here are a few examples of what can happen when individual pack members are lost to hunting, A research paper published in the Journal of Animal Ecology in 2014, similarly demonstrated that the death of a single wolf can impact the entire pack. Using data from a long-term study of wolves in Denali National Park, wildlife biologist Bridget Borg, with Scott Brainerd, Thomas Meier and Laura Prugh, studied what happens to packs when one of the alphas are killed. They found that although loss of a single breeding wolf may not adversely affect the overall wolf population, it can cause the dissolution of the pack, given the right context (small pack size and mortality occurring during breeding season). In most cases where a pack broke apart, the dissolution was preceded by a loss of an alpha (especially when the pack was small to begin with). They found that out of 70 packs in Denali National Park, the death of an alpha was associated with 77% of packs that split up. Moreover, the pack was more likely to dissolve if it was the alpha female (mother) that died or if the pack was small. snaring, or trapping. Borg, B. L., Brainerd, S. M., Meier, T. J., Prugh, L. R. (2015), Impacts of breeder loss on social structure, reproduction and population growth in a social canid. Journal of Animal Ecology, 84: 177–187. doi: 10.1111/1365-2656.12256 Researchers at Washington State University found that killing wolves to keep them from predating on livestock is counter-productive. In other words, the killing of wolves to protect livestock can actually cause more sheep and cattle deaths the following year. Wildlife biologist Rob Wielgus and Kaylie Peebles studied 25 years of lethal control data from U.S. Fish and Wildlife Services Interagency Annual Wolf Reports in Montana, Idaho and Wyoming. Wielgus et. al. found that killing 1 wolf increases the likelihood of attacks on sheep by 4% and on cattle by 5-6%. The reason for this is likely that indiscriminately killing wolves disrupts the social cohesion of the pack. Moreover, in intact families, offspring tend to stay with their pack longer and breed much later. When packs are disrupted, and dissolve, offspring tend to breed younger and there are subsequently more breeding pairs and packs of younger wolves without older, more experienced wolves to guide them. These packs can become bound to one place when pups are born and occasionally turn to livestock as an easier food source than elk and deer. Wielgus, B., Robert, Peebles, K. A. (2014), Effects of Wolf Mortality on Livestock Depredations. PLOS One, 9(12). doi: 10.1371/journal.pone.0113505 Not prohibiting hunting with hounds. If you've ever seen what's done to an animal using this method - it's one of the most abhorrent things anyone has seen in there lifetime. Not only cruel to animals hunted, but also to the dog trained to hunt them down putting them in harms way. This practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the public.	3	Acknowledge the fact that wildlife belongs to all American and most of us want to see wolves alive
Caleb Tydrick	All of it	Yes	I like the elimination of a numerical threshold which is used to weaponize against wolves. I think buffer zones should be enlarged. I think that there should be more of an emphasis on the ecological and evolutionary importance of a large wolf population. Deer have become a nuisance and are destroying wisconsin ecosystems.	I dislike the predominant focus on economics of a few farmers, when wolves are a public resource to all Wisconsinites. More should be focused on creating sustainable tourism economies that promote Wisconsin's wildlife and natural resources including wolves. Non lethal measures should be a top priority in depredation prevention. Native American input should also be held to the highest regard.	8	I love wolves. They are an intelligent beautiful and important species. They represent the best of the state and country when private and public organizations come together to promote conservation. Wolves belong here as do all Americans. They have a right to prosper as all wildlife deserves. They should always be he'd to a high regard.
Dave k.	Just the parts I am interested in	Yes	Having a lower population.	Having any wolves at all.	1	The Willow flowage area deer population has been destroyed by wolves.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
	Most of it	Yes	I appreciate the plan's thorough overview of wolf history and behavior in Wisconsin, the input from the tribes, and the consideration of the public's opinion. The education of all those potentially affected and the cooperation between all groups is crucial and will remain so going forward. Specifically... 1. I support the effort to assess the local wolf population on a small scale basis rather than meeting a statewide pre-set quota. 2. As a member of the farming community in Northern Wisconsin myself, I would encourage other farmers to use several non-lethal strategies, listed in the document to discourage and prevent wolf depredation in advance, not only after, problems take place. Livestock guardian dogs can be highly effective in maintaining a perimeter around your farm. 3. If zones are put in place limiting the wolves allowed to be removed, all efforts should be made to actively work with farmers in and directly around those zones to provide information on the packs and their specific radio-collared location in relation to the farms. A specific and consistent online method to provide this data to farm owners would be beneficial. 4. I encourage continued education of the general public to provide opportunities for understanding of how people can safely live alongside the wolf and prevent misconceptions.	I would discourage the disruption of wolf families/groups as much as possible to prevent negative effects on their ecosystem and respect their importance to the tribes. Providing additional funding to educate hunters and to prevent dog and livestock depredation prior to it becoming a problem may be a helpful tool.	7	Thank you for the opportunity to comment. Please continue to work with the public.
Kenneth A Block	All of it	Yes	- The reasonable integration of the Social Sciences Survey results into the draft plan as a whole. I do question the validity of its findings however (see #5). - The clear identification that wolf capacity and range in the state has perhaps reached its limits and maintaining present day levels is the ongoing goal - not continued expansion. - Acknowledging that BOTH lethal and non-lethal methods of management are valid within their identified constraints and application to specific situations. - The subzones utilized to protect wolf ranges in proximity to federally recognized American Indian reservations, as well as to allow greater flexibility to reduce wolf populations near higher human / domesticated animal interaction areas near the center of the state. - I like to expand my life experiences and have worked in large public natural areas as a ranger, I was a raw food vegan for two years until my hair started falling out, and my latest adventure has been to install (come on they are really non-green) lithium storage batteries and solar panels on my farm so I am not dependent on the grid, and I grow all my food, including meat. Life offers so many opportunities; unfortunately, for many advocates of anything, they too often have a one side, very unbalanced life experience. I have passionately experienced both sides of this wildlife predator situation - as a conservation employed ranger on the county, state and federal level in numerous states east, west, middle, north and south. I moved to Northern Wisconsin in part because wolves were present and I took the leap to start a multi-species farm - including sheep, the ultimate prey animal. It has been quite the experience. I do however see a lack of well-rounded perspectives from that survey of course, but so too I know that exists in government agencies and NGOs / conservation / wildlife advocacy organizations - especially with wildlife biologists. What is good in this plan is that you DO balance all the sides and perspectives concerning wolves. See # 7 for a caveat to this.	- The Social Sciences Survey NOT keeping the same questions / language the 2014 survey, then the INTERPRETATION of the new survey answers to compare to the 2014 answers. This huge subjectivity is NOT "scientific" and lends to a cloud of purposefully crafting OPEN ENDED questions to enable interpretations that might please special interest groups pressuring the DNR - most likely the supposed urban / "better educated" and urbane (supposed and self-anointed) protectors and appreciators lovers of wildlife. I do however laud the DNR for not allowing any such bias to unduly slant the actual objectives and goals of the actual draft plan. - There is absolutely no explanation of the liability for adverse human injuries and perhaps some future "virtually non-existent chance" of human death by wolf to the various governmental agencies involved in promoting reintroduction and maintaining wolf populations in Wisconsin. Depredations and human fatalities cause by bears and especially domesticated dogs are highlighted in this plan. YES - they happen, but they are never highlighted in reports by conservation groups or conservation agencies - if not for public media reports, we'd almost never hear about those. I suspect those are not reported because that would create a reality of dangerous interactions and perhaps negatively impact conservation efforts concerning bears and especially mountain lions. As to domesticated dogs; when pit bulls maul a person to death, usually its owner is prosecuted and sued in civil court for negligence. Funny, "Playing God in Yellowstone" is highlighted in this draft, yet the plan concerns not a bounded national park, but one third of an entire long settled and populated state. Compensation for livestock and pet depredation is not the same thing as liability for human injuries and death. Bear and mountain lion / human interactions will take place - however, they do not hunt in packs and maul their prey to death in packs. The public reacting to a pack of pit bulls mauling a human to death are not good. Sooner or later, with endangered species protections and the resulting the natural expansion of northern Minnesota wolf population into Wisconsin and the UP, and the ensuing spread in range virtually to the Dane County line, regardless of statistical probability, something will happen. Since the historic range of Gray will most likely will never infiltrate the northeast, especially in what I consider our sister state of Pennsylvania, the Wolf Range in Wisconsin is a huge gamble over the long term. The ever growing overpopulated (by "better educated wildlife and environmental advocates) urban sink hole of the Milwaukee / Madison region will prevent range creep between the cities and to the south. However, as it is now, the third most wolf pack population in the state surrounds Wisconsin Rapids, and is a stones throw from the Portage / Steven's Point corridor. Ironically, the Chicago / urban pit of the frozen north, Minneapolis / St. Paul / Rochester, is keeping the range of wolvers in that state to less than in Wisconsin it seems. God Bless your efforts at managing this range; a range much more difficult to manage and control than simply in a NPS unit such as Yellowstone of the isolated Isle Royal. Even up in	8	"Human intolerance". That term is so planned to evoke a biased perspective as does "human caused climate change". I had to smile every time I read that. It would be hard for me to work in this field nowadays. Of course - urban, educated wildlife and nature lovers are "tolerant humans" at least conceptually and aesthetically... Approval of this publicly proposed and commented on plan: Please have some semblance of ethics, morals, character and honor. Do not allow the NRB to substantially change this plan with amendments and approve it simultaneously without further public input - as was done with the Rib Mountains Master Plan.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
				the Wisconsin north woods (in the Chicago vacation home seasonal suburbs) we have managed to make a vast area of state and national forests into a patchwork of public lands and residential / mini urban intrusions. So too in zone 5, and the buffer zone 4A is proof there is danger between places like Necedah and Steven's Point - AND - the closing gap between Point and the Wausau area. - I doubt "ecotourism" will be successful in encountering wolves, but I am sure those educated urban wildlife lovers and national conservation organization members, sporting their REI caps and Subaru Outback's (with kayak racks) will try. They will find it harder to actually observe wolves in these generic patches of public wolf habitat. These are not an isolated Island, a million + acre NP. As it is it is hard enough to run into the right timing to see the huge herds of Bison at Custer State Park, Badlands or Wind Cave NP. So, I suppose I am pointing out the unfortunate tendency of the DNR to overplay economic development when supporting conservation plans, and "ecotourism" is just becoming double talk for crowding natural areas, destroying natural quiet and introducing economic development (hotels, crowded campgrounds, fast food, etc.) in the name of conservation and appreciating "wildlife". - I feel you are confusing American Indian Treaty law with "Sovereign Nations". Ther needs be a good Treaty Lawyer involved to add a synopsis of the actual status of Federally Recognized tribes under Treaty Law. They are technically "domestic dependent nations" that exist through the continuing good will of Congress. Yes - there are government to government relations - which does NOT make them "partners" (a term you use in several places), and that relationship is different between American Indian nations and the Federal Government than with State Governments. I also appreciate your respectful use of 'First Nations" mentions in the plan. However, like the Feds - and so many in our Congress and Executive that ignore / incorrectly apply Treaty Law and the Constitution itself, if you are speaking in Terms of American Indian Treaty Law, and you are in this plan, the reference is "American Indian", not First nations or Native Americans. Of course, since the rest of us are naive Americans - the use of those other terms are not surprising. - The Social Sciences Survey NOT keeping the same questions / language the 2014 survey, then the INTERPRETATION of the new survey answers to compare to the 2014 answers. This huge subjectivity is NOT "scientific" and lends to a cloud of purposefully crafting OPEN ENDED questions to enable interpretations that might please special interest groups pressuring the DNR - most likely the supposed urban / "better educated" and urbane (supposed and self-anointed) protectors and appreciators lovers of wildlife. I do however laud the DNR for not allowing any such bias to unduly slant the actual objectives and goals of the actual draft plan. - There is absolutely no explanation of the liability for adverse human injuries and perhaps some future "virtually non-existent chance" of human death by wolf to the various governmental agencies involved in promoting reintroduction and maintaining wolf populations in Wisconsin. Depredations and human fatalities cause by bears and especially domesticated dogs are highlighted in this plan. YES - they happen, but they are never highlighted in reports by conservation groups or conservation agencies - if not for public media reports, we'd almost never hear about those. I suspect those are not reported because that would create a reality of dangerous interactions and perhaps negatively impact conservation efforts concerning bears and especially mountain lions. As to domesticated dogs; when pit bulls maul a person to death, usually its owner is prosecuted and sued in civil court for negligence. Funny, "Playing God in Yellowstone", as some people perceive it still, is highlighted in this draft, yet the plan concerns not a bounded national park, but one third of an entire long settled and populated state. Technically the range spreads over at least half of the state regardless of exactly how many acres wolves occupy in that range. Compensation for livestock and pet depredation is not the same thing as liability for human injuries and death. Bear and mountain lion / human interactions will take place - however, they do not hunt in packs and maul their prey to death in packs. The public reacting to a pack of pit bulls mauling a human to death are not good. Sooner or later, with endangered species protections and the resulting the natural expansion of northern Minnesota wolf population into Wisconsin and the UP, and the ensuing spread in range virtually to the Dane County line, regardless of statistical probability, something will happen. A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
				Wisconsin Rapids and is a stone's throw from the Portage / Steven's Point corridor. God Bless your efforts at managing this range; a range much more difficult to manage and control than simply in a NPS unit such as Yellowstone of the isolated Isle Royal. In a way, you are making Wisconsin as settled and populated into a "public lands or park" for wolves with millions of people and hundreds of towns and cities as inholdings. Like those who dare to light "controlled burns" - sooner or later one "gets away". Someone has to pay the price - a manager, a person in addition to the pay or from the State / Federal treasury. Even up in the Wisconsin north woods (in the Chicago vacation home seasonal suburbs) we have managed to make a vast area of state and national forests into a patchwork of public lands and residential / mini urban intrusions. So too in zone 5, and the buffer zone 4A is proof there is danger between places like Necedah and Steven's Point - AND - the closing gap between Point and the Wausau area. Hint: all of those special interest groups like the Sierra Club who apply pressure to government officials and employees to take all of the risks implementing their appreciation for the environment and wildlife - will fade into the shadows and leave all the fingers pointing at those government employees if something tragic results. - I doubt "ecotourism" will be successful in encountering wolves, but I am sure those educated urban wildlife lovers and national conservation organization members, sporting their REI caps and Subaru Outback's (with kayak racks) will try. They will find it harder to actually observe wolves in these generic patches of public wolf habitat. These are not an isolated Island, a million + acre NP. As it is it is hard enough to run into the right timing to see the huge herds of Bison at Custer State Park, Badlands or Wind Cave NP. So, I suppose I am pointing out the unfortunate tendency of the DNR to overplay economic development when supporting conservation plans, and "ecotourism" is just becoming double talk for crowding natural areas, destroying natural quiet and introducing economic development (hotels, crowded campgrounds, fast food, etc.) in the name of conservation and appreciating "wildlife". - The recent amendments made after the DNRs Rib Mountain master Plan was submitted to the NRB comes into play at this point in my comments. The DNR used COVID and a mysterious reduction in previously approved funding as a pretext to allow the Chamber of Commerce in Wausau to hire an alpine ski development firm to produce the planning document for the DNR that the DNR lost funding to do on their own. This sham was so obvious, and although the DNR came to the NRB after years of planning and public input with a plan balancing special economic development / high resource, scenic view and natural quiet impact interests with extreme conservative / non-development interests, the NRB amended the plan then approved it making it the largest expansion option possible and negating all the balanced work the DNR presented to the board. In this move, the NRB actually developed most of what tiny designated "natural area" existed in Rib Mountain. Then, of course the NRB presented a planning award to the DNRs planner. Okay, so the old Potomac two-step is now the old Wisconsin two-step? Will lethal options also be eliminated through amendment in Madison once this plan gets under the nose of those educated and wildlife loving urban folks? - I am also pointing out the HUGE ongoing investment in personnel and funding to continue and maintain the wolf program in Wisconsin. I am sure the budget for those involved from the State itself has to be significant and thew goals of this plan can only indicate much more will be requested. I feel the actual cost of developing and implementing this plan going forward should be included as an appendix. - I feel you are confusing American Indian Treaty law with "Sovereign Nations". There needs be a good Treaty Lawyer involved to add a synopsis of the actual status of Federally Recognized tribes under Treaty Law. They are technically "domestic dependent nations" that exist through the continuing good will of Congress. Yes - there are government to government relations - which does NOT make them "partners" (a term you use in several places), and that relationship is different between American Indian nations and the Federal Government than with State Governments. I also appreciate your respectful use of 'First Nations" mentions in the plan. However, like the Feds - and so many in our Congress and Executive that ignore / incorrectly apply Treaty Law and the Constitution itself, if you are speaking in Terms of American Indian Treaty Law, and you are in this plan, the reference is "American Indian", not First nations or Native Americans. Of course, since the rest of us are naive Americans - the use of those other terms is not surprising. - Product B4c: Support increased congressional funding for USDA Wildlife Services. Yes, domesticated livestock falls under the auspices of the USDA. As it is their "Wildlife Services" division is total mission creep / overlap with the USFWS. That is not surprising, since the BLM, US Forest Service and USFWS began overlapping with the NPS by building visitor centers, and		

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
				developing educational programs, etc. All agencies do everything - we all have a "mission" to educate" the public. I am not saying that is a bad thing, it is simply a thing. Where the heck else are all of these continuing UW Steven's Point and Penn State Wildlife Biology and Forestry graduates going to get a job beside Animal Control for local law enforcements agencies, huh? Oh yeah, the DNR's Wolf Program! Sorry, I overlooked that. However, since you are all in this together while setting up your retirement jobs with those NGO not-for-profit "partner' conservation / wildlife groups, you should explain fully the ROLE the USFWS play in all of this. After all the USDA and DNR need agreements from the USFWS, as do the Tribes, to manage any wildlife in the good old US of A. That really seems to be missing here. Why? - "Another study attributed a 24% average reduction in county deer-vehicle collisions to changes in deer behavior associated with the areas being occupied by wolves": Look - the local police in most of the range will not pull over anyone unless they are driving more than 11 MPH OVER the posted limit. I have never lived in a state that has so many small towns and police departments who know everyone in the town somehow. Drunk driving, tailgating, illegal passing, and not enforcing posted speed limits in a reasonable manner contributes to this citing. Point? Anecdotal statements that do not consider all the obvious alternative contributing factors is propaganda purposefully cited to reach or support a preconceived end. In this case wolves might not impact deer hits; just enforce the MV laws and a lot of people and wildlife will be spared - including wolves. I saw a black bear on a forest road in Ashland County once - it was about to cross the road about 100 yards ahead. Some guy was tailgating me (45 MPH posted road), then passed me doing at least 60 MPH and missed the bear buy inches. A BEAR! Opps - he swerved so hard he failed to avoid a tree though! Maybe he was an urban educated tree hugger? - ..."avoiding letting pets out at night or unsupervised,..": Your plan referenced materials mention the psychological impact of depredations on land / farm owners. However, the goals and objectives of the draft itself only mention monetary compensation. You do mention and no-lethal abatement by using guardian dogs. These by nature must be out all night and not confined or near a building, even if your livestock are in proximity to, but cannot be placed in a building at night. As it is, many old farmer will swear they shed no tears when butchering or dropping off an animal at a locker for processing. Regardless of what PETA folks and Vegans might think, locker personnel always tell they see many a farmer tear up when unloading the stack trailer at the locker. You can tell yourself not to become familiar to that point with animals raised for slaughter. However - for two years or so you do everything to keep them healthy and protected from predators. After all of that concern and care - all people have feelings; we are all the same emotionally under the surface. That needs to be included in educating all sides - to provide a common ground and understanding. My Marama Sheep Guardian dog behind my woven wire electric fencing - if a lone wolf gets in, the wolf will lose. If a pack gets in - my kids will be forever scarred of she gets mauled to death. Protections need to be a little more lenient in specific situations. I'd much rather see a wolf pack remain free and alive. Heck, I see no need to shoot coyotes unless they jump over my fencing somehow and attack my livestock or pets. I think this plan should lobby for some more leeway in the ESA for specific situations, such as guardian dogs on private property. If you are going to lobby for more USDA Wildlife Services Funding, why not lobby congress on behalf of the state for amendments to the ESA? The is a lot of stress and remorse over the loss of livestock and guardian dogs / pets taken by any predator - and I am fully aware of those many other predators besides wolves. - As usually - plans always purposefully evade a premise that worldwide or even continental populations should be in the equation. There are plenty of gray wolves on Canada and Alaska to be sufficient for species survival. The Lower 48? I feel if you are making a claim that the developed state of Wisconsin has an "ecosystem" intact that can be improved or rejuvenated by wolves, and that Minnesota and especially Wisconsin should shoulder almost the entire recovery of the original range of wolves for the entire eastern woodlands of the United States - you need to say it and support that, This plan obviously infers that, but carefully avoids saying that in plain English or even Ojibwe!		
Clint Blackburn	Most of it	Yes	I don't like much of it. The plan still intends to annihilate a large segment of a species that has no intention of sending any other species to extinction.	It does not address the fact that wolves mate for like. The Alphas of a pack are a couple that, unlike most humans will be together and will both lead the pack for the reset of their lives. If the alphas are removed, the pack itself has little to no chance of survival	3	Remove any "Wolf Management Plan" and allow the wolves to survive in nature. It is not up to humans to decide what species survives and how many of them should be allowed. We are not superior to any other species.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Kjerstin Bell	All of it	Yes	Continuing to monitor and learn from existing wolf populations. Overall, though, there should be no management plan.	All of it. Why even include the statements from the tribal nations when you completely ignore all they say? Leave the wolves alone. They can "manage" themselves. Studying, monitoring, is important but can certainly be readily accomplished without annual planned slaughters. Indeed, the two have nothing to do with each other.	0	
Pamela W	Just the parts I am interested in	No	I appreciate the details & explanations of Wisconsin-specific wolf biology and history. I appreciate the acknowledgement that wolves are a keystone species and an important component of healthy ecosystems. I especially like the sidebar on pg 13/14 that describes wolves' ecosystem services. I appreciate that you have acknowledged tourism and spiritual aspects, wolves' role in reducing disease transmission, and possibly reducing deer-vehicle collisions. I like that you recognize public repulsion for vicious practices like pursuit with hounds and trapping and snaring. I like that you seem well aware of illegal kills and do not conceal the problem. I like that you seem to have surveyed many academic and scientific studies and include their findings in the Plan. I like your consultation with Tribes and study of public attitudes toward wolves.	I dislike the following: -No acknowledgement that wolf populations are self-regulating -It is offensive to describe hunting and trapping as "multiple benefits" -"Harvest" is an offensive and misleading term. Identify the actions as what they are: killings. -The composition of the Wolf Management Planning Committee is clearly biased, with only 2 or 3 token advocates among 29 committee members. It is disingenuous to describe the committee as "inclusive." -No apparent requirements or expectations of livestock producers and hunters with respect to compensation. I realize that compensation is mandated by statute, but surely administrative rules can establish responsibilities for livestock producers & hunters to properly steward their animals. -The Plan downplays nonlethal methods. -No acknowledgement of wolves as sentient beings. -Apparently, very inadequate enforcement, as evidenced by illegal killings. The number of collared wolves killed illegally between 1979 and 2021 is atrocious and shocking (p 53). -Killing of pups is unacceptable. -Awful "allowed methods of take" (foothold traps, snares, bait, electronic calls, pursuit by hounds). Each of these ignores fair chase principles.	6	I am impressed by the comprehensiveness of this Plan but troubled that you miss a glaring, screaming question: Yes, it may be possible for wolves to survive relentless persecution via recreational hunts, but why? Who does this serve? Doesn't this ignore majority public sentiment against recreational killing? On page xi "species management should…accurately reflect the ecological and social landscapes in which they are applied." In this respect, the Plan falls short.
Alexander Vaeth	Most of it	Yes	1. The overall emphasis on ensuring a healthy and sustainable wolf population that can fulfill its ecological role (vs. using subjective/political population targets). 2. Respect shown for the cultural significance of wolves, most importantly for First Nations members, and especially as evidenced in the inclusion of "buffer" zones around First Nation land where wolves may not be hunted. 3. The inclusion of Strategy B5- Continue to research conflict mitigation, prevention measures and develop new techniques for addressing conflicts. 4. The emphasis on educating the public about wolves and non-consumptive "uses" of wolves.	1. I think Strategy B5 should be the priority in mitigating livestock loss. That is, I think non-lethal prevention should be the primary strategy for reducing wolf-related conflict and explicitly outweigh all the rest. 2. I do not believe the plan mentions addressing the main source of wolf-related conflict: human encroachment on wildlife and lack of planning for sustainable human development. What can this plan and the Department do to advocate for more sustainable human development in Wisconsin? 3. I do not like that the wolf remains a game species in Wisconsin. 4. I do not like that the use of hounds for hunting wolves (or any other species for that matter) remains legal and enshrined in law in Wisconsin.	8	I believe this plan represents a step in the right direction for wolf management in Wisconsin. However, I think it remains hindered by its apparent orientation toward wildlife and wildlands in general as resources to be exploited. A more ambitious plan would consider more urgent aspects of wildlife management such as habitat protection and restoration, and the relationship between predators such as wolves and ecosystems that may prove more resilient in the face of climate change and species extinction.
	All of it	Yes	I appreciate the efforts made in the objectives and strategies listed at the end of the document. Its important, specifically, to inform the general public of the benefits of wolves to the entire ecosystem using science and data. The great thing about science is that it's true, whether or not you believe in it, and its important to show that wolves are not the enemy, as they are so often portrayed.	I have a concern regarding the current use of either the Adams or Fuller models in forecasting/determining this years quota. It doesn't seem, from what I read or saw, take into account the 2021 harvest season. If I follow the trend-line, would 2021 be considered an outlier? If so, what safe-guards would be in place so that the number of kills doesn't exceed the number of licenses?	7	I concerned with what exactly the motivation is on killing wolves. Maybe I missed it, but I didn't see it in this document, besides the studies referenced. It appears special interest groups and lobbyists have clouded the water with the notion that wolves are killing all the deer and that's why there's no deer for hunters, so it becomes just revenge killing. There really needs to be an emphasis made on getting facts based on science and data out to the public on the importance of wolves to the entire ecosystem. What actions are being put in place for poaching and falsifying killings or not reporting killings? There seems to be a lot of trust built in this plan that these hunters are going to follow the 24 hr call-in, assuming they call at all.
Jesse Niemeier	Most of it	Yes	N/A	No population goal or not a low enough population goal	1	I'd like to see the original population goal of 350
William McConnell	Most of it	Yes	The portions of the scientific background which are peer reviewed.	All three objectives seem to revolve around and depend on killing wolves in order to manage the population.	3	The courts have to manage wolf populations in WI because the WI DNR is politicized and science is often overruled. The WI DNR is beholden mainly to the hook and bullet crowd. The WI DNR conducted the outrageous 2021 "legal" wolf slaughter. The commission overseeing the WI DNR is highly political. Wolf-human conflict should be addressed by live trapping and relocation if possible. No hunting of wolves. No hunting wolves with dogs. No reimbursement for injured or killed dogs. No trapping whatsoever. Wolves are already heavily managed by automobile collision and poaching, neither of which is really managed or enforced against. The ridiculous, purposefully managed overpopulation of whitetail deer contributes to a higher wolf population. Many mammals are heavily over trapped. If this were not the case, wolves would have access to a more natural food source and may be less likely to encroach on domestic livestock. I believe there should be some large wild habitat areas where wolves are left to themselves and not managed by humans. They were here first.
Travis leuzinger	All of it	Yes	I liked the information on how harvest influenced the hierarchy of newly established packs. I think that is important information when considering the expansion of the grey wolf's range in Wisconsin.	I see why the social impact of grey wolf management is discussed in the draft, however I am much more concerned with the scientific and ecological management of the animal. If the goal is to create a cohesive ecosystem with grey wolves on the landscape then I believe that is best done through logical decision making rather than emotional persuasion.	8	I believe that the reinstatement of a managed harvest season is vital in effectively managing our grey wolf population. Wisconsin was once home to the grey wolf and should always be home to the grey wolf. I hope to have a healthy and managed population on the landscape for generations to come.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
	Just the parts I am interested in	Yes	I think a lot of work has gone into the plan. It attempts to find a balance between maintaining a viable wolf population and minimizing depredations and other negative impacts of living with wolves.	Specifically the collective quota of only 4 wolves for all 1B zones is too few. I raise sheep and cattle in a 1B subzone. Several of my neighbors have experienced significant losses of cows, calves, chickens, and even horses from wolf depredation, yet now we are placed within a 1B refuge zone.?? I am generally in favor of maintaining a healthy wolf population in WI. However I would think it more prudent to allow a certain number of wolves taken, per each 1B subzone. So if 4 wolves are taken in the 1B subzone around Bad River for example, close that subzone only, etc.	5	Thanks for all the work that has gone into drafting this plan.
Carol Johnson	Just the parts I am interested in	Yes	Removing an arbitrary wolf population goal is important to make sure the best-available science is centered in wolf management The low quota zones are an important and welcome addition to the plan The plan is rightly focused on the ecological benefits of wolves		10	
Jim Yates	Just the parts I am interested in	Yes	Keep harvesting using the zone maps according to needs	Trial area should have some harvest management	6	Keep managing with harvest maps proposed. Thanks
John shipley	Most of it	Yes	Long range plan	Really nothing		Please..NO hunting wolves with dogs…this is NOT hunting…no sportsman could advocate for that.
		Yes				Wolfs range bull.I'm 70. In the 60s and 70s there were no wolves in Rock county. Then came the DNR and the wolf. Calves and cattle have been dying ever since . And it's not feral dogs .
Julie Clare Zachman	Most of it	Yes	Sound science, better understanding of what the population numbers should look like, citizen input, respect for tribal input and treaty rights, better understanding of how wolves fit into the environments they inhabit.	Don't like a wolf hunt at all. I'd like to see plans for permanent and complete funding of research, studies, etc. Stop, stop, stop the hounding. Also, I'm surprised there are no veterinary groups in the Plan Committee.	8	As a Wisconsin resident and as a person concerned with the ways humans affect, and sometimes damage, the environment I would like to see no wolf harvest, and lethal control of wolves kept to the absolute minimum. I am pleased to see scientific knowledge play a central role in the wolf management plan, and I strongly support its continued centrality. The traditions and ways of knowing of native tribes are of great value as well. It's good that the Wisconsin tribes are being consulted, as they should be per their treaty rights, and that low quota zones are being established around reservations. While I am not a member of a tribe, my ancestors generations back no doubt had a close connections to their native places, the British Isles and Western Europe. They may have thought of some native animal as a brother, and had cultural traditions around them. There is no reason I shouldn't feel the same here in Wisconsin. My own religious tradition teaches about love that should be given to animals and nature. My birthdate and one of my given names relate to St. Francis of Assisi, whose life and teachings showed a love and respect for many animals — Sister Cricket, Brother Pheasant, Sister Swallows, and of course, Brother Wolf. Whether or not the many stories are apocryphal does not take away from the long history of humans desiring to live in love and harmony with the natural world, including scary predators. Being apex predators, highly intelligent, and near relatives of the animal species most beloved of all by humans, puts the wolf in a special spot, indeed. My admiration and respect for wolves does not mean I think everyone must love or even liked them. To have your farm animals killed by wolves has got to be horrific. It stands to reason that there should be the ability to control and compensate, as well as train, support, and educate those whose animals may become prey. Continuous scientific studies in this area must be funded as well. It also makes sense to me that those who live in wolf range should feel heard. It is nevertheless true that all Wisconsinites have a legitimate interest — economic, environmental, and emotional — in preserving our great forests, our unique trio of biomes, and the enjoyment of all sorts of visitors to our wilder places, including tourists, birders, vacationers, and other non consumptive appreciators of nature. I am very supportive of hunting in general. My sympathy for deer hunters, trappers, and other consumers of forest animals is tempered by my awareness that the fees and licenses purchased by such are sometimes used as a reason for a minority to have the primary say in wolf and herd management. The economic benefit of non-consumptive users are enormous, and the health, balance, and wise management of the ecosystem are important to all citizens. Your draft report touched on aspects of the effect of wolves on forests that greatly interest me. That their presence changes browsing habits of ungulates, predation of mice and voles, thus affecting seed dispersal, and no doubt many other effects, seems to me like a very big deal. This section followed a tempered account of claims made about changes to plant life in Yellowstone following the reintroduction of wolves. But I notice that the better quality data and methodology that have been used to study northern forests after wolves came back have resulted and findings of the same general nature, albeit less dramatically stated: wolf presence has an effect on the plants of the forest. This may be me romanticizing, but I think of apex predators like wolves as 'Protectors of the Plants'. I cannot imagine that we would ever have a full

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
						understanding of our own Wisconsin biomes if a keystone species that is supposed to be there is driven to a population that it wouldn't arrive at naturally. Finally, I believe there is a connection to mental health and hunting practices. I have heard of the "shoot, shovel, and shut up" saying of vengeful, illegal wolf killers. I've read truly vicious trolling of papers out of (I think) Michigan Tech that come to the 'wrong' conclusion Isle Royals wolves. I've read about bear hounding and the horrific regulations around putting trapped animals (feral cats, bear cubs) in roll cages to be terrorized for hours on end as part of hound 'training'. I'm sure there's more. Some day the full suite of inconsistent, and at times inhumane, regulations around the treatment of animals large and small in Wisconsin will become widely known, and it will be a shame and a stain on our culture. What's the mental health connection to wolves? Fair chase, and ethical hunting practices feed the soul. My very stressed out Dad would go hunting with his buddies on fall Saturdays and come back with pheasant and squirrel for Sunday dinner. Those Saturdays were good days, he was happy and at peace. If he ran around with a wolf-hating crowd of hounders, he would not have been the better for it, and those Saturdays and Sundays would not have been the pleasant memories they are.
Lee Robinson	All of it	No	The new plan removes an arbitrary population goal, ensuring wolf management is adaptive and based upon the best science; recognizes the ecological benefits of wolves; emphasizes reducing poaching; acknowledges successful wolf recovery requires engaging the steadily growing , and favorable public support of a viable wolf population; creates overdue buffer zones around tribal lands (add/expand); and notes accountable farming practices, such as proper carcass disposal, equates to fewer wolf-livestock conflicts.	I would like to see higher priority placed on proven, science -based non -lethal methods to reduce wolf depredation; permanent, stakeholder and scientific oversight boards of the wolf plan; and a framework to ensure it is regularly updated based upon the best available science.	9	I want to thank the WDNR for writing a wolf management plan that centers on science, public input, and Tribal engagement- all of which are the pillars of the best practices to protect, conserve, and sustain gray wolves, and other natural resources , in Wisconsin.
Keith Caulfield	Most of it	Yes	None.	The plan was written in an office by office dwellers, not in the woods by people that need to deal with the consequences of the poor judgment of others.	1	Please consider the number of communities in this state that prohibit specific breeds of domesticated dogs on the premise of safety. How is a wild wolf more compatible with a settled territory of Wisconsin than a pit bull?
Casey	Just the parts I am interested in	Yes	Focus on using coexistence strategy when dealing with wolves, eliminating population goals	Still allowing recreational wolf hunting. I think wolves can manage themselves well, and for problem wolves they can be dealt with on as needed basis	5	I would like to see hound hunting banned in known wolf territory, eliminate payout for hound depredation as I feel it's being misused by irresponsible and cruel people
Elizabeth Whelan	Most of it	Yes	I liked the fact that the plan removes the arbitrary numbers for the population. This gives the population an opportunity for more natural growth and retraction. I like that there was a lot of focus on the wolf's ecological importance. I feel like I know a lot about wolf biology but I gleaned more from reading the plan. I like that the plan includes low-quota zones around tribal lands. Thank you for listening to indigenous people. I appreciate that there have been multiple opportunities to provide public input.	I would like to see guidance or a plan in place for the future and updated reviews. I think the fact that this was the newest plan since 1999 shows that this needs to be a recurring effort. The DNR should definitely better regulate hound training on wolves. It should close wolf-focused hound training activities as each wolf-hunting zone closes. The plan currently would allow hounds to chase wolves for training purposes during the wolf hunting season, across the entire state, until the very last wolf zone is closed. This could go on for months and would interfere with the wolf breeding season in late winter. The plan would also provide better guidance to farmers on responsible predator-preventative methods. There are non-lethal methods available that should be encouraged.	9	Thank you for providing this plan. I hope it educates a lot of Wisconsinites about the place of wolves in the ecosystem.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
	Most of it	Yes	I like very little to nothing about the DNR wolf management plan. I graduated from the college of natural resources in Stevens Point in 1987. The change in the DNR and the bureaucracy has been unbelievable in my lifetime. Growing up in Northern Wisconsin and watching the WDNR go from a leader in wildlife management to a joke has been painful to watch. From the Kroll deer management to the Elk herd(going to feed wolves) to wolf management has been hard on hunters and sportsman to watch. I have been fortunate to have hunted through out Canada and the US for the past 40 years and see how WI has fallen behind after starting out as a leader in wildlife management. Like most avid hunters in Northern Wisconsin I have seen the deer,coyote, and even bear populations negatively affected by wolves in the areas my family hunt and spend our time outdoors. My family has property in Bayfield, Iron, Oneida, and Vilas counties. We have lost several dogs to wolves in the past 10 years and have had wolves take dogs down another half a dozen times. We have had wolves come in and attack our turkey decoys while trying to call turkeys. We quit letting our kids and grandkids walk our properties without one of us with them(usually armed). Wolves have been on the decks of our houses and hunting cabins in Oneida, Iron, and Bayfield counties. For the WDNR to allow politics, the people that live outside wolf populations, and the tribes to dictate how to manage wolves in Northern WI is just wrong. That's the same reason why I can't keep a walleye from lake Minocqua. This will be the first year since the patron license has come out that I won't be buying one. If your looking for the reason that hunters are leaving the WI system look no further than your management. I'm sure if you are still reading this you are saying good riddance, but I can assure you after hunting WI for 45 plus years the hunting public has lost all credibility in the WDNR wolf management.	As for what I dislike about the draft plan, I think the WI Wildlife Federation and Laurie Groskopf would be a good start with their 32 points against this plan. The biggest dislikes that come to mind would be No population goal,large buffer zones around reservations, and the wolf population estimates themselves. I also believe the DNR should be the main voice pushing elected officials and the federal government to delist from the Endangered Species List instead of using delisting as an excuse not to have to deal with wolf management or wolf hunting. The passion of someone like Laurie Groskopf who puts her time into this issue for no pay is worth more than most wolf experts the state pays. I personally hunt WI about 100 to 150 days per year depending on tags I receive. I work in the woods as a forester and a logger most the other days, so I have a pretty good idea what happens in the woods of Northern WI. The DNR is slowly getting rid of hunting, and and especially hound hunting and the hunting by promoting a unlimited wolf population. There is nowhere in Northern WI where that you can be confident of putting out a dog to hunt that you can be sure it won't get killed by wolves. And who wants to drag out what little is left from a wolf killed dog in front of their wife, kids, and grandkids. We find 40 plus wolves almost daily in Oneida county and go home a lot of days not being able to hunt due to too many wolves around. The most we found all going in to one 160 acre piece is 16 and the most we have in one picture is 13(taken on ice). During the last wolf season we cold tracked a big male 30 plus miles before starting the chase. He started with 4 others for about 5 miles and was joined by 3 more. After 2-3 miles the 3 left to the West and after a couple more miles he was by himself. After another 4-5 miles he was with another 4-5 wolves. We drove around each piece and probably should have chased some of the smaller wolves, but we stuck with the big male. In 30 miles of cold track he joined and left an additional two groups of 4-6 wolves. We got him clear of other wolves and chased him until dark. The number of wolves where ever we go is just overwhelming. There are about 40 people in our group of family and friends that hunt together and after talking with them I think 3 responded to this survey. After talking to 2 other groups bigger than ours they said none of them responded. Everyone says this isn't worth their time, since the state will do whatever it wants. It's too bad the DNR lost the backing of the hunting population, and now it will rely on people that just want as many wolves as possible in the state since it doesn't affect them.	1	
Susan Ballard	All of it	Yes	Extensive background and history of wolf populations info. Abandonment of an arbitrary numerical quota previously used. Inclusion of public attitudes data. Inclusion of some info on ecological effects/benefits of wolves on the landscape and as part of the ecosystem. Inclusion of tribal input. Buffer zones. Plans to educate public on wolves. Plans to teach rural residents about non-lethal abatement methods.	It treats wolves as a group to manage/"harvest" rather than the sentient, social, complex creatures that they are. The action steps do not respect the tribes view of wolf as brother whose fate is intertwined with humans. Department's acceptance and support of using dogs to hunt wolves. Hunting in particular zones as a means of conflict resolution (not realistic and no science provided). Not nearly enough emphasis on education of the public that personal safety related fear of wolves is way out of proportion to reality. Not enough emphasis on developing approaches to wolf-related activities to bring tourism, outdoor (non-consumptive) activities and associated dollars to Wisconsin. It does not address the destructive effect on packs, pups, breeding, genetic pool, etc. of hunting. The word "harvest" is by itself offensive in relation to wolves. It is recreational killing. It is too focused on the wants of a minority of WI's population, i.e. hunters & trappers. Those groups are over-represented on the Advisory Committee. Other stakeholders who use and value the outdoors are not represented at all except in the last catch-all category. Not enough to deter and reduce illegal poaching.	6	It is a great improvement over the previous plan. I wish there was more research included/cited about individual wolf and pack behavior and social systems. This would make the plan itself a better education tool. Some of the steps proposed such as educating farmers about non-lethal abatement and developing public education materials were mentioned but I fear it may be just lip service. Most of the automatic info sent out in alerts is "negative" and may cause more fear. Could there be more "good news" sent out in texts and email alerts as part of public education? e.g. cool snapshot captures, health of a local pack, etc. Thanks for the opportunity to review and respond to the plan!
	All of it	Yes	I like the fact that hunting and trapping are included in the plan as management tools, and the fact that the same methods of take as the most recent wolf harvest season, will still be in place.	I dislike the fact that there is no numerical goal involved for each zone and statewide. The population is still at a level where solid numbers are not out of the question.	4	I think it's interesting that there's no way for you to know where someone filling out this survey is from. Untold numbers of nonresidents, and even computer generated bots could be flooding the survey with their own answers to sway the system toward their agenda. Let's hope that doesn't happen.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
	All of it	Yes	I like the fact that a harvest season is integral to the management plan, and that all methods of take allowed in the most recent wolf harvest season, will continue to be allowed when future harvest seasons are open. I also like the fact that in several instances, the plan does admit to the fact that the growing wolf population, especially on public land in the northern third of the state, has had negative imacts on the elk herd and white-tailed deer herd. I like the fact that livestock/agriculture and hunting and trapping stakeholder groups were involved in coming up with the updated management plan.	I dislike the buffer zones around the reservations. The reservations are sovereign territory, of course, but outside of that, they should not hold sway over the rights of citizens of the state and the state itself, to manage wildlife populations, especially highly mobile ones, like wolves. I do not like the goal in Zones 1, 2, and 5: "yet harvest be specifically considered secondary to ensuring the long-term sustainability and ecological functioning of the wolf population in these zones. Accordingly, wolf harvest is recommended to occur in these zones, but at rates generally lower than prescribed elsewhere." With the amount of public land in those zones and the limited harvest of wolves in upcoming seasons, in addition to having the highest overall wolf population and density in the state, the harvest goal in those zones needs to be at rates the same or higher than prescribed elsewhere in the state. The wolf population in those zones is in no danger of becoming endangered or going extinct. But the total predator load in those zones, in addition to very serious winter severity conditions, on top of the aging and unhealthy forest habitat, it is all becoming too much for prey species to recover from year in and year out. Predator and prey species alike need to be managed with equal emphasis, not one is more important than the other. And the opportunity for a few people to hear a wolf howl or see a few for "wolf-related tourism" does not outweigh the importance of every other predator and prey species in those northern wolf range zones. I also do not like the fact that there is no numeric wolf population goal for each zone and statewide. It shows an obvious skirting of a major issue by those that wrote the plan, and it is obviously ignoring the justified concerns of a major percentage of Wisconsin residents that are directly impacted by the wolf population in the state. Yes, wolves are a very emotional issue, for both sides, but this vague plan will not help either side reconcile and come to agreement. The citizens of this state — especially those living and recreating in wolf range and are directly impacted by them, the wolf population itself, and all wildlife in Wisconsin deserve better. Yes, wolves absolutely deserve a place in our state, they are amazing animals, but they also deserved to be managed correctly, with all stakeholders in mind, especially of those directly impacted by them. I believe you need to go back to the drawing board with this, and involve more residents from the wolf range with in-person meetings and new email and traditional mail surveys. Again, this needs to be done right, and not skirt the sometimes uncomfortable conversations, and not give in to political games.	5	Go back to the drawing board with this and come back with a better plan. Wisconsin's wolves and other wildlife, and citizens — especially those directly impacted in wolf range — deserve the best plan possible.
Stephen Anderson	All of it	Yes	If the adaptive approach described allows for timely flexibility to respond to the ever-changing nature of wolf ecology and management as it appears it does, I favor this approach. We need a plan that can pivot and adjust annually and maybe even monthly to address this often polarizing issue of wolf survival. Seeking protection for den sites was also a positive point in the plan. Objectives E and F call for collaboration and sharing on"all things wolf" and I hope this includes cooperation with neighboring states and provinces for a more regional approach to managing Great Lakes wolves. The inclusion of individuals not necessarily affiliated with any organizations on the Wolf Advisory Committee is also a plus. I especially applaud the thoughtful matching of the 6 zones boundaries and objectives to the land cover types and percentage of public lands present. I support the call for continued reimbursement for livestock losses to wolf depredation. I very much appreciated the inclusion of the tribal perspectives, philosophies, and interests in this plan. I support their reverence for the wolf. I also applaud the commitment to continued research and improving upon methods of population estimation and modeling so confidence in the numerical data is enhanced. Though I have some apprehension regarding the lack of focus on numbers of wolves and population goals in this plan, I do commend what appears to be a sincere commitment to once and for all abandon any thoughts of a statewide goal of 350 wolves and the hope for wolves to be managed well above that level.	Funding remains a concern for me. Considering the costs of wolf management both monetarily and in terms of personnel time and effort over the past several decades, I am concerned about the continued funding of things like research, depredation compensation, law enforcement, etc. I'm not sure I saw much in the plan regarding future funding of wolf management, though I do support such funding. I fear some sportsmen will continue to object to their license and permit fees being used for wolf management. I was disappointed in the lack of habitat and habitat management discussion, a key component of any attempt to ensure the viability of a species. The northern forests are aging and suffer from encroaching development, privatization, and fragmentation....threats to wolf survival. I'd like to see mention of efforts going forward to increase both deer and wolf habitat, an endeavor that would not be mutually exclusive, as both species would benefit from more diverse, contiguous forest cover, as would other wolf prey species such as hare and beaver. Flourishing numbers of deer and wolves would be well received by both deer hunters and wolf advocates and perhaps reduce tensions between these two groups. I like to see a comprehensive plan and commitment to engage state, county, federal, and tribal managers in habitat management that seeks to diversify our forests and ensure younger stages of succession are not lost to aging and privatization. The plan should call for increased efforts to preserve large tracts of forested land, such as the state's easement effort to protect the Pelican River Forest as a working forest. While I support reimbursement for livestock losses to depredation, I have less concern for the loss of hunting dogs that are knowingly introduced into wolf range for the recreational hunting. The owners of these dogs must assume both the risk and responsibility of their actions and I do not support funding their losses. I support Adrian Wydeven and Green Fire's request to include all of Lincoln County in either Management Zone 1 or Management Zone 2. I would like to see a greater commitment to wolf survival at the "pack" level, given the unique social nature of the wolf. Research into pack survival in response to hunting and trapping pressures and strategies and responses to the loss of pack structure when individuals are removed should be stressed. I will be emailing some of my thoughts on wolf numbers or the lack of them in the plan, but as current wolf numbers stand, I would advocate for a total population of 700 or more wolves at this	8	I do have concerns that many people, on both sides of the wolf issue regarding increasing or decreasing their numbers, will object to the sometimes vague, open-ended nature of this plan and its generalizations. I understand this approach to planning, in light of the adaptive philosophy, but I remain concerned that this will foster a continued air of combative debate and polarization that will run counter to compromise going forward. Both sides will need to be heard and mediation must be sought as openly as possible with the best available data and knowledge of wolf ecology and human sociology. I hope this plan's adaptive nature and seemingly flexible approach will allow for the continuous compromise and concession future wolf management will require. The good news is most people want wolves on the Wisconsin landscape..something we have common and a foundation upon which consensus can be built. I wish the Department the best going forward and will stay engaged on this issue as best I can. Thank you for all the opportunities the DNR provided for comment on this management plan.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
				time, for reasons I will include in an email. The management plan dwells heavily on the management of the harvest of wolves in the event it is delisted...I am hoping the roles of research, habitat management, and public education receive their due diligence as a result of this plan.		
T Brandt	All of it	Yes	I like that the numerical number of wolves "allowed" to be sustained in the sate has been eliminated. The social survey that are being conducted to determine the interest in sustaining wolves in Wisconsin outside of hunting them. The increased recognition of the tribal rights and culture in valuing and protecting the wolf population. Working to reduce wolf related conflicts.	The concept of hound hunting needs to be eliminated. Overturning PA 169. No none should be reimbursed for the loss of a dog they put in harms way either by training or running them in territory held by wolves. No hunting of wolves should occur in or on land immediately outside of our National Parks/Forests. These areas should be off limits for hunting purposes so everyone can safely enjoy the wildlife and landscape. WOLF HUNTING DOES NOT REDUCE CONFLICT. IT DESTROYS PACKS AND FAMILIES LEAVING YOUNG ADULTS AND PUPS WITHOUT PROPER TRAINING AND GUIDANCE. There is still too much focus on killing, harvesting, how many wolves can be slaughtered- verses focusing more on coexistence. We need predators to balance nature.	7	WOLF HUNTING DOES NOT REDUCE CONFLICT. IT DESTROYS PACKS AND FAMILIES LEAVING YOUNG ADULTS AND PUPS WITHOUT PROPER TRAINING AND GUIDANCE. Killing adult and leaders of each pack destroys family balance. Leading to more wolf related conflict.
Doug Moericke	All of it	Yes	Inclusiveness - recognition of various opinions.	Bear hunting with dogs and all of the ramifications of this hobby	8	#1: Without habitat preservation, no animal population can exist. Specifically, concerning the wolf population, please provide wildlife corridors for wild animal population stability. #2: Given habitat / wildlife corridors mentioned above, genetic diversity will favor population stability. #3: Wildlife management of all species is really becoming human management. Politics vs sound science does not work, as demonstrated by the 2021 Wisconsin wolf slaughter. The historically famous "Wisconsin Idea" was destroyed by the wolf slaughter of 2021. Wisconsin has been a progressive, environmentally proud state viewed by many as one of the premier models. Wisconsin environmental leadership, such as John Muir, Aldo Leopold, Sigurd Olson, and Gaylord Nelson (Earth Day), has forged a pathway for others to follow. Let's bring back what we have lost. The new Wolf Management Plan appears to accomplish this.
	Most of it	Yes	Year by year stats		5	I was outside last night and our local coyote pack let loose. My 120lb dog was immediately by my side and the hairs stood up on my neck. I knew they were coyotes and we were safe. CAN NOT imagine the stress of living in wolf territory. I can manage the coyotes if they become a problem. I couldn't with wolves. I'm ok with a wolf presence, but they need to be managed. In my opinion we have an over population until the depredation reports/payments start decreasing and the deer/elk numbers increase. We had a hunt which didn't have much affect on the reporting. Please get the numbers under control so I can remain feeling safe going outside on my own property. I'd hate to lose that freedom if they move into my county unmanaged.
Miranda Siedelmann	Most of it	Yes	I agree with the 6th bullet of Objective B. It seems that farmers not being compensated for loss of wolf life has been an issue, and if they were compensated, the cattlemen may be more able to enjoy the benefits that wolves bring to the whole Wisconsin public, including them. I agree with Objective D, but I feel that public awareness of the issue is currently very low. My nuclear family and other relatives have lived in Wisconsin their entire lives and have never heard of the issue of a wolf hunt. I have also never heard of it until an Environmental Conservation college class I took made me aware of it. I hope that the DNR is able to increase funding in this area so that more people can participate in public comments like this one. I like that the plan hopes to consider the positions of all stakeholders, and I hope that it follows through on this promise. I like that the plan has an emphasis on evaluating the success of the plan and adjusting it as needed in the future. I don't think the February 2021 hunt was successful because it was very uncontrolled. The actual harvest went way above the quota. I think for a wolf management plan to be successful, it has to be enforceable.	Since Native Americans do not want wolves hunted on their land, the proposal to allow wolf hunting in subzones 1B and 2B seems insufficient. This is not recognizing their independence as an organization. Also, the area outlined around the reservation seems no more than 5 miles from the reservations in some places, when pack territories expand outside reservations, and according to the proposal, could extend from 40-100 sq miles. Extending these borders another few miles would not impact the overall harvest in any significant way, but would contribute to Natives' agency with what happens to the wolves that belong to their reservation. Like the rest of the Wisconsin public, they are affected by wolf behavior throughout the state, not just on their reservations. I hope that their input is heard on management of state wolf populations, not just wolf populations in their reservations. The bullets under objective A make no mention of keeping wolf packs staying intact. This is important for survival of the whole group, and could lead to secondary wolf mortalities following the hunt (the pack relies on all wolves, especially the alphas, for guidance in hunting). Indiscriminately killing wolves instead of targeting whole packs could lead to these issues Objective F: "Rely on science for decision-making" Benchmarks by which to evaluate success towards this objective are mentioned in this proposal, but none include measuring native plant abundance. Wolves reduce foraging of native plants by deer, which tends to improve plant abundance. Native plants help to improve water quality and abundance of other wildlife like Monarch Butterflies and Bees. The purpose of conserving wolves is not only to enjoy benefits of the wolf population, but to enjoy benefits of a landscape shaped by wolf presence, and I think this ecology should be considered as a benchmark. The economic value that wolves bring to the state ($375,000 per county per year in Wisconsin) is more than what they detract via cattle predation (only about 53 cattle per year in WI), so it would likely be worthwhile to investigate alternative methods to ensuring safety of cattle besides a wolf harvest. (specifically for zones 1A and 4A)	5	I don't see any proposed hunting season, but I think that it should not be during breeding season to avoid harvesting pregnant females who would then be unable to reproduce in Summer.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Max Culp	Most of it	Yes	I enjoyed the overall information on relationships of Wolves and other predatory species, as well as the possibility that a high enough deer density could withstand an active wolf population. Pages 14-19	Use of dogs to harvest wolves should not be allowed. An extended season for archery hunters should be created. An extended wolf hunting season while prohibiting use of dogs could be created to give more opportunity to the hunters.	8	The wolf expansion southward has me not worried about my pets or fellow man, but rather the humane nature of letting wolves starve to death. Due to rapid expansion of pack sizes along with southward expansion of pack territories is leading to a "wolf wave". The wolves outgrow the capacity for food of their environment leaving a wake of poor deer per square mile ratio that cannot feed the packs in subsequent years. Unless the pack moves further south down the state, the pack will slowly starve to death. Slow the rate of pack size growth to create a more stable ecosystem for this Keystone Species.
	Most of it	Yes	I like the addition and focus about email and text alerts to people to help them easily gain access to information.	I do not like the fact there is no population goal mentioned. I feel that not having a specific number to reference or set will lead to conflict between wolf enthusiasts, outdoorsmen, and hunters.	5	I think it is key that having population goals set is important. My concern is that people in areas with high populations of wolves will feel that they have no way to deal with wolves and this will lead to poaching.
	I have not read any of the draft plan	Yes				Please do not decrease the wolf population. Thank you.
Kevin Hite	All of it	Yes	Getting rid of a fixed number for a target population. Recognizing ecological benefits of wolves. Looks to use non-lethal means of reducing conflicts.	We have lots of issues with hounders trespassing, harassing, wildlife, and poaching and this plan does nothing to stop that. Hound training for wolves should be stopped. Wolf and coyote hunting should not be aloud at the same time to reduce gray areas if hunting is ever allowed again.	7	The oversight committee was stacked with groups that were pro killing wolves. Representatives of groups were not representative to its stakeholders e.g.Farmers Union. Or the allocation of representative was misrepresented eg. wolf facts / agriculture…
Virgil Schneider	Most of it	Yes	Morality rates and causes	That those from the city think they know better than those who have to live where the wolves are.	10	The DNR has done it's research, trust it
Sarah Bergstrom	All of it	Yes	I am in favor of the removal of any language regarding a numeric population goal. I like the emphasis on the ecological benefit and importance of wolves. I approve of the addition of buffer zones around tribal areas and zone-specific hunting licenses if a hunt takes place.	There should be an oversight committee as the new plan is implemented that includes 3rd party biologists and wildlife experts (and hunting and trapping organizations are NOT the same thing as wildlife experts.) A new plan should end payments for hunting hounds killed by wolves, especially in areas of known conflict.	7	This new plan is a good step in the right direction for wolf management in Wisconsin, but I do wish there was a greater emphasis on managing the human side of the equation through education, correcting blatantly false misinformation and non-lethal options vs focusing on lethal management of wolves, recreationally or otherwise.
Tracy	All of it	Yes	The map of previous and current range of wolves.; the inclusion of Wisconsin Tribal Perspectives and Cultural Significance and the inclusion of some of the indigenous nations names for wolf , ie ma'iingan, Mawaew.; the list of mortality and causes and other graphs.	Certain wording, such as harvesting. Wild animals are beings not crops. Why not just say licensed killing, and stop using this sanitized language of " harvesting". Unsubstantiated statements such as - "Wolves are unlikely to be exposed to any serious environmental contaminant issues while in their natural habitat". What about PFOS in the water and contaminates in the animals wolves eat.? Unless everything is thoroughly tested this is merely assumption or based on incomplete data.	6	I'd like to see more respect for wolves as a highly intelligent species. There should not be hunts on wolves. And definitely no hunts in the sub zones around the tribal lands. I appreciate the "compromise" lower killing allowance, but why not try zero hunt kills here? Hunting dogs should absolutely NOT be used in hunting wolves. Why would this be allowed to continue? And Trapping? NO. How can trapping ever be considered humane on such a highly intelligent being? I understand the state currently has an interest in killing wolves since they are delisted as endangered. Perhaps someday this will change. The plan has some allowances for change and i appreciate that. What about climate change and wolves? How this will affect their population is yet to be discovered. I'm glad the DNR values education. Please be open for the DNR to being educated directly by the wolves. On the wolves' level, through their own direct understanding of who we as humans have demonstrated ourselves to be. Hard to imagine? Just realize, wolves don't need to display our skulls to know about us. They try to avoid us. There is so much more of interest in nature - our immense natural resources- than what human "stakeholders" can ever experience without truly learning from these majestic beings. Thank you for this opportunity to comment.
	All of it	Yes	I'm not a real big fan of any of it to be honest. But activating sub zones to harvest has potential to be beneficial if done correctly	That af "fix" for farmers is to put up and build more expensive fences to protect livestock from wolves instead of being able to shoot the problem	1	The wolf population needs to be entirely moved to Milwaukee or Maddison people can see and understand why their unwanted. Or the population cut down to no more then 400
	Just the parts I am interested in	No	Removal of the perquisite to manage wolves by some preset numerical goal that had no scientific bases (previously 350 wolves). Increased recognition and reference to the ecological role that grey wolves play in the environment and habitat Incorporation of a social survey that supports positive views of wolves, knowledge of the ecological roles that wolves play and increased opposition to the motives and methods for killing wolves Tribal reservation buffer zones where wolves to support a wolves natural inclinations and known ability to travel far distances (i.e., previously no buffer zones existed); wolves do not know invisible boundaries.	Does not reflect best available science on wolf ecology, non-lethal methods for deterrence, and how undeterred indiscriminate killing impacts wolf packs, their well-being and behavior. Emphasis on recreational killing of wolves or 'trophy' hunting; instead the plan should strictly limit lethal management of wolves, particularly in thrill killing trophy hunts that eradicate hundreds of wolves in a season, instead lethal kills should only be used as a last resort after all non-lethal methods have been exhausted. Particularly in the cases of conflicts with livestock, to ensure ethical coexistence Abatement measures should be required to be demonstrated and exhausted on behalf of domestic animal owners and livestock owners before any compensation is offered Lack of understanding and consideration for tribal views on wolves and their value as a sacred resource to those peoples There is a clear lack of consideration for wolves as a keystone and critical species, as individuals and their contributions to maintaining the natural order in habitats Ill-defined wolf count estimations which currently appear to overestimate wolves greatly which could have severe consequences for population viability and confidence in state wildlife managers Hunting with hounds should absolutely be ILLEGAL for the safety of the dogs but also because it is cruel, inhumane, and unfair	4	

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
	Most of it	Yes	I am encouraged that the management plan takes Native American tribal concerns into consideration and establishes buffer zones around tribal lands to protect wolves in those areas. It will be nice to see those actually enforced.	The population estimates leave far too much room for guesses about the wolf population. There is still far too much emphasis on recreational killing and providing "hunter opportunity" to kill wolves. Emphasis needs to be placed on the value of this species to non-consumptive users of our lands. Wolves should not be killed. Wildlife should be preserved for all to enjoy. The Wisconsin DNR is too quick to promote lethal responses to the rare conflicts that result.	0	Stop killing wildlife/wolves and calling it management. The way these poor animals are slaughtered it's nothing short of cruelty and animal abuse for them only struggling to survive. The Big Bad Wolf was only a fairytale so lets quit letting it be used as an excuse for unstable people to continue to destroy these poor creatures along with their family pack structure and stability. Stop them from destroying wildlife that I and others respect and revere. Let's create a plan that allows our wildlife to live peacefully for all to enjoy. Thank you.
	All of it	Yes	I found the history and Native Indian comments very interesting.	I don't like culling and harvesting wolves. I agree with the Native Indians and feel the wolves should be protected and act as a culling ffor white tailed deer.	1	Protect wolves. Hunters don't need another animal to kill. Let them harvest the excess deer. Nature takes care of itself and keeps the balance.
Lana Silke		Yes	It tries to consider all the stake holders The 6th bullet of objective b supports compensating cattle owners for their loss. It will help them appreciate the other benefits wolves bring to the state.	Proposal allows hunting on reservations. Should be no hunting. Should emphasize worst time for wolf hunt when pups are young or during mating season. Should not be allowed to hunt pups. Pups are not radio collared so we can't be certain how many are killed. Also, Deer vehicle collisions are a big issue. In the proposal it says wolves save an estimated $350,000 per county per year. We want the proposal to show how ecnomically beneficial wolves are and that they improve driver safety. Only an average of 53 cattle are killed per year in Wisconsin.	5	
Peggy M	All of it	Yes	Eco tourism, protection of dens, protection or tribal packs, continued study of wolves, and compensation for livestock/pets	I dislike the use of trapping, baiting, and hunting wolves with dogs. I believe in rehabilitation of wildlife.	3	The current Wisconsin law allowing wolf hunts has very little to with actually controlling the wolf population and is all about people wanting to kill a wolf. I believe in hunting for food. Hunters aren't eating the wolves they kill and don't need the hide for clothing. Wolves help keep the deer population in check and help prevent the spread of CWD. They also help with keeping the coyote numbers down and support the ecosystem.
	Most of it	Yes	Increased weight given to tribal values and goals. Consideration that most Wisconsinites agree that predators keep nature in balance, are culturally important and deserve protection. I strongly oppose recreational hunting of wolves. The disaster of the 2021 hunt should not be repeated. Glad to see non lethal abatement considered	I do not agree that hunting wolves is necessary. Wolves have their families, their packs to rely on. Killing them for recreation is not justifiable. Dogs should not be allowed in the hunting of wolves. reimbursement for killing of hunting dogs by wolves should be eliminated. The makeup of the oversight committee has to include a more diverse group than just hunters. The committee should be formed before approval of the plan.	7	I was very impressed with the information provided in the plan. I was glad to see that you included a social survey as this represents the viewpoints of a greater number and diverse group of people, not just the hunting population. I would like to see the wolf plan include those who want to move wildlife management towards and ethical, science based, democratic vision of wildlife conservation that respects diversity and the value of all life. Dr. Adrian Treves, UW Madison should be invited to submit input to your plan.
	Most of it	Yes			2	
Julie Smith		Yes			0	Leave the wolves alone. They don't need you to "manage" them, which seems to mean catering to a minority that thinks you "harvest" them like vegetables.
	Most of it	Yes	goals		9	
Leslie Cunningham	Just the parts I am interested in	Yes	Basically, monitoring Wolves' health is acceptable.	Paying people who use dogs to hunt Wolves and then lose those dogs to Wolf predation is disgusting and wrong. Wolves should not even be hunted, and dogs should certainly not be used. Nature is perfectly capable of keeping populations in balance without human intervention.	2	

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
	All of it	Yes	I support the removal of a specific numeric goal for wolves in WI. I support the redrawing of wolf management zones except that Western Lincoln County needs to be moved back into core wolf range. There was no reason to move it out of primary wolf range. I also support the creation of the subzones around tribal lands. These subzones should be zero quota areas. I support the plan's emphasis on continued population monitoring and research including robust disease monitoring and collaring/tracking wolves.	The plan seems to be a little light on exactly how it is going to accomplish everything it states it wants to do. It promises a lot, but where will the funding come from? Where will the staff come from? Do you have the staff to do all the things you want to do in this plan? Specifically, when it comes to any sort of wolf "harvest" and especially after the debacle of February 2021 and the extreme overharvest, I think there needs to be a lot more law enforcement officers working those who "hunt" and trap wolves. In general, there needs to be a significant increase in the number of wardens working in the state. You want to reduce illegal killing of wolves, then you better invest in more law enforcement officers and do a much better job enforcing the laws especially around those user groups who don't like wolves and poach them. I didn't see anything written in the plan about carcass collection from harvested wolves. There is a lot of information to be collected from the carcasses including age, sex, and reproductive information from female wolves. While I am in general not opposed to a regulated harvest of wolves, I AM ABSOLUTELY OPPOSED to the use of hounds to hunt wolves. It is barbaric, inhumane, cruel, and completely unnecessary to accomplish harvest goals as was seen in the 3 earlier regulated harvests before the Great Wolf Slaughter of Feb 2021. I am appalled that the plan includes allowing the training of hounds on wolves? Why? It is not necessary, again see the results of the Feb 2021 slaughter. There is absolutely no need for hound training. What a farce. You say you want to reduce illegal killing of wolves and reduce the conflicts between hound hunters and wolves and then you go ahead and promote hunting wolves with hounds and training hounds on wolves. This is just legalized dog fighting. I seriously question the agency's concern for wolves when it advocates for hunting wolves with hounds. There is no fair chase in this. It's just a slaughter made even worse by allowing it to occur day and night. Where is the concern for the species? I see none. It's repulsive and it is mostly for this reason that I really don't have strong support for the plan. It seems too bent on placating those who don't like wolves. I don't support paying for hunting dogs or pets killed by wolves on public lands. People are on public lands at their own risk. Do you pay for hunting dogs and pets killed by bears, bobcats, fishers, or any other predator? I am supportive of depredation payments for livestock when wolves are listed as threatened and endangered but only if the farms affected are using best management practices for farming livestock. There seems to be too much room for fraud otherwise. I am not real supportive of payments once wolves are listed as a "game" species and farmers can do their own lethal control. Seems like double dipping. Kill the wolves and get paid.	5	The composition of the proposed Wolf Advisory Committee needs to be carefully considered so that it is balanced and represents a variety of viewpoints. Politics need to be removed from the management of wildlife in WI. We are in this mess of delisting and relisting primarily due to Republican politics and meddling. Management of wolves in WI needs to be based on sound science and administered by natural resources professionals.
Julie	Most of it	Yes	I like that it takes both a scientific and cultural approach. I like that so many visual graphics were used and that the report was easy to read. I feel like I learned more about how the wolf population benefits our ecosystem.	I don't believe hunters should be allowed to use dogs at all or be reimbursed for their loss. The depredation reports were interesting.	9	I like that the plan presents historical, cultural, and science-based information. I appreciate that it was easy to read.
	Just the parts I am interested in	Yes	Not much.	Why doesn't the plan address when the State of Wisconsin will obtain the same power to control wolves as the western states. When DNR leadership includes such plans then this plan will mean something. Until then this plan is meaningless.	1	The plan needs DNR commitment to reduce the number of wolves in northern Wisc to no more than 50. If you want more wolves in the state relocate them to southern Wisconsin

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Alexis Pegram-Piper	All of it	Yes	I appreciate the research, the thoroughness, and the history of wolves in our state. I appreciate that there is a nod to Indigenous perspectives, that they are included.	First of all, I am incredibly concerned that ranching/farming and hunting interests are overrepresented and feature so prominently in the report. Let's be stronger as a government department that is supposed to represent the interests of ALL citizens (and I emphasize state actual Wisconsin citizens). Let the majority of citizens (who favor wolf protection and conservation, resoundingly), the sovereign tribal nations of Wisconsin, and the science lead--and NOT special interests who are out for blood and money. Relatedly, I am also concerned many out of state licenses were issued to "sports"/"trophy" hunters to come into Wisconsin with their sick culture of killing to murder wolves here. In addition and VERY significantly, the report does not take into enough account the disastrous, horrifying, shameful, ABOMINATION wolf slaughter of 2021, when (I don't think I need to tell you, but I want you to know that we Wisconsin populace hasn't forgotten) 216 wolves were slaughtered in a disgusting bloodlust, which was 83% over the quota. No one had control. Shameful. This is a blight on all of us, one that will stain and haunt us for decades to come--unless we do much better. This wholesale slaughter of a brother, magnificent species that has fought back from the brink of human-caused extinction and cruel bounty hunting needs to be accounted for, and should consequently bring any lethal measures used to "manage" wolf populations to zero or very near zero. I am also concerned that farmers are not disposing of dead livestock in ethical, responsible, humane ways that help to protect wolves from slaughter, rather than setting them up for their own demise. How many different farmers reported livestock losses or was it the same farms? What kinds of behaviors on the part of the rancher/farmer contributed to the livestock loss and wolf encounter? The report and our future wolf plans also need to address the reprehensible, abominable use of hounds/dogs to hunt wolves. This kind of "hunting" (if we can call it hunting because the wolves stand no chance against guns, dogs, snowmobiles, and rage-fueled trophy hunters) so unethical for the dogs and their prey (wolves, coyotes, and bears) that its physically hard to stomach. For more on this, I would like to refer you to some excellent public radio reporting on the issue: https://www.wbur.org/onpoint/2022/01/26/newly-removed-from-the-endangered-species-list-whats-next-for-americas-gray-wolves Wisconsin is the only state that allows this repugnant, reprehensible method of "hunting" and we should all be ashamed of this. Any future reports and plans need to address this reality. And we all need to be aware of the inhumane, cruel treatment of animals every time a wolf hunt happens, and when it happens with hounds the cruelty is unthinkable and unbearable. I also know that this report does not fully consider the relatively "new" science on how integral wolves are to ecosystems. I would like to see this integrated and more fully considered in future versions of our state's wolf plans. I would also like to see information on wolves numbers BEFORE white, European settlers. Why don't we really know this and why aren't THESE pre-colonizer numbers considered? These numbers should be the target. In addition, I want the compilers of this report and the policy makers to know that you don't have to be an enrolled member of one of the two main tribes primarily mentioned in the report (where is the Ho Chunk tribe reflected in the report?)to know that wolves are a sacred species, our teachers and our brothers and sisters. I know for a fact that many, many more Wisconsinites feel and acknowledge this reality: our fates are intertwined with wolves and what we do to them is a reflection of how evil and reprehensible we humans can be. What we do to them will revisit all of us ten fold. This report is a start, but I know we can do better. We need to do better in the ways that I have outlined here.	3	End the law requiring a wolf hunt. End, END all hunting with dogs. It's reprehensible and the opposite of "sporting." End out of state interests and do your best to be independent and led by science, rather than beholden to farming, ranching, and hunting money and lobbying.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Joel Trick	Just the parts I am interested in	Yes	There is a good overview of background information, including history and issues. The plan also honestly acknowledges problems related to agreed upon population goals.	The Plan lacks specifics regarding population objectives.	8	As acknowledged in the Plan, "substantial agreement on these objectives has proven elusive due to opposing values related to wolves and wolf harvest". Herein lies the problem, as some stakeholders (i.e. bear hunters) are opposed to wolf population levels that would be required to support harvest, based upon the best science. I recommend that Wisconsin DNR gives the greatest weight, and final decision authority on harvest quotas, to the consensus opinion of wildlife professionals. Any quota should be fully supported by science and be carefully managed to prevent any chance of over-harvest. Stakeholders who hold views that are incompatible with science-based management of wolves should not be allowed to compromise the formulation of appropriate population goals or harvest quotas. The Wisconsin DNR should also make a greater effort to accommodate the wishes of Tribes regarding the management of gray wolves in Wisconsin, and careful to prevent harvest of animals that are legally reserved for the Tribal share of the harvest quota. I am strongly supportive of active measures (as allowed by listing status) to address depredations, including lethal control. I am also supportive of monetary compensation for damage to livestock at agricultural facilities and loss of pets by homeowners or passive recreation users. I am strongly opposed to any monetary compensation to the owners of hounds that are intentionally transported to areas known to be inhabited by wolves. These hound owners know the risks to their animals, and should assume any cost associated with any losses they incur. This is in stark contrast to losses suffered by other Wisconsin citizens which are out of their control, and could have a direct negative impact on their livelihood.
Nancy Lannert	Just the parts I am interested in	Yes				We should protect the wolves
	All of it	Yes	Objective A & C	Objective B	5	Too much hunting, too many people hunting without regulation. Overall the hunting is taking on a unhealthy management and appreciation for a beautiful asset of this state and leading to misinformation about the animal
Mary Boettcher	I have not read any of the draft plan	Yes				I was distressed to hear about the Feb'21 wolf hunt in which the number of wolves killed went over quota by 83% with little reduction of wolf population in areas where wolf/livestock of pet conflicts were most likely to occur. Also distressing was the killing during breeding season. It disupts territorial defense, pair bonding, and sucessful breeding. I hope these issues are addressed in the draft. Lastly, hounds should not be used to hunt wolves. It's inhumane and embarassing to the state of WI, the only state that allows it.
	Most of it	Yes	Not much	It does not reduce the number of wolves in northern Wisc. It does not accomplish anything nor improve the situation in northern WI. It merely kicks the can down the road.	1	This plan solves nothing. This plan does not provide the means for landowners, farmers, ranchers, homeowners, etc to simply and effectively eliminate wolves on their property.
	Just the parts I am interested in	Yes			3	They’re already. to many causing damage.
	Just the parts I am interested in	Yes	NOT MUCH	Lack of numerical goal. Lack of simplified methods for landowners to kill wolves Lack of financial plan where those who want wolves should be required to pay for the costs of maintaining those animals. They should pay costs of keeping wolves	1	The plan is a huge waste of time and energy. It doesn't solve the basic problem of too many wolves in northern Wisc. It should come up with a plan to relocate wolves to areas where they currently do not exist such as Dane and Milwaukee counties

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Steve Janusiak	All of it	Yes	I like the accountability for a science-based management of wolf conservation, the focus on wolf population monitoring (including improving and increasing resources and cooperation with the public, universities and organizations), as well as the focus on education to the public. I think removing numeric goals is essential to the Wolf Management Plan. Simpson (2019) supports this idea along with the reviews of multiple literature sites that discuss the ecology of pack living. I like the wolf zones, especially the "zero quota" zones around the tribal zones. Considerations made by "Wisconsin's Greenfire" on rezoning might be considered. Mandatory harvest registration and in-person certification are essential. Eight hours is an appropriate amount of time for registration. I support the quick shutdown of zones when a quota is met. I support issuing enough licenses to keep the season short, or other methods to keep the season short to support other hunting seasons and allow for the wolf breeding season. I expect outreach to the Native American tribes and the support of their values, and I appreciate the input from the tribes. The proposal seems thorough and science-based.	I am confused as to why we would have a numeric goal on wolves if we do not have a numeric goal on other species such as deer or bear. The 1999 plan established a management goal of 350 wolves when there were only 200 or fewer wolves in the state. This numeric goal is one of my biggest concerns. The plan should identify funding methods. The plan should include a timeframe for implementation and for how often it will be reviewed for modification if necessary.	9	I believe it is important to continue science-based research to support decisions made on wolf management in Wisconsin. I believe it is important to consider Native American values when implementing the Wolf Management Plan. The historical overview of wolves in WI (pages 45-50) is an important part of public education, especially on page 48 where it is discussed that expansion is unlikely (Simpson 2019). Continued monitoring and efforts are key to the plan. I hope educating the public will continue to reduce anxiety and concern regarding wolves and the likelihood of humans being harmed by wolves. Collaboration with Minnesota and Michigan may assist research. I have concerns regarding the equality of composition of the Wolf Advisory Committee being representative of the broad range of wolf concerns and opinions in the state. My statements and considerations are reflective of a review of the "Wisconsin Wolf Management Plan, 2022," the "Wisconsin's Greenfire" organization paper written on January 20, 2023 and "An Analysis of Wisconsin's 2022 Draft Wolf Management Plan" written in January 2023 by primary authors Adrian Wydeven, Tom Hauge, and Jenny Washam, et al. I concur with the recommendations from these organizations, and I value what the WI DNR has done to create this Wolf Management Plan.
Jessie Espeseth	All of it	Yes	We need a management plan of any sort at this time so I like we are working towards another season	Areas that Animals cannot be harvested in will have issues with farmers and local people and pets because no fear of humans	8	The counts of the wolves are extremely off
	All of it	Yes	Objective A	Objective B And C	1	Too much hunting of them. Also there are too many illegal hunters in the state. And they get away with it.
	Most of it	Yes			1	I have hunted and trapped for over 60 years in Wisconsin. I go up north many times each year . The last ten years some places you see more wolf tracks than deer tracks . For y4ears The outdoors people in this state have contributed to deer and elk orignizations to improve their numbers and management. All we have done is feed wolfs. The elk herd never will get to a real huntable herd unless the wolf population is reduced to an acceptable number. Farmers have had too many animal losses and have been paid a lot of money for them. This is because the DNR does not want to really want to control the wolf population with a realistic plan. The DNR bows to the animal rights groups, who think the wolf population should expand till deer hunting is gone. They will change their minds when the wolf is in their backyard.
Courtney Mares	I have not read any of the draft plan	No				Wolves need full protection in all of the Northern Rockies including the northern Rocky Mountains region where the mass murder of wolves by hunting and trapping occurs. Hunting and trapping of all species needs to be banned. It is animal cruelty and torture and trophy hunting is colonization by conquesting another being and taking parts of its body as a trophy reducing an animal to property which ignores the fact animals feel pain, suffer, and feel terror like humans do every day. Allowing such cruelty of hunting and trapping to happen to any species denies our own humanity. By diminishing another being you diminish your self.
	Most of it	Yes		The plan lacks emphasis on reducing the number of wolves to a point where all negative impacts are eliminated. A numeric population goal is needed set at a low number such as 50 .	0	DNR leadership is sorely lacking. This plan ignores the need for northern Wisconsin to dramatically reduce the number of wolves. The people of northern Wisc. Look forward to a time when DNR leadership again recognizes that they work for us, a time when they again realize that there is a large part of Wisc. North of Eau Clair. This plan is typical of the ignorance of our DNR leaders about the needs and desires of northern sportsmen and women. It is also typical how they are more concerned about the Tribes than other citizens. We wonder how much do Tribes contribute financially to the DNR budget? If the Tribes want the wolves why doesn't the plan provide means to deliver wolves to Tribal lands from areas where the rest of us want the wolves removed?

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Bob Burton	Most of it	Yes	1. It appears to be very thorough and informative. 2. Wolf Population Dynamics covering data on human-caused mortality, including legal hunting. 3. Tribal perspective. 4. Explanations of proposed Objectives. 5. Historical overview of wolf population and management. 6. Zone structure proposed. 7. Correlation between overwinter minimum count analysis and the less manpower-intensive territory mapping, the latter being more manageable with greater numbers of wolves than when the minimum count took root.	1. Missed opportunity to include explanation of regulated hunting as part of a sustainable program (Objective D on Increasing Public Understanding). This is mentioned elsewhere, but is left out of the Public Understanding agenda. To me, that's something that needs to be included in public outreach. Anti-hunters will be campaigning against a hunt with emotional appeals. Heck, on pages 19 & 20 there are references to sustainable impacts from regulated hunting, as well as all human-caused mortality (poaching, vehicles, etc.). 2. Seems vague or wishy-washy on need for population estimates. On the one hand, "Effective quota setting begins with accurate estimates of population size... (pg 67), and Objective A1 talks of continuing wolf population monitoring, A2 of being science-based and data driven to establish population characteristics (characteristics?). On the other hand, on pg 98 we are introduced to "adaptive wildlife management" and on pg 99, the report refers to an "adaptable approach, value-based, and informed by science". Not based on science, but only informed by it in a subjective value-based approach. And on pg 97, From Recovery to Sustainable Management, the report says an alternative to numeric goals is to prioritize action in response to conditions. Again, this sounds like it leans away from objective, science based to subjective management. Also in that section (pg 97) it says this type of approach is already used for other game species such as bears, turkeys, grouse, and deer, adding that the lone exception is for elk. Elk use numeric goals. The reason given is that elk are in a recovery status, while wolves are not. I would argue that, recovery status or not, elk need numeric goals because their total numbers are small. Even bears exist in Wisconsin in far greater numbers than elk. So it is with wolves. An error of plus or minus 100 bears (or deer, turkeys, or grouse) is not going to be a huge issue for the population. For elk that's a significant number for the population! So it is with wolves. Their numbers are also on the small end of the scale and need careful, more precise management. Population estimates MUST be part of wolf management going forward! Population is a number that impacts harvest quotas and license numbers as part of SUSTAINABLE management. Looking ahead to future wolf hunting seasons, population numbers will be important in setting quotas. Along with that, the kind of sustainable harvest impact reviewed on pg 19 will increase public confidence in such harvest quotas (remember the debacle of the last wolf hunt?).	8	Much effort has gone into this. Many thanks for all involved. To some degree, it's a thankless job, as no matter what comes out of it, there will be some unhappy people. Probably lots of them. Continue to do your best for the resource and for the people of Wisconsin.

Courtney Mares	I have not read any of the draft plan	No		Wolf conservation is more than an ecological issue. It is economical issue in which our stance on it determines the depth of our humanity. The Golden Rule commands that we are to treat others how we wish to be treated and vice versa that we should not do unto others what we would not want done to ourselves. The rule is taught by various religions even ones predating Christianity. The hunters and politicians would hate to be shot, let alone shot for being human so why they are condoning and shooting wolves for being wolves? Humans depicted and view wolves as ruthless bloodthirsty killers, as monsters. It is actually we humans who are ruthless killing, bloodthirsty monsters. We have scapegoated the wolf for what we fear in other people and ourselves. To come to terms with our own humanity and and to acknowledge it not deny it, we have to protect the vulnerable both human and non human because if we were in their place, we would want our existence respected. Wolf extinction would be a disaster. First, after they were removed from the Endangered Species list, their populations were decimated out of human cruelty and hatred. On August 1 in the article Why the U.S. government is allowing bears, wolves to be hunted in their dens. “When wolf hunting season opened in Alaska on August 1, it became legal in many national preserves for hunters to kill nursing mothers in dens with their pups.” In February 2021, Wolf hunters murdered more than 300 wolves in two days, a third of the state’s population. (Wisconsin Hunters Kill Over 200 Wolves in Less Than 3 Days) “The gray wolf lost Endangered Species Act protections last year, prompting a recent hunt that killed at least 216 wolves — far exceeding a quota set by state wildlife officials.” “At least 216 wolves were killed in less than 60 hours, exceeding the state quota of 119 and prompting Wisconsin to end what was meant to be a one- week hunt four days early, according to the Wisconsin Department of Natural Resources. Environmentalists, who fought unsuccessfully in state court to stop the hunt, said the killings had occurred during breeding season, when gray wolves are especially vulnerable. They said the large number of wolves killed in such a short time underscored the need for President Biden to put the gray wolf back on the list of animals protected under the Endangered Species Act.” “These animals were killed using packs of dogs, snares and leg-hold traps,” Kitty Block, chief executive of the Humane Society of the United States, said on Tuesday. “It was a race to kill these animals in the most cruel ways.” (Cramer, 2021). As a result, there gene pool for breeding is decreases which leads to inbreeding. If the gene pool keeps decreasing, wolves do resort inbreeding to maintain their numbers which further shrinks the gene pool. There is no fair chase when humans hunt animals because humans have intelligence and weapons that animals will never have or understand and humans were evolved to be born with the upper hand over other organisms. Animals don’t stand a chance against human cruelty, they can delay it from happening to them but unless humans act differently, their suffering will come. The financial costs of wolf hunting is wasteful upon wolf conservation. Washington spent $425,000 a year for trapping, helicopter captures and surveys, collaring and year-round study in 2017 per wolf. In the fiscal year of 2015, Idaho’s budget was $1.63 million for wolf related expenditures including depredation, enforcement, hunting-trapping oversight, monitoring, research and administration. (Landers, 2017). Idaho’s state budget for wolf reintroduction is “$800,000, plus more than $500,000 for livestock depredation.” Washington’s state budget is “$2.9 million, soon to be cut by 50 percent.” (Landers 2017). In Yellowstone National Park, a GPS collar costs $2,500 each and VHF collared are $600 each. The funds will also go toward monitoring flights to locate wolves in Yellowstone says Yellowstone Forever’s website. As a whole, wolf restoration Yellowstone costs 30 million and wolf watching brings in 35 million dollars each year total nearby hotels, restaurants, gift shops, and wolf watching tours. (Randall, 2020) . The ecological and economical benefits of wolf conservation far outweighs the costs. As far as wolf conservation has come, there is still a long way to go. If politicians and other people don’t clean up their act, we will never get a second chance to make amends for the wolf genocide our ancestors committed. Another wolf genocide is happening now and this is our chance to make it right. “At the same time, it’s not finished. We have not restored wolves to where they can and should be where it’s ecologically correct. We still have a lot of conflict, and concerns.” If state plans weren’t so “over-controlling, wolves would be running over the spine of the Rockies into the south-west today.” “When wolves were deemed recovered enough to be removed from the endangered species list, management of populations was left to each state. In Wyoming, people are allowed to shoot wolves on sight outside the borders of national parks. In Montana, it is permissible with a hunting permit.” Regardless of the challenges ahead, the thriving wolves in Yellowstone illustrate the success of the Endangered Species Act as a framework to		Wolves need full protection in the Northern Rockies and trophy hunting needs to be completely banned for all species it is animal cruelty and torture.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
				conserve biodiversity, and a hopeful example at a time when the UN has revealed that the planet is on the brink of the sixth mass extinction" writes Cassidy Randall in the Guardian article "A rewilding triumph: wolves help to reverse Yellowstone degradation. Second, despite this evidence of the economical impact and ethical issues, in August 2021, Biden agreed that wolves should be kept off the endangered species list and that protection for them should be discontinued. "FARIBAULT, Minn. — President Joe Biden's administration is sticking by the decision under former President Donald Trump to lift protections for gray wolves across most of the U.S. But a top federal wildlife official on Friday told The Associated Press there is growing concern over aggressive wolf hunting seasons adopted for the predators in the western Great Lakes and northern Rocky Mountains NPR article Biden Backs The End Of Protections For Wolves. But Worries About Hunting Grow wrote. As a result of Biden's decisions, more wolves died because he refused to protect them from human cruelty. Finally, without wolves ecosystems fail. After wolves were killed out of Yellowstone the ecosystem fell out of balance. The elk and other populations increased and overgrazed which resulted in a lack of trees for songbirds and warmer rivers. Without wolves to control the park's beaver population, the beavers removed so many willow from the park that there was less shade to cool the rivers and the juvenile fish in the rivers experienced an increase in the temperature of the water and the stream banks eroded away without tree roots to support the streams. The beavers prefer slower moving water and because the river flow increased due to erosion, they left after willows died. The wolves absence from the park also resulted in an increase of coyotes. The coyotes killed off pronghorn fawns and as a result, there was less prey for coyotes. (Biodiversity, californiawolfcenter.org). Politicians, ranchers and hunters choose to be prejudiced toward wolves and all influence each other to do the same and pass anti wolf laws and politicians choose to uphold those immoral laws thus contribution to wolf genocide and a loss in biodiversity. It's not just the hunters and the fish and wildlife agency who have wolf blood on their hands but politicians too whether indirectly such as Joe Biden or directly such as Gov. Greg Gianforte. They are all responsible for the murders of wolves indirectly and directly. Killing a wolf pup being nursed is it just as evil as killing a child in being nursed. It's murder but the victim is of a different species. The lives of non human species are just as sacred as that of human lives. In Genesis 1:26 it is written humans have dominion over animals and nature, that humans are meant to rule over them and control them. Since the Bible was written by human beings which are all flawed, the Bible does contain propaganda and instructions relevant to the time it was written. European settlers were predominantly Christian so for them, these messages allowed the genocide of wolves. When the Bible was written, there was no awareness or the understanding of biodiversity and how important it is nor how fragile ecosystems are unlike today. If that passage of Genesis was written with today's understanding, dominion would be replaced with caretaker or steward which is what our relationship with nature-biodiversity was always meant to be. As a result of humans embracing the dominion and ruler mindset over animals, over the years, animal exploitation, abuse, neglect, and trafficking has taken place with the consequences impacting humans in the form of disease transmission and deaths and serious injury from trying to force human will onto wild animals who are designed by nature not to submit to human will. So today when I read about the California U.S. District Judge Jeffrey S. White decision to restore protections to grey wolves in the lower 48 states, it was a bittersweet. The wolves in northern rockies where they are cruelly slaughtered by hunters do not get the same protection, neither the wolves in Alaska where the pups are murdered in their dens while their mothers nurse them during hunting season. What needs to happen is hunting must be banned permanently in Alaska, Idaho, Montana, Wyoming, the northern rockies, Missouri, Michigan, and in and out of the northern rockies. "Wolves absolutely do not fit the definition of a recovered species," says John Vucetich, who studies animal ecology at Michigan Technological University, to Vox's Benji Jones. "A species isn't considered endangered only if it's at imminent risk of extinction. It's about when have humans done enough damage to a species that corrective action is required." -Smithsonian magazine February 15 2022 Sincerely, Courtney M

Jayden Janusiak	Most of it	Yes	I like the accountability for a science-based management of wolf conservation, the focus on wolf population monitoring (including improving and increasing resources and cooperation with the public, universities and organizations), as well as the focus on education to the public. I think removing numeric goals is essential to the Wolf Management Plan. Simpson (2019) supports this idea along with the reviews of multiple literature sites that discuss the ecology of pack living. Additionally, I am confused as to why we would have a numeric goal on wolves if we do not have a numeric goal on other species such as deer or bear. The 1999 plan established a management goal of 350 wolves when there were only 200 or fewer wolves in the state. This numeric goal is one of my biggest concerns. I like the wolf zones, especially the "zero quota" zones around the tribal zones. Considerations made by "Wisconsin's Greenfire" on rezoning might be considered. Mandatory harvest registration and in-person certification are essential. Eight hours is an appropriate amount of time for registration. I support the quick shutdown of zones when a quota is met. I support issuing enough licenses to keep the season short, or other methods to keep the season short to support other hunting seasons and allow for the wolf breeding season. I expect outreach to the Native American tribes and the support of their values, and I appreciate the input from the tribes. The proposal seems thorough and science-based.	The plan should identify funding methods. The plan should include a timeframe for implementation and for how often it will be reviewed for modification if necessary. I do not support allowing training of dogs on wolves when any wolf harvest zone is open.	9	I believe it is important for continued science-based research to support decisions made on wolf management in Wisconsin. I believe it is important to consider Native American values when implementing the Wolf Management Plan. The historical overview of wolves in WI (pages 45-50) is an important part of public education, especially on page 48 where it is discussed that expansion is unlikely (Simpson 2019). Continued monitoring and efforts are key to the plan. I hope education to the public will continue to reduce anxiety and concern regarding wolves and the likelihood of humans being harmed by wolves. Collaboration with Minnesota and Michigan may assist research. I have concerns regarding the equality of composition of the Wolf Advisory Committee being representative of the broad range of wolf concerns and opinions in the state. My statements and considerations are reflective of a review of the "Wisconsin Wolf Management Plan, 2022," the "Wisconsin's Greenfire" organization paper written on January 20, 2023 and "An Analysis of Wisconsin's 2022 Draft Wolf Management Plan" written in January 2023 by primary authors Adrian Wydeven, Tom Hauge, and Jenny Washam, et al. I concur with the recommendations from these organizations, and I value what the WI DNR has done to create this Wolf Management Plan. Thank you for your consideration.
	Most of it	Yes	The plan removes a numeric population goal. The plan creates low quota zones around Tribal lands where the Tribes requested it. The plan is rightly focused on the ecological benefits of wolves The plan is reflective of the public opinions survey that was released along with the plan and finds that opinions toward wolves have grown significantly more favorable towards wolves There is expressed commitment to science and continued research with partners and acknowledges that "keystone species such as wolves are an important component of a healthy ecosystem"	The DNR should better regulate hound training on wolves. There is currently no guidance in plan for next review or update. The plan acknowledges that there are responsible farming practices and other non-lethal options to reduce wolf and livestock conflicts, but stops short of recommending that the DNR prioritizes these opportunities.	8	
	Most of it	Yes			2	Wisconsin should eliminate wolf-hunting adjacent to Tribal reservations. Hunters should not be allowed to hunt down wolves with dogs or from the air. Trapping wolves should not be allowed. Poisoning wolves should not be allowed. There should not be a cap on the wolf population.
	I have not read any of the draft plan	Yes				Kill 'em all
Roy Sook	All of it	Yes	None	All	1	5.9 million people in WI but only room for 350 wolves?
	Just the parts I am interested in	Yes	Tribal input, and acknowledging changing perspectives in society	The idea of any management, although I realize it is necessary to deal with the widely varied interests	9	Thank you for all your work...it is acknowledged and appreciated
	Just the parts I am interested in	Yes		It does not solve the issue of too many wolves in Wisconsin.	0	The DNR shows its contempt for the sportsmen, landowners, and people of northern WI. By continuing to ignore them, by placing more importance on wolves than people.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
	Just the parts I am interested in	Yes		The plan lacks a numerical population goal. It should have a goal of no more than 50 wolves statewide.	0	The plan does not address problems caused by too many wolves in northern WI. It merely glosses over the problem and ignores the concerns of northern WI property owners, farmers, ranchers pet owners and families.
	Just the parts I am interested in	Yes	That sportsman may actually be able to pursue & hunt wolves legally again!	Not having a population goal set in the plan! 350 is what was voted on by the Conservation Congress! Buffer zone around reservations isn't feasible for owners within that area. They pay taxes!	4	Need to get population goals back in plan & stop dragging this process out! Power & sound science should be in control of the state! The wolf population has recovered & needs management! The lack of a plan is the problem.
Elise Balzee	Just the parts I am interested in	Yes	I believe the section 4 is sensible and balances the need to protect/conserve the grey wolves and others stakeholdersz.		10	Thank you for everything you do!
	Just the parts I am interested in	Yes	As all plans WI DNR puts together they are large. This plan is over 170 pages in length. The average citizen is NOT going to sit down and read this plan. I see there is an executive summary - but it should be bullet points not huge narrative blocks!	The extreme detail and repetition.	0	I am all for the wolf making a comeback in the United States but there has to be some reasonable parameters. In other words, the wolf population needs to be controlled and monitored. Currently the "powers that be" are NOT controlling the wolf population. The attempts have been insignificant. From where I sit, it is going to take wolf preying on humans before the "powers that be" wake up. and start listening to the general public that are requesting the wolf population be controlled. I challenge those that advocate for no control on the wolf population to start living, working, and recreating in the north woods of WI!
K. Lezenby	Most of it	No	I like that the plan considers non lethal solutions to resolve conflicts with wolves and that it takes into consideration the range of viewpoints about wolves and coexistence with them, including those of different affected tribes. I found the in depth report informative.	I disagree with its plan to compensate ranchers for cattle. I think it would be more effective and ethical to subsidize nonlethal deterrents in order to promote their use, diffuse conflicts, and spare wolves lives. I don't like that the report sets wolf population targets lower than before they were killed off in Wisconsin, especially since the data indicates that wolf populations plateau naturally while the human population continues to grow exponentially, encroach on their habitat, and threaten them in multiple other ways. I also disagree with the permitting of trophy hunting, trapping, and use of dogs to hunt wolves. Trophy hunting is a frivolous reason to take the lives of sentient beings. Trapping causes prolonged suffering and intense terror as does hunting with dogs.	2	
Philip ingram	Most of it	Yes	I don't want wolves in Wisconsin	I don't want wolves in Wisconsin	0	I don't want wolves in Wisconsin
J Mark Wendling	All of it	Yes	-No numerical goal -Recognition of ecological importance -Buffer zones -Inclusion os social survey & significance	-Inadequate acknowledgement of the efficacy of non-lethal interventions. -Inadequate assessment of lethal management consequences. -Bias favoring recreational killing, including emphasis as a management strategy. -Failure to limit lethal management to extraordinary circumstances. -Failure to adequately acknowledge that legal "harvesting" encourages illegal killing. -Failure to acknowledge the detrimental consequences of hound hunting on both wolves and dogs. -Failure to recognize that the great majority of dogs killed by wolves are hounds, and that a high percentage of these have non-resident owners. -Failure to adequately acknowledge the substantial expense to Wisconsin taxpayers of compensation for hounds killed by wolves, and that much of this money goes out of state. -No comparison of the efficacy of non lethal and lethal livestock predation mitigation strategies. -No recognition that a majority of Wisconsin citizens , including those identifying as hunters, are opposed to the sport hunting and trapping of wolves. -No scientific study of the source of whitetail deer included in wolf diets (vehicular road kill vs healthy animals). -Conflicting agency objectives inadequately addressed. -Inadequate consideration of tribal views in ceded territory. -SOM estimation methodology is fundamentally flawed, and will substantially and consequentially overestimate population levels. -Broad scale policy does not adequately provide for scientific of individual pack health and dynamics. -Inadequate strategy for education the public regarding the critical ecological role of wolves.	7	This draft management plan, and its purported reliance on the best available science, is a substantial improvement over historical management practices driven primarily by politics and small, vocal, special interest groups. It is a good start, but needs additional work.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Jo Garrett	Most of it	Yes	1. Science - This plan is science based! It's driven not by politics or myths about wolves.It is hoped that all the stakeholders will realize the importance of looking to science for the framework of this wolf management plan. It's crucial. To that end, there is not some arbitrary number of Wisconsin's wolf population. The population number will be decided by science and will reflect any ecological changes. 2. The importance of wolves in the ecology of our state - the plan highlights the ecological importance of wolves, as a keystone species in this management plan. This is very important. Other species and the landscapes they inhabit are affected by the presence of wolves. 3. Quota limits - it is very important that quota limits are lowered near tribal areas. I know that for many in the tribes they regard the wolf as "brother wolf" and for many, any harvest of wolves is a great offense. I hope that quota numbers need to be zeroed out or curtailed near tribal areas that the desires of the tribes will be paramount.	1. The DNR must be more proactive about regulating hound training re: wolves. As written, the plan would allow hounds to chase wolves until the last wolf zine is closed. This could go for months and could interfere with the wolves' breeding season. Not good. 2. There needs to be a specified plan for the next review or update. 3. It is important to for the DNR to highlight and prioritize any non-lethal methods to control wolves on farms so they don't prey in livestock. For example, the use of flock protection dogs, such as the maremma. Please insist that the DNR explore any all non-lethal methods.	9	It is important to oppose any payment to replace hounds that are injured or killed in hunting wolves. There is no reason the precious state dollars should be used for this purpose. The burden should be on the hunter, not the state taxpayer.
Craig Butler	Just the parts I am interested in	Yes	Did not read total doc.	Harvesting section: 1. Only resident harvesting. No non-resident. 2. No hunting with dogs. 3. 10:1 hunter/wolf license quota not 20:1 4. A means to verify harvest number quickly needs to be programmed.	9	
Regan Downey	Most of it	No	I appreciate that DNR staff will no longer use the numeric goal of 350 wolves when they're managing wolves. I also appreciate that staff took the time to conduct a survey about peoples' views regarding wolves. A majority of people support wolves and don't want to see them killed, and the social survey reflected these beliefs.	I do not like that DNR staff continue to ignore the numerous studies that highlight the sentient nature of wolves and instead allow for unethical practices. I also do not like that lethal methods of wolf control are touted as more successful than non-lethal methods of coexistence and livestock protection. Numerous studies, including research led by UW-Madison scientists, prove the success of non-lethal interventions.	4	I would like to see WI return to more structured, peer-reviewed methods of determining wolf population, rather than using occupancy models. There's a high margin of error in these models and an overestimation of the wolf population could set recovery back rather than propel it forward.
Richard G Urban	All of it	Yes	1. The entire document deserves praise for its comprehensive presentation of history, biology, sociological and legal analysis, as well as a reasoned proposal to pull widely differing perspectives towards the center of a mandated wolf hunting season. This report is a significant accomplishment on its own. 2. Proposals for regulation of the hunt by specific zones, including buffers around reservations. 3. Registration requirements for wolf kills. 4. Restrictions on hound training. 5. Eliminating mention specific wolf population goals. 6. Emphasis on accurate, well-executed population surveys. 7. Proposals for public education programs. (Unfortunately, education does not effectively offset long held belief systems in adults.) 8. Plan for increased efforts at depredation and harassment reduction. 9. Clear listing of objectives in wolf management. 10. Providing better opportunity for Tribe's input. 11. Placing scientific research and monitoring as cornerstones for the plan.	1. Continuation of compensation for hunters who lose hounds to wolves, particularly when the hounds are run on public lands. Hunters need to take this risk of loss on their own. I would not remove compensation for owners of dogs used for small game or bird hunting, or pets. 2. To be fair to people with different viewpoints, I would prefer not to see "harvesting" listed as a benefit of a healthy wolf population in Wisconsin. While many people may approve of a wolf hunt, for many reasons, this does not necessarily constitute a benefit.	9	1. Greater and more effective law enforcement is needed. As a resident of Oneida County, I have heard far too many local stories of violations that went undetected. While people may fallaciously boast about such things, there no reason to think all such reports are false. The department needs more wardens, during and out of wolf hunting season, to aid prevention as well as enforcement. 2. I would like to have a more detailed description of how the behavior and survivability of wolf packs is affected by the loss of one or more members, if this is known, and how it might be applied to quota-setting and regulation of hunting. 3. While I doubt the department has any significant influence on state legislators, whatever actions can be undertaken by administrators and the remaining science staff at DNR to influence them to prevent passage of legislation such as 2011 Act 169 should be taken. 4. I offer a sincere thank you to everyone involved in this very substantial and impressive effort.
Alan Capelle	Most of it	Yes	Info & maps on the various wolf mgt. zones; background & history of managing wolves in Wisconsin and the region...	see comments below...	5	1) I still think the plan needs an overall population goal to strive toward based on latest estimates, funding sources, etc. 2) As the size of the individual units will increase over time, how will the DNR handle potential concerns/conflicts as wolves come into closer contact with folks in cities/urban areas that might not appreciate having the wolves in closer contact with humans? 3) Budget wise, will the DNR be able to cover increased depredation losses? 4) Does the DNR plan on publicizing/promoting the wolf as a highly valuable and beneficial keystone species to an evermore urban human population? Public support for the new plan will be crucial to success..and 5) Has the USFWS/courts given any details on the longevity of the current federal endangered species listing? What are our options for delisting and state mgt. of the wolf population?

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Michelle Janusiak	All of it	Yes	Components I like: I like the accountability for a science-based management of wolf conservation, the focus on wolf population monitoring (including improving and increasing resources and cooperation with the public, universities and organizations), as well as the focus on education to the public. I think removing numeric goals is essential to the Wolf Management Plan. Simpson (2019) supports this idea along with the reviews of multiple literature sites that discuss the ecology of pack living. Additionally, I am confused as to why we would have a numeric goal on wolves if we do not have a numeric goal on other species such as deer or bear. The 1999 plan established a management goal of 350 wolves when there were only 200 or fewer wolves in the state. This numeric goal is one of my biggest concerns. I like the wolf zones, especially the "zero quota" zones around the tribal zones. Considerations made by "Wisconsin's Greenfire" on rezoning might be considered. Mandatory harvest registration and in-person certification are essential. Eight hours is an appropriate amount of time for registration. I support the quick shutdown of zones when a quota is met. I support issuing enough licenses to keep the season short, or other methods to keep the season short to support other hunting seasons and allow for the wolf breeding season. I expect outreach to the Native American tribes and the support of their values, and I appreciate the input from the tribes. The proposal seems thorough and science-based.	Components I dislike: The plan should identify funding methods. The plan should include a time frame for implementation and for how often it will be reviewed for modification if necessary. I do not support allowing training of dogs on wolves when any wolf harvest zone is open.	10	Other Comments: I believe it is important for continued science-based research to support decisions made on wolf management in Wisconsin. I believe it is important to consider Native American values when implementing the Wolf Management Plan. The historical overview of wolves in WI (pages 45-50) is an important part of public education, especially on page 48 where it is discussed that expansion is unlikely (Simpson 2019). Continued monitoring and efforts are key to the plan. I hope education to the public will continue to reduce anxiety and concern regarding wolves and the likelihood of humans being harmed by wolves. Collaboration with Minnesota and Michigan may assist research. I have concerns regarding the equality of composition of the Wolf Advisory Committee being representative of the broad range of wolf concerns and opinions in the state. My statements and considerations are reflective of a review of the "Wisconsin Wolf Management Plan, 2022," the "Wisconsin's Greenfire" organization paper written on January 20, 2023 and "An Analysis of Wisconsin's 2022 Draft Wolf Management Plan" written in January 2023 by primary authors Adrian Wydeven, Tom Hauge, and Jenny Washam, et al. I concur with the recommendations from these organizations, and I value what the WI DNR has done to create this Wolf Management Plan. I attended the public continuing education offered by Northland College regarding wolf ecology, tracking, management and conservation. I feel the education has increased my ability to make considerations in a science based, objective manner. Thank you for your consideration.
G. Klein	All of it	Yes	Non-numeric population goals Use of term Stewardship	Hound training on dogs	7	See written comments emailed separately
	Just the parts I am interested in	Yes			0	All wolves should be placed on the endangered species list and not be harmed in anyway.
	Most of it	Yes	none	the wolf is a predator. Using elk as an example is unnecessary, Deer are the main species that wolves prey upon, It's necessary that wolves keep the deer in check as deer are decimating the northwoods of native plant species.	3	I think there the wolf population should be at maximum to keep the deer population in check.
	Most of it	No	I appreciate the efforts of all WDNR staff involved in updating the state's wolf management plan. Although I believe the current plan needs significant updating (see next section), I recognize the efforts and improvements made to the previous plan, including: ● Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. ● There is much greater recognition of the ecological role of wolves ● The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves ● The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed)	● The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on (see reference list below): ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution ● The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. ● The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ○ A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings. ○ Hounding or hound training, which are akin to allowing legalized dogfighting, should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public. ● The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. ○ Despite Act 169, which mandates a wolf hunting season, the department can still restrict the implementation of lethal methods by setting minimal quotas, including a quota of '0' wolves, restricting timing and methods. ○ Several studies have proven a proactive non-lethal approach leads to better conflict mitigation. ○ Lethal management often fails to provide a long-term solution to wolf predation and has the least consistent success rates when compared to non-lethal practices. In addition, there is significant evidence showing that lethal wolf management may be less functionally effective at mitigating subsequent	0	

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
				livestock losses than non-lethal deterrents. ● The plan should require the implementation of abatement measures as well as the use of non-lethal conflict minimization techniques by domestic animal owners for the latter to receive compensation for confirmed predation. ● The plan also runs contrary to public values towards wolves (and omits mention of such majority values from the plan), despite department surveys evidencing that the broad public cares about wolves as individuals (and not just for the viability of the population). Given the recent liberalization of killing wolves by the state, it would be incredibly informative to note majority support of the following reasons for opposing a regulated wolf hunting/trapping season (which are all omitted from the plan): opposition to specific methods of harvest like hounds (64%) or traps (70%), feelings that hunting wolves is unnecessary (62%) or culturally offensive to Native American tribes (57%). ○ All such reasons convey majority disagreement with practices currently promoted and endorsed by the legislature and the WDNR, and such a conflict between managers and the public should not only be acknowledged, but foregrounded and carefully considered in policy (instead of dismissed). ○ Such decisions to omit literature or downplay evidence (e.g., such as majority opposition to killing wolves and their reasons) are contrary to principles of scientific integrity (e.g., present all relevant scientific evidence to the public) as well as ethics (e.g., disguising ethical decisions, such as recreational wolf killing, as robustly supported by science). ● Conflicting agency objectives (e.g., optimizing public hunting and conflict mitigation) are not only not acknowledged, but even misunderstood as harmonious, against the body of scientific evidence. That culminates in the prioritization of consumptive values and policies; e.g., according to the body of scientific literature, use of lethal methods, and especially public hunts, are contrary to most objectives relevant to: harm mitigation, the wellbeing of wolves, their ecological roles, and their non-exploitative enjoyment (i.e., Objectives A, B, D and F). ● There is a stark lack of consideration for individual wolves, wolf population health (including wellbeing), and measurable indicators for assessing any harms barring disease prevalence (e.g., accounting for cortisol levels or other stress hormones, measures of pair/pack persistence) ● There is an inappropriate understanding and consideration of tribal worldviews about wolves. Tribal worldviews of wolves are misconstrued as 'cultural benefits' tribes receive from the existence of a wolf population, when in fact tribal worldviews consider each individual wolf as a person and relative. Cultural respect and sensitivity towards such views, shared by many non-tribal members, demand the strict mitigation of lethal measures, especially recreational killing, as opposed to their current promotion in the plan. ● In general, all omissions of scientific literature, the arbitrary prioritization of policy objectives, the rhetoric of the plan and the dismissal of public values and concerns for wolves point towards a biased, unscientific and instrumental view of wolves that promotes values contrary to broad public perspectives on wolves. ● 'SOM' wolf estimation methodology – From a recent critique: "The new methods sacrifice precision, but are believed to retain adequate accuracy and sensitivity to changing conditions for reliable decision-making. We review evidence for the accuracy, precision, and sensitivity of the new 'scaled occupancy model' (SOM) applied in Wisconsin. We conclude that the Wisconsin method would systematically overestimate wolf abundance by large (but currently incalculable) margins. Because Wisconsin, similar to other states, not only changed to unverified methods but also implemented widespread wolf killing, shortcomings in their estimates of wolf abundance may have far-reaching consequences for population viability and confidence in state wildlife managers. We discuss findings from Wisconsin alongside similar findings for other states' occupancy models being insensitive to human causes of mortality that have recently increased. Overall, Wisconsin's proposed method for estimating wolf abundance shows significant departures from best practices in scientific measurement. Verification will require independent replication and unbiased tests at multiple scales in multiple habitats under different human-induced mortality rates, and peer review before the new methods are considered reliable." (Treves & Santiago-Ávila, 2023)		
	All of it	Yes	Because this is about the wolf hunt, I see nothing positive.	The biggest thing is that wolf hunting doesn't reduce conflict. It increases it and hurts families	1	The biggest thing is that wolf hunting doesn't reduce conflict. It creates false reporting and payments to individuals that are, in fact, participating in canine fighting.
	Just the parts I am interested in	Yes	The scientific approaches used	I object to use of dogs to hunt bear or wolves. I would like to see these practices prohibited.		

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Jodi Richard	Most of it	No	That you are allowing wolf packs to roam naturally and you support ranchers and residents who lose animals to predation.	That you allow hunting and trapping of wolves.	4	
	Just the parts I am interested in	Yes	Well thought out and comprehensive. Seems to capture all elements important to creating a solid management plan, capturing both quantitive and qualitative data.	I did not read the entire plan so perhaps I missed this. . .I assume there was a section on the cost of doing nothing to manage the wolf population.	8	Glad you are taking time to be inclusive with creating the plan from tribal members to those that live in wolf territory. Sadly this issue is highly emotionally for many, making it very challenging to come to consensus. Thank you for making an extraordinary effort to create some kind of balance
Karen Tolley	Most of it	Yes	Follow science based data to make current and future plans for management. Also having a wolf summit to keep communities informed.		9	
Chad Hedmark	All of it	Yes	I thought the entire plan was interesting. The statistics drew my attention the most. Everyone has an opinion of some sort on any topic. Statistics is where I try to base my opinions rather than just feelings. That being said statistics can be massaged a bit to fit the authors opinion and obviously they are not 100% accurate all the time.	Some things are assumptions that are almost listed as fact. Two come to mind. Wolves and CWD. It is heavily inferred that wolves will positively impact CWD in the deer herd. There are more than a few errors in this assumption. First of all how many deer in the wild have tested positive for CWD inside the wolf range? To my knowledge very few, like single digits. The primary CWD area is in the south. One could make the argument that this proves the theory however CWD was in the State when our wolf populations were low. CWD is an issue that is being handled very poorly. There is strong evidence that CDW can be eliminated and even reversed with the supplementation of the correct minerals that our deer herd and most herds are deficient in. We know this is true as we have cured the exact disease in cattle and more so in sheep. Wolves can reduce Lymes disease. The idea that wolves and coyotes don't get along and coyotes and fox don't get along therefore fox and wolves should get along is a stretch at best. To further imply that fox eat more mice than coyotes is just plain ignorant. Coyotes do take fawn deer and some of the very sick however the coyote is a farmland animal. He prefers more open spaces to hunt rabbits and small game like mice. Anyone who has been successful at trapping any numbers of coyotes know this and uses this common information when laying out a trap line. I do not like that I don't see any place where there is an actual number of wolves that the department is trying to achieve. How can you have a management plan and not have a number in mind? Would the department attempt this with any other managed species? This is a recipe for disaster and it will cause more backlash from the public that may be on the fence for support of the wolf program.	5	There was obvious concerns from some when the wolf program began. People ranged from full support to no support. I believe this range could probably be laid down on the map and you would see the support gets less the closer you got to the areas where we currently have them. This being said most people where I live (Florence County) had support for the wolf as long as it was controlled and didn't "get out of hand". There have been years in the very recent past where they were out of hand in and around my house. When we had our first hunting seasons the people here behaved with the wolf. The attitude wasn't necessarily "glad they are here" but the people at least had the illusion we had a season and we would be able to target some areas that had high populations. Once the seasons were suspended the people felt like the one thing they had was taken from them. They were reminded of the original population goals of around 300 animals. They were looking at State counts in excess of 1,000 animals. Many of us felt like the entire thing was sold to us like snake oil, we were told "don't worry there wont be that many" and yet we were over 3 times the original goals! It was interesting to read through the carry capacity numbers. You probably should have omitted these figures from your report. It honestly paints a picture that you have no idea on what the correct capacity is. The supporters of large numbers of wolves live in the cities. They don't have to worry about putting their dogs outside to urinate, they don't have to worry about their kids playing alone in the back yard. There hasn't been an incident with a humane attack yet however last week 2 adult wolves came through my yard. The thought goes through your mind. I instantly remembered my child hood of playing in the snow alone well after dark. I can't let my kids do this right now. Most people I know and myself included do not want to see the wolf gone however we also do not want to see them run rampant. Wolves are not an animal that you will just jump in your car, drive 4 hours north and you will see them frolicking through the woods. I'm sure that's the idea many have in their mind. This isn't Yellowstone park where everything is so accustom to people that they are oblivious. I admit I haven't been to Yellowstone. I wonder how many people that visit there actually see a wolf in the wild there? I found it interesting that Beaver will make up about 42% of the wolves diet if there is a good beaver population. I spent an entire day last week looking for active beaver ponds. I only found 1 active colony. The APHIS program has decimated the beaver populations in my area. This is a program that seriously needs to be looked at. We went through a period after the great depression of extremally low populations of beavers. Are we repeating a trend? The bottom line is this. Wolves are here, they will always be here and we will learn to live with them and coexist. However the success of a wolf management plan will only be realized if those who encounter them the most are at least somewhat happy with the impact they have.
Kristin Brendle	All of it	No	Thorough document containing a lot of information outlining Wisconsin's attitude toward wolves	I dislike that Wisconsin has declared that when wolves are delisted they are categorized as game animals. Human population has just surpassed 8 BILLION. Climate change and all the damage that brings and we believe wolves are ours to hunt and torture. Shame on all of us.	2	
Kelsey Bender	Most of it	No	Protecting the wolves	NOT protecting wolves	3	
Douglas Kozel	I have not read any of the draft plan	Yes				Please, no inhumane killing. No traps or poisons. No aerial hunting. Think about restoring natural preditors.
	Most of it	Yes	Objective B. Reduce and maintain the population		2	

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Elizabeth Huntley	Most of it	No	From what I have read, the tribal perspectives on Wisconsin wolves, which has been vastly under appreciated and ignored.	Sadly, (and purely from a scientific viewpoint) the research on wolf mortality, as it appears the research is mixed. Act 169 - one of the worst legislative Acts written primarily for Bear hounding interests to persecute wolves being passed in 2012 - what a disgrace to the state of WI.	2	Reimbursing bear hounders for dogs killed by wolves is obscene. What a slap in the face to WI taxpayers. "Harvesting" of wolves is also very objectionable (outside of livestock depredation issues) considering that wolves self-regulate their populations. Disrupting wolf packs by allowing the hunting and trapping of wolves is despicable. You guys are still catering to the bear hounders and trappers. Really sad.
Carolyn	Just the parts I am interested in	Yes	Minimizing the wolf harvest near tribal reservations, but think the quota in those subzones would be better if it were zero. Also, making wolf licenses valid for only specific zones to limit hunters' ability to hunt anywhere. Focusing on non-lethal methods for farms with chronic wolf encounters/conflicts.	Having a season to train dogs to hunt wolves is a bad idea and will increase conflicts of all kinds. Having wolf hunters go to areas of conflict to hunt is not good. The plan should include the idea that it needs to be pro-actively updated every 5 to 10 years rather than just left until "whenever".	4	Eliminate the mandate that Wisconsin has to have a trophy wolf hunt/trap season when wolves aren't federally protected. Thanks for reading my comments.
Brian Wilderman	All of it	Yes	Fact/science based/detailed mapping.	Only thing concerning me is the mapping of zone 6 should be broke down into zone 6/7/8 to give a more science base/area for pack/pair/pup dispersals.	9	none at this time
Angela Rey	Most of it	Yes	It is based on historical data collected and statistics (facts) and takes into account overall eco-system.	Nothing specific is disliked.	10	It is critical that wolf management is based on science and not misinformation. This draft plan considers all aspects of wolf management.
Husband/Wife Oneida Cty Residents	Just the parts I am interested in	Yes	Thank you for giving more time for the public comment period. We like and appreciate the fact that you are moving forward with trying to create a plan, in anticipation of the Federal delisting of wolves in WI. We can also appreciate the fact that you must consider all peoples of the state and stay sensitive to everyone's opinion. However, with that being said, we believe that you need to understand that we have to live with them in our back yards, that we deal with it on a day-to-day basis, they don't. Doesn't that mean anything?? We have wolves encroaching into our dog yards!	*Upset with the wanting to get rid of the numeric population goal for wolves. If you talk to most avid WI hunters, we want 350 or less. Why would you want a "no number" attached to it the wolf population?? Most other large carnivores have it, correct?? *It's unfair to tax-paying citizens for the ridiculous buffer zones, which is their own land and should be able to do whatever law-abiding things that they wish. Should not be considered as Tribal lands. *This is biased towards hound hunting. Hound hunting has been going on for centuries and should continue going forward as one of the most efficient and ethical ways of hunting. *The wolf numbers are skewed to fit the DNR's agenda. The population is much higher than DNR portrays. With not counting pups, dispersals, and wolves that are clearly in areas claimed to be in "unsuitable wolf territory", the population appears to be way higher than what is claimed by DNR. *Frustrated with not having public hearings/meetings for people to attend, especially in the heavier wolf population areas. *Obtain good quality and long lasting GPS collars for tracking wolves, instead of only having 6 working collars. Monies need to be invested to create a more believable model. *Draw up a more "user friendly" informational draft plan going forward, for those that just want specifics and not lengthy, unneeded history. *Continue to issue harvest licenses by state-wide, instead of zone specific. *R3 Program (Recruit, Retain & Reactivate) is promoted by the DNR. If less wolves were on the landscape, there would be so many more deer, so that many hunters would by licenses and get back into the woods. You promote this program but it would be so much more productive if you decreased the wolf population down to 350 or less and brought the deer herds back up.	2	Continue to consider the major sporting groups input including WHBA, WTA, WWF, WCC, etc. The orginal plan from 1999 had a numeric population goal. Those that developed that plan, realized that they needed a population goal that was socially tolerated to avoid developing strong negative attitudes towards wolves. Your removal of that numeric population goals, dismisses that strategy altogether. Shouldn't the people that live up in the Northwoods, have their voices heard more than those that aren't directly effected by the wolf population.
David Boffa	Just the parts I am interested in	Yes	The inclusion of background information on wolves and their importance to the ecosystem; the proposal of "subzones" around tribal lands	There is still an emphasis on lethal interventions, including recreational killing of wolves. I'm not sure this represents the best and most up-to-date science on coexistence with wolves. Furthermore, the continued support for the use of hounds in wolf hunting is cruel and inhumane, for both wild and domestic canids. I also don't appreciate support for conflicting interests of recreational hunters and scientifically-backed wolf management. It's unclear that hunts actually reduce things like livestock-wolf interactions (and by destabilizing wolf packs there is the potential that this might *increase* unwanted interactions).	3	I wish this plan better reflected current science, respect for tribal views on wolves, and an appreciation for the public's views on wolves. Furthermore, I would have liked to see some consideration for the wolves as beings deserving of consideration, in the same way that we consider domestic canids worthy of protections and ethical treatment.
david haenel	Most of it	Yes	nothing	increased area for no hunting wolfs around the reservations, the tribes have raped the resources enough already them protecting the wolves is another shot a everyone else, No population goal is ridiculous it lets the DNR paly politics even more that you already do politics . Once again the DNR fulfils it's acronym of DO NOTHING RIGHT	1	Stop playing politics and coddling the tribes manage all the resources, you sold the deer off for 12$ apiece then blame a bad winter that didn't happen for the poor population. Again DNR DO NOTHING RIGHT. been hunting for 62 years never seen it this bad and as much BS by madison idiots
Amy Burns	Just the parts I am interested in	Yes			5	Wolves were "managed" into near extinction, then "managed" to bring back a healthy population, now they need to be "managed" again... Nature will manage itself. Protect the wolves from humans and leave them be!

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Ron Bero	Most of it	Yes	The following is from a guide I received. However - fundamentally - where and if it exists within the plan (lets face it - this is a government document, finding the point was virtually impossible for me - but I also can't deal with insurance forms) the importance of predators within the ecological landscape has been seen over and over and over again. Predictors manage their own populations. Any human "harvest" should be highly specific (i.e., not left up to hunters from who knows where (and I am a Wisconsin deer hunter)). so here are the canned comments: • The elimination of a numerical target population • The importance of the ecological benefits of wolves and inclusion of tribal values and knowledge. • The attempt to minimize the impacts of a recreational hunt by adopting buffer zones around tribal lands, shortening reporting requirements and making hunting licenses zone specific. • Emphasizes the use of non-lethal methods to reduce conflicts.	Sorry - not specific here (except the point where I let you know I am pasting canned comments). What I dislike? any reference or allowance whatsoever of hunting wolves. They are dogs fergodsake (yes, bigger, scarier, I've seen them, heard them, am afraid of them (I'm an old white guy who grew up in a city but then left, its in our nature) I carry a gun and would shoot one (probably illegal) if it attacked me or my dog but also recognize the probability of that is about the same as a scary monster jumping out of my basement). whilst the forgoing was perhaps rather unclear - to simplify - we should not allow wolf hunting and based on my review of the plan, you do - so, don't. and here - the canned comments (and by the way - the first one is critical): • Absent is a commitment by DNR to work with the legislature to overturn PA 169 and remove payments for hunting hounds, killed by wolves. • Hound training must be stopped. • The plan should establish a zero hunting quota to protect wolves in our national forests and other areas prime habitat. • The recreational hunting/trapping to reduce conflicts has no scientific basis. • At a minimum, DNR should ban the use of dogs to hunt wolves in our national forests. • There is considerable uncertainty in estimating wolf populations based on the occupancy model and should not be used solely to determine population. • The plan should include an oversight committee which is comprised of biologists and professionals.	7	I think I editorialized pretty much above - jut just in case you missed it - THERE SHOULD BE NO WOLF HUNTING. If there are problem wolves - fine, kill them, move them etc. - it's what we do with criminals - but there probably aren't that many. Oh - and I forgot - trapping ? if that is anywhere therein (I saw reference to some outdated moronic trapping association) - get it the h____ out of there. Oh - just in case you were wondering, I live in Vilas County.
Amy Plamann	Most of it	Yes	There were many elements that I liked, such as the DNR having the right to remove a numerical population goal. I appreciate the DNR making information about wolves transparent. Developing a Wolf Conflict Mitigation plan is also a step in the right direction. One of the most important is showing the harms caused by trophy hunters and trappers. It's unconscionable to think in this day and age either are even still allowed. If wolves are such a problem now why did the DNR even bring them back into Wisconsin, just so they can be killed again?	Having a season to train hounds for wolf trophy hunting is irresponsible and inhumane. It leads to so many other problems such as increased harassment of nontarget wildlife and trespassing issues. What's really sad is this hunting is allowed to accommodate a small percentage of Wisconsinites. Why do we cater to such a small percentage of hunters? Why don't we study the harms of killing wolves. The plan seems to cater to irrational "perceived" harms from wolves. The plan should definitely include a provision to update it at least every 5-10 years rather than simply being "valid until it is replaced".	5	I would love to see Wisconsin stand out as a leader in the country and show that we have a conscience, that we try to do the right thing for people and animals and that we can learn to live together in peace and harmony. I haven't seen one study that shows justification for killing wolves. My hope is that this draft be revised to eliminate trophy hunting and trapping, that is purely senseless, wasteful killing. I would like to see further discussions on nonlethal methods for preventing conflicts with livestock. I would also like to see a strong commitment to give all Wisconsinites a seat at the table in help guide the wolf policy. Based on the 2022 public opinions survey detailed in the wolf plan, the majority of Wisconsinites clearly value wolves and want them to thrive in Wisconsin. These values should be more proportionately represented in groups that have influence over wolf policy.
	Most of it	Yes		Trapping of wolves, although there are established WisDNR “standard” trapping practices, I still think it is an inhumane method of killing wolves. I would prefer that wolf trapping practices in Wisconsin be prohibited all together.	4	
David Lunde	All of it	Yes	The proper use of science	Track survey will never be an accurate way of determining counts.	7	If the quotas can be filled in 48 hours of the season being opened you should seriously consider recalculating your numbers. Your counts are not even close. Bayfeild, Douglas, and Washburn counties alone hold populations closer to your survey
	Just the parts I am interested in	Yes	I like no numeric wolf population goal, managing wolves to a sustainable statewide population, buffers around reservations, and having an adaptive management plan.	I do not like the hound dog training period on wolves and I strongly object to the allowance of chocolate bear baits that wolves might ingest in their shared territory with bears. The wolf management plan should include a goal to eliminate the presence of chocolate baits, plus since no substances toxic to canines are allowed during a wolf hunt, it makes zero sense to allow that type of bait exposure during periods with no open season on wolves.	9	Nice job!
Blake Christensen-day	I have not read any of the draft plan	Yes			6	Wisconsin should do good to the wolves by protecting them because we need them to survive, without them all ecosystems will die. Wisconsin Farmers Say that we don’t need wolves. “Wolf predation has not only taken a toll on livestock farmers, owners of hunting dogs and family pets, the state also has paid out nearly $3 million in damage claims.” I think that this paragraph needs more detail because, I personally work on a farm and wolves are usually calm around people that are calm around them, but if you have pets and the human feels threatened by the wolf, the pets try to protect you by attacking the wolves and then the wolves lash out and kill your pets in self defense. So in this case I disagree with them, we need wolves. Is the gray wolf actually endangered? Video said that the wolves could be off the list and it's ok if all the wolves are gone in the U.S because there are still plenty of wolves in Russia and Canada. I originally thought that we could get rid of wolves because of the video Is the gray wolf actually endangered? But now I know we need wolves to survive because without them species will die. The Sierra Club and the DNR said In ecosystems, different species rely on each other to survive. If one part of the ecosystem is removed, the whole ecosystem can be destroyed. In Wisconsin there are too many deer and this is leading to less plant species as the deer are overeating the plants. Wolves act to control this deer population they also, limit the spread of lyme disease through rodents I agree with the Sierra club and DNR that we need to keep the wolves and if they die out so will all the other animals because it is a chain reaction that starts with the wolves dying. Now that I read all the sources I can, I truly Believe Wisconsin should do good to the wolves by protecting them because we need them to survive, without them all life as we know it

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
						can die. Hi, I'm Blake christensen-day the author of the feedback you (hopefully) just read. If you feel like you need to check my sources you can email me at [redacted]
	Most of it	Yes	The Biology/Ecology, Population Dynamics and the public/ tribal perspectives were all good. The in-depth plan was overall, very good and very informative.	I didn't see anything that covered the previous hunting season's methods. How did chasing wolves with dogs become a so called hunting method. Who was at the table when the methods were decided on. There was a study listed with limited information on the effects of wolves on CWD. Perhaps there is only one study but a more in depth look at that would be interesting.	8	I live in Bayfield county. I have hunted and trapped my entire life in Wisconsin and Michigan often having encounters with wolf/wolves. I also survey and have had encounters while working. I would list most of my encounters as being a very positive experience. My deer hunting success is very high and I am rather disappointed, as it looks like deer hunters view the wolves so negatively. I know where I live, a lot of the sentiment is negative towards the wolf, but that isn't everyone in Northern Wisconsin. Somehow the perception is that very few folks in rural northern Wisconsin tolerate the wolves and that is not correct. I did like the segment on non lethal methods. I believe if it is your animals you should take care of them. I have animals and birds in what is considered a wolf area and I have never had any depredation but I achieved that through fencing. I didn't see any mention of the overharvest in the last season that was held. when it was known that the season was going to end, my town was busier than opening day of deer season the next day and boy were they out to kill wolves. Not exactly conservationist. I hope there will be a way to deal with that overharvesting before the next season is held. I train retriever's and we use direct pressure, indirect pressure, attrition and mostly repetitive methods to train our dogs. It sure would be good to get a professional/ scientific view of effects of using dogs to chase wolves and how this either increases or decreases conflicts between wolves and dogs. Perhaps Wolves are so different from dogs that they wouldn't learn from that type of pressure, but I believe they learn and every time a hound is attacked in my area the talk is we need to kill more wolves. It's like letting your kids play in the road and then complaining about traffic. I hope that the methods for killing wolves in future season's will be re-examined. Finally, the segment about education and outreach is good and I hope is implemented fully. Educating people on a healthy Wolf population is a great goal. May not be the easiest to achieve but outreach is a start.
	Most of it	Yes	None of it	Lack of population number	0	Get back to our 350 population number
Bill	Just the parts I am interested in	Yes		Population should be reduced.	3	Keep the population to 350. Too many elk killed by them. Population is too big now at 1200.
Haley	Most of it	Yes	Nothing. We DONT need wolves period			
	Just the parts I am interested in	Yes				i think there should be regulated wolf harvest in wisconsin. There needs to be wolf hunting and trapping to regulate the population. I say this because the amount of livestock that is killed due to wolves is detrmental to the farms and care takers to them. Not to mention the amount of wildlfe and pets killed anually due to wolves. wolves are good for the ecosysem but they need to be managed. the population goal number can be raised a little more but there is alot more wolves out there than what is reported.
Michael Ballmann	Most of it	Yes	They need to be managed	There is no set population goal.	2	DNR needs to set a population goal. I would like to see a goal of 500 wolves. You need to give more weight to the opinions of those living in wolf territory.
Keith vandervelde	All of it	Yes	Limiting the population	Not enough money set aside for wolf damage to livestock and dogs	9	Keep in mind a pack of wolves can go on a killing spree and kill and injure many animals
Berry	Most of it	Yes	Tribal input and additional comments from all citizens interested in this very important issue.	I feel it lacks strong scientific based conservation.	2	The state of Wisconsin as a whole has a responsibility to get this right for the sake of, most importantly the wolves, and for the sake of all that must coexist with them.
Roxanne Hemmerling	Most of it	Yes	I liked the statistics you used and the fact you cited your references.	Was difficult for a lay person to get through.I wanted to see a summary that was quick and easy at the end of the document.	6	I would expect the DNR would have the best interest in the wolf with the management plan. A plan that would not involve any political influence.
Carol	Most of it	Yes	The insight it provided into the life, behavior and habits of wolves through their life span.	This was a very thorough and detailed plan. I cannot think of anything that I did not like about this plan.	10	This plan makes me feel proud to be a resident in Wisconsin. Wolves are a Wisconsin treasure that deserve our protection.
	Most of it	Yes	I personally think wolves should be hunted until they are gone from Wisconsin	Again, there was a reason Wisconsin didn't have wolves. Most and I mean most don't want them here	0	
	Most of it	Yes				Increase wolf population.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Adrienne Seltz	All of it	No	Buffer zone around tribal lands Dropping goal of only 350 wolves see comments	Emphasis on recreational hunting Absence of public input which supports wolves see comments	3	Hello and thank you for this opportunity to weigh in. I'm in New Mexico and have long experience with haggling over proposed management rules and plans for the Mexican wolf. They're still not getting it right. The main reason is that FWS and state game agencies continue to cater to and appease consumptive users (who are in the minority) and ignore the majority stakeholders, the general public including ethical hunters and Native Americans. Here are my reasons I don't support this plan. 1. Too much emphasis on recreational hunting. There is no science backing recreational hunting as a valid management tool. In fact, studies show that poaching increases when packs are disrupted by hunting as do depredations. Along this line, hound training and hunting should be illegal. It is harmful to the wolves, bears, and the dogs. 2. The SOM methodology for population estimates is highly questionable, as seen from its use in MT and ID. 3. Use of coexistence methods should be mandatory in order for ranchers and farmers to be eligible for depredation compensation. Current studies show that these methods are very successful. Yes, it is expensive but maybe money is better spent helping producers prevent situations before they happen rather than just paying out and having them go through the added emotional turmoil. There are NGOs who can help with this...contact Defenders of Wildlife. 4. There seems to be little regard for the wolves themselves, as individuals, for their wellbeing, or for the emotional trauma dealt to them and their families when they are killed. Wolves are sentient, family oriented being who evolved along side us and probably helped us by guarding and hunting, allowing us to survive as a species. They should not be killed except in extreme cases of personal harm. They should never be killed on public lands as all species should be allowed to thrive there. Ranchers who use these lands for grazing must be responsible for their livestock...again I say, coexistence methods work! The Public Trust Doctrine demands that public lands and wildlife on those lands be conserved for us, the public. 5. Plan slants towards consumptive users, as usual. This is especially evident in the obsession with recreational hunting. We do not eat wolves. You discuss your public surveys but they are not included in the plan itself. The plan does not acknowledge that the majority of your constituents support wolves as individuals and do not want them hunted. You include letters from Tribal leaders but then fall back to hunting in a total disrespect and disregard of what they said. The emotional trauma of Wisconsin's horrific wolf hunts of late is abuse put upon these people and also on those of us far and near who respect life, appreciate the incredible animals around us, and literally cannot comprehend the glee people get from wanton killing of others we share this planet with. And I will end with climate change, If we do not start protecting every wild land and animal we have we will be the next to go. All species have a right to exist and we gain many eco-benefits from plants and animals without which we might not survive. It's time some of these "plans" start recognizing this and create a better vision. Thank you and good luck. Adrienne Seltz Sandia Park, New Mexico
Mary Hahn	Most of it	Yes	I like the fact that you got input from so many sources, and the draft plan seems very fair to all parties.	I really like all aspects of the new plan and that it will replace a severely outdated plan. I want you to know also that I am strongly against any type of trapping and making any type of wolf hunting legal. Thank you!	10	Great job, let's do this!
	All of it	Yes	nothing, It should include specific population goals which greatly reduce the current population	You don't admit that the wolf population is out of control and needs to be greatly reduced	0	It is typical political speak with nothing concrete
Sheila Starrett	Just the parts I am interested in	Yes	Not having a set numerical goal for killing wolves. I like the section on non-lethal deterrents.	There should not be a season to train hounds for trophy hunting. This is disgusting and amounts to sanctioned dog fighting. I think the DNR should suggest that current law be changed and should not be required to have a wolf hunt. Including irrational fears that some uneducated people have regarding wolves should not be in the plan.	5	The benefits of wolves greatly out weighs any negatives. They are so important for the ecosystem and restoring biological diversity. Their social structure is so important for the pack and killing one can cause huge repercussions. Most people in Wisconsin value wolves. Only a very small group wants to kill them. Those of us who value wolves should have more of a say in what happens to them.
	Most of it	Yes	Not much! How can you manage something without any numbers?	Everything!!!!! This plan represents nothing for the people that have to deal with wolves on a daily basis. This shows that an apex predator rates higher than any huntable animal.	1	We need to address the concerns of people that have to deal with the effects of wolf damage on a daily basis. How can we have an apex predator without some kind of control. No other predator has been allowed to roam the countryside unabated to prey on anything they feel like.
David Graves	Most of it	Yes	I like that the plan promotes a healthy and sustainable wolf population and particularly that it acknowledges on page 24 that "It is well-documented that the costs associated with wolf recovery are borne disproportionately by those living within wolf range" and "Nested within the general public, positive attitudes toward wolves are more common among urban residents, those living outside of wolf range, and self-identified animal rights advocates and conservationists". As a landowner who has a cabin on 60	The fact that the plan does not utilize specific population goals for wolves, or at the very least indicate a recommended direction for wolf population in relation to the current estimated population. On page 111 Product A1b it states "Currently, the federal Eastern Timber Wolf Recovery Plan from 1992 includes a defined recovery goal of 100 wolves for the combined Wisconsin- Michigan population. Current post-delisting criteria for the western Great Lakes region indicates emergency relisting may be warranted under various circumstances including if the combined Wisconsin-Michigan wolf population were to decline to 200 or fewer wolves, or if the Wisconsin population declined to 100 or fewer wolves. Similarly, the current state threatened species level set by the 1999/2007 state	4	Again, I feel that the plan it should have a specific population goal and that those people living in, owning land in, and or recreating in wolf territory should have there opinions carry more weight than those who aren't affected by wolf populations, although I realize that is hard to do. As for our contacts with wolves: (1) in 2006/2007 my daughter volunteered to survey wolf tracks in the area near our cabin. I would drive her around for the surveys. While we typically found wolf tracks they were nowhere near as common as today. Back then we had to work to find tracks. Now days it is very common to see tracks. (2)My son has been and avid bowhunter in the area. If he has had deer in his area near the end of the day he will often sit in his stand till it gets fairly dark so as not to spook anything as he gets

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
			acres located in the Chequamegon National Forest in the Town of Drummond our first hand contacts with wolves as well as DNR confirmed contacts (Wolf Depredation Maps) bear hunters have had with wolves near our cabin have made us aware of the "potential" dangers wolves could pose, particularly to pets and small children, as well as while less likely, to adults as well and therefore impacted how we utilize the land. I would hope that the plan would put more importance on the views of those who actually live in and those who own land and/or recreate in wolf range as opposed to those who live in a more urban area and may never set foot in wolf range. While very important to take everyones views into account it is also very important to understand it is much easier to have a positive view on higher wolf numbers if you don't have to deal with the negative impacts those higher numbers may present.	wolf management plan is a late winter count of 250 wolves in the state outside of tribal reservations." That along with the management goal of 350 wolves recommended in the Oct 27, 1999 WI Wolf Management Plan shows that specific numbers have been used by both federal and state agencies in the past. On page 111 it states "It is inherently difficult to explicitly define what constitutes a healthy and sustainable wolf population". So should wolves suddenly be delisted again, without a specific population, and realizing how hard it is to define a "healthy and sustainable wolf population" how would the DNR decide on whether to hold a wolf hunting season and if there was a season on what numbers to set as a quota?? It seems to me that for whatever reason this plan is WAY OVERDUE and LACKS A SPECIFIC POPULATION GOAL. As we have waited for this long overdue plan to come out I was certainly expecting some type of fairly specific population goal to be part of it! Or without it, in the event of wolves being delisted again is the population goal of 350 from the 1999/2007 plan by default the accepted goal??		out of his stand. On two occasions as he was doing so he had multiple wolves come through within 30-40 yds of his stand. The first time there was snow on the ground and we went back the next day and confirmed wolf tracks and the 2nd time they actually let lose with a couple of loud howls. my son is not easily scared but in both of these cases even though he was carrying a handgun with him he still wasn't comfortable getting down from his stand in the dark. So in both cases he called and I drove out with a 4-wheeler to get him. if it had been a bear instead of wolves he would have had no issue getting down. (3) Approximately 12-15 years ago I went for a walk through the forest and ended up on a forest road about 3/4 mile from our cabin. I was walking down a straight stretch of that road and I started hearing something moving back in the brush a little ways off the road. at first I thought I had spooked a deer or some other animal. But as I continued down the road I occasionally heard something moving through the brush moving parallel to the road along side and slightly behind me. With the heavy vegetation I wasn't able to see anything. This continued for approximately 1/2 mile until I came to an intersection with another forest road. As I got there a truck came up from behind on the road I had just walked on. As he pulled up along side of me the driver rolled down his window and asked if I knew that 3 wolves had just crossed the road about 50-75 yds. behind me, which I didn't. The truck was one of the light green US Forest Dept. trucks. After that I didn't hear or see anything else. At that time I was in my early to mid fifties, healthy and in good shape and really didn't really feel in any danger. But it was somewhat unsettling to realize that these wolves were aware I was there and were still comfortable staying close to me to "check me out" or whatever you want to call it. I was 6'2" and220 - 230 lbs at the time. It made me think about how would they have reacted to a smaller person, a child or even an injured adult? Historically the chances of a wolf attacking a human are extremely rare but there is always the chance of it could happen, as pages 81 & 82 of the draft plan points out. A good friend of mine had a similar experience down in the Loretta - Draper area a few years earlier. he was taking a long hike back to his deer stand during gun season and he also kept hearing something moving along with him a ways back in the brush. In his case there was snow on the ground and no leaves on the trees. Eventually he got into a less brushy area and was able to see a wolf moving on a hillside along with him. When he actually turned and started heading towards it it ran off. Like me he said he didn't feel threatened by it but it was unsettling to know it wasn't overly afraid of him either. Totally different than anything either of us had experienced when we had contact with bears in the woods. They had always ran off. (4)Both My son and I have seen wolves walking through when we were sitting on deer stands unaware that we were there. Me only once but my soon multiple times. (5) We typically have multiple trail cameras around our cabin and fairly it is not uncommon to see both coyotes and wolves on them as well. (6) The owners of a cabin near ours are avid grouse hunters and have a black lab they hunt with. Two years ago they were hunting near our cabins and they said all of a sudden a wolf came out of the brush chasing their dog. Luckily a shotgun blast scared it off. (7) And finally the volume of wolf tracks we see, the reports of dog depredation in our area, and finding a fresh deer kill by wolves make us definitely aware of the increase in wolf activity over the years. While I would agree it is very unlikely that anyone in my family or anyone using our cabin will ever be attacked by a wolf or wolves it is something we definitely think of and take into account. It definitely factors into how we watch small children and pets. And about 10 years ago I was diagnosed with a rare and untreatable form of muscular dystrophy. at this stage I am only able to walk for short distances and only with the aid of canes or walking sticks if in the woods or on our trails. If trying to help cut brush or do any kind of work on our trails I have to ride a four wheeler out to the site and then I crawl around on my hands and knees doing whatever I have to do. I have very little strength in my arms or legs. I have to wonder if a wolf would have any fear of me if he saw me crawling around. My case is unusual but it could apply to anybody with health issues, injuries as well as children. So in conclusion I feel that we need some type of set population goal and the vast majority of people I know that spend any time in the wolf range around the Drummond/Barnes area feel that the numbers now are much too high and should be closer to the 350 goal set in the 1999/2007 state plan. I personally would prefer that number but would not be opposed to 500 or so. But higher than that I feel is just too many! At least for the densities we are seeing in our area. Thankyou!

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Gary Feest	Just the parts I am interested in	Yes	First off, I like the Department mission statement to enhance and protect natural resources-- especially the part about SUSTAINING ALL LIFE. I don't mind hunting for food but hunting for "sport" I have to disagree with. I agree with eliminating the arbitrary numerical target population, and I agree with the acknowledgement of the importance of the benefits that wolves provide the natural ecosystems of the state. I applaud the inclusion of tribal values and knowledge, I agree with the attempt to minimize the impacts of recreational hunting by adopting buffer zones around tribal lands, shortening reporting requirements, and making hunting license zones specific. I like that the plan emphasizes the use of non-lethal methods to reduce conflicts---not to reduce populations of wolves but to reduce CONFLICTS.	what I don't like about the plan is there is no commitment by the DNR to work with the legislature to overturn PA 169 and remove payments for hunting hounds, killed by wolves. Wisconsin is the ONLY state that reimburses hunters for dogs who are killed by wolves. Hound training must stop; in fact, hunting bears, wolves, coyotes, or bobcats with hounds should be outlawed. I can see hunting fowl with hounds make sense, but I'm against predator hunting. The plan should exclude national forests from hunting of wolves. There's really no scientific basis for recreational hunting or trapping to reduce conflicts. The plan should include an oversight committee that's made up of biologists and professionals.	7	For the most part, I like the plan; however, the Committee was overly influenced by hunting organizations. They represent a very small minority of Wisconsinites. Too much emphasis was placed on the killing of wolves rather than co-existence, and appreciation of their positive contributions to Wisconsin's natural environment.
Bob N.	Just the parts I am interested in	Yes				I have just been made aware of draft plan, & therefore, do not have time to read, nor assess details. However, as a keystone species, I would like to see as large as a gray wolf population, as is reasonably feasible, in Wisconsin!! They will not only significantly benefit the environment they occupy, but will also benefit WI with increased tourism, hunting, etc. However, with an increased population, there will likely be some predation of livestock, pets, etc. As such, I would highly support a system that night compensate owners that sustain a significant (& proveable!) loss (at least livestock). Thanks, & keep up the scientific & great work you do!!
Thomas Grall	All of it	Yes	The science	That people want more than 350 wolves.	3	Keep the management level at 350 wolves. If people want more than 350 wolves, trap the access number of wolves in Northern Wisconsin and relocate them to Southern half of Wisconsin. Also bring back a hunting and trapping season to control the wolf population.
Bernadette Masur	Most of it	No	With reference to wolf management that the number 350 was taken out and there is no cap: recognition of the importance of wolves in regards to conservation, healthy sustainability, ecology and the benefits of wolf populations in the state: social surveys showing concerns for wolves and they want to coexist with the wolves and many opposed to the current killing practices; inclusion of all the Native American tribes importance and significance of the wolves along with adoption of buffer zones around tribal reservations	Recreational hunting and the notion that wolf hunting decreases wolf hunting conflicts, what it really contributes to is continual recreational hunting; hound baiting and reimbursement for hounds injured or died, in wolf hound attacks. Whom ever subjects or trains their dog for wolf baiting and hunting has no regard for their animal or the wolves, it is just part of recreational hunting; remove chocolate bear bates; the new occupancy model this model does not take into account mortalities not detected, the number used seems to be the same model number used for bears, deer, elk so it is like all the animal counts using almost the same and not taking into account wolves that have been hunted, illegal killings, the number could change each year and there needs to be more people to record the findings do reports on the dead carcasses, also tracked wolves with GPS collars there is only a small number and if a pack disappears how is it detected, the wolves range changes and that is not taken into account so the model needs to be restructured and more employees, volunteers need to be involved. The proposed new occupancy model can be manipulated to save or destroy wolves does it really save wolves?	5	The plan needs to recognize and incorporate the public values towards wolves, and learn to coexist with the wolves. 70% surveyed feel wolf hunting is unnecessary, take that into heart with this plan and rather than reimbursement for a loss of a hound that money needs to go back to the ranchers to put up non lethal methods of deterring wolves away, public education about wolves, but if the plan is just to harvest wolves, and give licenses to anyone, get rid of all the wolves just to satisfy recreational hunters, disregard of the understanding and consideration of the tribal world views about wolves than it is all about the money from recreational hunting and the state is failing its people. Also if there is going to be a wolf advisory committee the people need to know who will represent this committee, there should be a democratic representation showing all the committees and groups involved with the state's wolf habitat and existence, not only from those who drafted the wolf management plan.
David Awtrey	All of it	Yes	-Recognition of differing needs of the hunting zones in terms of management and attitudes. -Using other methodologies to confirm the reliability of the new population estimates -Stating that science based evidence will be used in setting goals and monitoring progress. -No specific population number included. -Inclusion of non-lethal means to avoid depredation of livestock - Recognition of the cultural value of wolves to tribal members -Including education efforts. Overcoming ignorance is the only way forward.	-Providing time for training wolf hunting dogs. This provides an infinitesimal segment of the population of Wisconsin a massive concession. (Product C2h) -There are too many deer. The entire landscape is altered by managing deer as a "herd to be harvested" let the wolves do their work. - Page 69 says there is "no mechanism for establishing a realistic quota" given the complexities of values, there certainly seems to be a skew toward protecting the tiny minority of "hunters" who lose dogs. -Are we really compensating people for pet depredation? What are the numbers of pets killed by cars or euthanized in shelters?	8	The bear hunters wrote the rules that resulted in the last hunt disaster. Time to cut them out of the equation.
Ed Belan	Just the parts I am interested in	Yes	It was too long at 178 pages for me to read since the comment deadline nears.	I dislike the fact that we do not have the 350 wolf quota that was agreed to when the wolves were introduced.	1	Three wolves just killed a deer in my yard. It was sad! I quit deer hunting this past year after 57 years. There is more wolf sign than deer sign in the state forest where I use to hunt (Flambeau River State Forest). Many residents feel as I do. Limit the number of wolves thru a controlled hunt.
Nancy Wellander Sloan	Most of it	Yes				I strongly support allowing the wolf population to thrive. I oppose using traps and being chased down by dogs. I feel many people would not agree with me, but wolves keep nature in balance. They keep the deer population in check. I listened to a farmer whose dogs guard the farm, and prevents animals from being killed, without hurting the wolves. Thank you.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
	Just the parts I am interested in	Yes			0	
	Just the parts I am interested in	Yes		Sub zones are way to big. Or make limits a lot higher	1	Please listen to northern wis residents. We see every day what this number of wolves has done to our area.
	Most of it	Yes	Numbers should be regulated		10	Should listen to people who live with the wolves
	Most of it	Yes	trying to get to managable number	the timeline of the whole process	2	there is place in Wisconsin for wolfs but not the numbers in the last 10 years
Dennis Draves	All of it	Yes	I like the idea of not having a concrete population number as it's too general. Goals for population should be area specific not state wide.	Population should be determined by science, not by prejudice either for or against	9	Keep emotions out of the population decision making process. There will be areas where the population is detrimental to the environment, and areas where the population a positive
Pam George	All of it	Yes	Letting the wolves run And leaving them alone they're just like a dog	I dislike the idea of hunting them at all there is no reason why they need to be hunted we brought them to Wisconsin And now people want to hurt them or kill them that's ridiculous		Leave them be here in Wisconsin no Hunting
Christy	Most of it	Yes	Allowing natural fluctuations	any ideas of trapping wolves or using dogs	3	I really do not support setting a population limit, or use of dogs and trapping of wolves.
	I have not read any of the draft plan	Yes	There's a stigma about wolves. People in the Northwoods shoot them as they encounter them. It's not reported and they're proud.	You do not have an accurate data on wolf kills. The people take this matter into their own hands.	1	I didn't read it. You have inaccurate data on populations and how many wolves were predated by unnatural means.
	All of it	Yes	None of it	All of it	1	Sounds to me like the people that drafted this plan are a bunch of wolf lovers
Al Greene	Most of it	Yes	I like the idea that a specific number of wolves is not in the plan	Not enough weight given to those that enjoy seeing wolves in the wild	8	Generally like it.
Mike klein	Most of it	Yes	On going Management of the wolf population to ensure a viable and stable level that successfully co exists with all state humans	Trapping should be discouraged if not eliminated. Compensation for wolf predation of pets and hunting dogs doesn't make sense to me. Compensation for all farm animals does make sense.	8	Ecological science has shown that a stable wolf population ensures numerous benefits and these are missing or diminished minus wolves. We need this apex carnivore in Wisconsin.
Muffie Taggett	All of it	No	Moving away from a "number" and updating how the monitoring is being done. Taking more conservative stance throughout (in favor of science and hopefully giving slight edge to the Wolf) and really trying to put science first. Taking public input so that management decisions feel more inclusive and transparent. Recognizing ALL stakeholders in the process.	I would support more "aggressive" stance grounded in science. Wolves are NOT a game animal and fully support (as it seems do many Wisconsin citizens) a conditional "harvest plan" as a DNR management tool. I would absolutely take "hunting with hounds" off the table. I don't support it with bear hunting and certainly not in harvesting wolves. Like most Wisconsinites (born and raised, not a current resident), support conditional public hunting with professionals doing the heavy lifting.	8	Wolf must come first. DNR has a tough job but needs to stand firm when it comes to NRC and pressure from special interest hunting groups. WE can not allow a shameful repeat of what happened in 2021. Wolves are NOT a Game Animal and should NEVER be hunted as such. I support Harvesting as a management tool, absolutely. But never for sport with hounds. Shame on those hunters for taking unfair advantage. They Can not be trusted not to do again which is why DNR and Management Plan must have "teeth" and full support of Legislature. Thanks again for the opportunity to listen and learn. Greatly appreciate the progress the DNR has made and will continue to support.
Eugene and Mimi Wuest	Most of it	Yes	We like the respect for the needs of specific areas of the state.	We think the limits tend to be set too high. We need our apex predators to control other species.	4	Please continue to extend protection to wolves in Wisconsin.
	Most of it	Yes	None of it	All of it	1	
David Breunig	Just the parts I am interested in	Yes	Do need to keep the wolf population under control	.No number for population estimate.	1	Need to release two packs in the Madison Arboreteum.
Supervisor Josh Pozdolski of Adams County	All of it	Yes	Further research and education is necessary. Wolves should be held in the same regard and of yhe same importance to the ecosystem and food chain ad the bald eagle. A overpopulated deer herd is causing major danger to nighttime drivers and also also major damage to area crop farmers that wolves would naturally curb.	Killing wolves (especially pack leaders) often causes a displacement of wolf packs and lone disparate wolf situations that are more likely to prey on vulnerable livestock.	1	Please refer to the emailed comment that I also submitted in this site with regards to further education on how wolves are necessary members of the ecosystem and why it's necessary for residents in Wisconsin to learn to live and appreciate wolves as vital residents of this habitat that they helped create and establish long before we as humans took over and declared wolves a enemy out of ignorance.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Keith Stummer	Most of it	Yes	Ensuring a healthy and sustainable wolf population is important...such an awesome, intelligent animal! Reducing Wolf/People conflicts is key...this isn't 1850 anymore. Public awareness of the real world life of wolves is so important! It's not all rainbows and unicorns for the average wolf in Wisconsin.	Maybe I missed this? You didn't set a population goal? Not a real confidence builder.	8	Having spent 35 years bowhunting in Bayfield county I have observed many wolf packs. In the 2000's I typically saw packs of 6 to 10 wolves filing through in single file or actually involved in an organized hunt on a deer. Since 2014 or so the packs I have observed were only 2 or 3 wolves. I have not seen a large pack in over a decade. My laymens theory on this is that the wolves aren't able to raise as many pups anymore because they are under food stress. They have reduced the deer herd to a point that they are now eating beavers and berries to make due. A quick look at Google Earth historical timeline pictures will show you that beaver dams were reduced by 60% or so during the 2000's. The beavers are actually are making a comeback recently. My point is that the wolves are starving and that smaller pack size is a very easy to determine metric for assessing wolf health. I see lots of info on wolf population estimates with the Scaled Occupancy Model, but what about the health of these wolves? Those smaller packs have a lot harder time bringing down a deer. In Bayfield county I think pack size of 6-10 is a healthy bunch of wolves. A pack of two or three are suffering. The public needs to understand that complete protection of wolves is leading to those same wolves suffering rather than thriving. Thanks for taking the time to read this.
Amy Seguin	Most of it	Yes	I appreciate how your plan is giving local input into the management of the population goals.	I guess I don't appreciate the specific prescriptions that a plan like this should have. With the high likelyhood of litigation,I feel that there should be very specific precriptions that leaves little to the imagination.	4	I feel that there should be specific language prescribing a wolf population reduction around the Jackson and Clark county area! More emphasis need to be placed upon the white tail and elk population protections!
Dylan Shaw	Just the parts I am interested in	No	Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. There is much greater recognition of the ecological role of wolves The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed)	The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature. The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. The plan also runs contrary to public values towards wolves (and omits mention of such majority values from the plan), despite department surveys evidencing that the broad public cares about wolves as individuals (and not just for the viability of the population). Given the recent liberalization of killing wolves by the state, it would be incredibly informative to note majority support of the following reasons for opposing a regulated wolf hunting/trapping season (which are all omitted from the plan): opposition to specific methods of harvest like hounds (64%) or traps (70%), feelings that hunting wolves is unnecessary (62%) or culturally offensive to Native American tribes (57%).	4	
Alex	Most of it	Yes	I like the fact the plan acknowledges it's time to shift to a management phase vs recovery. I also like the small 1A & 1B zones and the the flexibility in shutting them down early, while leaving others open.	It's a start, but there needs to be follow up action. Developing Best Management Practices for harvest should be next. I also think the zones should be further broken up and treated like the the 1A and 1B zones. For example, zone 3 covers a large area. During a harvest it would be good to shut down parts of the zone to take the pressure off the packs in the public hunting areas. Like Wolf Monitoring survey zone 20a would be hit hard because has a large amount of public land and easy access. This also will have affect of limiting the opportunity for the anti hunter/trapper/houndsman groups to rigorously harass the folks out participating in a legal sporting season. Like they did the last season.	9	Thank you for your hard work in putting this very difficult plan together under the hardest of political environments.
Jon Rausch	Most of it	Yes	I like that there are scientific reasons being used. And the true understanding that management needs to be done.	I dislike the boundaries around the tribal grounds. If the tribes dont want hunting of wolves on there lands then fine. But if I own land in the subzone I should not have my rights killed as a result of their beliefs.	4	I think the plan is weak as it seems to be caving to the screams of urban people. More consideration should be given to those who live in wolf areas. And those who do should have more freedom to deal with problem wolves.
Debbie	All of it	Yes	The continued discussion of wolf management and more research to be done.	If I understand correctly, you are still in discussion and in the research mode before making any hunting decisions.	0	I do not believe in any need to hunt them. Fencing around farm animals are known to to help the loss of farm animals. I grew up on a farm in Black River Falls. Predator animals are always going to be there. Hunters want the thrill of killing a wolf and that is not a reason to disburse them. They have been around for hundreds of years. If hunting dogs go in their territory then the owner of the dogs should beware. Wolf pack areas are posted. You look at research very few litters of wolf pups survive. It is common sense to leave them be. After all we invaded their space.
Rick Wanke	All of it	Yes	Population of wolves to be limited to 350, and Ruth right of landowners and residents to protect their property by eliminating the predator if necessary.		10	A hunting season is necessary to limit the population of wolves and keep the wary of humans and humans property. They need to know they are hunted and not always the hunter.
James S. Fuller	All of it	Yes	I am in favor of addressing wolf numbers using a scientific team while being sensitive to local concerns. Not putting a finite annual number but looking at it geographically.	I feel that we need to back to protecting the wolf and not letting opinions and old school fear dictate anything to the WI DNR. We need to not worry about economics or inflated so called damages.	5	Go back to the Tony Earl days of protecting air, water and soils and all that lives within the Wisconsin space. Quit trying to satisfy small groups of loud people.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Bruce Markert	Just the parts I am interested in	Yes	Thoroughness	Lack of population goals for wolves. Maximum population should be between 500-600.Wolves in Vilas County has negatively affected deer hunting. The wolf must be managed as other species with no exception. Personally I don't think the DNR has a handle on the numbers of wolves in WI until we have a more consistent season with harvest feed-back.	5	I have hunted around Winchester in Vilas Co. for over 40year. This area as documented by local DNR game manager had the highest big buck numbers and quality. Now very few hunters hunt the area and it seems like we have lost the gene pool to product big bucks. We don't even know the size of the Cedar Lake wolf pack which directly affects the area that I have hunted.
Rebecca Johnson	All of it	Yes	non-lethal control of conflicts Public understanding/education regarding wolves Science based management.	If you are using a hunting dog, it might get killed, should not get reimbursed if the dog loses. Pet owners(non-hunting) should get reimbursed. Trapping should not be allowed. No hunting season	5	Unfortunately, people enjoy the sport of killing just to kill, the last wolf season, the number of wolves supposed to be killed was over the amount before they could stop the season. Long lasting effects of killing the matriarchs really cannot be understood by man.
	Just the parts I am interested in	Yes	Educating the public.			Gray wolves are sacred to Native people—they're family. Native nations should have the final say—no ifs, ands, or buts.
	Just the parts I am interested in	Yes	history, background, conflicts, tribal views,			
	Just the parts I am interested in	Yes	Reducing registration time for wolves killed by trophy hunters and trappers to 8 hours. Creating subzones adjacent to tribal reservations to minimize wolf harvest. Ideally the quota in these zones should be reduced to zero. Making wolf hunting licenses valid only for a specific zone. Removing a numerical population goal from the plan. Developing nonlethal deterrent methods for farms and increasing public education.	Too much emphasis on trophy hunting and trapping wolves when they are not protected by the Endangered Species Act. The law mandating such wolf hunting seasons in Wisconsin should be changed. Objective C does not mention the many benefits of wolves, like biodiversity and disease reduction. It is wrong to have a season to train hounds for wolf trophy hunting. This is like state-approved dogfighting.	5	Please eliminate the mandate for Wisconsin to have a wolf hunting and trapping season, when the animals are not protected by the Endangered Species Act. Please update the plan every 5-10 years. Emphasize nonlethal methods of wolf control. Recognize that wolves are intelligent, social animals that provide ecological and social benefits.
	All of it	Yes	NOT MUCH	lack of a population management goal of 350	0	1. we must have a management goal of 350, without a specific number to manage to depredation control will never happen. 2. I feel this survey should also be checked against, the % of reply's coming from the metro populations and their total metro populations, and compare the % to the populations replying to that of the people living in wolf country. the people in wolf country have something to loose. Metro areas have a serious problem with predators also that the State taxes pay for..... those predators walk on 2 legs 3. I support the WWF's published 32 point reply to the "DRAFT" 4. I hope this plan gets changed soon and this is not just an effort to delay completion.
bob bultman	Just the parts I am interested in	Yes	-- wow, lots of great info and education, keep it coming! -- the numerous ecological values and benefits of Wolves cannot be understated - our Forests need Wolves! -- let's not manage Wolves to an arbitrary number -- buffer zones around Indigenous Lands	-- focus on wolf protection and the wellbeing of wolf families, not recreational killing -- no tax dollars spent on hunting dogs! you know what you are in for. this is a ridiculous welfare program. -- no dog hunting or training - it's legalized dog fighting and completely unfair. -- more emphasis as a keystone species -- more recognition of Wolves as smart and sentient -- minimize recreational killing -- include more current science -- follow the public polls and listen to general public more than special interest killing groups. let the will of the People be the law of the Land. -- maximize non-lethal conflict mitigation -- more input from Tribes	6	-- Wolves belong. Wolves belong in all of their ancestral territories. -- Center Indigenous wisdom regarding Wolves and how we live with them -- more emphasis on non lethal interactions -- prohibit/avoid killing of alpha females and males -- our Forests need Wolves!

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
	Most of it	No	Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. ● There is much greater recognition of the ecological role of wolves ● The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves ● The adoption of proposed buffer zones around tribal reservations	The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on (see reference list below): ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution ● The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. ● The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ○ A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings. Hounding or hound training, which are akin to allowing legalized dogfighting, should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public. ● The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. ○ Despite Act 169, which mandates a wolf hunting season, the department can still restrict the implementation of lethal methods by setting minimal quotas, including a quota of '0' wolves, restricting timing and methods. ○ Several studies have proven a proactive non-lethal approach leads to better conflict mitigation. ○ Lethal management often fails to provide a long-term solution to wolf predation and has the least consistent success rates when compared to non-lethal practices. In addition, there is significant evidence showing that lethal wolf management may be less functionally effective at mitigating subsequent livestock losses than non-lethal deterrents. ● The plan should require the implementation of abatement measures as well as the use of non-lethal conflict minimization techniques by domestic animal owners for the latter to receive compensation for confirmed predation. ● The plan also runs contrary to public values towards wolves (and omits mention of such majority values from the plan), despite department surveys evidencing that the broad public cares about wolves as individuals (and not just for the viability of the population). Given the recent liberalization of killing wolves by the state, it would be incredibly informative to note majority support of the following reasons for opposing a regulated wolf hunting/trapping season (which are all omitted from the plan): opposition to specific methods of harvest like hounds (64%) or traps (70%), feelings that hunting wolves is unnecessary (62%) or culturally offensive to Native American tribes (57%). ○ All such reasons convey majority disagreement with practices currently promoted and endorsed by the legislature and the WDNR, and such a conflict between managers and the public should not only be acknowledged, but foregrounded and carefully considered in policy (instead of dismissed).	4	I am in opposition of any lethal methods when dealing with Wolves and other predators as well. Due to the increased threats of more Zoonotic diseases-just are still spreading, mutating-we NEED to REDUCE close contact with Wild Animals and STOP taking them out of their habitats! It's the 21st century-we have done enough damage-time to honor the 30% by 2030-Protecting, Restoring, ReWilding Wilderness areas, Forests, grasslands, etc too. Wolves should be put BACK ON the ESA as well! They are Icons of the West-are Sacred to Native Tribes and the MAJORITY of People from ALL over the World want them PROTECTED! We cannot allow for barbaric, savage violence in a modern, educated society!
Greg St . Onge	Just the parts I am interested in	Yes	No specific wolf number for the state			I am against the use of dogs by Wolf hunters. I've seen bear hunters trespass on my property for many years to hunt Bears and I expect the same from Wolf hunters. They never ask permission to hunt on my land even though it's posted. They put out bait like they own the land
	All of it	Yes	Documentation of the history of the wolf in the state is very thorough and gives a good background for the plan. Inclusion of the tribes persepectives is enlightening. The way the reservations are handled as "protected" areas for wolves is beneficial and also may have made sense in some of the core range with large tracts of public lands (but maybe not realistic socially).	Based on the percentage of the 2021 harvest by use of hounds it appears that a training period may not be necessary. Hound hunting is popular in the state but you have to wonder if the negatives to other users and stress on wildlife justifies the few people that it actually benefits.	9	In an ideal world I think the core area in the state should leave the wolves alone unless problems arise that require action. It is not an ideal world and the plan is well done and does an excellent job of taking all views into account. Nice job!
	Just the parts I am interested in	Yes	It's clear a lot of effort was put towards making this thorough and complete.	I don't have free time to read 170 pages about wolf conservation, but I still want to be heard. I'm concerned that the thought process behind wolf hunting caters to special interest groups (hunters) that don't represent the interest of the greater population.	3	Livestock predation from wolves is hard for me to understand because I'm under the understanding that most people aren't actually seeing wolves kill their animals. I especially don't like that bear hunters run old dogs into wolf country to get a rebate after wolves kill their dogs. Why should hunters have so much clout in these discussions when the population that wants to hunt wolves is only ~14,000 people? Would you make changes to wildlife management if every gay person in the state of Wisconsin expressed interest in there not being a wolf hunt?

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Janine Onsager	Most of it	Yes	I like how detailed the plan is. it not only includes positive and negative attitudes that are portrayed but, gives details about how the Tribal Nations feel. It also includes health risks to Wolves and diseases that reduce the population.		5	I believe in science so follow the facts, not emotions.
Elaine and Severin Swanson	Most of it	Yes	Acknowledging the ecological value of wolves. A willingness to consider non-lethal control of wolf predation on livestock. Removing a numeric recovery goal. Responding to society's growing interest in co-existing with wolves. Respecting WI tribal perspectives and cultural attitudes.	The overabundance of hunters on your committee creates a grossly unfair outcome. The draft at its inception appears to have determined that wolf hunters, hound hunters, trappers, special interest groups deserve to be served first, we the people second. We oppose recreational hunting to resolve conflicts that can and should be managed in proven non-lethal ways. We see no evidence in the Plan that hunting wolves decreases wolf-human conflicts either. Credibility of DNR's wolf population remains highly questionable. Wildlife killing contests continue, with no account for slaughtered wolves. Likewise snaring, baiting, poaching, illegal killing. This is wolf mortality ignored. In addition, where is the necessary oversight committee, and who will be on that committee? Further, we abhor hound hunting - a vicious practice that has left a shameful mark on the state of WI. The Plan should state absolutely no funding for hounds injured or killed during this barbaric hunting practice. Along with this, there should be no hound training whatsoever.	6	Impressive effort given major differences in how people view the land, wildlife, dominion shared or exclusive to humans. Truly a difficult task to take on. In summary, we would like to see the Plan reflect the voices of those who advocate for reverence and respect for wildlife. Additional peer reviewed studies. An ethical demonstration of the agency's mission - to protect and enhance the ecosystems that sustain all life. We are very concerned about increased violence and suicide rates among our children. Recent news of shootings at a high school in the midwest revealed the shooter had a history of torturing wildlife. Children learn from a young age - maybe sharing space with pets or creating habitat for wild species - they learn that non-human animals experience fear and feel pain as we do. Studies have shown that cruelty to animals is often a warning of more violence to come. Mental health should be everyone's responsibility. The agency's mission statement - to consider the future and generations to follow. Thank you for your dedication and high principles drafting this document.
	Most of it	Yes		We must have a serious reduction of wolf numbers now!	0	We must have a serious reduction of wolf numbers now!
Mary Garrett	All of it	Yes	Finally we are letting the Native Americans have a voice in management of an animal very important to them. And finally we are letting the people who study wildlife and ecology have influence over how these decisions are made, rather than in the earlier plan which could hardly be defended on these grounds.		9	I am very happy to see that wolf management is not being handled in a simple-minded and scientifically ungrounded way.
Scott Wildberg	Most of it	Yes	The need to control the population through lethal means and the stronger need for population control in more populated areas.	So much of the research is not Wisconsin based but out appears that it is being considered higher over other inputs.	5	
	Most of it	Yes	I like that there are alot of people involved. It was interesting to read the Native American beliefs. There were a lot of studies referenced.	That there is no number attached. The snowshoe hare was mentioned as a prey for the wolves. Back in the 80's and early 90's there were a lot of snowshoe hares around. We would hunt them before or after deer season. However, I haven't seen one in 25 years. You should also be looking at bringing back those numbers and maintain a healthy balance of this species as well. I am wondering why they are not endangered.	3	Put a number out there. 350. Have a hunting season if there gets to be too many.
	Just the parts I am interested in	No		The number of wolves allowed to be killed every year should be zero.		
	Most of it	Yes			10	

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Shelley Wyndham	All of it	No	None	wolves should never be hunted, killed for trophies call it what you will - wolves are treasures and it is high time wolf killing - not 'management' needs to be stopped.	0	Several researchers recently took an extended look at Wisconsin's 2022 'scaled occupancy model' for estimating wolf counts in the state and concluded that the Wisconsin method systematically overestimates wolf abundance by large margins. This is due to several factors, and perhaps the most concerning part of all is that these over-estimations likely extend to other states using similar counting methods. New Counting Methods Despite there already being several proven methods developed by Wolf scientists over the course of many years, Wisconsin and other states have chosen to attempt to cut costs and create a lot more gray area and margin for era for their counts. As Adrian Treves and Francisco J. Santiago-Avila put it in their recent paper titled Estimating wolf abundance with unverified methods, "The new methods sacrifice precision but are believed to retain adequate accuracy and sensitivity to changing conditions for reliable decision-making…We conclude that the Wisconsin method would systematically overestimate wolf abundance by large (but currently incalculable) margins. Because Wisconsin, similar to other states, not only changed to unverified methods but also implemented widespread wolf killing, shortcomings in their estimates of wolf abundance may have far-reaching consequences for population viability and confidence in state wildlife policy." The new counting method combines estimates of pack size, ranging pack area, and occupied range. This method is used in Wisconsin, and similarly, counts have been used in Montana and Idaho. Perhaps unsurprisingly, each of these states has also expanded the allowance of wolf hunting and killing over the last several years, and these estimates don't always do a great job of factoring in all those wolves lost. Estimated Wolf counts as of January 2023 Flawed Metrics The changes to Wolf counting in Wisconsin and similar states are dependent on Wolf populations reaching a number that makes it difficult to take a "census" approach, and instead, take a new approach, called the 'scaled occupancy model' (SOM), which attempts to estimate the total number based on several factors. The SOM has three components, each estimated with separate models: an estimate of the area occupied by wolves, an estimate of territory size, and an estimate of pack size. The problem is that Treves and Santiago-Avila determined that all three components carry levels of uncertainty, that when compounded together, create a wide margin for error for the total count. Perhaps one of the most telling metrics that shows this flaw is described by the two researchers in the study: "It is important to note here that the data input to the SOM comes from previous years (two winters of snow track surveys and four years of pack-occupied range estimates)." So the data used in the SOM has a range of up to four years, meaning if a wolf pack was seen within the last four years, they got counted in the estimate. In case there was confusion of what that four-year range meant to counters, the Wisconsin Department of Natural Resources included an Addendum that clarified the pack just had to be observed at least one of the previous four years. The biggest flaw in that logic is that a pack could've been seen prior to the aggressive wolf hunts and other wolf killings that happened in 2021. The killings were so brutal, hunters killed 218 wolves in just four days, blowing past their 119-animal quota, and knocking out as much as 30% of the state's wolf population, and that's just what was officially reported. That means any one of those wolves could've been counted in previous years, and would still count in the most recent count, despite clearly being wiped out since then. As the study puts it, "The SOM was developed and compared to the traditional method entirely under conditions without hunting or killing of suspected predators of domesticated ungulates (Stauffer et al. 2021), raising questions about its sensitivity to population changes caused by legal killing." Conclusions This study brings up some very valid questions about the counting methods employed by Wisconsin and other states using similar methods. We never advocate that wolves should be killed or culled through hunting or other methods, but even if you do think that wolves in these regions are at a sustainable enough number to be periodically hunted, this study calls into question whether we can trust the data being provided by these states about the overall population, and how it might have shifted since legal wolf killing was sanctioned. It's best that the concerns about the new Wisconsin 'SOM' method are brought about now, as a means of informing public policy debate about how best to count and manage these wolf populations in Wisconsin and in Wolf management states across the US.
Coleen Johnson	All of it	Yes	That the management of the wolves will no longer be referenced off an old, unsupported and unscientific number of 350. And that the wolves are finally being seen as the ecological counterpart that they are.	The current draft still does not reflect the best available science. There really isn't any science shown and the effects of the large killing and unreported killings is not taken into account. There is nothing in place to stop lethal and inhumane management, like hounding which is not a sport at all and is like dog fighting which is illegal.	4	There is not a sold protection here for a full management plan. There is not enough scientific literature to support the plan and not enough safety nets to protect the wolves from the cusp of extinction again. The woods and the animals within are for everyone to protect and help maintain properly.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Ryan	Most of it	No	To be honest, I was sent this on November 10th (the 11/9/22 draft) and I read it then, so it's fuzzy, and a million things have happened in life since then. However, I was impressed by how science and economic truths were hand in hand. Wolves were not a huge economic problem for the state. The overall plan is heartening. Maybe send a copy to Montana...they aren't so enlightened.		9	Hey, I'm a naturalist, nature-first person. Unless wolves are causing undue stress to people directly, I say leave them be. Populations will stabilize themselves. Of course, I'm also of the belief that people are on THEIR land, that the wolves should have first rights, but that'll never be too popular. Thanks for your work on this.
Susan Mackreth	Most of it	Yes	The plan is comprehensive and statements are well documented. Every issue that usually arises when wolf management is discussed was addressed. I especially appreciated the grounding in gray wolf biology, ecology, and the inclusion of their meaning to the Native American tribes in the state. I also like dividing the state into zones with different goals. I live in Zone 1 and am happy to have as the primary objective a healthy and sustainable wolf population. Finally, I think the adaptable approach to achieving goals is a sound strategy.	I didn't find anything with which I completely disagreed. The term "landscape of fear," may be a standard term, but it puts an emotional spin on the basic predator/prey relationship, and should be avoided. Last thing we need is more emotion in the wolf management discussions.	10	Thank you for all the work you put into the plan. Wolf management informed by science, rather than dictated by political pressures, is the correct way to proceed.
Terrence McDermott	Most of it	Yes	I like the following: 1. The plan has a goal to ensure a healthy and sustainable wolf population & effectively balance the trade offs between objectives. I also like that there will be emphasis on non-lethal methods to reduce wolf/human conflict. 2. The plan divides the state into zones, with licenses being specific to each zone. Each zone's population & wolf/human conflict issues are taken into consideration individually, rather than the state as a whole. 3. The plan allows for adjusting harvest quotas by zone based on current conditions, rather than basing harvest numbers on an arbitrary number set decades ago. 4. The plan includes Native American tribal input, respecting tribal values & allowing for a buffer zone around tribal lands.	I dislike the following: 1. Allowing the use of bait & dogs to hunt wolves. As a hunter, I don't feel that using bait is true hunting. Hunting should be walking through the woods seeking out your game, not shooting game over a pile of bait or having dogs chase down your game for you. That is not how I define the sport of hunting. Bait is also indiscriminate - other wildlife can be unintentionally poisoned or sickened by the bait. Poisons and bait should NOT be allowed, especially on public lands. 2. An area of Lincoln County was added to Zone 3 in the proposed Management Zones. Western Lincoln County should be part of Zone 1 or 2, as that area is part of the heavily forested, original prime wolf habitat.	7	The goal of reducing wolf/human conflict by having a hunting season is counterproductive. Wolves hunt in packs which enables them to take down larger prey. Hunting breaks up packs, forcing wolves to hunt smaller prey, which leads them to livestock & domestic pets - creating more wolf/human conflict. A wolf hunting season creates a repeating cycle of wolf/human conflict.
	Most of it	No	the proposed plan has some good elements to it - buffer zone around tribal lands, no more quota numbers which are outdated, better understanding of the importance of wolves ecologically	the plan still includes the killing of wolves as a management plan, disregarding the research that shows the negative impact on wolves, the ecosystem which loses a top predator and on the breakdown of the social structures of wolves and leads to more human -wolf clashes. It also disregards research on non-lethal ways of managing wolves where they pose a genuine threat to livestock. It disregards that most people in our state (i lived in WI for many years and still own property there) do not want wolf hunts.	2	We need to reset our attitudes and policies using science as a guide not sporting. We need to work from a goal of co-habitation with the native species of our state, nurturing ecological resilience and health of the wolf population and definitely not causing harm. That should be the baseline.
	All of it	Yes	None	None	2	I was lied to back in the late 90s and told we were going to hit a goal of 350 and then manage them. I don't mind a few wolves but when you meet your quota in two days there are too many!!!!
Brad Hilton	Just the parts I am interested in	Yes	Dividing into regions.	The overall ability of the plan to be instituted. The number of wolves seems to be mean very little. Politics seem to rule logic and science.	4	When a hunt is allowed make the harvest large enough to meet the goals. The number of wolves must be reduced.
	Most of it	Yes	Nothing	Increasing the target population number when there's already a population over 1,100 with the current 350 threshold.	1	We do not need to eliminate wolves from Wisconsin, but I feel their numbers should be managed. A yearly hunt with a lottery like bobcat, bear, etc in my opinion is the best way. And the money raised from applications can be used to better track the populations of wolves throughout the state so we can have a better grip on the population figures. I know we will have to decide how many tags to award each year. I think we should follow the same guidelines from the February 2021 hunt for 2-3 years and look at the effect on population and then the number of tags awarded can be adjusted up or down based on the population trend.
Michael Kuhnen	Just the parts I am interested in	Yes	I like that there is no target number of wolves for the state, that Native Americans and their values have been included along with the buffer zones, and that the hunting licenses are zone specific.	The plan should include the following: Absolutely NO reimbursement for hunting hounds injured or killed by wolves Eliminate all hound training Eliminate all hounds from hunting wolves Create a committee that includes more scientists and environmentalists to review and update the plan. Hunting organizations are overrepresented. Repeal Wisconsin Public Act 169--there should not be a law that mandates a wolf hunt.	7	Why should taxpayers pay for a dog who is injured or killed hunting wolves?

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Dan Buckler	All of it	Yes	I really appreciated how respectful this plan was to wolves and humans alike. It recognizes, celebrates and encourages wolf presence in Wisconsin in perpetuity, and at such numbers to hopefully ensure a strong, healthy population. The plan was well thought out, with a huge amount of research integrated into it. I commend the planners and writers on this difficult task. The recent social surveys on public perceptions of wolves have been incredibly important, and I think the plan's writers have been spot-on with using those surveys, along with current biological and ecological science, to be of the utmost importance while formulating the plan. And so I applaud all of Objective E, but I'll single out Product E2A for being so critical. I'll also call out Strategy E5 in being very important to help understand wolves' role in forest management, particularly considering the immense impact their preferred prey have on forest regeneration. There seemed to be great recognition of tribal considerations and I am happy about that. I am very sympathetic to farmers and ranchers whose animals are predated upon. I was glad to see a lot of consideration given to this audience to try to minimize wolves' impact (especially with nonlethal abatement), and to fairly compensate them if possible.	I do not support wolf sport hunting of any kind, especially the use of dogs and trapping. I found non-consumptive wolf benefits (Objective C, Strategy C3) to be given pretty minimal consideration compared to hunting and trapping, especially since the vast majority of people (within and without wolf territory) enjoy wolves in these ways. I don't understand Product F2e: Apply for CITES (Convention on International Trade in Endangered Species of Wild Fauna and Flora) authority. Why would we be encouraging / allowing wolf trophies to cross international borders?	7	Related to Objective D – I would find a public advertising campaign to be potentially very useful and informative in demystifying and destigmatizing many of the common (mis)characterizations about wolves. Like the fact that you could count with just two fingers how many times there was a negative wolf-human interaction in the 20th century in the contiguous U.S. Related to Strategy F1 – perhaps try to include habitat managers or foresters here. Perhaps they're already included, but it would seem important to include folks growing trees/forests, since regeneration is so affected by deer (and thus potentially by wolves). Thank you for all of your work.
jim dzimiela	I have not read any of the draft plan	Yes	none	none	1	What a poor tool and I guess you don't want any feed back! jim dzimiela
Paul Collins	All of it	Yes	I am very encouraged that the draft plan removes a numeric goal for gray wolves in Wisconsin. The management plan takes Native American tribal concerns into consideration and establishes buffer zones around tribal lands to protect wolves in those areas. The plan shortens the timeframe that wolf kills are to be registered from 24 to 8 hours. The 24 hour loophole has been used and abused far too often. Wolf-kill tags will be zone specific. The plan is significantly better than what it would be replacing. The absurd "350" number has been used and abused for far too long and it is good to see that disappear.	The occupancy model method of population estimates leaves far too much room for guesses about the wolf population. I would prefer the use of numbers based on actual observations and visual counts. There is still far too much emphasis on recreational killing and providing "hunter opportunity" to kill wolves. More emphasis needs to be placed on the value of this species to non-consumptive users of our lands. While non-lethal methods are discussed to prevent conflicts with livestock, the DNR's partnership with the USDA Wildlife Services shows that lethal methods seem to be the primary response to alleged predations. An additional 65 wolves were killed in 2021 in response to alleged predations on livestock. This is unacceptable. There should be separate committees for science and "stakeholders." Having only one committee gives far too much weight to the political agendas of "stakeholders" that far too often skew toward killing and agricultural interests.	7	While the plan is significantly better than what it is replacing, I respectfully ask that more emphasis be placed on coexistence with wolves rather than killing and "hunter opportunity." I would also like to see less reliance on the USDA "Wildlife Services" and how they resort to killing to "solve" conflicts. If Wisconsin wants to regain "management" of this species then it seems quite hypocritical to partner with a federal agency that seems more about revenge than actual mitigation.
Judith culp	All of it	No			1	
Nick Kufalk	All of it	Yes	I like that the WI DNR started the process of creating a plan. That's about it.	I dislike that there is no clear population goal, I dislike the buffer zones around reservations that are already off limits to non tribal members, I think the survey that was complete is super hokey and doesn't represent a clear public perception of wolves. I never got a survey to full out about my attitude towards wolves and NO ONE I know filled out a survey relating to wolves either. So it makes me really question who got to fill out this survey. I also don't feel like the people who have to live and deal with the wolves are being heard or really worked with. To me it feels like a whole lot of people who love in southern wisconsin and in different states are getting their opinions on the matter heard more. I also feel very disrespected as a sportsman's in Wisconsin that groups like Humane Society of the United States and the Sierra Club were even part of the Wolf Committee because everyone nows that these are Anti-Hunting groups who only sue and extort to get their way and will never stop until they end all methods of hunting. I am not against wolves and I know they have/deserve a place in Wisconsin.	3	
	Most of it	Yes	It's good to see representation from the tribes and buffer zones for tribal lands.	Still a need for an oversight committee with more emphasis on biologists, professionals, etc.	7	Still too much emphasis placed on killing rather than co-existence.
Robert Gage	All of it	Yes	Wolves are an important part of the overall ecological system in Wisconsin. Any hunting of wolves should be prohibited, and they should be protected.	As above, wolves are an important part of the balance of nature. Any effects on livestock and family dogs (keep them indoors or in pens) is minimal.	1	Wolves should be back on the endangered species list and hunting wolves should be outlawed in this state and nationally.
	Most of it	Yes	the fact that there is a plan and encouraging the biodiversity of having wolves on the landscape	no specific population goals	2	I feel that the number of predator species in the state should be better managed and numbers reduced

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
	All of it	Yes			9	I listened to the extreme spectrum of comments on the 3+ hour zoom call. Most comments I'm sure, hope, will have no impact on the plan which I fully support with the addition of the written comments by Greenfire. And to counter comments by some - I support the plan AND I live in zone 1, have land in 1a and 1 (family land for 80yrs). We own nearly 1,600ac, have wolves on the property daily (many cameras); have no irrational fears; have many small grandchildren; recreate outside daily; respect balanced predator / prey relationships. I appreciate the huge social study included in the plan. I do NOT support $ reimbursement for predation but understand it. I do not support hounding but understand it. I support trapping but not wolves. Keep up the great work. Thrilled to have a new thoughtful, thorough plan. Please try to incorporate Greenfire's written comments into the plan.
Ryan M Olson	Most of it	Yes	none of it	no population number set.	2	create a season and come up with a lower population number to maintain.
Gustavo de las Casas	Most of it	No	I like that you are removing a target number for the wolf population. I also like much that you are engaging the ecological importance of wolves, as well as including tribal values.	I dislike that: there is no oversight committee, that it allows recreational hunting/trapping to reduce conflicts, and it allows use of dogs to hunt wolves.	6	The Committee should not have overrepresentation by hunting organizations, which are a minority special interest group. There should be equal representation by other stakeholder groups.
Janette Dean	Most of it	No	Any form of protection of wolves from any lethal actions against them.	As a Wisconsin-born person now in Minnesota, I agree with many on these points: Several studies have proven a proactive non-lethal approach leads to better conflict mitigation. ○ Lethal management often fails to provide a long-term solution to wolf predation and has the least consistent success rates when compared to non-lethal practices. In addition, there is significant evidence showing that lethal wolf management may be less functionally effective at mitigating subsequent livestock losses than non-lethal deterrents. ● The plan should require the implementation of abatement measures as well as the use of non-lethal conflict minimization techniques by domestic animal owners for the latter to receive compensation for confirmed predation. ● The plan also runs contrary to public values towards wolves (and omits mention of such majority values from the plan), despite department surveys evidencing that the broad public cares about wolves as individuals (and not just for the viability of the population). Given the recent liberalization of killing wolves by the state, it would be incredibly informative to note majority support of the following reasons for opposing a regulated wolf hunting/trapping season (which are all omitted from the plan): opposition to specific methods of harvest like hounds (64%) or traps (70%), feelings that hunting wolves is unnecessary (62%) or culturally offensive to Native American tribes (57%). ○ All such reasons convey majority disagreement with practices currently promoted and endorsed by the legislature and the WDNR, and such a conflict between managers and the public should not only be acknowledged, but foregrounded and carefully considered in policy (instead of dismissed). ○ Such decisions to omit literature or downplay evidence (e.g., such as majority opposition to killing wolves and their reasons) are contrary to principles of scientific integrity (e.g., present all relevant scientific evidence to the public) as well as ethics (e.g., disguising ethical decisions, such as recreational wolf killing, as robustly supported by science). ● Conflicting agency objectives (e.g., optimizing public hunting and conflict mitigation) are not only not acknowledged, but even misunderstood as harmonious, against the body of scientific evidence. That culminates in the prioritization of consumptive values and policies; e.g., according to the body of scientific literature, use of lethal methods, and especially public hunts, are contrary to most objectives relevant to: harm mitigation, the wellbeing of wolves, their ecological roles, and their non-exploitative enjoyment (i.e., Objectives A, B, D and F). ● There is a stark lack of consideration for individual wolves, wolf population health (including wellbeing), and measurable indicators for assessing any harms barring disease prevalence (e.g., accounting for cortisol levels or other stress hormones, measures of pair/pack persistence) ● There is an inappropriate understanding and consideration of tribal worldviews about wolves. Tribal worldviews of wolves are misconstrued as 'cultural benefits' tribes receive from the existence of a wolf population, when in fact tribal worldviews consider each individual wolf as a person and relative. Cultural respect and sensitivity towards such views, shared by many non-tribal members, demand the strict mitigation of lethal measures, especially recreational killing, as opposed to their current promotion in the plan. PLEASE STOP ALL LETHAL ACTION AGAINST WOLVES WHO BELONG IN THE ECOSYSTEMS OF OUR GREAT LAKES STATES AS WELL AS ACROSS NORTH AMERICA.	5	It is unethical to try to put such low and arbitrary population limits on wolves as some states aim to do when wolves properly regulate their own populations. Humans have taken up far too much land and space for their own purposes without an ecological focus on how our ecosystems thrive when they are optimally benefitting all parts of each system due to the mutually necessary relationships between the air, land, water, animals, plants, etc., of a particular area and the proper scientific study of this (see: Ecology definitions).
Victoria Troxler	All of it	Yes	-the adoption of buffer zones around tribal lands and making hunting licenses zone specific -incorporating the ecological benefits of wolves	-the plan should enact a zero hunting quota to protect wolves in national forests -Ban the use of hunting dogs -include a diverse oversight committee of wildlife biologists and professionals, ensure that the committee is not biased	7	There's an overall emphasis on killing wolves instead of reducing conflicts with them

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
	Most of it	Yes	Very little. Wolves were eliminated in the past for a reason.	If the wolves are important to the natives, have them fence in a portion of their tribal land so the wolves remain where they are wanted. Tourists who are concerned could then visit them on the tribal lands.	0	We live and farm in NE WI. Our farm is adjacent to the Nicolet National Forest. We breed our cattle for docility among other EPD's. On any given night, you can hear wolves howling in the distance. Our cattle can be outright aggressive, in the past couple years, especially when they have calves. Deer in our area have moved out of the woods, living in the pastures and vandalizing our hay, corn and silage stores. The only tracks of wildlife I see when further than 1/2 mile from our farm are wolf tracks and scat. Bear hunters with cameras had pictures of 13 DIFFERENT wolves about 1/2 mile from our farm. Wolves are not romantic, they are vile predators. Why was the quota for the season met in 24 hours or less last year? There are a great deal more that 350 wolves in WI.
	Most of it	Yes	Considering anther season	That the dnr n their management goo ruus have no idea on the actual wolf population nor are they even close to being accurate	5	
	Just the parts I am interested in	Yes	NADA	The plan lacks the ability for private property owners, ranchers, farmers, residents to kill wolves on their property. You can bet that if Madison or Milwaukee had wolves in your backyard, something would be done about this. This plan is just further bureaucratic mumbo jumbo from a sad bureaucratic agency. The DNR certainly stands for dept. of no results. If I was the individual responsible for this plan, I would transfer to the IRS or some other agency where you expect those people to know nothing and care nothing about resource management and care nothing about the citizens you supposedly serve. This plan is useless and a typical example of government wasteful spending. Sad, Sad, Sad	0	I can't find enough words to express my Intense hatred for this plan and of the Sad, Inept leadership in the DNR.
Abhishek Patwardhan	Just the parts I am interested in	No	What I like about the plan is the following: Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. ● There is much greater recognition of the ecological role of wolves ● The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves ● The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed)	What I do not like about the plan is the following: The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on (see reference list below): ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution ● The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. ● The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ○ A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings. ○ Hounding or hound training, which are akin to allowing legalized dogfighting, should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public. ● The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. ○ Despite Act 169, which mandates a wolf hunting season, the department can still restrict the implementation of lethal methods by setting minimal quotas, including a quota of '0' wolves, restricting timing and methods. ○ Several studies have proven a proactive non-lethal approach leads to better conflict mitigation. ○ Lethal management often fails to provide a long-term solution to wolf predation and has the least consistent success rates when compared to non-lethal practices. In addition, there is significant evidence showing that lethal wolf management may be less functionally effective at mitigating subsequent livestock losses than non-lethal deterrents. ● The plan should require the implementation of abatement measures as well as the use of non-lethal conflict minimization techniques by domestic animal owners for the latter to receive compensation for confirmed predation. ● The plan also runs contrary to public values towards wolves (and omits mention of such majority values from the plan), despite department surveys evidencing that the broad public cares about wolves as individuals (and not just for the viability of the population). Given the recent liberalization of killing wolves by the state, it would be incredibly informative to note majority support of the following reasons for opposing a regulated wolf hunting/trapping season (which are all omitted from the plan): opposition to specific methods of harvest like hounds (64%) or traps (70%), feelings that hunting wolves is unnecessary (62%) or culturally offensive to Native American tribes (57%). ○ All such reasons convey majority disagreement with practices currently promoted and endorsed by the legislature and the WDNR, and such a conflict between managers and the public should not only be acknowledged, but foregrounded and carefully considered in policy (instead of dismissed). ○ Such decisions to omit literature or downplay evidence (e.g.,	4	I would also request that the the following studies be incorporated into the plan (which currently are not integrated into the plan), in order to have all the best available science at hand. 				such as majority opposition to killing wolves and their reasons) are contrary to principles of scientific integrity (e.g., present all relevant scientific evidence to the public) as well as ethics (e.g., disguising ethical decisions, such as recreational wolf killing, as robustly supported by science). ● Conflicting agency objectives (e.g., optimizing public hunting and conflict mitigation) are not only not acknowledged, but even misunderstood as harmonious, against the body of scientific evidence. That culminates in the prioritization of consumptive values and policies; e.g., according to the body of scientific literature, use of lethal methods, and 2 especially public hunts, are contrary to most objectives relevant to: harm mitigation, the wellbeing of wolves, their ecological roles, and their non-exploitative enjoyment (i.e., Objectives A, B, D and F). ● There is a stark lack of consideration for individual wolves, wolf population health (including wellbeing), and measurable indicators for assessing any harms barring disease prevalence (e.g., accounting for cortisol levels or other stress hormones, measures of pair/pack persistence) ● There is an inappropriate understanding and consideration of tribal worldviews about wolves. Tribal worldviews of wolves are misconstrued as 'cultural benefits' tribes receive from the existence of a wolf population, when in fact tribal worldviews consider each individual wolf as a person and relative. Cultural respect and sensitivity towards such views, shared by many non-tribal members, demand the strict mitigation of lethal measures, especially recreational killing, as opposed to their current promotion in the plan. ● In general, all omissions of scientific literature, the arbitrary prioritization of policy objectives, the rhetoric of the plan and the dismissal of public values and concerns for wolves point towards a biased, unscientific and instrumental view of wolves that promotes values contrary to broad public perspectives on wolves. ● 'SOM' wolf estimation methodology – From a recent critique: "The new methods sacrifice precision, but are believed to retain adequate accuracy and sensitivity to changing conditions for reliable decision-making. We review evidence for the accuracy, precision, and sensitivity of the new 'scaled occupancy model' (SOM) applied in Wisconsin. We conclude that the Wisconsin method would systematically overestimate wolf abundance by large (but currently incalculable) margins. Because Wisconsin, similar to other states, not only changed to unverified methods but also implemented widespread wolf killing, shortcomings in their estimates of wolf abundance may have far-reaching consequences for population viability and confidence in state wildlife managers. We discuss findings from Wisconsin alongside similar findings for other states' occupancy models being insensitive to human causes of mortality that have recently increased. Overall, Wisconsin's proposed method for estimating wolf abundance shows significant departures from best practices in scientific measurement. Verification will require independent replication and unbiased tests at multiple scales in multiple habitats under different human-induced mortality rates, and peer review before the new methods are considered reliable." (Treves & Santiago-Ávila, 2023) Finally, while I am happy to see that tribal perspectives are included in the Draft management plan (pages 38-44), I would hope that these are taken seriously in that the suggestions and viewpoints that are outlined in the 4 different tribal responses, are implemented and taken into account. Particularly the view of the wolf as a 'brother' and rather a view of 'managing' wolves, more of a 'relationship plan' with wolves. Wolves should be allowed to determine their own numbers and no recreational hunting of wolves should be allowed or be a part of any 'management' plan. Wolves, as has been seen from many other areas (Yellowstone/Denali etc.), reach stable population levels themselves without any need for management, i.e. wolves are perfectly capable of managing their own numbers.		https://doi.org/10.1016/j.biocon.2014.12.016 Bruns, A., Waltert, M., & Khorozyan, I. 	All of it	Yes	The over all biography on wolves	The fact that this is still up for discussion.when they were introduced the goal was set at 350,when that goal was met there was going to be a season. Second,how are people and judges making decisions on something that they don't have to live with ,wolves aren't in thier backyard	1	
	Most of it	Yes		Dislike no mechanism for killing wolves on private property.	0	After all the time people have told the DNR about problems with too many wolves in northern WI, it is very disheartening to see DNR has no concern for people in northern WI. The plan lacks ability for private property owners, farmers,ranchers, residents to kill problem wolves on private property. It is evident the current administration does not care about the people of northern WI. We have been ignored again in this plan.
Fred Szponer	Just the parts I am interested in	No	I appreciate that some improvements have been made in terms of viable wolf population numbers and the ecological impact of wolves but there are a number of areas that need significant rework.	The current draft does not reflect the best available science regarding widespread and indiscriminate killing of wolves and the negative impact on the overall health of the pack. The effectiveness of non-lethal interventions, especially relative to lethal ones is also lacking in the draft. The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. Extremely cruel methods of wolf management or "hunting" should be completely forbidden. Trapping, baiting, hunting with hounds or chasing wolf packs with ATVs or snowmobiles are deplorable methods that should have no place in 2023 society. The plan should require the implementation of abatement measures as well as the use of non-lethal conflict minimization techniques by domestic animal owners for the latter to receive compensation for confirmed predation. The plan also runs contrary to public values toward wolves which strongly indicate much greater concern and support for healthy wolf populations and a disgust toward barbaric hunting methods such as those mentioned above. A healthy wolf population can be a tourist attraction to the vast majority of people that would visit the northern forests for reasons other than to derive some warped thrill from taking the life of such majestic creatures.	4	
David Rieckmann	All of it	Yes	- Removal of an arbitrary wolf population goal - The plan is properly focused on the ecological benefits of wolves - The plan creates low quota zones around Tribal lands where the Tribes requested it - Using science-based research for wolf coexistence	- This should not be called a wolf "management" plan. The plan name should be changed to the Wolf Coexistence Plan to better reflect the important role of wolves in a healthy balanced ecosystem. Wolves are a valuable keystone species filling a vital role for balanced natural biodiversity - Disallow hunters from training and using dogs to chase down and kill wolves. This is an unsporting, barbaric and inhumane practice that harms dogs and wolves. I don't appreciate hunters and their dogs running roughshod through my public lands and forests - Wolves are not "harvested" for consumption like food crops or forestry trees. Change the archaic term "harvest" to "killing" - There is not enough emphasis on non-lethal methods of coexisting with wolves	8	- Please give strong consideration and inclusion of the Wisconsin Green Fire organization's response to the draft wolf plan - Thank you for removing the arbitrary wolf numeric population goal - The Plan must be focused on the ecological benefits of wolves - Wolf coexistence must be based on scientific research and wolves critical role as a keystone species in a healthy balanced natural ecosystem - Thank you to WDNR personnel for their hard work preparing this draft plan
Jack Culp	Just the parts I am interested in	Yes	The plan outlines actual strategies, data, and talking points and works to solve and provide answers for each common complaint or confusing data set.	It's LONGGG and cannot be effectively summarized. This isn't an issue within itself but media portrayal will skew the report without a proper short summary that includes the solutions.	9	
Mark benecke	Most of it	Yes	Need population goal of 300	Need a population goal	0

	I have not read any of the draft plan	Yes	Zone Changes: 22. The plan includes the creation of buffer zones surrounding reservations, effectively giving the management of the wolf population on both public and private lands to the tribes. We oppose the creation of buffer zones surrounding reservations that would take away the rights of private landowners and public land stakeholders. We also oppose giving away wildlife management authority. 23. The agricultural areas in these newly created buffer zones in the draft plan will go largely unprotected and have inadequate protections for pets and livestock. Private landowners will have unequal treatment under the law for which they are protected under the Constitution. 24. The zone restructure is now based on wolf occupancy and not based on suitable habitat. The unmanaged wolf population has forced wolves out of prime suitable habitat into inappropriate areas, creating conflicts. Not all areas are appropriate to have wolves. We request the zone structure return to the original science-based, habitat-based zones. Goal Statement/Objectives: 25. The Goal Statement in the draft plan does not address where wolves are appropriate. The draft plan needs to take a hard look into what is good for wolves and what is good for humans. Low interactions between the two are best. Wolves should only reside in high-quality wolf habitat and not be managed to the maximum biological carrying capacity. No other species in Wisconsin is managed to its maximum biological carrying capacity. 26. The draft plan implies the elimination of hunting with dogs which is Constitutionally protected. It also implies wolves have more rights to the land than hunters. This narrative is not science-based and all such implications should be removed. 27. Objective B is missing long-term controls for agricultural conflicts. Wolves are known to move down the road and create conflicts with just short-term controls. 28. The goal statement or objectives do not address any form of population control. The official position of the Wisconsin Wildlife Federation is a population goal of 350 wolves in the State of Wisconsin. We strongly request the numeric population goal of 350 wolves be maintained in the final plan.	Zone Changes: 22. 	Just the parts I am interested in	Yes		Lack of an annual wolf hunting season. Lack of easy ability of landowners, farmers, rural residents to kill wolves on their own land	0	Plan needs options for residents to kill wolves on our own property to protect our livestock, pets, children, etc. Plan needs to make it easy for residents to kill wolves without dnr involvement.
	Most of it	Yes			1	
	Just the parts I am interested in	Yes		The plan lacks an annual wolf hunting season. There should be one until all wolves are eliminated	0	The plan needs to provide for the ability for landowners, farmers, rural residents to easily kill wolves on their own property to protect themselves and their livestock, pets, children.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Sarah Nevins	Most of it	Yes	I appreciate that you cite the research that you use, and I like that you are educating about wolf behavior, habitat, impact on the ecosystem etc. Seems well-informed.	The idea that there could be a "safe" percentage of wolves to harvest. This idea endangers the conservation success that we have all worked so hard for. "Current support for lethal control is high among rural stakeholders (Lute and Carter, 2020) and is preferred over non-lethal and preventative measures such as guard dogs, lights, fencing or reducing access to human food" I dislike this statement. I am a rural stakeholder, I reside in a township in Bayfield county. I do not support lethal control of wolves. People need to be responsible for their animals, move them indoor, use proper fencing, keep food put away etc. If someone essentially baits a wolf by leaving their hunting dogs tied up outside (which lots of people foolishly do around here!) It is not the wolves fault for "attacking" their dog. This is absurd, let's act/treat people like adults and not blame it on an animal engaging in their normal behavior. I very much prefer that people use non-lethal methods, and the DNR should be encouraging and/or enforcing this. Donkeys work, lights work, flagging works. Let's use our big brains. " lethal control is consistently found to be less effective at stopping predation issues when compared to non-lethal control (Treves et al., 2016)." from page 28.	4	I appreciate that you attempt balance in this draft. My above comment highlighting the discussion over lethal control brings a question to mind. (" lethal control is consistently found to be less effective at stopping predation issues when compared to non-lethal control (Treves et al., 2016)." from page 28).If, at the conclusion, research shows that lethal control is less effective (which seems obvious to anyone who knows anything about wolves or animal behavior in general) then WHY is there a whole debate about whether of not it should be engaged as a method? It is shown to not work, or maybe have opposite effects, due to disruption of the pack. So on one hand, I appreciate the balance of ideas, on the other hand.. some of the ideas are not grounded in reality so seem perhaps less than helpful. On page 21, the section ends with this this interesting statement which has no citations. "Nevertheless, numerous wolf populations exposed to harvest and other sources of human-caused mortality have been studied over the last several decades and collectively have suggested that wolf populations are remarkably resilient to human-caused mortality, including regulated harvest. Experience with regulated wolf harvest in Wisconsin has largely supported this finding." First of all - what studies are we talking about, "over the last several decades"? Because wolf hunting has not been legal anywhere in this country for decades. We have 3 unfortunate years of our own to look at for data. Why are there no citations on this grand finale paragraph? I don't think it's logical or scientific to assume that they'll just bounce back if we keep shredding their family structure year after year. Wolf repopulation was intentional and successful, let's keep it that way. They are intelligent and their family units/packs are more important to them than other animals like deer. It is not reasonable to assume that hunting them will help anything, their numbers do not need "management"; they manage their own numbers, killing each other off if numbers are too high. It will have detrimental effects, increasing poaching and a negative attitude towards wolves. Hunting wolves pushes an idea that wildlife is disposable, that trophy hunting is acceptable. Trophy hunting is NOT resource management As I stated, I am a resident of Bayfield county, one of the most wolf-dense, wildlife-dense counties in the state. I spend a lot of time outdoors, as do most of my friends and family. No one I know is afraid of wolves or thinks they shouldn't be here. Not one of the avid hunters I know wants to hunt wolves, in fact the ones I've spoken to about it think wolf hunting is cruel and disgusting, as I do. People do not eat wolves. Trophy hunting is absolutely not a sport and it should not be sanctioned by the state.
	Just the parts I am interested in	Yes		I do not like the lack of a wolf hunting season. There should be an annual hunting season until the population is reduced to no more than 100.	0	The plan must address reducing the number of wolves to no more than 100.
Mia Haber	Most of it	Yes	I learned so much about wolves in general and the history of wolves in Wisconsin from reading the plan. I feel like I understand many of the complex issues involved in maintaining a wolf population in our state.	A statement upfront saying how many minutes an average reader might need to read the entire plan minus references would be helpful. The plan required time and attention to really read and understand. Of course, the audience for the plan is not really a casual reader, rather someone who is already interested in the topic. The length isn't a problem, just set expectations for readers.	7	I am proud that there are areas in Wisconsin that are wild enough to support wolves. Wolves make our ecosystem healthy and their presence here is beneficial. I respect the tribes of Wisconsin and it's important their views on wolves are included in this plan. The last wolf hunt in WI was embarrassing for the state and infuriating for anyone who cares about wolf conservation. I dislike the way the hunt was handled and do not want a repeat in the national news. Since the population of wolves stabilize in an area that can support them, Wisconsin could do without hunting wolves at all. That said, if a hunt goes forward, Wisconsin should not issue 10x more licenses than the expected harvest and rely on the 24 hour report requirement. Hunters have no incentive to report accurately and every incentive to keep hunting on as many licenses as they can get. They have demonstrated the system only works if the hunters act in good faith. They did not. I think that limiting licenses to specific zones and reducing the registration time to 8 hours is movement in the right direction. I'd like to see a system where hunters could report their wolf immediately via text (sex and gps location included) and receive a notice via text when a zone is closed. I hate the idea of trapping at all and I am against hunting bears of wolves with dogs. I agree that conflicts with humans need to be managed including killing wolves that have lost their fear of humans. I think hunters that use dogs for wolf or bear hunting should not be reimbursed by the state for killed or injured dogs. Nor should the state reimburse pet owners who had their pet out of their immediate control. If landowners have problems with wolves, they should report it and an agent should assess their concerns. If they do have a problem wolf or wolves, a professional hunter should be brought in rather than simply issuing a license to kill any wolf to the landowner who can then sell it on. I was impressed with the parts of the plan that dealt with educating the public. Most Wisconsinites live in urban areas but I think all Wisconsinites need to keep areas of our state wild or we will lose too much of our heritage.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
	Most of it	Yes	Increasing public understanding of wolves, including regulated wolf harvest season		10	Keep up the good work, and good luck
	Most of it	Yes	That wolves need to be managed like many other predators with sufficient numbers within the state.	We need a plan that will help us manage wolves throughout the entire state of WIsconsin. Currently the plan creates buffer zones and doesn't include management for areas outside of the "wolf zones." Just like the bear population, wolves will continue to expand and reach almost every area within the state. We need a plan to reflect the ability to manage wolves even if they fall outside of the "normal habitat area." Finally, we need assurance that they will be kept at a suitable number. I understand that setting a number like 350 is hard to manage however losing that number value provides too much leeway for anti-hunting groups to argue that no management is needed to keep the wolf population "suitable" in the state.	2	I hope that you listen closely to groups within the state that are impacted by wolves such as the Wisconsin Bear Hunters Association, Trapping Association, and farmer Associations. Also, remember that management plans should not be political but instead based on scientific data.
Kevin stelljes	Most of it	Yes	The detail and unbiased text	Bone	8	I have no sympathy for hunting dog deaths
Jordan Aberman	Just the parts I am interested in	Yes	I believe the adjustable approach is wise and should assist accomplishing the plan goals. I'm glad there is an emphasis on sustainability and the wolf population fulfilling its ecological role.	A wolf hunt/harvest seems unnecessary and incongruous with the notion of fulfilling an ecological role, unless this role is arbitrarily and artificially limited to areas currently inhabited by wolves, or to some other imposed human parameter. In which case, using the language of 'fulfilling an ecological role' is at best incomplete and at worst intentionally misleading. True restoration and sustainability actually calls for significant expansion of wolf territory throughout their historic zones of habitation. While I'm aware this will not be immediately possible everywhere in WI due to a litany of factors, it should nonetheless be the goal of a responsible, forward-looking wildlife plan to think beyond immediate possibility, and to contend with how to reintroduce the wolf to its historic range in as much of the state as possible. I'm not sure this plan does that and a hunt/harvest seems like a concession made to a very small, vocal group, and not reflective of either the majority opinion in the state or the best scientific practices.	6	
Pete Koenig	Most of it	Yes	That the DNR is open to wolf harvest. Wondering why 350 population limit went away...???	Seems to be some stretch thinking i.e. "sufficient wolf numbers could potentially limit incidences of lymes disease in humans" and "wolves could suppress or even eliminate CWD in wild elk or deer herds"....really??	5	I would like to see population goals lower.
Rose Wood	Most of it	Yes	I like all of WI Greenfire's comments and recommendations - please adopt them. Especially removal of numeric quotas, buffer areas at tribal reservations, in person hunting registration and genetic sampling etc.	Reimbursement for any hunting dogs during any time of the year. I realize you don't reimburse during hunting season. But I disagree with hunting with canines on canines. It's sanctioned dog fighting. I hope we can end all hunting on wolves.	8	Greenfire seems to really have ideas I align with. Please adopt their recommendations.
Kathy Bero	All of it	Yes	Overall, I feel like more could be done but am happy to see buffer zones around tribal land, making licenses specific to zones, but mostly taking into account the importance of wolves to our ecosystem. This is reflective of how well the natural world manages itself and how poorly we have done. Causing them to suffer for our insatiable need to control land and water.	Hounds should be eliminated and not allowed to hunt wolves. It's cruel and cowardly. I don't really know how it's any different that illegal dog fights. It's cruel to the hounds who inevitably are injured. I've run into hounds in the woods injured and lost and it's horrific. Then finding the owners, who carelessly throw an injured animal into the back of a pick up. That should be registered as animal cruelty and the owners should not be allowed to have dogs. Disgusting. The WDNR should ban the use of dogs to hunt wolves period. The WDNR should absolutely not allow hunting wolves in national forests or other prime habitat. We are the aggressors, claiming control over lands we don't even legitimately own. I do not like that the plan randomly sets recreational hunting and trapping to "reduce conflicts." Seriously? Camping and paddling through wilderness areas as well as being a land owner in Vilas county - presumably the county with the biggest population of wolves - we have had zero issues with wolves and our family pets (dog). There are numerous wolf trails around our cabin and we've found parts of deer on our land, but never had we had an issue with wolves. In addition, we have been up close and personal with wolves checking us out while hiking or sitting around the camp fire. Guess what. Not one was aggressive even though we had dogs who also did not seem alarmed. We need to stop demonizing wolves for being wolves and let them be.	6	This plan and the committee that drafted it, put too much emphasis on killing wolves rather than setting the stage for co-existing with them. Of course, what else could we have expected with a committee that is out of balance with overrepresentation of hunters who make up a minority. Will wonders never cease.
	Just the parts I am interested in	No	Hunting/Trapping to control population and create environment where wolves are wary of/stay further away from livestock, farms and households.	I support the Wisconsin Wildlife Federation Board 32 wolf plan objections. I specifically request the 350 target be maintained and that landowners/residents in wolf territory be given ability to protect livestock, pets and family.	1	Only currently a non-resident as attending grad school out of state. Family owns more than 250 acres in northern Wisconsin. I and family members regularly are on the property and have experienced increased threats from wolves in the past decade.
Michael Bryant	Most of it	Yes	None	The number of wolves. We need a number And your zone idea is not good	1	Pick a number and reset zones Then FIGHT TO GET A SEASON
	Most of it	Yes	There is an attempt show that this plan is based on scientific evidence , however the plan has failed in this attempt.	The plan is purposefully long and tedious with poor if any statistical validity. I'm sure it is intended to be intimidating to the average person. Wolves and other resources are property of all the people of Wisconsin and should be treated that way. Adequate funding	0	Current levels of enforcement are presently lacking as evidenced by continuous killing of wolves by poachers in northern Wisconsin. I am sure the political will of our current legislature will continue with their abysmal record of neglect.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
				of enforcement will be minimal or non- existent . It appears to be a clever marketing scheme at best		
P F Wanke	Just the parts I am interested in	Yes	Hunting/trapping season to be re-instated.	I support the Wisconsin Wildlife Federation Board 32 wolf plan objections. Most important to me is that the 350 goal/limit be maintained; landowners have ability to protect livestock, pets and family; and do not create zones outside of reservations.	1	Relative to the commentary period, disappointed that greater weigh is not being placed on landowners/residents that are within wolf territory versus those who do not have to live with the wolves. Inherently unfair to have those who gain positives (an occasional visit or "feel good" moment) BUT DON'T HAVE TO DEAL WITH THE NEGATIVE ASPECTS (dangers to family or property) of wolves equal say to those directly impacted.
	All of it	No	I appreciate the efforts of all WDNR staff involved in updating the state's wolf management plan. Although I believe the current plan needs significant updating, I recognize the efforts and improvements made to the previous plan, including: ● Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. ● There is much greater recognition of the ecological role of wolves ● The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves ● The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed)	Gray wolves have made a significant recovery since being placed on the endangered species list in 1974. However, their populations are still limited to certain regions in the United States, and conflicts between wolves and humans continue to arise. In order to manage wolf populations effectively, it's important to consider a range of factors, including habitat suitability, genetic diversity, and public attitudes towards wolves. One key strategy for managing wolf populations is to establish a balance between preserving the species and protecting the interests of humans, particularly in areas where wolves may pose a threat to livestock or other animals. To achieve this balance, managers can employ a range of methods, such as habitat restoration, selective hunting, and non-lethal deterrents. By implementing a comprehensive management plan that takes into account these factors, it's possible to ensure the long-term survival of gray wolves while also minimizing conflicts with humans.	5	1. Establish and enforce regulations to protect wolves from hunting, trapping, and persecution. 2. Monitor wolf populations and conduct regular surveys to assess their status and distribution. 3. Encourage coexistence between wolves and humans through public education, outreach, and engagement. 4. Develop and implement measures to reduce conflict between wolves and livestock, such as fencing and non-lethal deterrence methods. 5. Consider reintroducing wolves to suitable habitats where they have been extirpated or are currently absent. 6. Collaborate with neighboring jurisdictions and stakeholders to ensure coordinated management of wolf populations. 7. Use scientific research to inform decision-making and adaptive management strategies.
J A Wanke	Just the parts I am interested in	No	That wolf population will be controlled so fewer attacks on farm animals and pets as well as lower risk to landowners	I support the Wisconsin Wildlife Federation Board 32 wolf plan objections. Most important to me is the 350 population target be maintained AND landowners are allowed to protect livestock, pets and of course family members.	1	I was a longtime resident of Wisconsin and only moved out-of-state to care for elderly parents. Still own more than 300 acres in northern WI which family members use regularly.
Tom Boe	Most of it	Yes	We finally have a plan put together regardless of how flawed it is...	1)The 350 count needs to remain in the plan!! 2)Subzones make no sense 3)Federal Judges from outside wolf range should have no jurisdiction on wolf issues or ESA action 4)If your serious about population control than set the target harvest level where it should be. You know that native Americans are not going to fill they're quota so take that into account and place the harvest quota where it needs to be in the hands of those whom actually care about control!!	1	I totally disagree with a number of issues in the wolf Mgt. plan for the following reasons: A) No minimum count!! Whom do you think your going to offend by placing a count in this plan?? B)It appears your being influenced more by wolf advocates than by science?? If you care to know the truth about the wolf situation by specific area you need to listen to the sportsman and sportswomen along with the farming community. These are your best source of information cause they're the people that are out in wolf territory!! C)I don't think that federal judges from outside the wolf ranges should have any right to request a relisting of the timber wolf on an endangered species list. 2)I'm 73 years old and I've been a sportsman for as long as I can remember! A) I don't hunt deer because I dislike them. Quite the opposite, I hun t deer because as a kid I witnessed what can happen with hoarse winters and over population. Seeing a group of yarded up deer starving to death leaves a lasting impression for sure. It's a constant reminder of how important sportsman and sportswomen are to the population control levels established by science. We hunt all game animals in part for the same reasons. It makes more sense to control populations than to face the consequences of no control. Wolf deprivation costs, starvation, reduced livestock vigor resulting in reduced profits, just to name a few. 3) Its high time to recognize hunting dogs for what they truly are verses the perception of what they are! A)Hounds are predominately gentle and loving spirits just like your ordinary house pets (which many of the are also). They're bred to trail and hunt specified game be it Raccoon, Fox, Coyote, Bear, Bobcat, Rabbit, or potentially Grey Wolf. They don't do this because they're being forced to. They do this cause genetically they have it in they're genes and they truly love what they're doing. Hounders are not "Killers" they're conservationists doing what they can to help control populations of targeted game species to State managed levels. This is a necessary control measure. 4) We don't blame the "wolf lovers" for they're feelings on wolves. We don't totally agree with some of the false statements as such but I guess they have a right to believe what what they want. I just wish they would take the time to go to the woods, with those of us that face the fear of wolf depredation on our Family hound pets and see first hand what we see and are faced with. 5) Sub zones closed to wolf harvest is a very BAD IDEA!! Some of the most heavily populated wolf range is in the heart of these sub zones. They'll continue to grow in numbers pushing more of the wolf range to the South. Move South to more people, more livestock, and more pets!! That would spell disaster for sure. You think you have high deprivation pay out now, you haven't scene nothing yet!! If

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
						these ceded areas are so important than maybe the cost of wolf deprivation should become the responsibility of the reservations requesting it!! Thanks for the opportunity to share feelings and thoughts on this very important matter!!!
Francene Amari-Faulkner	All of it	No	The importance of the ecological benefits of wolves.	Hound hunting and training MUST be stopped. Recreational hunting is not recreational.	6	The committee seems to be over represented by hunters which is disheartening. Wisconsin has rich wildlife and I wish it was valued for its life.
Eric Johnson	Most of it	Yes	not much of any of it.	The lack of specific population goals. how can you manage anything without specific goals. By leaving it up to the whims of the leadership of the time is irresponsible. The lack of effective tools for livestock producers to protect their livestock, and the stress related to wolf pressures.	1	This plan does not address the needs of livestock producers in the state that deal with wolves on their farms. This plan lacks the structure of actual population goals. How can there be any long term management with the goals changing from one administration to the next. This plan should look at population goals for areas that can sustain wolves. And not expect to have wolves roaming the whole state.
joe	Most of it	Yes	the desire to keep population at level that there is little conflict between humans and wolves	no population goals. the tribes should not be able to save tags to save wolves from being harvested	1	The wolf needs to be managed. there needs to be a population goal
	All of it	Yes	None	Why do the tribes have so much say	1	Needs to be a hard number for quata
Thomas Boehm	Most of it	Yes	Education and outreach efforts to help change public attitudes towards wolves. From the draft, it appears that wolves are by far less of a threat to people than domestic dogs.	Why should the public be responsible for predation losses, especially recreational dogs? The payouts by the DNR are enormous, ineffective in dealing with the underlying issue, and invite abuse. Despite heavy lobbying, all hunting with dogs should cease immediately. Cockfighting, dog fighting, bearbaiting, bullfighting and other bloodsports from the middle ages have been justifiably curtailed. As a long time hunter I believe the use of dogs is nothing but cheating, unsportsmanlike not to mention cruel. That the DNR is compelled to compensate hunters for their own risks is highly ironic. Let them hunt like deer hunters do, without dogs.	6	Thank you very much for your diligent work on this thorny issue.
Tina Heggeland	All of it	Yes	The level of conservation is great. Not relying on numbers and maintaining this beautiful species is so important.	There really is not anything I dislike. People need to understand that we are invading the animals' territories and not the opposite.	9	
Mark Martin	Most of it	Yes	I like that you looked at the history of all elements of the wolves in Wisconsin. I also like the fact that a population goal was not part of the plan.	None. I missed seeing the positive impact by wolves related to removing sick deer like those with CWD.	10	I am not a member but also support the wolf comments provided by Green Fire. There is no reason to use the goal of 350 since that was developed when wolves were relatively new to the state.
Carl Anderson	All of it	Yes	Rather than a lenghty repitition, I concurr with all of Wisconsin Green Fires comments and recommendations, please adopt them. I really like tribal inclusion, buffer zones around reservation lands, removal of numeric management goals, in person registration for hunting, genetic sampling requirements. Adaptive management of our wolf population should be a key part of Wisconsin's Management Plan moving forward.	Plan should simply call for elimination of dog hunting. Plan should refpect that a general hunting season should only be allowed if required and mandated by State Legislation.	8	Please adopt Wisconsin Green Fire recommendations in to the final plan.
	All of it	No	The Resources and to Protect the Wolves at all cost ! and the healthy safe environment for the Wolves !	I didn't see anything i didn't dislike !	10	i would like to know do you have like a Sanctuary to Have Wolves to keep them safe and to have wolf programs to educate People to Learn about the Wolves ?
Adrian P Wydeven	All of it	Yes	Elimination of numeric goal. Focus on ecological benefits of wolves. Buffer areas around reservations. Varied goals for zones based on land use and potential for conflict. Using an adaptive management approach informed by science, and emphasis on education. The updated public attitude survey is very thorough and useful.	Placing western Lincoln County in Zone 3; should be in Zone 1 or 2. Focus on longer hunting and trapping season for user satisfaction; should balance season length with satisfaction for more users, but avoid long seasons that extend in late December and January or possibly February that will disrupt winter track surveys, and disturb breeding wolves. Dog training on wolves should only be allowed when specific zones are open to harvest.	9	The plan provides strong scientific basis for wolf conservation. Areas of concern listed above need to be addressed, but overall it is a tremendous effort toward wolf conservation in WI. Great Job!
	I have not read any of the draft plan	Yes				Wisconsin needs the ability to manage the wolves, they are getting to populate and very little fear of humans and pets
	Most of it	Yes	all		10	
	All of it	Yes	The fact that it is out here for comment	I live in area 1 and have wolves on my sidewalk to my house. I am highly concerned that plans for area 1 may be more limited for wolf control as area 1 is one of the main areas which wolves will be considered in a "home " territory	4	Maybe because they are too close to my home and don't seem affected by our human presence here, I am hesitant to see less control and potentially greater permissibility for their protection in zone 1. I honestly feel there are too many in my area already.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
John Siegworth	Just the parts I am interested in	Yes	Outstanding research and communicated in great depth and detail--thank you. I particularly am interested in the population distribution, the suitable habitat, and the various ecology and population dynamics in the plan.	I didn't have any areas of dislike in the plan.	9	I am a supporter of wolves in Wisconsin. As apex predators, they hold a critical place in our ecosystem and contribute to it's overall balance. As an example, I own a cottage on a secluded lake in northern Wisconsin (Vilas county) and have observed a variety of animals through the years on the ice during the winter months. There was a time (25-30 years ago) when 60-80 deer would come across our lake (on a nightly basis) to feed on our shoreline and in the woods--it was quite a sight to see this many deer at once. The deer would browse whatever they could find, to the point where there was very little undergrowth. As the years went by and wolves became more prevalent, we noticed considerably fewer deer, both crossing the ice in winter and during the other seasons. Consequently, much of the understory growth began to regenerate and fall back in line with the way nature intended to be. There were still plenty of deer around, but not in such large and unnaturally high numbers. Our observations allowed us to conclude that the wolves were responsible for these changes. Now we have deer, but we also see wolves, bears, foxes, otters, etc.--things appear to be in balance, the way that nature intended it to be.
S Nightingale	Just the parts I am interested in	No	Mainly the following: that there is much greater recognition of the ecological role of wolves. The adoption of proposed buffer zones around tribal reservations. Also the inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves.	The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on: ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics. The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. The plan also runs contrary to public values towards wolves (and omits mention of such majority values from the plan), despite department surveys evidencing that the broad public cares about wolves as individuals.	4	
Trevor	Most of it	Yes	The fact that we're actually getting somewhere on wolf control	It's not aggressive enough and the tribal buffer areas are B.S. the tribes already get their large portion of the quota, they shouldn't determine what management happens outside their lands..	3	This plan isn't near aggressive enough.
Elspeth O'Vanin	All of it	Yes	Non-lethal methods used to reduce conflicts with wolves. Ecological benefits of having wolves in the environment. The knowledge and cultural information from the Native American Tribes. This information was ignored in the past. The Native American Tribes co-exist with wolves. This knowledge should always be included in the wolf plans.Set up buffer zones for wolves around tribal lands. Graphs, charts and maps clarify the plan information.	DNR needs to work with legislature to overturn PA 169. Stop and remove payments to owners of dogs killed by wolves. Using dogs to hunt and kill wolves should be illegal- and it should be enforced.Recreational hunting and trapping is not based on scientific facts. Hunting and trapping is based on traditional and a desire to control the natural environment. Disliked the information from hunters, ranchers and farmers portraying wolves as an enemy. Not enough information from biologists and scientists about wolves and their struggle to survive. The committee has too many members representing hunters. Not enough representation from people who are against hunting wolves. Lethal solutions do not provide long term solutions - killing wolves only gives satisfaction to wolf haters and hunters who want to wipe out wolves completely.	7	Set the wolf hunting quota at zero! There should be no hunting or slaughter of wolves! Continue meeting and consulting with the Native American Tribes for advice and knowledge for creating wolf plans. Stop allowing hunters, trappers and other wolf haters to influence laws and policies. Everyone should have an input on how to create plans for wolves, not just the minority of wolf haters! Stop caving in to wolf haters and killers. Use a plan to co-exist with wolves. Never allow a wolf slaughter to happen in Wisconsin again! Focus on the survival and protection of wolves in Wisconsin. Do not allow any hunting groups or hunting organizations in Wisconsin or outside of Wisconsin to kill wolves. It is 2023, not 1823. We need to modify the policies and protect the wolves because they are an important part of nature. If wolves are not protected, they could become extinct in the future. The Wisconsin DNR needs to do more to protect wolves in Wisconsin!
Paul Moldenhauer	Most of it	Yes	Educational awareness. More science based population studies. More control by tribal entities to be more autonomous and protected. Proposals for more citizen input and monitoring of wolf activity. -The provided data in this study showing history, numbers and importantly changes in population attitudes towards wolf numbers and the significance of their role in nature. (seems too many for so long are obsessed with fairy tale stories of how evil and menacing wolves are). - Highlighting numbers of where depredation truly exists and is most meaningful; from irresponsible hunters using their beloved animals irresponsibly.	Relying on hunters, especially hounders, to be more informed, respectful, transparent, compliant with the laws already established.	6	Glad that wolf hunters with their dogs are not compensated for their irresponsible, barbaric use of their animals in their indulgence of this so called "sport". Dogs should not be used for bear hunting as well. Further, knowing the risks to their " beloved" pets, there should be no compensation for the irresponsible loss. There should be requirements that any hounded must provide proof of insurance coverage for their animal and use of it. - redirect any compensation funds towards the hiring of more law enforcement officers. In zones 1&2 the area is vast and only a few officers are available. The hunting groups realize this and take advantage of it. - redirect funds towards farmers etc for enhanced livestock protection measures to ensure further against losses and costly payouts and negative coexistence between farmers and DNR and conservation. - Enact a shorter and definite time and date frame for the culling season. Have available an extra time frame available if the established quota is not met and where the quota needs to be met. Where any hunter can then resume on their quest. 2022 season was a disaster with the frenzied onslaught that occurred with the wait and see method of establishing whether or not the quota was met. I witnessed this disregard for the law on several occasions in Bayfield county. . - The plans as laid out are noteworthy and commendable, even though my household, and many in our community are opposed to the wholesale annual harvesting of wildlife that occurs in our region of zone 1. Especially with the aforementioned barbaric use of dogs for their indulgence in their "sport". However for any plan to be successful the rules , laws, ethics must be abided by and enforced and where not abided by, consequences as specified by law be firmly applied.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Austin	All of it	Yes	Wolf management is a must, and we must get them off the endangered species list.	Estimation numbers, implies not allowing hunting with dogs	2	
	All of it	Yes	Considering all aspects with all parties in mind	Lack of an open season	4	
	Most of it	Yes				As a person who first visited our family cabin on Devil's Creek in the Blue Hills of Rusk County in 1962 and has since lived on or near that sight in Wolf Hunting Zone 3 for over 40 years, I have experienced first hand the impact of wolf hunting with dogs on contemporaneous outdoor recreational activity. 1. Every time hunting seasons are lengthened or new seasons are introduced it often infringes on other people's enjoyment of public lands. For instance, for about 25 years my husband and I hunted ruffed grouse on foot with one of our bird dogs. We also liked to ride our horses, hike, and cross-country ski. Starting in early September we now travel elsewhere for our outdoor recreation even though we live 2 miles from public land. 2. To me, hunting wolves with dogs seems cruel and unnecessary for the both the dogs and the wolves. Also, if traps are used, how do owners of bird dogs and other pet dogs know where the traps are so their dogs won't be injured by them. 3. For people who are worried about their personal safety or that of their pets, perhaps carrying Pepper Spray or Bear Spray would make them feel more confident. 4. I believe the DNR could do a better job of educating the public about how extremely unlikely it is that they or their pets might be injured or killed by wolves. Carrying Pepper Spray or Bear Spray might help people's confidence to enjoy the woods.
Timothy Coburn	Most of it	Yes	That you got rid of the 350 cap on wolves that number is outdated & justifies constant killing	It seems your committees are always stacked with anti wolf, pro killing groups. There's enough killing going on every day on the news it's another mass shooting. I'd like Wisconsin to take the lead & not encourage killing & guns. The animals are here to teach us, not to be harvested like some crop.	6	Thank you for letting us have our voices heard & making a very good attempt at a wolf management plan.
	Most of it	Yes	I like that people are noticing the problems wolves cause.		7	My experience with wolves is that they reduce wildlife in the area they are living at a high rate.
Katie Franklin	I have not read any of the draft plan	No	Any plan that allows life to co-exist with the human species in the way that the original inhabitants managed their resources is good.	Any actions that destroy life without regard for the balance that was evolved and allows for diversity.		
Susan Roberts	Most of it	Yes	I favor not setting a numerical goal for wolf population. I like that you seem to be involving the tribes more. I like an increased emphasis on education. I like the buffer zones regarding tribal land.	I think that trophy hunting interests are still over represented. I would like to see even more emphasis on non-lethal management around farms and "wolf caution" areas that hounders continually ignore. Let's get rid of paying them for their dead dogs.	7	I think that the use of hounds on wolves needs to be restricted to the greatest extent possible under the current law. Let's face it. This does not have broad public support and is really only supported by a group of bear hunters who do not reflect public sentiment. Everyone else is horrified by this.
	All of it	Yes	That it will be controlled by the WI DNR, as all WI wildlife is.		5	Delist the wolves. The WI DNR should manage control and numbers - like all other wildlife.
	All of it	Yes	i like the sub zones around the reservations with zero quota. I like the management without a specific kill number per year.	I would like to see wolves encouraged to repopulate the counties along the Mississippi River in zone 6. I would like to see that listed as a goal.	8	I have hunted deer for years in wolf country, and I view wolves as a positive part of the environment. If wolves could be encouraged to live in the southwest part of the state, I think it could help to reduce the overpopulatio of deer, and contribute to controlling CWD in the deer herd. The tribes need to be heard and there opinion taken into account. What happened with the overharvest of wolves in the last hunt was very disrespectful of the tribes, and I hope it never happens again. If the tribes decide not to use their quota, that does not mean that others get to kill those animals.
Mike Peterson	All of it	Yes	What's there to like? The plan of a train wreck and needs a multitude of changes.	The Goal Statement is inappropriate. No other species in Wisconsin is managed to it's maximum biological carrying capacity. Wolves are not an appropriate species in many places. Wolves and humans do not need to habitat next to each other. Ideal locations for wolves needs to be scientifically found and the zones need to be based on those findings. The plan implies no dog hunting will be allowed and it's our Constitutional right to be able to do that. Rewording the plan is necessary.	1	The public hearing time frame is ridiculous. We're hunting, trapping, enjoying the outdoors. Add in holidays and that public hearing time is just too short. Besides, not everyone has readily accessible internet or email. There has to be a better way you can notify everyone and give them appropriate abilities to respond.
roland d'amour	All of it	No		no lethal intervention nor hunting of wolves should be allowed.		
Erica Ripp	All of it	Yes	I like the fact that you agree we need a plan.	One of the things I dislike is the idea of restructuring zones. Wolves have now populated spaces that are not ideal. Zones should be returned to the science and habitat based zones. Another thing I dislike is the implication that the ability to hunt with dogs would be removed. Verbiage in the plan also reads that the wolves holds more right to the land than hunters do. That's not science based. Rewording is clearly needed. How about population? Wisconsin Wildlife Federation has stated that 350 is the carrying capacity. Let's stick to the science they have provided. And while you're at it, a timeline of accountability would be great to ensure the population goal is achieved before the population gets excessively high and out of control.	0	The way public comment is being handled is frustrating. Overlapping hunting seasons and holidays leaves many folks unable to properly respond. Please extend the public comment period. Also, public hearings/meetings should be held in wolf populated areas. They are the ones dealing directly with these animals. Their voices v should be heard.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Casey Zirbel	All of it	Yes	I appreciate the detail, and the indepth coverage of various tangents of input.	I dislike the idealogy of having to have a strong population of wolves to allow them to flourish. The state is not ecologically the same as it was 50 to 150 years ago. Most land is developed into farm lands, meaning hedge rows and marshes. This will make deer hunting less enjoyable for the general populace of hunters, meaning lost funds and lost traditions. This also means wolves will be more prevalent in human populated areas. Depredation will be a huge concern. Coyote hunters will start seeing less coyotes and more wolves, which we can't hunt nor can we do anything about. Wolves can stay north of highway 10, that would be feasible and reasonable. But to have an expectation of of having wolves go as far south as Adams and Buffalo counties are going to put unnecessary strains on biodiversity and the ecosystem. The Elk herd is struggling enough, introducing more wolves will reduce that population further. The first animal of mine I lose to wolves will be the last, most wisconsinites feel the same.	1	I appreciate the concerns for biodiversity and retaining a healthy populace of natural wildlife. However, the state has changed. The animal populations are ever changing. Let's get Wisconsin to where we have too many elk and deer, then let wolves roam free with a hunting season.
Mary Amunson	I have not read any of the draft plan	Yes				I would like to see a reasonable hunt if necessary to manage wolf numbers, however I am against trapping as it is too much suffering for the animals. Beyond that, I think shooting wolves that are threatening domestic animals should be allowed on a case by case basis.
	Most of it	Yes	I like the different zones, and the iformation on how much money has been spent.	I didn't like the some of the surveys with people that don't live close to any wolves, they shouldn't be able to give their opinions.	4	In northern wi the land values have been rising, which helps support the local tax base for our roads and schools. The people spending 3 to 4 thousand a acre to white tail hunt they didn't buy the land to see wolf tracks or bear. I can see there are less deer hunters in the northwest areas of wi. Some deer camps have been active for many years and after the wolves moved in they are not seeing deer to harvest so they closed up camp and haven't came back.
Gene Szymaszek	Just the parts I am interested in	Yes	*inclusion of tribal values and their historical traditions *importance of yearly data to determine trends on the health of the wolf populations *attention to a possible wolf hunt, and definite boundaries of management zones, time of hunts and reporting requirements (to avoid what happened with that last Feb slaughter) *expansion of non lethal controls of emerging wolf populations in parts of the State. *continued discussion of a sustainable wolf population and monitoring of impacted areas of the State.	*Need to ban hunting wolves with dogs. Bears, and raccoons can be treed. The almost 400 dogs injured is a red flag of cruelty. *National forests regulations should be different than for farming areas (like no dogs used for hunting) *continued improvement of wolf population estimate systems. *Need a balanced oversight group of scientists, wolf experts, hunters and some to monitor. *Admit that the science data is imprecise and continue to leave emotion and politics out - just the facts as presented. *Overturn PA 169 as a conflict. Dogs should not be used to hunt wolves and the State should not pay for injured dogs that should not have been used to hunt them (almost 400 over the years)	7	Great job putting all this data in one document, especially the trends over many years. For years we were led to believe that 3 to 400 was the target population for our State. The study "shows" a larger number can be sustained without any unusual impact on deer hunting (in most of the State). And the process of reducing the size of the wolf population in certain areas can be supported by science and data so that decision makers can make solid acceptable recommendations for all concerned. We know how to kill these animals (without hound dogs). But how to live with these animals will take some time and hopefully less bullets to find a sustainable population balance. The committee appears to be over represented by hunting interest groups. Hopefully their bias has been (will be) diminished in the operation of this plan. Great effort and recognition of a good plan
Annette Zeman	All of it	Yes		see below	1	My 2 main concerns are: the unlimited Population and the Buffer zones. As a landowner in Sawyer county we see constant signs of Wolves. I am concerned with the amount of sign I see. we are unable to let our housedog out for fear of a wolf getting him. It is only a matter of time before some child gets attacked and you can believe their will be a court case then. Obviously, those who put this plan together are not having to deal with the day to day potential exposure of an attack perhaps if they were they would redraft and once again limit the number of wolves
Paula Doyle	Just the parts I am interested in	No	Acknowledging the ecological benefits of wolves and the part they play in indigenous/tribal values & the knowledge those communities have about wolves. Using non-lethal methods reduce conflicts between wolves & other creatures.	There should be no hunting of wolves. They manage their own populations without our interference. No trapping of wolves. Plan needs an oversight committee of biologists and other professionals who understand the role of the wolf in our ecology. No use of dogs to track or hunt wolves.	5	
Anthony Gulig	All of it	Yes	Wolf biology, predation numbers, and statistics, relationship with tribal managers and tribal interests	I dislike nothing about the plan as proposed. Should a wolf harvest again be authorized, regulations have to be put in place to prevent hunters and trappers from overharvesting. The delayed registration procedures encouraged such an overharvest.	10	
Marsha Stanek	All of it	Yes		1. We recommend that the DNR continue to not include a numeric goal, as these can and have been used against the species. 2. We encourage the DNR to place less emphasis on “lethal management” and more on the value of the wolf to the ecosystem, indigenous culture, and to “non-consumptive users.” The reliance on USDA Wildlife Services is concerning as lethal options seem to take priority over non-lethal as shown by the numbers. 3. We encourage the DNR to have separate committees for science and for stakeholders. This provides a buffer between the science and the politics and special interest agendas. 4. We also recommend far more restriction on the use of hounds against wolves for hunting and “training.” We understand that the use of hounds is allowed under state law, but rules are almost nonexistent and their use should be minimized.	3	

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Andrew Vrakas	Most of it	Yes	It seems like you recognize last year was an epic failure.	You appear to be ignoring whole chunks of peer reviewed data that suggests we have a lot fewer wolves. You start with the presumption that we have too many wolfs and wolf packs in the state and that they cause actual problems. They need to be left alone, not because they are cute and cuddly on a license plate but because they are crucial apex predators who have a right to exist. Further the dog hunting lobby exerts undue pressure and that activity is extremely unpopular with the general public. We all know how that would go if you put it to a statewide vote. The practice of financial compensation for lost dogs is infuriating. The human contact and conflict level with wolves at this time does not want any lethal harvesting on a wide scale basis.	1	Quota=0. Focus on control of problem animals if and when they arise. Eliminate hounding.
Adrian Treves	Just the parts I am interested in	Yes	I support the elimination of the ill-conceived population goal of 350 wolves in late winter of the 1999 plan. I support continued use of winter snow-tracking because field-based ground-truthing is the only way to sort out the mess created by the inappropriate use of the scaled occupancy model explained next.	Note it is unlawful to limit the word length of a public comment, so I am hereby notifying you that http://faculty.nelson.wisc.edu/treves/archive_BAS/Treves comment on wolf policy 2023 WI DNR.pdf (letter) and http://faculty.nelson.wisc.edu/treves/archive_BAS/Pubs_for_public_comments.zip (scientific articles). My biggest concern about the WDNR wolf management plan is the proposed use of the scaled occupancy model (SOM) to estimate statewide wolf abundance. With Dr. F.J. Santiago-Ávila, I have found five major shortcomings in the WDNR use of the SOM that each lead to over-estimation bias. I describe the five shortcomings below but first the implications. The bias we found in methods used by the WDNR means the 2022 estimate of the state wolf population is an over-estimate by a large margin. Future use of the SOM in such an unscientific and inaccurate manner makes all future population estimates suspect. The risk of such bias is to place the wolf population in jeopardy if a wolf-hunt is ever held again. Therefore, based on the science and without remedy, I predict the next wolf-hunt will lower the state wolf population to the statutory listing level or lower (Treves A & Louchouarn NX. 2022). 5 major problems with the WDNR SOM and the application of Stauffer et al. 2021: Unprecedented two winters of snow-track surveys included in the 2022 population estimate, spanning Dec 2020-Feb 2021 and Dec 2021-April 2022. This means dead wolves were likely counted towards the probability of occupancy by wolf packs. Models of past wolf occupancy were validated on data 2-5 years after the last wolf-hunt not 1 year after. That makes the 2022 application invalid. Models of land cover were from 2016 and insensitive to increases in human-caused mortality (e.g., Feb. 2021 wolf-hunt, both legal and illegal killing, and summer 2021 USDA-WS killing). That makes Stauffer et al. 2021 invalid today. Its occupancy probabilities need appropriate validation with more recent data. WDNR abandoned quality control standards for snow-track surveys that had been in place since 2000-2004. By using data from surveys blocks that were snow-tracked zero to two times, the WDNR likely included lone wolves, transient wolves, non-wolves, and erroneous counts of wolves for calculating occupancy probability. Pack size and territory size were based on small samples that were not representative of the whole state yet were extrapolated across the state. Our papers are available for free (Treves & Santiago-Ávila FJ. 2023. Estimating wolf abundance with unverified methods. Pre-print free at http://facultynelsonwiscedu/treves/pubs/Treves_Santiago-Avila_critique_of_WDNR_2022-2023_SOMpdf http://faculty.nelson.wisc.edu/treves/pubs/Treves_Santiago-Avila_critique_of_WDNR_2022-2023_SOM.pdf and Treves A and Louchouarn NX. 2022. Uncertainty and precaution in hunting wolves twice in a year. PLoS One 17: e0259604. 10.25.465697https://journals.plos.org/plosone/article?id=10.1371/journal.pone.0259604). Please note that if you do not click and download this free pre-print, I will assist any who would hold the WDNR accountable for collecting and reviewing the public administrative record. If you attempt to justify ignoring our evidence because it is currently a pre-print under review by a scientific journal, I hereby notify you that I post all published papers freely on my website and by the time you read this the paper is likely in print. Contact me directly at [redacted] if you cannot find the published version. Finally, if you attempt to justify your approach to the SOM by simply citing Stauffer et al. 2021, I will expose the undisclosed competing interests behind that article and the fact that the Journal of Wildlife Management was not signatory to the Committee on Publication Ethics until 2022, and is therefore not a well-regarded or reliable journal. Furthermore, please note the WDNR application of the SOM violates the steps required by Stauffer et al. 2021 to apply their model scientifically. Therefore, I recommend fixing your unscientific application of their work, following our recommendations, and aiming for the best available science. Above and beyond the problems we have found in the WDNR use of the SOM, this commentary addresses common policies and claims made by wildlife	1	...cont'd ... Therefore, articles in that journal, the Wildlife Society Bulletin and Wildlife Monographs did not have the guardrails on publication ethics recommended by the Committee on Publication Ethics, which include scrutiny of potentially competing interests among authors, peer reviewers, editors, and the publisher, the Wildlife Society. Nor did the journals have guardrails for correction and retraction of misleading or fabricated science. I asserted above that meta-analyses and systematic reviews are relatively more valuable than single studies for drawing generalizable inferences about the effectiveness of any method for preventing wolf predation on wild or domestic animals. Although the 11 studies below differ in standards of evidence, sample sizes, and inclusion criteria, one consistent conclusion emerges: without RCTs or other robust designs that control confounding variables, it is impossible to claim with confidence the effectiveness of any method. That does not mean we have zero information or knowledge, but rather that your caution should be heightened when we lack RCTs for this field of science. Krausman PR. 2022. Improving the journal of wildlife management: A response to the perspectives of Johnson et al. (2021) and Gould et al. (2021). The Journal of Wildlife Management 86: e22167. https://doi.org/10.1002/jwmg.22167. Therefore, articles in that journal, the Wildlife Society Bulletin and Wildlife Monographs did not have the guardrails on publication ethics recommended by the Committee on Publication Ethics, which include scrutiny of potentially competing interests among authors, peer reviewers, editors, and the publisher, the Wildlife Society. Nor did the journals have guardrails for correction and retraction of misleading or fabricated science. I asserted above that meta-analyses and systematic reviews are relatively more valuable than single studies for drawing generalizable inferences about the effectiveness of any method for preventing wolf predation on wild or domestic animals. Although the 11 studies below differ in standards of evidence, sample sizes, and inclusion criteria, one consistent conclusion emerges: without RCTs or other robust designs that control confounding variables, it is impossible to claim with confidence the effectiveness of any method. That does not mean we have zero information or knowledge, but rather that your caution should be heightened when we lack RCTs for this field of science. Moreover, van Eeden et al. 2018 in PLoS Biology showed how differently four studies regarding lethal methods published between 2016-2018 drew from the literature despite similar search criteria. "Our four reviews [6–9] jointly screened >27,000 candidate studies. The four sets of inclusion criteria differed in geographic coverage, carnivore species, and standards of evidence and research design (see S1 Table), which limited overlap in the studies that passed screening (only 19% of studies were included in two or more of the four reviews; no study was included in all four, S1 Fig). The differing inclusion criteria also meant that it was not possible to conduct a quantitative comparison (meta-analysis) combining the data from our four reviews, but we suggest that such an analysis should be conducted in the future as evidence increases. None- theless, our reviews came to remarkably similar conclusions, irrespective of methods, suggest- ing that our conclusions are robust."p.3 van Eeden et al. 2018 PLoS Biology. Because we brought together almost two dozen authors from 11 countries for van Eeden et al. 2018 in PLoS Biology, it is the leading review that drew the clearest consensus. That consensus included (a) the field needs stronger inference and (b) that lethal methods have not been studied with as high standards of inference as non-lethal methods. Moreover, combining van Eeden et al. 2018 with more recent work indicates that several non-lethal methods are more effective in protecting domestic animals than lethal methods appear to be. Note that even though these meta-analyses do not concern only wolves, one can learn from studies of the effectiveness of interventions against other predators to draw inference about how these would work against wolves. Among those non-lethal methods shown to be more effective and studied multiple times are fladry and livestock-guarding dogs when deployed and maintained correctly as explained in the source articles reviewed. The studies also endorse effective fencing albeit fewer RCTs have evaluated it. Other promising methods tested by RCT only once against wolves includes

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
				agencies about their jurisdiction's wolf populations. I have attempted two steps: (1) disentangling value judgments from scientific claims, and (2) my perception of the consensus in the scientific community if any. Paraphrasing Oreskes 2019: No single study should be considered reliable, even replicated studies await consensus in the scientific community, and only qualified experts with a track record in the particular field can weigh in on that evidence. Sometimes it is too early to claim consensus and sometimes consensus in the scientific community should be reached but the intrusion of claims by those who have financial or non-financial competing interests will distort or delay scientific consensus and its application to policy. Therefore, I offer below my own view of consensus within the scientific community about several bodies of evidence in the wolf science-policy interface. Where I cannot find consensus I try to illuminate the standards of evidence one should employ to weigh contrasting research and select the best available science. Section 5 addresses scientific integrity requirements under US federal law and the potential legal jeopardy for lower jurisdictions receiving federal funding that do not adhere to federal rules on research misconduct. Here I am primarily concerned with the breach of scientific integrity represented by selective citation of articles that support the predetermined policy outcomes. See the recommendations ons scientific integrity from the National Academies of Science (NAS 2017. Fostering integrity in research. Washington, DC:) The National Academies Press), which states, "…careless or negligent crediting of prior work violates the value of fairness" p.36, https://doi.org/10.17226/21896 . Moreover, many scientists view selective citation as misconduct, e.g., see this Science article for the data supporting that claim De Vrieze J. 2021. Landmark research integrity survey finds questionable practices are surprisingly common Science 7 July 2021 https://www.science.org/content/article/landmark-research-integrity-survey-finds-questionable-practices-are-surprisingly-common. Beyond selective citation, the WDNR has an issue with transparency in data sharing, disclosing assumptions, and clearly explaining methods. I direct them to the following articles explaining objectivity in methods and assumptions: Treves et al. 2021. Transparency about values and assertions of fact in natural resource management. Frontiers in Conservation Science: Human-Wildlife Dynamics 2: e631998. 10.3389/fcosc.2021.631998. & Treves A. 2019. Scientific ethics and the illusion of naïve objectivity. Front Ecol Environ 7: 361. doi:10.1002/fee.2091. & Treves A and Santiago-Ávila FJ. 2020. Myths and assumptions about human-wildlife conflict and coexistence. Conserv Biol 34: 811–818. 10.1111/cobi.13472. & Treves A. 2022. Best available science" and the reproducibility crisis. Front Ecol Environ 20: 495. 10.1002/fee.2568. 1. Population viability assessments (PVAs), minimum viable populations, and strict numerical delisting targets. First and most importantly, value judgments arising from personal, organizational, or governmental commitments, investments, and preferences for certain outcomes are the first steps in PVAs because the following inputs or decisions are value-based choices not scientific decisions: (A) how far ahead in time should one forecast (e.g., perpetuity or a few years, see Frankham et al. below for preserving evolutionary potential and consider whether the jurisdiction is fulfilling the trustee duty to preserve the asset for future generations); (B) how much risk of extinction is the public willing to tolerate and how much is the agency allowing? (e.g., near zero? Or a predetermined level of risk?). (C) Did the modelers exclude any threats (e.g., super-additive mortality from human-caused killing, illegal killing, catastrophic disease)? (D) Most PVAs risk being misapplied to jurisdictions rather than to actual biological populations. (E) The decision to focus on census population size (all individuals) or effective population size (Ne, shorthand definition is all breeding individuals). Each address different aspects of viability. The former addresses demographic viability without guarantees that the surviving animals will be healthy and reproducing effectively, whereas the latter is more precautionary and addresses evolutionary potential. If evolutionary potential is preserved, one can generally assume demographic survival has also been preserved. In wolves, where virtually all packs contain only two breeders, effective population size can be estimated by the number of packs in one year (although this too may be an over-estimate because not all pairs breed each year) but the rest of the population provides a source of new breeders to replace those that die. References and notes for section 1 only Consider the distinction between science-informed decisions and making decisions based solely on science from the quote from Vucetich JA, Nelson MP and Phillips MK. 2006. The normative dimension and legal meaning of endangered and recovery in the U.S. Endangered Species Act. Conserv Biol 20: 1383-1390. "The ESA's requirement that endangerment be determined 'solely on the basis of the best scientific		range riding using low-stress livestock handling. Likewise, I recommend consideration of methods that proved effective from RCT studies with other predators, despite never having been tested on wolves, such as painted eyespots on livestock and humans assisted by deterrent noise-makers and dogs. Recent meta-analyses of lethal methods against predators of wild ungulates suggests unpredictable outcomes. Although it did not focus on wolves, many of the included studies were of killing wolves to protect wild ungulates. The authors below review the many decades of research on this question and note the shortage of RCTs or the poor quality of controlled studies used to address the question. Therefore, I see no scientific consensus on the effectiveness of killing wolves to protect wild ungulates. I do see consensus on a value-based issue relating to evidence; namely that the design of predator-killing programs should be treated as experiments and monitored scientifically by independent uninterested parties. A recent study in Alberta, Canada also shows that "increasing large-predator populations do not necessarily reduce hunter harvest of elk" and that sustainable hunting of elk has continued, and populations have increased with increasing large predator populations (Trump et al. 2022). Another recent study analyzing 4 decades of efforts in Alaska, US to reduce abundance of large predators, including gray wolves, brown and black bears, found: (1) no positive correlations between killing of bears and subsequent moose hunting, (2) moose hunting was negatively correlated with the prior year's wolf killing (weak relationship) and (3) no differences in mean moose hunting during periods of recent liberalized killing of predators relative to prior periods (Miller et al. 2022). Even when interventions to protect other animals from wolves are effective, there is little consensus on how long effects persist. As the authors below have shown, virtually all studies are one grazing season or briefer. Few interventions have been studied long-term. One has to look at single studies to understand the likely short-term and long-term effects of an intervention, but then I caution the results apply only to that design and experimental set up. 3. Estimating wolf abundance with methods other than validated mark-recapture methods Recent work by Creel (2021) and Treves & Santiago-Ávila (2023) points out the many scientific shortcomings in the recent approaches taken by the states of Idaho, Montana, and Wisconsin to estimate their statewide wolf abundances. Before shortcuts can be safely taken to estimate wolf abundance accurately, precisely, reproducibly, and with sensitivity to changing conditions, the new methods should be validated by third-party, independent scientists comparing new methods to old methods. Thus far, no shortcut to mark-recapture methods has proven reliable. Creel S. 2021. Methods to estimate population sizes of wolves in Idaho and Montana. Comment on "endangered and threatened wildlife and plants; 90-day finding for two petitions to list the gray wolf in the western united states". Federal Register 86: 51857. https://www.regulations.gov/comment/FWS-HQ-ES-2021-0106-49075. https://www.regulations.gov/comment/FWS-HQ-ES-2021-0106-49075 Treves, A., Santiago-Ávila, F.J. 2023. Estimating wolf abundance with unverified methods. Pre-print posted for pre-publication review. http://faculty.nelson.wisc.edu/treves/pubs/Treves_Santiago-Avila_critique_of_WDNR_2022-2023_SOM.pdf 4. Killing for tolerance Finally, the claim that killing wolves improves public tolerance has failed multiple tests by multiple lead authors using different datasets and entirely different approaches to the question (social scientific, population ecology, wolf survival). Unfortunately, I am a co-author on almost every study, so opponents may cite non-independence of the studies. That assumes I can somehow persuade or compel other scientists to do my bidding. That is ridiculous on its face but is probably best disputed by pointing to the diversity and independence of these authors compared to the homogeneity of the opposing side. Moreover, disputing the independence of the many studies refuting the idea that killing improves tolerance also ignores the Nordic studies that do not involve me (see below) and ignores the weakness of evidence that killing improves tolerance. The contrasting views are either not peer-reviewed, have not been replicated, have shortcomings that have been exposed in subsequent peer-reviewed work, or did not address the question. Furthermore, some advocates for killing for tolerance have pivoted to claiming killing wolves opens a space for dialogue with a few powerful, narrow interests. Setting aside the ethics of killing wolves for that purpose, the evidence from Hogberg et al. 2015 does not support the claim because the prime target demographic group in Wisconsin (men residing in wolf range who have familiarity with hunting) had the sharpest decline in tolerance for wolves after wolf-killing was liberalized to include public hunting and trapping. In summary Attitudes to wolves became more negative or did not improve when protections for wolves were reduced [1-5].

				and commercial data available' does not mean scientists have exclusive right to determine the normative dimensions of specifying the conditions of extinction. This mandate merely provides science the exclusive right to determine whether specified conditions for endangerment are met by particular species." Carroll C, Lacy RC, Fredrickson RJ, Rohlf DJ, et al. 2019. Biological and sociopolitical sources of uncertainty in population viability analysis for endangered species recovery planning. Scientific Reports 9: e10130. https://doi.org/10.1038/s41598-019-45032-2. Abstract: Although population viability analysis (PVA) can be an important tool for strengthening endangered species recovery efforts, the extent to which such analyses remain embedded in the social process of recovery planning is often unrecognized. We analyzed two recovery plans for the Mexican wolf that were developed using similar data and methods but arrived at contrasting conclusions as to appropriate recovery goals or criteria. We found that approximately half of the contrast arose from uncertainty regarding biological data, with the remainder divided between policy-related decisions and mixed biological-policy factors. Contrasts arose from both differences in input parameter values and how parameter uncertainty informed the level of precaution embodied in resulting criteria. Policy-related uncertainty originated from contrasts in thresholds for acceptable risk and disagreement as to how to define endangered species recovery. Rather than turning to PVA to produce politically acceptable definitions of recovery that appear science-based, agencies should clarify the nexus between science and policy elements in their decision processes. The limitations we identify in endangered-species policy and how PVAs are conducted as part of recovery planning must be addressed if PVAs are to fulfill their potential to increase the odds of successful conservation outcomes. Frankham R, Bradshaw CJA and Brook BW. 2014. Genetics in conservation management: Revised recommendations for the 50/500 rules, red list criteria and population viability analyses. Biol Conserv 170: 56-63. https://doi.org/10.1016/j.biocon.2013.12.036 Abstract: Conservation managers typically need to make prompt decisions based on limited information and resources. Consequently, generalisations have essential roles in guiding interventions. Here, we (i) critique information on some widely accepted generalisations and variables affecting them, (ii) assess how adequately genetic factors are currently incorporated into population viability analysis (PVA) models used to estimate minimum viable population sizes, and (iii) relate the above to population size thresholds of the IUCN Red List criteria for threatened species that were derived from genetic considerations. Evidence accumulated since 1980 shows that genetically effective population size (Ne) = 50 is inadequate for preventing inbreeding depression over five generations in the wild, with Ne ⩾ 100 being required to limit loss in total fitness to ⩽10%. Further, even Ne = 500 is too low for retaining evolutionary potential for fitness in perpetuity; a better approximation is Ne ⩾ 1000. Extrapolation from census population size (N) to Ne depends on knowing the ratio of Ne/N, yet this information is unavailable for most wild populations. Ratio averages (~0.1–0.2) from meta-analyses are sufficient, provided adjustments are made for dissimilar life histories. Most PVA-based risk assessments ignore or inadequately model genetic factors. PVA should routinely include realistic inbreeding depression, and genetic impacts on evolutionary potential should be incorporated where appropriate. Genetic generalisations used in conservation, the treatment of genetics in PVAs, and sections of the IUCN Red List criteria derived from genetic considerations, all require revision to be more effective conservation tools. Finally, the selection of a specific numerical target or even a range of targets presumes a value judgment at some point in the process. For an explanation of how this plays out in sustainable harvest models applied to wolves, please see Treves A, Paquet PC, Artelle KA, Cornman AM, et al. 2021. Transparency about values and assertions of fact in natural resource management. Frontiers in Conservation Science: Human-Wildlife Dynamics 2: e631998. 10.3389/fcosc.2021.631998. 2. Are lethal methods *valuable* tools in the toolkit to prevent adverse predation by wolves? (* you can replace valuable with other value judgments such as best, essential, necessary*) None of the terms surrounded by * are scientific in this context, they are all value judgments. A scientist would write lethal wolf control is a tool in the toolkit. The adjective is a flag that someone is attempting to impose their values on their readers. A scientist would add the adjectival phrase "effective to achieve x" or "ineffective to achieve x" or related measurable criteria that do not presuppose a normative judgment about whether one should use lethal control (as do the * adjectives). Note the word control can be misleading if not defined as it may convey to some audiences that prevention has been achieved even when it has not. In most cases in wolf policy, effectiveness of lethal or non-lethal		Poaching was higher when wolf protections were reduced, measured by individual wolf survival rates [6-9]. Poaching was higher when wolf protections were reduced, measured by wolf population dynamics [10-13]. Attempts were made to challenge the latter results, all of which failed because they lacked data to support their claims [14, 15] or had shortcomings that made them irreproducible [16-23]. Our calls for corrections of the latter studies have yielded one correction thus far [24-26]. We await further corrections and retractions. Poaching is the major cause of wolf mortality and it is mismeasured or under-reported by agencies because of cryptic poaching [27-29]. Miscellaneous work on poaching and the effects of lethal management, to guide more or better enforcement and also more effective management policies: [24, 28-38]. Note a debate in the Nordic countries remains unresolved pending sharing of all data and transparent debate about statistical methods. The Scandinavian analysis that claimed that liberalizing wolf-killing will reduce wolf-poaching has been challenged [39, 40]. Similarly, two papers by the same pair of authors studying the Finnish wolf population concluded, "We conclude that tolerance for carnivores cannot be promoted by legal hunting alone…" [41] but in 2018, they concluded, "Our results provided evidence that poaching is a matter of local intolerance toward wolves and that the problem is mainly related to wolf hunting." [42] but suggests legal killing pre-empted illegal killing by removing wolves that would have been poached [41, 42]. Clearly, further investigation with accepted methods is warranted. I oppose the use of hounds in mammal hunting because the precautionary and prudent scientific study of this method has not been conducted to confirm that unlawful interactions do not occur and harm endangered species, target wildlife, by-standers, or the hounds themselves (36). 5. How research integrity influences the quality of science Certain principles of research integrity affect the quality of science so strongly that failure to adhere to minimum standards of scientific integrity result in unreliable, irreproducible, or fabricated scientific findings. The US federal government has repeatedly tightened regulations and policies to avoid breaches of research integrity, so I will restrict myself here to point out the most common and problematic research misconduct that would render policy based on such science unsound and vulnerable to legal jeopardy. Falsification, fabrication, or plagiarism is illegal for any recipient of federal monies, which could place state and tribal wildlife agencies in legal jeopardy if they produce such work, because of federal support for fish and wildlife agencies. Financial penalties may be due upon conviction. A portion off such penalties can be won by whistle-blowers who report research misconduct (see https://www.whitehouse.gov/ostp/ for federal regulations and policies including relevant Congressional Acts). Non-disclosures of potentially competing interests, whether financial or non-financial. Authors of scientific work whose institutional affiliations are state or tribal wildlife agencies should beware of this breach because it can lead to correction or retraction of scientific articles ,following the Committee on Publication Ethics guidelines on transparent disclosures https://publicationethics.org/. Similar recommendations apply to US government agencies NAS National Academies of Sciences EM. 2017. Fostering integrity in research. Washington, DC: The National Academies Press. & Biden JR. Order PE (Ed). 2021. Memorandum on restoring trust in government through scientific integrity and evidence-based policymaking Washington, D.C.: & Treves A and Batavia C. 2021. Improved disclosures of non-financial competing interests would promote independent review. Academia Letters Article 514: 1-9. Other breaches of research integrity include selective citation, sloppy peer review, publishing in predatory journals that simulate peer review but publish anything if paid, and intentional use of inappropriate statistical analyses or p-hacking (De Vrieze J. 2021. Landmark research integrity survey finds questionable practices are surprisingly common. Science 7 July 2021, https://www.science.org/content/article/landmark-research-integrity-survey-finds-questionable-practices-are-surprisingly-common. Kretser et al. 2019. Scientific integrity principles and best practices: Recommendations from a scientific integrity consortium. Science and Engineering Ethics: 1–29 & Mejlgaard et al. 2020. A general lack of transparency, failure to share data, failure to disclose assumptions, methods, value judgments, and failure to embrace open, independent review can all affect the reliability of science. Indeed, articles published by the Wildlife Society before 2022 were published without the ethical guardrails of the Committee on Publication Ethics, COPE

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
				methods is oriented to reducing future losses of domestic animals or wild animals. Starting with domestic animals, beware of certain value judgments inherent to this question: (A) do the domestic animals or wild ungulates take priority over wolves, especially when lethal control is envisioned? That would also be a value judgment. (B) Also beware of the value judgment that all lethal methods can be meaningfully grouped into a single category. Scientifically, neither lethal nor non-lethal interventions can be grouped for a claim of effectiveness because each variety and each implementation may differ from the next in effectiveness based on design, location, conditions, effort, etc. Only when followed by the details of studies of effectiveness can one group two or more methods together to make claims (i.e., the advocate for either needs to anchor their conclusion about a method in a study specific to that method). (C) Some methods for protecting domestic and wild animals from wolves are in a gray area between lethal and non-lethal. This and other false dualisms are common in this field. (D) Effectiveness as I have defined it above has no spatial or temporal specification but should. No method is always effective, therefore the claim of effectiveness should be applied to a particular time, place, and design of the intervention. When scientists communicate clearly, we cite a study when making such a claim. All implementations are experiments, no single study will predict with perfect certainty whether a new application is effective. (E) Another subtler value judgment is whether the effectiveness of lethal methods and effectiveness of non-lethal methods are commensurable, because the effects of one cannot be reversed while the other may be. Given the caveats above, single studies are no basis for confidence until replicated. Therefore the methods that have been replicated by two or more studies show they are effective should give the most confidence. Therefore, systematic reviews or meta-analyses are our best basis for predicting whether a given intervention is effective. Even systematic reviews and meta-analyses are prone to error if they have a small sample size to draw from, authors have competing interests, or the analysis did not consider strength of inference. The strongest inference is drawn from randomized, controlled trials (RCTs) of methods to prevent predation on domestic or wild ungulates. Preferably those RCTs include crossover designs, blinding, and are subjected to authentic independent review and efforts at replication. The next and much lower strength of inference is the silver standard of before-and-after comparison without randomization. That is the highest standard reached for lethal control of wolves and was only reached in 3 studies to my knowledge. Michigan USA: Santiago-Avila FJ, Cornman AM and Treves A. 2018. Killing wolves to prevent predation on livestock may protect one farm but harm neighbors. PLoS One 13: e0189729 10.1371. France, 9 regions: Grente O. 2021. Présentation des objectifs et de la méthodologie de la thèse sur l'efficacité des tirs de loup et la gestion adaptative du loup, menée conjointement par l'oncfs et le cefe. Gières, France. Slovenia: Krofel M, Černe R and Jerina K. 2011. Effectiveness of wolf (canis lupus) culling as a measure to reduce livestock depredations. Acta Silvae et Ligni 95: 11-22. (Note the data from this study were reanalyzed in a silver-standard design by Treves, A., M. Krofel, and J. McManus, Predator control should not be a shot in the dark. Frontiers in Ecology and the Environment, 2016. 14: p. 380-388.) In the below graphic, I summarize the three studies' findings on the effects of lethal methods on wolves but again note that we still have no RCT on killing wolves to protect domestic animals and note the methods for killing wolves in the three studies differed somewhat. My co-authors and I do not consider the analysis by Bradley et al. (2015) in the Journal of Wildlife Management to be reliable because (a) the authors could not explain several steps in the methods to us, (b) they did not share the data for us so we could use our own methods, (c) their methods biased the results toward favoring lethal control by extending the time horizon for livestock losses beyond the point where wolves held a territory. Thereby, they counted vacant territories as if territories can kill livestock, rather than packs. Their approach seems analogous to a study of a hospital treatment that measured filled and vacant hospital beds rather than the survival or death of patients) - see detailed explanation and discussion in Santiago-Ávila et al. 2018. Furthermore, the journal in which Bradley et al. 2015 was published, only subscribed to the Committee on Publication Ethics (COPE, https://publicationethics.org/) in Krausman 2022.... continued in the next text box...		(Krausman PR. 2022. Improving the journal of wildlife management: A response to the perspectives of Johnson et al. (2021) and Gould et al. (2021). The Journal of Wildlife Management 86: e22167. https://doi.org/10.1002/jwmg.22167), signifying that such articles should be considered less reliable until proven each article followed COPE best practices on its own. This also means the Journal of Wildlife Management is considered less reliable than journals or publishers that have been signatories to COPE for longer. Finally, government agencies in the USA are trustees of nature including wildlife. They are trustees for current and future generations, so their duty is to preserve first and regulate current uses second, to prevent substantial impairment of the trust assets. Catering to a subset of the public or interest groups is unlawful. Failure to regulate illegal uses or over-use is likewise unlawful. Note it is unlawful to limit the word length of a public comment, so I am hereby notifying you that http://faculty.nelson.wisc.edu/treves/archive_BAS/Treves comment on wolf policy 2023 WI DNR.pdf (letter) and http://faculty.nelson.wisc.edu/treves/archive_BAS/Pubs_for_public_comments.zip (scientific articles).

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
steve	All of it	Yes	I like the very in-depth information about the effects of wolves and the habitat in which they live. Of course this is based as a general assessment of the whole Wisconsin lands scape. People who manage our lands for wild life create browse and cover for more animals to exist. The facts and stats were very easy to read and understand.	I do not like the overall methods of population estimation. My belief is there's more wolves then estimated. Jus t in the last 5 years I have gone from an occasional wolf to many on trail cam pictures. I have not harvested a doe in that time and my main food plot went from 10-12 deer to 2-3 ,This is in a 200 acres owned. Watching the numbers in this time and looking at the data it does not match up. I also do not like the fact that the reservation numbers are not included. Wolves on average room 50 miles and can decimate land owners outside of the Res.The population cap needs to be lowered to the original numbers or close to. Hunters are a much more human way to control deer numbers then wolves. I believe this is a tool for DNR to control numbers. On that subject, I did not read anything about how wolves kill there prey, It is not pretty. My property has very healthy deer. I have had my share of pictures of healthy deer that survived attacks only to have chunks of the rear end chewed bit marks. They kill many fawns ,again not pretty. 300 wolves would be plenty to maintain a population. Out west they hunt wolves pretty hard legally and illegally and still have a herd they have troubles controlling.	2	I think the public opinion and input is skewed by groups that use there numbers, which is fueled by videos only showing the beauty of the wolf. They are beautiful and majestic animals. But there is a very ugly and viscous side to them. Think of the very healthy animals they take down and dine on while still alive. The healthy live stock they kill and leave to rot. I believe the people that have conflict and property that the wolves live on have a better idea of whats going on. These are reasons why I think the wolf cap should be to original number of 300. The old adage you give them an inch they take a mile. This strategy has been used many times in history. Another reason to weight opinions to people that deal with wolves not people that look at pictures and pretty videos.
Linda	Most of it	No	I like that the benefits of wolves are stated through scientific study, that the public survey shows more people have positive views of wolves and support their protection, and that the original intentions of the number "350 wolves" were to INCREASE it to that number as a realistic goal at the time, not in the context of today and reducing it to that number.	Any mention of allowing trapping makes me cringe, it is nothing other than torture.	9	350 wolves to me means they are on the brink of extinction. These beautiful and important animals are important to the health of entire eco-systems. I am sick of people wanting to kill vulnerable animals just for the sake of killing them, not to mention the horror they cause to them and their packs before the actual killing. It is a very small number of people that could ruin the survival of this important animal for all of us, as they came very close to doing in the past. There are non-lethal methods that can be used for management.
Mary Emerson	Most of it	Yes	The inclusion of tribal concerns and culture surrounding the wolf. The history of the wolf in Wisconsin from the time settlers arrived in Wisconsin. The scope and comprehension of the entire report is impressive.	I understand that wolf management is necessary, but I'm not convinced that depredation is as wide spread as reported. I have great concerns about trapping, though I applaud you education efforts and careful regulations about it.	8	Thank you for the tons of effort that went into this report! I don't support trapping at all because I think it's cruel. I also remain opposed to the use of dogs in hunting. Why is Wisconsin the only State to allow this?
	Just the parts I am interested in	Yes	ha			
	Most of it	Yes	none	just like deer and bear population goals the wolf population needs a number per "unit"	0	
Patricia Lowry	All of it	Yes	I greatly appreciate the efforts of the Wisconsin DNR staff involved in updating the state's wolf management plan, particularly in light of the egregious wolf slaughter of 2021 that resulted in 200+ wolves killed in a few days. Hopefully, creating a wolf management plan that utilizes unbiased, scientific principles free of political manipulation will yield a humane approach to managing a respected carnivore that inhabits the northern portion of our state. Improvements to the previous plan, which I support include: The elimination of wolves in Wisconsin being managed by the previous numerical goal of 350 wolves. Acknowledgment that wolves play an important ecological role in our state. The use of a social survey which demonstrates that wolves are high regarded by most citizens of our state who also understand the important ecological role that wolves play. According to the survey, 75% of Wisconsin residents surveyed agreed that people and wolves should be able to coexist and 80% agreed that it's important to maintain a wolf population in Wisconsin. Objective A; Ensure a healthy and sustainable wolf population to fulfill its ecological role Objective B: Address and reduce wolf-related conflict Objective D: Increase Public Understanding of Wolves in Wisconsin Objective E: Conduct Scientific Research to Inform Wolf Management	Objective CI: Provide multiple benefits associated with the wolf population I do not support recreational wolf hunting in any form. Many wolf hunters aren't like other hunters that hunt for food or sport. Perhaps the WDNR isn't aware of the painful torture that occurs when hunters set their hounds on wolves found in their traps or when groups of 6+ hounds chase down wolves and tear them apart. I've seen many images of these gruesome acts on Facebook and elsewhere. This isn't hunting, this is animal abuse. WDNR Wolf Population Estimates: The management of Wisconsin's wolves should include an independent, scientific review by scientists from multiple disciplines who have peer-reviewed, scientific publications on wolf mortality, hound-hunting, or human dimensions of poaching. The independent scientists should be chosen to add unbiased research so as to provide best practice recommendations for wolf management and avoid scientists with conflicts of interest or beholden to the USFWS or the WDNR. That panel should be authorized by the USFWS to inspect all data collected by the WDNR and make recommendations based on scientific evidence instead of possible biased management strategies that promote recreational killing. Wildlife management should be based on science and not politics. Objective C - Product C2h: Pursue administrative rules to establish a designated season for dog owners to train for wolf hunting activities: Wisconsin is the only state in the US that allows hounds to harass and/or kill wolves during the hunting season or during training. What are the long-term effects of this? Why hasn't the WDNR considered the impact of running hounds on wolf populations? Most lethal interactions between hounds and wolves favor the owner of the dead hounds who are reimbursed financially, but who is monitoring the deaths of wolves during hound training? And is poaching taking place during these unmonitored dog-on-dog events? It's interesting that dogfighting is illegal in all 50 states unless one of the dogs is a wolf. In addition to using hounds for wolf hunting, wolf hunters are allowed to train hounds on wolves without strict regulation and without safeguards for wolves or hounds. The unregulated use of running hounds on wolves can't guarantee the safety of wolves that might be confronted by large packs of hounds consisting of as many as six or possibly more dogs. This activity is unmonitored because hound training is not currently regulated. Has	6	There are more citizens of this state that value wildlife without having to "harvest" it. When will we be represented in WDNR management plans?

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
				the use of training hounds on wolves been factored into statistics on wolf populations? What are the long-term effects of training hounds on wolves? How does this impact the cohesiveness of a wolf pack in addition to impacting rates of reproduction and survival?		
	Most of it	Yes	I think the history of the wolves is interesting.	I understand that having some wolves in the ecosystem is a good thing. I also understand that the original goal number of wolves was around 350 animals. We are well above and beyond that number. There NEEDS to be a goal number. We cannot let the wolf population continue the grow the way it is right now. It is currently out of control and there is no end in sight. I also do not like that there are buffer zones around reservations. If a property owner owns land with in the buffer zone, will they be able to hunt there own property? It is not right to tell them they cannot do so. I also think hunting wolves with dogs should be allowed. I find it ironic how we protect the reservations by creating buffer zones because of the heritage with wolves, but when it comes to the heritage of dog hunting we have no problem nixing that.	1	We need to go back to the original plan of a goal of 350 wolves.
	Just the parts I am interested in	Yes			8	
Russ Wanke	Just the parts I am interested in	No	Hunting seasons to reduce population and "shift" wolves away from populated/farmland areas	I agree with the Wisconsin Wildlife Federation's 32 objections and specifically that the 350 wolf population limit be maintained, landowners/residents be able to protect livestock, pets and family; and no special zones outside of reservations.	2	I was a lifelong resident of WI until moving out of state to care for ailing parents. Still own 320 acres in northern Wisconsin and still spend considerable time there managing the land
	Just the parts I am interested in	Yes	focused wolf harvest in problem areas	There needs to be a population goal. How can we properly manage without a population goal??	4	People who stay in their houses like the idea of wolves. My family lives in a very rural area and we like to enjoy the outdoors. We have seen way too many wolves close to our home in the past few years, including on trail cameras near our house as well as wolf tracks. Last year I almost hit one with my truck!! That means there are TOO MANY!! They are not spread out evenly in the state, they are in packs, and we don't appreciate having to live by a pack!!
	Most of it	Yes		Should have a season on them every year. There is more out there than you guys are reporting.	2	
	Most of it	Yes	Hunting seasons to bring down the population and increase likelihood wolves stay away from homes and farms	Plan needs to return to the 350 original population goal, allow landowners to protect their livestock, pets and family, and avoid the slippery slope of Indian Tribes ability to regulate game outside of reservation.	2	Commentary of the landowners within wolf range should be given much more weight than residents or non-residents not living or owning land in northern Wisconsin. Where is that criteria in this commentary plan? Isn't it basically unfair for those who don't have to live with the wolves (the negative aspects) to push a higher number of wolves on those who do have to live with the negative consequences?
Jennifer	Just the parts I am interested in	Yes	The detailed research being done from birth to adults.	The thought of a hunt being done on these beautiful animals. I'm sorry for the problems the farmers face, but can't there be a more humane way?	9	
Arlen Brown	Most of it	No			8	I applaud you and thank you for your concern and time and caring..for the wolves and for our planet.
	Just the parts I am interested in	Yes		I don't like that there is no population goal	1	
	Just the parts I am interested in	Yes	Removing an arbitrary wolf population goal is important to make sure the best-available science is centered in wolf management. The low quota zones are an important and welcome addition to the plan. The plan is rightly focused on the ecological benefits of wolves		9	
Margie Sprecher	Most of it	Yes	The 350 number is gone. Including multiple tribal voices.	Dog training. Population number process is bogus. Depends on area. There should be No hunting in the high population area such as Chequamegan. Who will implement the management plan not stated. The 25% who are unsure on trapping and dog use are not in favor of either. Comparing wolves to deer hunting is not comparable. Natural balance is so important. Too many deer. Wolves help with that. Poison! Bear baiting needs to be banned and it impacts other animals. No reimbursement for hounds. That is their choice.	1	

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Mark sherman	All of it	Yes	None	All	1	Not needed
Donna Huntington	Just the parts I am interested in	Yes	Science based. Quotas `are not a specific number, but varies by area, population and conditions.	Allowing the use of dogs in wolf hunting. Being the only state which allows this is not an honor.	8	
Austin Hundertmark	Just the parts I am interested in	Yes	A season is need every couple of years atleast to keep numbers in check and depredation of hounds down. The hunt isn't just about killing wolves but even running on and pulling the dogs off will put the fear into the wolf so they know there are other things out there bigger and stronger.	Thinking we need any around in the first place. Look at the deer populations in Northern Wisconsin. Its pathetic. Bars are closing because they live on the couple weeks of deer season but people just don't travel to the north to hunt now. Land cost has depreciated, people payed 2 times what it is worth now just because the wolves are so thick there are no deer left to hunt. The wolves aren't just ruining populations they are ruining the local economies in the north woods.	1	We need more hunts to control to population and to put the fear back into the wolf so we quit hearing about all the dead dogs. Old bear hunters have been running dogs forever and no they are slower and less agile. They shouldn't be punished with a dead dog because it takes them a little longer to get to a tree. Let's bring the population down atleast so we can hunt and feel good about hunting in the northwoods.
Kyle	All of it	Yes	More hunting.	Less hunting	1	Need better management of wolves. Need a hunting season now.
Brandon hill	Most of it	Yes	That wolves would be managed.	We need to better know their numbers and follow the original management goal of 300. It is to arbitrary	2	
Carsen Severson	All of it	Yes	I do believe the state needs a hunt. The numbers listed on population I believe are low and they need to be kept in check	Taking non lethal methods only works for so long why not get rid of the problem from the start by issuing tags.	7	I personally believe your numbers are off. There are way more wolves then what the dnr count says and more conflict between people and wolves that are documented in the draft.
Tyler nicholson	Most of it	Yes	There isn't much to like about the plan other than the information is spread out fairly well	Non-residents should not be considered for wolf tags. The wolf population estimates seem incredibly low for the wolf sign I see from southern Jackson County to Eastern trempeleau all the way to clam lake. The projected wolf population was 350, that's where it should stay or atheist close to that number. It definitely shouldn't over double. The deer population in Clark County where I mainly hunt for deer has dropped drastically over the last 10 years and the wolf sign is inevitable.	2	Listen to the hunters, farmers, homesteaders, and other people that actually live with the wolves, not the people that live in Southern Wisconsin or the big cities that think wolves are just wonderful animals that have no negative effect on everything else in the state because of the beautiful pictures they see on the internet.
Judy Archibald	Most of it	Yes	● The elimination of a numerical target population ● The importance of the ecological benefits of wolves and inclusion of tribal values and knowledge. ● The attempt to minimize the impacts of a recreational hunt by adopting buffer zones around tribal lands, shortening reporting requirements and making hunting licenses zone specific. ● Emphasizes the use of non-lethal methods to reduce conflicts.	● Absent is a commitment by DNR to work with the legislature to overturn PA 169 and remove payments for hunting hounds, killed by wolves. ● Hound training must be stopped. ● The plan should establish a zero hunting quota to protect wolves in our national forests and other areas prime habitat. ● The recreational hunting/trapping to reduce conflicts has no scientific basis. ● At a minimum, DNR should ban the use of dogs to hunt wolves in our national forests. ● There is considerable uncertainty in estimating wolf populations based on the occupancy model and should not be used solely to determine population. ● The plan should include an oversight committee which is comprised of biologists and professionals.	7	Most of the plan is good. Hunters are over represented despite being a minority of people in the state. Too much emphasis was placed on the killing of wolves rather than co-existence.
Dana Lawrence	Just the parts I am interested in	Yes	Must have mngmnt	Use science not emotions	1	
	Most of it	No		The best guess for population is way off. Come to northern Wisconsin Price, Ashland, Iron Co. wolves have decimated our deer herd age class. Finding a buck of 2.5 years is almost non existent.	2	
	Most of it	Yes	That you are actually making a plan	The no mention of the set population goal, and the creation of subunits!	1	Have set goals in writing in the plan!
	Just the parts I am interested in	No	Wolves should always remain under federal protection and also remain a non-game species animal		7	
	Most of it	Yes	Needing to manage them to keep numbers in check	Total number in the state	1	We need a season to keep them in check one that won’t be taken away every other year
Ester Gonzalez	Most of it	No	I appreciate that this plan is being revisited. Mainly, that 350 will not be a threshold for wolf populations, and that the WDNR is open to receiving input from a societal survey. Plus, the recognition of wolves as an important part of ecological cycle in Winsconsin.	There are not enough studies to calm down misinformed opininions that blame wolves for the demise of deer, etc. A more Holistic study is needed to see the real impact on the environment from killing wolves. Also, more nonlethal methods of reducing livestock depradation are needed, and for this, there needs to be more studies since it is too easy to blame wolves and other predators on the loss of livestock. Change in habitat, and economical loss also lead to cows dying off.	7	I lost trust in the Wisconsin DNR after the wolf massacre of 2021. I feel like it is weak against rifle associations, hunting groups, poachers and hunters. The DNR should be protecting wildlife and their natural resources instead of selling out to special interest groups. It supports a culture of violence and not appreciating or protecting life, and white supremacy. Animals are not here to serve as shooting targets, we know better now, we have to protect what was wrongly eradicated by ignorance before. I prefer to see wildlife alive, it's priceless and should not have a dollar sign attached to its head. Thank you for taking my comment, may an ethical and scientific decision be made.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
	Just the parts I am interested in	No		No scientific research, no consideration of the impact of killing wolves on an individual wolf and destruction of their wolf family	2	Please consider the wolf as a family member with feelings and social being of a group in which every wolf has a clear defined role and not only consider wolves ass numbers you can reduce
Judith McDermott	All of it	Yes	1) No longer following an arbitrary or outdated set number for the target population. 2) Emphasis on use of non-lethal methods to reduce wolf/human conflict. 3) Including tribal values in the plan and having buffer zones around tribal lands. 4) Having a zone-specific hunt with licenses being zone specific. 5) Shortening reporting time requirements	1) THE USE OF POISONOUS BAIT SHOULD BE BANNED. It is shocking to me that the DNR allows hunters to place poison on our public lands. Public lands are used by everyone, and to allow a particular group to place toxins on our public lands is a travesty to the rest of the population. In doing so, you are allowing the poisoning of all wildlife, along with pets & even children who come into contact with it. And because chocolate is toxic to canids, it should also be banned as a bait. 2) If chocolate is continued to be allowed as bait, then the compensation program should include dogs belonging to the general population that are sickened or killed by bait placed on our public lands. By not including this, the plan shows favoritism to a particular group when all taxpayer dollars support public lands. 3) The plan contradicts itself by allowing dogs to be used to hunt wolves, as this practice increases the very conflicts that the plan states it is trying to reduce. Compensation for dog losses is controversial, as it provides hunters an incentive to use dogs to hunt wolves, yet also provides scientists accurate data & numbers for dog losses and eliminates credibility of media exaggeration of these. At the very least, if dogs are going to be used, then hound training should be restricted to only the zones open for hunting at the time, not starting the day after Thanksgiving and remaining open until the last day of the last zone's season as the draft plan recommends. 4) Western Lincoln County is core wolf habitat and should be in Zone 1 or 2, not in Zone 3 as the draft plan is written. 4) Zone 3 & 4 should NOT have hunting allowed, as, with the exception of western Lincoln County, these are areas with a lower wolf population to begin with. 5) The "Occupancy" model that is used for estimating deer population is NOT an accurate way to estimate the wolf population as it is not based on scientific data. it only works for deer because of the large deer population in our state. 6) The plan should include an oversight committee comprised of large carnivore biologists & other scientists.	5	The plan doesn't take into consideration the species-specific aspects of wolves. Because wolves live & hunt in packs, indiscriminate human hunting of wolves breaks up the pack & causes wolves to hunt smaller, easier prey like livestock & pets. This creates more human/wolf conflict, which is exactly what the plan states it's trying to reduce. (In their plan, Michigan actually stated that recreational hunting doesn't reduce conflict with wolves.) In closing, wolves don't need humans to regulate their population - abundance or lack of prey regulates wolf populations. This plan promotes the killing of wolves, not co-existence as it states.
Tessa	All of it	Yes	-Wolves won't be managed based on a numerical goal/ quota. -Emphasis on public education, research, monitoring & protections for wolf dens. -Subzones not assigned quotas but rather limits. -Establishment of buffer zones in relation to tribal reservations.	-Subzones 1B & 2B should have a limit of zero. If you must have a numerical limit please include any wolves taken illegally/ suspiciously. -The continued use of killing of wolves for recreation and the use of lethal management. please consider non-lethal management strategies and let ecology be your management tool except in truly lift threatening cases. - you need to make hounding or hound training illegal - it is cruel to wolves and hounds alike and should be banned altogether- it is archaic and barbaric! yes, that would also mean no hunting of bears with hounds. -The plan should outline more severe and immediate punishment for those illegally killing wolves. -	5	Although this management plan appears to be a huge improvement over the abused quota system, I would like to see the bulk of the management be focused on research and education. There is so much scientific evidence that should be used and WI could contribute to that body of evidence with dedication to fact finding, monitoring and understanding the benefits of a healthy wolf population to all our wild animals and their interactions.
Kyle Johnson	All of it	No	Not much	You need to prioritize hunting as a method of legal take. You also need to admit that wolves need to be managed to much lower population objectives given how populous the state is.	1	
	Just the parts I am interested in	No	Wolves should remain under federal protection always,,, wolves should also be considered a non game species		7	
	Most of it	No	Wolves must remain federal protected	Wolves must be considered a non-game species	5	
Benjamin Paul Bishop	Most of it	Yes	I like all of the objectives outlined in the plan.	None.	9	
cara	Just the parts I am interested in	No	-Wolves will not managed by the goal of 350 wolves. - Finally realize wolves play a vital role in our ecosystem. - Realization that people actually like wolves, know that they are so important to our lives as a species and are against killing them! -buffer zones	-Bad science! The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on (see reference list below): -wolf ethology, sentience, sapience, sociability, agency and wellbeing -effectiveness of non-lethal interventions, especially relative to lethal ones - the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution -The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. -The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. -A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard	4	Save wolves!

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
				and incidence of illegal killings. -Hounding or hound training, which are akin to allowing legalized dogfighting, should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public. - The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. - Despite Act 169, which mandates a wolf hunting season, the department can still restrict the implementation of lethal methods by setting minimal quotas, including a quota of '0' wolves, restricting timing and methods. -Several studies have proven a proactive non-lethal approach leads to better conflict mitigation. -Lethal management often fails to provide a long-term solution to wolf predation and has the least consistent success rates when compared to non-lethal practices. In addition, there is significant evidence showing that lethal wolf management may be less functionally effective at mitigating subsequent livestock losses than non-lethal deterrents. - The plan should require the implementation of abatement measures as well as the use of non-lethal conflict minimization techniques by domestic animal owners for the latter to receive compensation for confirmed predation. - The plan also runs contrary to public values towards wolves (and omits mention of such majority values from the plan), despite department surveys evidencing that the broad public cares about wolves as individuals (and not just for the viability of the population). Given the recent liberalization of killing wolves by the state, it would be incredibly informative to note majority support of the following reasons for opposing a regulated wolf hunting/trapping season (which are all omitted from the plan): opposition to specific methods of harvest like hounds (64%) or traps (70%), feelings that hunting wolves is unnecessary (62%) or culturally offensive to Native American tribes (57%). -All such reasons convey majority disagreement with practices currently promoted and endorsed by the legislature and the WDNR, and such a conflict between managers and the public should not only be acknowledged, but foregrounded and carefully considered in policy (instead of dismissed). -Such decisions to omit literature or downplay evidence (e.g., such as majority opposition to killing wolves and their reasons) are contrary to principles of scientific integrity (e.g., present all relevant scientific evidence to the public) as well as ethics (e.g., disguising ethical decisions, such as recreational wolf killing, as robustly supported by science). -Conflicting agency objectives (e.g., optimizing public hunting and conflict mitigation) are not only not acknowledged, but even misunderstood as harmonious, against the body of scientific evidence. That culminates in the prioritization of consumptive values and policies; e.g., according to the body of scientific literature, use of lethal methods, and especially public hunts, are contrary to most objectives relevant to: harm mitigation, the wellbeing of wolves, their ecological roles, and their non-exploitative enjoyment (i.e., Objectives A, B, D and F). - There is a stark lack of consideration for individual wolves, wolf population health (including wellbeing), and measurable indicators for assessing any harms barring disease prevalence (e.g., accounting for cortisol levels or other stress hormones, measures of pair/pack persistence) -There is an inappropriate understanding and consideration of tribal worldviews about wolves. Tribal worldviews of wolves are misconstrued as 'cultural benefits' tribes receive from the existence of a wolf population, when in fact tribal worldviews consider each individual wolf as a person and relative. Cultural respect and sensitivity towards such views, shared by many non-tribal members, demand the strict mitigation of lethal measures, especially recreational killing, as opposed to their current promotion in the plan. -In general, all omissions of scientific literature, the arbitrary prioritization of policy objectives, the rhetoric of the plan and the dismissal of public values and concerns for wolves point towards a biased, unscientific and instrumental view of wolves that promotes values contrary to broad public perspectives on wolves. -'SOM' wolf estimation methodology – From a recent critique: "The new methods sacrifice precision, but are believed to retain adequate accuracy and sensitivity to changing conditions for reliable decision-making. We review evidence for the accuracy, precision, and sensitivity of the new 'scaled occupancy model' (SOM) applied in Wisconsin. We conclude that the Wisconsin method would systematically overestimate wolf abundance by large (but currently incalculable) margins. Because Wisconsin, similar to other states, not only changed to unverified methods but also implemented widespread wolf killing, shortcomings in their estimates of wolf abundance may have far-reaching consequences for population viability and confidence in state wildlife managers. We discuss findings from Wisconsin alongside similar findings for other states' occupancy models being insensitive to human causes of mortality that have recently increased. Overall, Wisconsin's proposed		

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
				method for estimating wolf abundance shows significant departures from best practices in scientific measurement. Verification will require independent replication and unbiased tests at multiple scales in multiple habitats under different human-induced mortality rates, and peer review before the new methods are considered reliable." (Treves & Santiago-Ávila, 2023)		
	Most of it	Yes	Maintaining the ability to harvest wolves via hunting and trapping to regulate the wolf population.	The buffer zone around the tribal lands, designated as the sub zones. When determining harvest numbers and allowing half of the harvest tags to go to a tribe that publicly declares they won't use them is bad science. If you are setting a population reduction goal but only having access to half of that but pretending like that isn't a factor in the population dynamics is BAD SCIENCE.	5	There should be direct explicit advocacy in the report stating that Wisconsin's wolf population is NOT endangered and needs active management by the WI DNR via hunting and trapping
Mara Lang	All of it	Yes	Absent is a commitment by DNR to work with the legislature to overturn PA 169 and remove payments for hunting hounds, killed by wolves. ● Hound training must be stopped. ● The plan should establish a zero hunting quota to protect wolves in our national forests and other areas prime habitat. ● The recreational hunting/trapping to reduce conflicts has no scientific basis. ● At a minimum, DNR should ban the use of dogs to hunt wolves in our national forests. ● There is considerable uncertainty in estimating wolf populations based on the occupancy model and should not be used solely to determine population. ● The plan should include an oversight committee which is comprised of biologists and professionals.	Absent is a commitment by DNR to work with the legislature to overturn PA 169 and remove payments for hunting hounds, killed by wolves. ● Hound training must be stopped. ● The plan should establish a zero hunting quota to protect wolves in our national forests and other areas prime habitat. ● The recreational hunting/trapping to reduce conflicts has no scientific basis. ● At a minimum, DNR should ban the use of dogs to hunt wolves in our national forests. ● There is considerable uncertainty in estimating wolf populations based on the occupancy model and should not be used solely to determine population. ● The plan should include an oversight committee which is comprised of biologists and professionals.	7	Overall, the plan is good; however, the Committee was overrepresented by hunting organizations even though they represent the *minority* opinion of Wisconsinites. Too much emphasis was placed on the killing of wolves rather than co-existence. There also needs to be a complete removal of the use of trapping.
	Most of it	No	The plan recognizes the greater ecological role wolves play in our natural environment.	There are non - lethal alternatives to Recreational killing and culling of wolves . These should be explored in depth and with true concern for our natural world.	4	The plan should prioritize wolf protections . Wolves are a vital part of the ecosystem in Wisconsin and throughout the United States.
Ray Boyer	Just the parts I am interested in	No	That you seemingly understand the importance of Wolves and that they should have some protections.	The killing of Wolves. It should not be permitted. First they are endangered in Wisconsin and most importantly they are DOGS. You dont shoot DOGS! If numbers get too high in a particular area some should be moved. Ideally a few bonded Wolves moved together as they are very social Animals.	1	Wolves are majestic wild Dogs and they should be protected. Other means rather than killing should be used to manage Wolf populations.
Kell Took	All of it	No		Killing wolves. Just stop killing them.	1	
	Most of it	Yes	Nothing	Poor population estimates due to the wolf tracking units not all being tracked and not all being tracked to the three time standard. Lone and dispersing wolves not being counted. Creating further buffer zones around the reservations. No numeric population goal. I believe population goal should be maintained at 350 wolves. Wolves should only reside in high quality habitat where their will be low interactions between humans.	1	This draft plan does not seem balanced for the state. This plan seems to favor pro wolf groups and seems to ignore the concerns of the northern Wisconsin residents as well as hunters in northern Wisconsin.
Carolyn Forde	All of it	Yes	-I appreciate the DNR expertise, time, and energy that went into the plan process. -I concur that it is important to remove numeric goals from the management plan. -I endorse science-based management of wolves. -I endorse an expanded focus on outreach and education.	-I understand current state law requires a hunt when the wolf is not under federal protection. However, based on the literature cited in the plan, it would seem hunting is not an effective means of management. I would prefer to see more focus and energy around non-lethal means of management. -I disagree with the removal of "reservation wolves" when considering wolf hunt quotas. -I disagree with the use of dogs to hunt wolves. Again, I understand that current law allows this practice. I would like to see education about the negative repercussions of hunting wolves with dogs in any DNR outreach and education. -A weakness of the plan is that it was formulated without many citizens at large like myself.	7	I have tried to educate myself about wolves in Wisconsin. My thinking has evolved over the years. First, I supported federal protections for wolves. Then I embraced the idea that Wisconsin was the best manager of its wolves. I have lived in Sauk County, Marathon County, and now live in Rusk County. After listening to people around the state discuss wolves, learning about the 2021 wolf hunt, and giving this issue a great deal of thought, I have concluded that federal protection is necessary for the wolf. Culturally, Wisconsin citizens are stuck with antiquated notions of wolves. Fear mongering continues to be the order of the day. Special interests and politicians pander to the public when it comes to wolves. My children who are in their late 20s want wolves on the landscape. They see the value of wolves in their lives. Only when my children's generation alongside Wisconsin's native peoples are making policy for Wisconsin, will Wisconsin be a responsible manager of the wolf population. As if to prove me right, a "gentleman" named Matt Lallemont from Chippewa Falls has placed a letter to the editor in this week's Ladysmith News: it purports to share comments made about the wolf in Wisconsin and the proposed Wolf Management Plan from a WWF listening session on Feb. 18 in Solon Springs. There is not a single positive comment about wolves in the piece.
Rita Meuer	Most of it	Yes	It doesn't seem like much of a compromise.	Hounds being used to hunt. Hounds are treated as poorly as wolves and their babies. Having a numerical limit on shooting these creatures. It is used against the conservation people. There needs to be a separate division of science and current DNR people. The current DNR are Ani wolf and pro hunters.	3	See above.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Kenneth Chong	Most of it	No	Increasing public understanding of wolves in Wisconsin sounds like a great thing to have as an objective.	Scaled occupancy model for estimating wolf populations is using data from years prior to 2021 wolf hunts, which would have a major impact on accuracy due to significantly reduced wolf populations since that year.	7	
	Most of it	Yes	removal of numeric goal---focus on ecological benefits and sustainable population(and address conflicts), redrawing zones, buffer zones around reservations, focus on population monitoring, scientific approach, education and outreach, the protection of den sites, mandatory harvest registration, in-person certification and zone specific permits	return western Lincoln Co. to Zone 1--a core wolf range(most suitable wolf habitat), limit dog training to only when zone is open to hunting/trapping season, make sure licenses are issued so quotas met in reasonable time to avoid long season that interferes with wolf breeding/normal activities and winter tracking surveys, need to explain how each zone's population will be guided to achieve plan's goals and a healthy, sustainable wolf population, a wolf advisory committee needs to strongly represent science and tribal concerns and a true wildlife conservation mission, the DNR and NRB need to ask for changes in ACT 169 (ACT 169 has caused serious problems in the way wolves are treated.), DNR should periodically meet with scientific experts to review wolf population, more general public and school education, more research needed(CWD and wolves, the connection between WI, MI, and MN wolves,)	8	should limit the killing of wolves by focusing on only those wolves that are truly causing problems/conflicts with honest farmers DNR needs to resist outside forces and use the powers it has to set quotas and other details of the wolf season plan needs to always put emphasis on science, truth, fact and ethics plan should never yield to individuals or groups that push otherwise
	All of it	Yes	Let the wolf population grow to 1500 or more.	Minimum wolf population of 1000 wolves is to low.	5	No trapping of wolves. No hunting wolves from the air. Drones cannot be used to hunt wolves or any other animal.
Marc Thwaits	Most of it	Yes	The continuation of research being conducted by the WDNR to maintain a healthy wolf population in the state. Giving the Native tribes more input in wolf management. Creating more objective ways of deciding how the animals are to be managed rather than bowing to the gripes of barroom "biologists" who have little objective data to contribute.	Paying for hunting dog and pet deaths. Paying for livestock predation when nothing has been done to prevent the predation in the first place.	9	Reduce the plan in size by eliminating repetitive sections on history of wolves in WI, what wolves prey upon, and similar repeated sections. I appreciate all the hard work from all the people who did the research and assembled the information into this document.
Cathryn Corey	Most of it	No	It is very detailed . It covers a lot of information. I appreciate that such diverse groups were involved in the process.	HArvest information .	6	
William R. Seybold	All of it	Yes	The previous plans referred to a 350 wolf recovery goal set when the population was much lower. The number proved contentious over the years, even though the original plan authors said it was never meant as a cap. The 2022 draft plan does away with that debate entirely. It's also reflective of a new direction for wolf management in the state. Most Wisconsin somewhat or strongly agreed that predators like wolves keep nature in balance(77%), wolves are culturally important (71%), and wolves are special animals that deserve our admiration (75%). Similarly, a majority of Wisconsinites agreed that people and wolves should be able to coexist (75%) and that it is important to maintain a population in Wisconsin (80%). More than ever before, the DNR has taken consideration into the ecological benefits of wolves, including CWD, landscape of fear, etc, This should be priority one over all the goals. Increased acknowledgement of tribal values and goals is essential. Tribal Perspectives and cultural Significance as part of the development of this plan, the department formally requested that the federally recognized tribes in Wisconsin contribute a written narrative on the cultural significance of wolves to be included in the plan. The invitation was extended to all tribes and their needs were addressed. While I am firmly against recreational hunting of wolves, I think the zone system and shortening if reporting is a step in the right direction. I support buffer zones. We should not allow what happened in 2021 to ever occur again. While I also oppose lethal removal of wolves for depredation I am glad to see extensive talk about nonlethal abatement and increased scientific proof when it is needed.	Overall, most people in I would first like to state that when the DNR stacked the committee with pro-wolf-hunting groups they continued an anti-democratic and failed policy of the Walker administration by dismissing the values of the majority ot the public that do not support killing wolves even in cases of livestock loss (Manfredo et al. 2020) and completely ignored the will of the youths and future generations of Wisconsin residents. Therefore, any claim about a majority view or balanced committee in this report in inaccurate on its face. We should not be using recreational hunting as a conflict resolution tool	7	The DNR did a good job overall. Please include those who want to move wildlife management towards an ethical, science-based, democratic vision of wildlife conservation that respects diversity and the intrinsic value of all life.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Lisa Hannon	Most of it	Yes	I support farmers being able to shoot a wolf on their land. Yes to buffer zones around tribal lands (and I am very glad that Native representatives helped develop this plan). I understand the concern of livestock owners who may be affected by the buffer zone, but that is less critical than the EPIDEMIC of missing and murdered Native women in this country. As a white woman survivor of sexual assault, I am enraged that this continues, so anything that keeps non-Native men away from tribal lands is a big yes for me. I commend your adaptive wildlife management approach, and use of best practices to count and collar the wolf population, and I love that educating the public about wolves is an important component of the plan, as I have helped give classroom presentations on wolves myself.	No to USING dogs to hunt wolves. No to trapping. No to night hunting.	8	If wolves are on the Endangered Species list, there won't be a hunt, will there? Finally, here is a link to a resort I just learned about where you can view passing wolves from a glass wall in your cabin. If we had something like this in Wisconsin, with proper safeguards to prevent habituation of the wolves, it could be a wonderful tourism draw. I'd go there myself in a heartbeat. https://www.parcomega.ca/en/accomodation/sleep-with-the-wolves/wolf-cabins/
Jay Jocham	All of it	Yes	Wolf history and phenology. Scientific and fact-based research. Plan to scientifically maintain wolf populations in Wisconsin.	I don't like the fact that wolves are still hunted with dogs. I would hope that wolves are allowed to exist in significant numbers without excessive hunting or need for conflict resolution.	8	I enjoy living in a rural town in a management district. I have seen wolf sign and tracks but never a wolf. It is good knowing they are here and I don't understand the hatred for them. I hope your education component is successful in addressing this ongoing problem of misinformation. Thank you.
	All of it	Yes	I like the information on the history of the plan and how arrived at its current interpretation. I especially appreciate the tribal feedback to the project	It has been too long that the DNR has looked into solid science on the Wis. wolf management plan. Especially when as it was debated on numerous programs including NPR Science Friday. Very informative!	6	I never had a wolf intimidate or threaten my daughter while playing outside. However, I did have her run into our home with fear of wolf-hunting dogs wearing collars and trespassing on our land.
Linda carr plourde	Just the parts I am interested in	No	Removing the arbitrary wolf population goal. Focus is now on the ecological benefits of wolves.	Better regulation on hound training so that it does not disrupt the WOLF breeding seasons. HOUNDS SHOULD NOT BE USED TRACKING AND HUNTING WOLVES.	9	I am from Wisconsin, 2 college degrees from Wisconsin, taught in the public schools in Wisconsin, receive Wisconsin State teachers retirement benefits, & have my cemetary plot is in Wisconsin. I currently have a home in the Seattle area. But my heart & home is Wisconsin. My daughter as a student at the university of Washington studied & observed the wolves in Yellowstone national park. She shared what she learned and currently works for US Forest Service in Idaho. I followed the Wolf season last year and would to see a change. I am not a hunter or farmer.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
	Most of it	Yes	There are many instances of planning to study or continue studying the many different aspects of the whole wolf issue. It is very hard to make a smart plan without studying and taking the scientific part out of the information gathering. The DNR is the scientific reason behind animal populations and the public emotion needs to be kept at bay.	Overall there are many many bases covered by the plan in theory, but saying and putting together the correct information are two separate things, and over my lifetime it seems the correct decisions don't always get made from the data that is collected.	4	I don't have as many comments on the wolf plan, as I do on the outcomes. Plans can be made until we are all blue in the face--what matters is if the plan is actually producing outcomes that society can live with. Myself, I want to see wolves be a part of Wisconsin, but it has to be manageable. Wolves have marginalized many enjoyment of their pets, livestock, and recreation, and the been detrimental to alot of the economics of Northern Wisconsin. There is no doubt that the explosion of the wolf population in the north has had a drastic effect on the deer and elk populations, which has in turn decimated economic development and even just continuation in the north. The lack of deer, as a result of added wolf pressure, has played a large part in land values across the wild land areas of the north being rather worthless. These areas once thrived with deer camps that brought alot of money to the region, and that is almost all gone. I commend the DNR on staying with the elk project as long as they have, but goodness gracious...if getting a viable elk population in Wisconsin was a business, it would have been dropped long ago. Look at Kentucky's elk population--we started long before them. Yes, they do not have the predators that we do. But, what is the sense of striving for the elk herd if we aren't going to do anything about the depredation? As far as wolf control goes, I feel there is a disconnect for wolf, bobcat, bear, etc. in Wisconsin management that needs to be looked at. Take the level of bobcat tags as a good example since it has been in existence a long time. Hound hunting drives the force being the harvest. But, when applying for a tag, it seems like you have a year where snow is good, and there is a good harvest. Then is said there were too many taken, so tags get cut. The next year, snow is bad, so harvest is very poor, and it is looked at as oh no, the harvest was bad because the harvest was low. No it wasn't, and it can't be both ways. The same can't be done with wolf populations. I know the modeling plans to be different, but the resource regulates itself to an extent. If populations are low, people don't harvest game. If populations are high, harvest is decent. But an even keel needs to be looked at for populations and let the resource manage itself a bit. I must reiterate though, the detrimental economic impact that wolves have on northern Wisconsin is much more than is given credit, and I don't care what anyone says, any meaningful wolf 'tourism' dollars to the north is laughable. I have spent alot of time in wolf country recreating and working, and I have seen very few wolves in my life. If people are going up north to view wolves in Wisconsin, that will be a total of once per person when wolves inhabit areas where you can at best see 8 feet into the woods. And unfortunately, anybody's best chance of seeing is if they are killing something that was by the road and in most cases that will be the wolf killing the person's dog. No other game species in Wisconsin is just let free to do whatever it pleases to the rest of every other species. When deer got high in the early 2000's, plenty of doe tags were offered to supposedly make that healthy again. As I stated above though, the emotion is killing the whole thing by the courts letting the emotions in and stopping the DNR from being able to properly manage the wolf scientifically as a game species--but once science prevails, and not emotion, strive for outcomes, not just plans.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Caryl Pfeiffer, Cloverland Twp, Vilas Co	All of it	Yes	-Designed to be adaptable based on new information through multi-faceted oversight objectives, hopefully throughout the year. -Harvesting quotas-issued licenses zone specific. -Wolf monitoring through GPS collaring (hopefully increase)-look at sponsorships & donations for collars. -Buffer zones around tribal lands. -New zone boundaries seem easier to enforce. -Decisions based in science, world-wide research findings, and input from all citizens. -Exclusion of dog depredation reimbursement while hunting wolves (include training as well). -Continued efforts to find nonlethal methods for depredation issues. -Ethical/humane focused hunter/trapper programs. Providing key information/literature with license applications (required wolf-related hunter training-better). -Preventing going over quotas; reduced window for harvest registration (4?), in person certification, tagging requirements. -Honoring Native tribes wishes in every way possible. -All in-the-field methods to determine wolf populations. -Any and all authority given to DNR to prevent unethical/inhumane hunter practices/behavior.	-Feeding/baiting of any kind (particularly sugar products). -Night hunting of any kind. -Hunting using dogs for wolves (bear/coyote). -Killing contests (not mentioned in plan). -Compensation for dogs used hunting wolves (training also). -Electronic calls. -Any loopholes/exclusions/exceptions in rules enabling poaching. -Training dogs using live animals in barrels and confined areas (not mentioned). -All unethical/inhumane but accepted practices (DNR and/or State sanctioned). -Sanctioned wolf seasons when specific wolf management is more effective. Wolves themselves, best mechanism for managing own populations given the chance. -Missing is satisfactory non-hunter satisfaction indices. -Unsure about comparative accuracy of the scaled occupancy model.	7	Sincere thanks to everyone (past and present), who played a part in the creation of the 2020 Wolf Management Plan Draft. I can appreciate the challenge of creating a plan that is very controversial from the start, involving many opposing views and legal constraints.Overall, my concerns with the 2022 wolf management plan relate to the ethical components, partially based on the following: 1) "In the United States, while the right to keep and bear arms is constitutionally assured, hunting is a privilege to be repeatedly earned, year after year, by those who hunt. It is well for hunters to remember that in a democracy, privileges, which include hunting, are maintained through the approval of the public at large. Hunting must be conducted under both laws and ethical guidelines in order to ensure this approval." – Jack Ward Thomas, 13th Chief of the US Forest Service 2) Those entrusted in our State to protect our wildlife and the ecosystems that sustain all life (taken from WI DNR mission statement), must never allow what happened in February 2021 to be repeated again – EVER. The brutal slaughter brought by those of unconscionable integrity, will forever be associated with Wisconsin, including: our citizens, the WIDNR, DNR Advisory Board, State Legislators and the WCC board. 3) It is easy to forget that we humans are a miniscule, dispensable part of the overall ecosystem, but the most egocentric destructive part of it. We are doing a phenomenal job of destroying our entire planet in record time, because we put our selfish interests before anything else. Wildlife species throughout the world are in serious decline. There is an exploding increase in sanctioned hunting of wolves in western United States. 4) US Rep Tiffany's latest proposed bill to delist wolves, asks that reissuance of the final rule not be subject to judicial review, essentially attempting to interfere with basic democratic processes., as well as having States independently manage "their" wolves. Wolves in Wisconsin are not confined to just Wisconsin. Gray wolves and wolf population dynamics are interconnected throughout the US and beyond. We saw briefly what State management of wolves in Wisconsin (with republican legislative control) looks like, with the February 2021 wolf harvest. It was a tragic and disgraceful display of wolf mismanagement, influenced by a group from outside of Wisconsin. Sponsors of Tiffany's bill includes only 2 Wisconsin groups (of 20 from outside WI). Not one democratic US representative supported Tiffany's bill (only 5 WI republicans supported the bill. 5) NORTHWOODS CULTURE: I have lived in Wisconsin my entire life. I have visited northern Wisconsin for many years, now living in Vilas County-Cloverland Twp (year-round) for nearly 24 years. In recent years I have witnessed an increased egocentric arrogant attitude by gunowners, citing their constitutional right to hunt on their property at any time of the night (year-round), regardless of its impact on those living in very close proximity. If you complain to the authorities, you get a harassment citation against you. Northern Wisconsin has a long history of racism against Native Americans. I believe the DNR should consider that political, racist, anti-government and nationalist views may all be connected to wolf intolerance, and what can the DNR do about it.Would like to see formation of an independent permanent ethics board to review all sanctioned hunting practices with goal of improving integrity of Wisconsin hunting.
Rich Gullixon	All of it	Yes	The plan doesn't seem like a management plan, but relationship plan were we just really need to learn to live with the 1000's of wolves despite the terrible consequences. I really don't see any upside to the new plan. It will be challenged in court and wolves will continue to be unmanaged despite selling us a lie with first plan to manage wolves after 300 or so. Was this number put so low to get public favor? Now the rug is pulled out from under our feet and the wolf experts are saying that WI should have many times more wolves.	It will not result in wolves being managed at an acceptable number. Your collusion with the anti's, Natives and extremist downstate at the expense of the true conservationist will continue. You do not have a handle on the population, or if you do you are under-reporting the true population.	0	What has happened to the DNR? Your actions tell us who you represent and it is not the sportsmen and conservationist who fund your organizations and programs through licenses, fees, etc. The way the last wolf hunt was portrayed in the media and hyped up by the DNR to portray the exact opposite of what happened and why so many wolves were harvested so quickly was shameful.
L. Ciorlieri	All of it	No	Thank you for including the First Nation letters as part of the draft plan. Very eloquent. Also, thank you for the history of wolves in Wisconsin. Very detailed. Also, having numbered zones is an improvement.	Occupancy modelling for wolf population numbers seems too broad. Population between 741 and 1200? Probably 972? I am pleased, though, that no "cap population number" has been included. Thank you	4	Having a RECREATIONAL wolf hunt legally required when (not if) wolves are again delisted is horrifying and barbaric. It is as though the plan was written in the 1950s, not in a world of climate change and the sixth extinction. Wolves are intelligent beings who have a pack structure which is destroyed when humans randomly kill their members. They have as much right to their lives as you do yours. A wolf hunt does NOT help resolve predation, quite the opposite. And using hounds to hunt wolves? Using hounds to hunt bear? Having a huge training window for hounds who will hunt bear seems an invitation for inevitable conflict with wolves Crops are harvested. A wolf is not harvested. It is killed for the thrill of seeing the light extinguished from its eyes. And if the wolf is trapped, then it is killing by torture.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
	Most of it	Yes	I like that there were lots of statics	Where are the appropriate/manageable population counts for each zone? Where are the approximations of wolf population to maintain an appropriate deer population? What is the set season?	1	
	Most of it	Yes	Showing how many pets and livestock are getting killed. Shows you that's there is a problem	The radius outside of reservation should not even be considered	1	
Nicole	Most of it	Yes	Recognition of the ecological value of wolves	Missing updated/recent evidence illustrating negative effects of wolf hunting and trapping on pack structure, and it's connection to increased livestock predation.	2	Research shows the many negative impacts of human interference in wolf populations. Wolves are critical in a healthy ecosystem, let's focus on coexistence, education, and prioritize non-lethal means of management. Outlaw the vile practice of hounding, which indiscriminately harms wildlife, people, and the hounds themselves.
	Most of it	Yes	Not 1 thing. I totally object to all of it	All of the plan is nothing but politics. The state needs to leave the politics out and face the reality of the problem. Let's get real about the reality of the states wolf population	0	
Kyle Paulson	All of it	Yes	I liked section 1 the gray wolf biology segment.	I don't like how you don't have a population goal. The Wolf needs to be managed like any other predator animal. The 350 max goal of population should remain. There are multiple conflicts with hunting dogs every year because of the wolf. How is it that in original plan of 350 wolves and we are now over thousands of wolves without managing them? It doesn't make sense having a goal and letting it run out of hand. The state needs to take control and instead of having federal protection. I dislike how you have buffer zones around native reservations. You're implying if someone owns land in these buffer zones, pays taxes, buys hunting license, they can't even partake on hunting the wolf on their own land?	1	Please have a season on the wolf in Wisconsin in fall of 2023. It is getting out of hand when I can drive around in areas I hunt and see more wolf tracks than any other animal.
	All of it	Yes	-All aspects are being reviewed. Hopefully, a reasonable outcome/resolution can be developed; although I am cautiously optimistic.	-As stated in the previous question, I believe the holistic approach is a smart idea. However, it seems (historically speaking) the weights and balances favor the hunter and the hunter's agenda. I, myself, am a hunter and enjoy the past time of hunting for food (not trophy hunting). I strongly disagree with any "potential" piece of the plan that may allow for an unfair advantage, the near or distance future, that may cause a repeat of killing far too many wolves (or any animal for that reason) as was the result of the recent wolf hunt.	7	While wolves are an adaptable species, humans are much more so. No law or plan will ever make all people happy/content. I believe this plan is, in theory, well-developed and takes into account the beliefs of multiple groups. Ultimately, I sincerely hope the wolf population will regain a foothold in our state and nation. Humans, on the other hand, have taken far too many liberties when it comes to hunting, development, and more, without much regard for other species/the planet. This plan, assuming it is worth the paper it is written on, is a step in the right direction.
Pamela Alvesteffer	Most of it	No	A greater recognition of the ecological role of Wolves. The social aspect that there's an increase in positive views of Wolves and their roles in their ecosystems. Acknowledging the social oppositions to the motives and methods of killing Wolves. Proposing buffer zones around tribal reservations.	Does not reflect the best scientific research available and is lacking scientific reference in the following areas: 1. Wolf ethology, sentience, sapience, sociability, agency and wellbeing 2 Effectiveness of non-lethal interventions, especially relative to lethal ones 3. The impact of widespread killing on Wolves' physiology, behavior, wellbeing, and social dynamics. The plan should prioritize Wolf protections and concentrate solely on non-lethal management of Wolves in response to livestock conflicts to ensure ethical coexistence. Hounding practices should not be allowed The plan should require the implementation of abatement measures as well as the use of non-lethal conflict minimization techniques by domestic animal owners for the latter to receive compensation for confirmed predation.	5	Wolves are an essential part of their ecosystems - we must learn to coexist with Wildlife using non-lethal methods and strategies. Thank you
Ivy Alcazar	Just the parts I am interested in	No	The explanation of the vital aspects wolves possess and the non-lethal methods provided.	n/a	5	Why Wolves are Important Wolves are an extremely important aspect of the ecosystem and provide many different varieties of creatures in the balance of nature. The overpopulation of deer has been blowing up over the past few years and consuming the vast majority of plant sources--which many other animals such as beavers--assist in building dams for balanced river flow. This can improve the lives of songbirds, fish, bears, and other animals. All of this is connected to wolves. One of the main reasons these beautiful and stunning creatures are persecuted is because they "target" cattle. In early US history, settlers traveled over the land by horse-drawn wagons over the new west. The massive settler population nearly wiped out all of the elk, deer, and bison; which are animals that wolves naturally prey on. Because of this, the wolves have no choice but to resort to hunting the cattle instead. As a result, the wolves became hated and persecuted throughout the world and were hunted maliciously. Wolves almost went extinct in the early 1900s--if it wasn't for the ESA (Endangered Species Act) Wolves were placed on the Endangered Species list and were saved. But, many years later, the Trump administration removed them once again and they were hunted to the brink of extinction once again. But, on a faithful winter day on February 10th of 2022. Wolf advocates can only hope that this will stay the same. But despite the wolves being protected in many states such as Colorado and parts of North America, they still need protection in the Northern Rocky Mountains.
	All of it	Yes	Just the general consensus that we should be using this resource.	Catering to the antis	7	

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Jesse Boettcher	All of it	Yes	Lots of good data and statistics. I especially noticed that humans can kill up to 29% of the wolf population annually before there would be a drop in sustainable population. Objectives A, B, and C were well thought out and comprehensive.	I do not appreciate that Tribal input is ranked so high in value as to how we manage wolves on non-tribal lands. I do not like that Tribal members get equal quota numbers, despite the fact that they will not be harvesting wolves. This lowers the annual harvest numbers and will not be effective in managing total wolf numbers. We will continue to see increases in wolf population.	6	There needs to be a number set for maximum wolf population per management zone and not a "statewide population goal". Something like 500 wolves for Zone 1, 200 for Zone 3, 50 for Zone 6, etc. Then allow for a 25%-30% harvest rate per zone per year. I would also like to see different quota limits for hunting vs trapping. Actually, the same quota for both. 50% of wolf tags for hunters (hound or predator callers) and 50% for trappers. Also, I believe that there are more wolves in my area (Sawyer County) than the DNR claims. I run an extensive trapline for beaver throughout the winter. I see more wolf tracks than coyote tracks every time I'm in the woods. I trap a lot of remote areas far from major roads. There are a lot of wolves. I can no longer trap coyotes in my area, because I will catch wolves and they aren't fun to release.
	Most of it	Yes	They need to be managed	Take opions none woodsmen	4	There more now then ever
	All of it	No	NONE OF THEM! Wolves are ESSENTIAL! The data shows wolves have a NEGLIGIBLE EFFECT on livestock. There are 2.8 million cattle and sheep in Idaho and only 173 were killed by wolves in 2020. IT IS COUNTERPRODUCTIVE TO ENCITE CONTROL ON WILDLIFE POPULATION! Hasn't humanity done enough?	NONE OF THEM! Wolves are ESSENTIAL! The data shows wolves have a NEGLIGIBLE EFFECT on livestock. There are 2.8 million cattle and sheep in Idaho and only 173 were killed by wolves in 2020. IT IS COUNTERPRODUCTIVE TO ENCITE CONTROL ON WILDLIFE POPULATION! Hasn't humanity done enough?	1	There are incredibly shoddy science + ethics behind some of the policies. Adding to the slaughter of wolves has a profound effect on wildlife. Since when did humans know whats best?
LYNN CRAWFORD	Most of it	Yes	Ensuring a healthy and sustainable wolf population is a goal. Reducing the incidence of chronic wasting in the white tailed deer population is mentioned as part of the wolf management plan.	That 62% in areas with wolves approve of the inhumane practice of trapping and that 51% outside of areas with wolves approve of trapping. I also am disappointed that the barbaric practice of hunting with dogs is permitted.	9	Thank you for the opportunity to comment.
	Most of it	No	Proposed buffer zones; acknowledgement of wolves' ecological, cultural and environmental value; recognition of increasingly favorable public sentiment towards wolves; willingness to avoid traditionally cruel and inhumane control methods (eg, will no longer be managed by reference to the old numerical goal of 350 wolves.)	Should focus more on non-lethal control, and should be based on the best available, nonbiased science to address the effects of lethal control on wolf packs and their ability to recover, and the effectiveness of non-lethal vs. lethal control. Plan should also require livestock owners to use nonlethal control methods in order to qualify for compensation due to loss of an animal to wolf depredation.	4	Please take sound science and improving public opinion into consideration, especially the views of Native American tribes in Wisconsin. THank you for considering my comments
Maureen & Dale Gross	Most of it	Yes	This new plan is much more comprehensive, more holistic and more open to the general public then in the past. The WDNR claims this management plan is formulated, unbiased scientific fact. The WDNR must hold true to this in every way. Implementing citizen education will also be very beneficial as people become better acquainted with our native wolves which eliminates much of the fear of the unknown when it comes to wolves. We have had 6 unintended encounters with wild wolves and never felt threatened. Education can go a long way in vanishing human/wolf conflicts.	t is generally felt that wolves themselves should be allowed to determine their numbers and distribution on the broader landscape, as opposed to having humans make this determination. In addition, taking a wolf's life is a serious consideration that requires substantial justification. pg. 43 of the Plan. This is the philosophy we need to follow moving forward. Farmers should be encouraged to raise bison rather than cattle since bison take little care, evolved with wolves and provide a healthier, tastier meat for the table. Farmers must immediately dispose of any afterbirths and house any wounded livestock to discourage any interaction with wolves. Have a hunting season will not reduce poaching. Even legal hunts create problems with hunters acting like they own all the land and roadways during the hunt. There have been issues with bear hunters also resulting in vehicle collisions with residents. Also hunting predators with hounds needs to be outlawed. This is a barbaric practice with both hounds and predatory game being seriously and/or mortally wounded. This unethical hunting method must be stopped immediately which will end hunting dog/bear/wolf conflicts. Wild canids are not eaten by humans and the fashion market has fallen out of favor for furs. There is no purpose to hunt/trap these animals other than to fulfill "fun" for blood thirst humans. There is already a heavy toll on wolves from other human caused wolf deaths. Hunting of coyotes during pupping season needs to end now for it leaves the pups to starve to death--totally unacceptable. The bottom line is that wildlife management plans must foremost deal with managing people which is the basis of nearly all wildlife/people conflicts. The plan mentions problems with wolves killing pets, but does not address dogs killing wolves. Why? Dogs killing wolves result from irresponsible dog owners. Dog packs kill wildlife and threaten, even kill humans. This must stop.	8	The botched wolf hunt of Feb. 2021 must never happen again. This was a hard lesson. It appeared as though the WDNR lost all control over the hunt and the number of wolves killed. A very bad reflection on the Dept. "Hunters and trappers killed 216 gray wolves in the 2021 Wisconsin wolf harvest season, 82% above the state-licensed goal. The swift pace of the wolf kills, mostly by hunters using trailing hounds, took the DNR by surprise." Milw. Journal. Wolves play a vital role in our ecology and they should be allowed to do so.
William J Ebbott	Most of it	Yes	See attached comments sent to you by my brother, which I agree with.	See attached comments sent to you by my brother, which I agree with.	3	

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Michael McLain	Just the parts I am interested in	No	I was impressed by the serious and substantial aspect of the draft Plan, which is evident in the goals that are put forward, the topics that are addressed. Thank you to all concerned for the huge amount of work and seriousness of purpose reflected in the Draft Plan.		8	I am a resident of the state of New Mexico, a place where I have come to appreciate nature and wildlife as a vital and precious part of our heritage as Americans. The presence of wolves in the wild is something I hope our grandchildren and great-grandchildren and all future generations of Americans will have because wolves are an essential part of the richness of our American wild. Wisconsin is an important state and what you ultimately decide to do with respect to management of wolves will have an effect nationwide. From the draft Plan I perceive your seriousness of purpose as you approach the issue of Wolf Management. I sincerely hope wisdom, fairness, and foresight will guide your deliberations and inform the choices that are ultimately made. You hold part of the soul of America in your hands. As a citizen of this country, I thank you for your work and I pray that the final result will benefit the long-term presence of wolves in the wild of the beautiful and great state of Wisconsin.
Kevin Schiebenes	All of it	Yes	I like how there are no specific number of wolves that are managed for. I like that the positive impressions of wolves in the state is a consideration.	I would like to see minimum population limits set regardless of the public's perception of wolves. I'd also like to see more research looking at the impact of wolves on chronic wasting disease in deer.	8	I think that the indigenous people's input on this plan should be placed in high regard and see the Wolf as a brother to share life with. I personally support a high wolf population and would like to see it expand it's range and population.
Terry Sorenson	Most of it	Yes	I read it about a month ago,now I don't remember much about it.	I don't think the dnr is aware of how many wolves there are in different counties.	2	Last year,my family did a spring Turkey hunt,which I have been doing for the last 30 years.Our group of 4 hunters didn't even see one Turkey, but I did see my first wolf.We also bow hunted in the fall and I saw 7 deer and my brother didn't even see one deer in 4 days of hunting. We had several pictures of wolves on our trail cameras and so did our neighbors.It was the worst year we ever had in 50 years of deer hunting. The wolves are killing all the wild life in our area of Adam's county. There needs to be another wolf season,or there won't be any deer or Turkeys left.
dennis germain	All of it	Yes	nothing	your team is not helping. find a new team that doesn't cater to the liberals or the Indians.	0	WOLF SEASON SOON' THIS BULLXXXX HAS TO STOP...
Karen Samelson	Just the parts I am interested in	Yes	The plan takes the tribes into account and sets low quotas in the zones around the tribal lands where requested. The plan uses science. The plan doesn't set an arbitrary total. The plan acknowledges the benefit of wolves to the ecosystem. The plan talks about working to improve education and also working with farmers to decrease depredation and conflict.	It does not set a timetable to reevaluate the plan. It does not do enough to limit hounds and training, which among other things could interfere with breeding season.	9	Thank you for taking the time do a comprehensive plan and survey public opinion. This was sorely needed after the recent hunting season debacles.
T. J. Edwards	Most of it	Yes	Background research into wolves.	No specific management/population goal for wolf numbers.	3	This plan is sorely lacking in having some solid population goal for wolves in Wisconsin. The tribes are not interested in harvesting wolves so they should not be allocated part of any harvest quota. Additionally, it is both wrong, biased and impractical to have a six mile non-harvest goal around tribal lands. In 2021 APHIS captured and euthanized over 40 wolves in three townships in Douglas County. These are wolves that could have been harvested legally but hunters/trappers if a better management plan were in place. DNR should also consider "auctioning" off a certain number of wolf kill permits to raise money for wolf management. This potentially could raise thousands of dollars for management. I am very pro-wolf and believe that they have a significant place in Wisconsin. During the last wolf season I harvested a wolf the first day via predator calling. These animals are truly a trophy and should be managed in part as a trophy animal. I believe that the population goal should be above 500 wolves. DNR is dropping the ball by not having a wolf management plan that does not include hunting/trapping and a population goal.
Dean Schaffer	All of it	Yes	Most of it.	We need a numerical quota, you cannot manage any species without a population goal.	2	
Caleb	All of it	Yes			1	
	Just the parts I am interested in	No	not much	I believe the wolf population has a negative effect on other wildlife and needs to be heavily managed.	1	Open the season back up on them
DAVID REICHERT	Just the parts I am interested in	Yes	We need a plan that addresses all issues. We don't need warm and fuzzy. We need a firm number that we manage to.	Precluding harvesting of wolves outside of the reservation boundaries.	4	

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Carole Ackelson	All of it	No	I like that the government of Wisconsin is open to protecting wolves	I dislike that wolves are still being hunted despite numbers being low. I dislike how they're being hunted with the use of predator calls, baiting, hunting dogs (which if injured the government then reimburses. Wouldn't it be easier not to bring them if they'll be hurt?) In Pennsylvania, it's illegal to use baiting for deer during hunting season, why is it legal for wolves which are in a more difficult position when it comes to humans, as humans see them as a threat to both themselves and livestock.	4	There should include sections which help the public understand that wolves are a necessary part of an ecosystem and not to be killed "as needed"
	Most of it	Yes		No population goal. Subzones around Indian reservations.	1	
	Most of it	Yes	The goal to educate people about wolves Sustain the population goal	Buffer zones around tribal land…they should have no say on what I can do on my own land since it borders tribal land!!!!!! Not taking numbers and population control from the people that spend every day in the woods and witness the number of wolves and how they are affecting the population of other animals, What was wrong with the wolf population 10 years ago? Why change something when it's working???????	1	If we let the Native Americans have the right to make decisions for us…we should have the right to make decisions for them!!!! Pretty soon the whole state will be no hunting but for the Indians!! Listen to the people that are in the woods every day the hunters. Not the people sitting in an office in Madison controlling with no experience.
Douglas Marhefke	Most of it	Yes	The history, details, facts, numbers are great and easy to find, overall, it's a very comprehensive, easy to navigate report.	Why are you proposing the use of sub-zones? There are no viable reasons for sub-zones, other than to take away the rights of citizens and private land owners in Wisconsin. Why are tribal nations allowed to dictate jurisdiction over Wisconsin residents, when the residents of Wisconsin cannot dictate to tribal nations how they conduct business? This was not clarified in the report. If sub-zones are created, whom is to enforce the rules in the sub-zone areas? The tribal nations or DNR/local municipalities? It appears as if tribal boundaries and authority is being extended onto state, county, local and private land will this require statutory clarification through the legislature? Will the federal government be involved as tribes are actually foreign sovereign nations. Why should Wisconsin and local governments, private landowners relinquish their rights? Per your research, wolves are increasing in population by at least 5% a year. A number that seems to be highly sustainable and healthy for the. The legal precedence this creates into the future…what eventually is to prevent other species from being added to the proposed "sub-zones" in the future on the behest of tribal nations? Also, will the tribal nations have wolf tags allocated to them? Will they need wolf tags to hunt on their reservation? Can the tribal nations hunt on state, county, township property, with or without tags as they do spearfishing? Will they be able to hunt on the private property of individuals without the owners consent? From pages 62-63….there needs to be more and complete transparency. Where will the funding will come from….Wisconsin tax payers, game licensing fees, tribal partnership? More details are needed. There are so many multifaceted legal rights points to dissect in this report that were left out, but mostly, how can my state, county, township, and private ownership rights be stripped away to a different (foreign) sovereign nation? Just a little bit of my background, I'm neither a hunter nor a fisherman. I'm not against wolves and believe they are good for the ecosystem. Also, I do feel we should have a yearly wolf hunt to keep the bio system healthy and in harmony as we do with other animals. I feel the DNR does a fine job of doing this for the residents of the state of Wisconsin.	0	Thanks for your time
Doreen Germain	All of it	Yes	nothing	we need a season and we need it now	1	there is nothing in there that makes sense. the tax payers that live and hunt up north should have more say in the matter.
	Most of it	Yes	"There is a need for additional research to identify circumstances under which wolf predation impacts deer population." There are fewer deer in public hunting areas. Many deer have moved into residential areas - Is this an attempt to avoid wolves? What about the decline of coyotes? They too seem to be moving into residential areas to avoid the wolves who don't tolerate them being in their territory.	Solutions for managing the overabundance of wolves. WI is way over the original goal. I wish they were never reintroduced in our state. Who's bright idea was that?! Their numbers are out of control! I can't walk in the woods with my dog because wolf tracks are everywhere. What is WI doing to get the wolves delisted? You have a plan for zones and hunting permits but when will this happen? What is the DNR doing to support this? What are our politicians doing to fight for being in control of what is happening in our state? It is ridiculous that a federal judge keeps getting them delisted. If the argument is there are not enough in the lower 48, then let's share them with other states. (Although I don't really support this either because we would be setting them up to face the struggles we have now.)	2	Wisconsin needs to fight to have the wolves delisted! We need to take back control of our wildlife management!! There used to be plenty of deer and coyotes in northern Wisconsin but that is no longer true. Every year in the winter, I find fewer and fewer deer and coyote tracks but NOT WOLVES! The wolf population is out of control and it is very disheartening for those of us who live near them. Wolves have changed our outdoor experiences in a very negative way.
Joy Burk	Most of it	No	Wolves not being managed by an arbitrary numerical goal of 350 wolves.	I dislike the hunting season; I dislike the allowance of trapping wolves; I dislike the use of hunting dogs; I dislike the fact that the use of proven nonlethal methods to minimize, reduce, or eliminate wolf-livestock conflicts are not included and not at the forefront of the draft plan.	1	I read a journal article that illustrates positive results to deter wolf-livestock conflicts by use of nonlethal methods. The study was conducted over a 7-year period on large scale grazing operations. Journal article: Adaptive use of nonlethal strategies for minimizing wolf–sheep conflict in Idaho. Journal of Mammalogy, Volume 98, Issue 1, 8 February 2017, Pages 33–44, https://doi.org/10.1093/jmammal/gyw188 Published: 02 February 2017 Please read. I request that Wisconsin take measures and implement these nonlethal methods into the management plan.
William Gauger	All of it	Yes	Killing wolves	Not Killing enough	1	Too many

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
	Most of it	Yes			1	Please stop allowing and enabling the killing of the wolves.
	Most of it	Yes			6	I still believe you have not shown where there are packs are located in zone 5 and 6
	Most of it	Yes	did not see much I like	going away from the 350 wolf goal	0	myself and kids hunt northern Oconto and Forest county sit all day and never see a deer ,how long do you think I will get the kids to go
	I have not read any of the draft plan	No				I'm asking you to behave like a resident of a planet whose creatures are all in danger of destruction. We humans have done nothing to care for our only home and its animals. To think you have to "manage" wolves is the height of hypocrisy! They are necessary - we are not. They better the planet - we do not. We are beyond stupid while trying to impress other humans with our need to "control" what happens on this earth. We have destroyed nearly everything we have touched, including the native peoples who know so much better than white people ever will. So use this opportunity to prove you have a right to be on this planet. Leave the wolves alone! They manage themselves and the ecosystem just fine without anything humans can do. Don't use tax dollars to coddle ranchers and cattle. Be of some value.
Lois Bressette	Just the parts I am interested in	Yes	I liked reading about the wolf habitat. Particularly the diversity of where they live. The most interesting is how varied the wolf diet is. From white tail deer and elf to small mammals and berries. I also enjoyed reviewing the data to support your narrative. For example the data on year by year causes of elk mortality.	I would have preferred to see more relevant (local to Wisconsin) empirical research to support the plan. The plan is not concise and lacks clarity. There are many sections that ramble on, with no coherent direction. For example while reading several sections, (pages 99-100) I was confused and left with more questions.	5	I would like to one day see a consensus among the people of Wisconsin in regard to wildlife management. The voice of non hunters need to be heard as well as the voice of those who hunt. Hunting groups and trophy hunting outfitters should not be the only ones driving wildlife management. Their claim to increase tourism and contribution to the economy is over valued. What is undervalued is the significant roles that predators (wolves) play in maintaining a healthy ecosystem.
	Just the parts I am interested in	Yes			1	I am a supporter of WI Wildlife Fed. and am in full agreement with their assessment of the wolf mgmt plan.
	Most of it	Yes	None	Allowing for any method of wolf “harvesting”	1	
Ron Heinrich	All of it	Yes	The number designations and order in which they are presented do not indicate a level of importance as to which elements were liked or disliked most. 1) The development/use of zones and subzones, as well as tribal lands, to think about about the effects of wolf populations in various parts of the state 2) The use of widespread and tested methodologies when determining the best analytic tools, i.e., use of overwinter abundance estimate rather than overwinter minimum account 3) The use of scientific methodologies generally, and an ecological approach more specifically (Objective A), to address wolves and their role in healthy ecosystems 4) Priority placed on addressing possible depredation conflicts in a timely manner (Product B2b) while recognizing claim submissions may take some time (Product B2d) - . getting buy in from those most affected is obviously extremely important.	The number designations and order in which they are presented do not indicate a level of importance as to which elements were liked or disliked most. 1) The apparent equal weighting, from survey data, of opinions expressed by those of us from cities (I'm from madison) who have little or no interaction with wolves, and those whose lives are influenced on a much more regular basis - rural communities are likely to felt "less heard" 2) I didn't see any explicit discussion of efforts going forward to relate wolf populations to those of other non-canid mesocarnivores (a possible Product of Strategy E5), it would be good to know how bobcat, lynx, and wolverine populations may be affected by wolf populations. 3) While low quota harvest numbers around tribal lands are a welcome addition to the wolf plan, I would like to see zones 1b and 2b off limits to hunting, i.e., expanded non-quota buffer zones but with the caveat that if lethal removal is necessary for say livestock depredation (figure 23 seems to show some past examples) that would be done by the DNR. 4) The notion that if substantial depredation were to occur in a year livestock payments might have to be prorated (Product B4d). This seems unacceptable, at least it would if it was one of my livestock. This relates to comments made below about the budget for the wolf plan more generally.	8	I'd like to thank the DNR for an informative management plan with a very valuable (at least for me) historical component, I learned a lot. While not part of the management plan, per se, the lack of a budget outlining anticipated costs of the various Objectives, particularly Objective B, makes getting completely behind the draft plan a little tenuous from my perspective. Overall though, it seems well researched and ecologically driven both of which are very positive.
	All of it	Yes	Listening to tribal voices	It could be a reckless plan	5	I am a traditional deer hunter and so is my family for over 100 years. A wolf hunt hurts healthy deer population as well as natural wildlife cycles.
	Most of it	Yes				I'm commenting regarding this statement I just received in a DNR email ojectives to balance tradeoffs: "Providing multiple benefits associated with the wolf population, including hunting, trapping and sightseeing." What???!! Benefits of wolves? How arrogant, as if they exist for us. In one clumsy statement, you've lumped deranged recreational wolf killers/torturers with people who want wolves left alone?! Nobody goes sightseeing for wolves! What a ridiculous attempt to appease hunters. Why don't we white people just turn the land back over to the native tribes? They will have nature back in balance before we can say the despicable word "quota."
Dave Schmitt	All of it	Yes		Not having a more definitive, numerical population goal.	4	Would like to know more on how the wolf numbers are to be determined per local.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Charles Norz	All of it	Yes	I like the plan as it lays out a science based approach to wolf management.	I dislike the lack of details around decisions for harvest quotas. As stated "This plan recommends engaging the department's Wolf Advisory Committee in the process to annually assist in reviewing data.... " I would like to see that there is transparency in this process. Without transparency, there can be an abundance of influence from outside lobbyists. The annual reasoning of decisions of zone harvest, and even no harvest by zone should be made public. This adds transparency and also a annual record that can be reviewed to help ensure trends are moving in a positive direction.... or if in a negative direction then corrective action can be made based on past actions.	7	I believe there is inconsistency regarding the wolves benefit in regards to CWD. In the section "Selective Predation and Chronic Wasting Disease" I believe the conclusion is not accurate. The document states ". In conclusion, whether predators can truly reduce CWD prevalence and spread remains unknown and more research is needed." I would say a quick web search details several reports that shows strong evidence that predators do help reduce CWD. I would also note on page 23 there is a quoted study that indicated predators do help reduce CWD in whitetail dear. ....."The cascading effects of wolf presence also reduce disease transmission, such as Lyme disease to humans and chronic wasting disease in white-tailed deer (Wild et al., 2011; Levi et al., 2012; Bergstrom, 2017)." Thank you for revieing my concerns
gaila olsen	I have not read any of the draft plan	Yes				I don't care to read it because wis's wolf plan is always way behind minnesota's plans (where i originally come from)...and that is where i have most of my wolf encounters...up in the BWCA....why don't you study theirs and learn....
Dr. Allyson Dallmann	All of it	No	The removal of a numerical population goal, adding buffer zones around tribal reservations, recognizing the wolf's Keystone, Apex predator status and being essential to ecological balance, conducting and including the social survey showing the population's positive perception of wolves is increasing as well as their opposition to reasons and tools for killing this amazing animal.	The mission statement of the WDNR begins with "To protect and enhance our natural resources: our air, land and water; our wildlife". Wolves are wildlife and natural resources contributing to the "ecosystems that sustain all life." Allowing them to be killed is NOT protecting them. Mission statement continued: "To ensure the right of all people to enjoy these resources"- We cannot enjoy them if you allow them to be killed. "To work with people to understand each other's views and to carry out the public will." The vast majority of the public oppose wolf hunting, so that should be sufficient to stop it. Further you state "In total, the plan is focused on a holistic and pragmatic approach to wolf management, conservation, and stewardship." Wolves don't need human "management" (killing) because they regulate their own populations. Adrian D. Wallach et al, 2015, stated "apex predators are distinguishable by a capacity to limit their own population densities (self-regulation). We tested this idea using a set of life-history traits that could contribute to self-regulation in the Carnivora and found that an upper limit body mass of 34 kg (corresponding with an average mass of 13–16 kg) marks a transition between extrinsically- and self-regulated carnivores. Small carnivores share fast reproductive rates and development and higher densities. Large carnivores share slow reproductive rates and development, extended parental care, sparsely populated territories, and a propensity towards infanticide, reproductive suppression, alloparental care and cooperative hunting. We discuss how the expression of traits that contribute to self-regulation (e.g., reproductive suppression) depends on social stability, and highlight the importance of studying predator–prey dynamics in the absence of predator persecution." What is an apex predator? - Wallach - 2015 - Oikos - Wiley Online Library In 2017, Brandy R. Fogg stated, "Current wolf population management strategies in the U.S are not supported by scientific research and are doing more harm than good." The Dangers of Controlling Wolf Populations - Yale University Press Allowing wolves to be hunted is antithetical to conservation, ignoring the very nature of nature itself. Selectively valuing some species and working hard to extirpate others, is neither conserving nor following best, current science, nor adhering to the majority of constituents, nor being ethical. The dictionary definition of conservation is "preservation, protection, or restoration of the natural environment and of wildlife." I am very concerned that Wisconsin and other states have twisted the word conservation to allow apex predators to be eliminated, or at least reduced to the point that their genetic diversity be so minute that they cannot survive as well as denying their innate right to live. Quantifying the effects of delisting wolves after the first state began lethal management (wisc.edu) In 2021, Treves et al stated "…the State of Wisconsin began lethal management first among all states and tribes that regained authority over wolves. Here we evaluated the initial success of reaching the state's explicit objective, "…to allow for a sustainable harvest that neither increases nor decreases the state's wolf population…" We used official state figures for hunter-killed wolves, population estimates from April 2017–2020, and the latest peer-reviewed model of individual wolf survival to estimate additional deaths resulting from federal delisting. More than half of the additional deaths were predicted to be cryptic poaching under the assumption that this period resembled past periods of liberalized wolf-killing in Wisconsin… we expect a maximum of 695–751 wolves to be alive in Wisconsin by 15 April 2021, a minimum 27–33% decline in the preceding 12 months. This contradicts the state expectation of no change in the population size. We draw a conclusion about the adequacy of regulatory mechanisms under state control of wolves and discuss the particular	2	As other authors, researchers and wolf observers have noted, wolves are sapient, sentient, social beings forming closeknit bonds, feeling sadness, pain, joy, and loss. Many humans have tried for so long to distance themselves from other species based on the misconception that non-human animals don't think or feel, but we know this is false and ignorant. We humans don't speak the same language they do so we don't understand what they are thinking, feeling or saying; this doesn't mean they don't think, or feel, it means WE DON'T UNDERSTAND, which is a human shortcoming. Killing one family member DOES disrupt the functional capacity to find food, care for their young, AND they feel a heart wrenching loss, like we do when a family member dies. The USFWS uses the 3Rs, Representation, redundancy, resiliency to inform species recovery and so should Wisconsin. Wildlife watching has always been my favorite thing to do; unfortunately, we always had to go to Yellowstone to see my favorite species, wolves, because of their near extirpation in America. The focus on wolf decimation especially in the Greater Yellowstone ecosystem is baffling, ignorant and fiscally irresponsible. As a vet, I've witnessed animals suffer, their sensitivity, compassion, personalities. Just because humans don't understand wolf-speak, and non-verbal forms of communication, does NOT mean they don't do and feel it. Their cortisol, heart, respiration, blood pressure- increase under duress, but do you really need a monitor to know if your son or spouse is killed you and your kids will suffer? Protecting wolves helps stabilize their families, benefits ecosystems, advances non-lethal management aiding ALL species, and exhibits societal growth to step away from short-sighted killing of our keystone, apex icon who thinks, feels, and loves family as we do.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
				governance conditions met in Wisconsin. We recommend greater rigor and independent review of the science used by agencies to plan wolf hunting quotas and methods." Brandy R. Fogg, 2017 questioned "How many times must agencies be trusted to enact wildlife management policies based on scientific research be shown that removing top predators from an ecosystem leads to a breakdown at all levels of the food web? The science against these policies is overwhelming but when it is ignored there is ultimately more damage done than ever would have been inflicted by the wolf populations being targeted for extermination." The Dangers of Controlling Wolf Populations - Yale University Press This draft excludes current scientific studies and documentation or inaccuracies on most topics including: 1) Wolf family dynamics such as interdependence, sentience, sapience, and stress individuals and the whole family suffer due to killing one of their family members. Wolves evolved to depend on family structure stability year to year, but lethal control and hunting destroy stability and prevent them from performing ecological functions including predating ungulates much larger than they and raising young. Just one loss can significantly alter family dynamics, as Cassidy et al 2023 noted researching decades of data concluding human-caused mortality of any wolf decreased odds of pack persistence through the biological year 27% and reproduction next year 22%. If a pack leader is killed persistence decreased 73% and reproduction 49%. Human-caused mortality triggers pack instability in gray wolves - Cassidy - Frontiers in Ecology and the Environment - Wiley Online Library Beyond PVA authors: "recommend a framework based on the three Rs—the ecological principles of representation, resiliency, and redundancy". Beyond PVA: Why Recovery under the Endangered Species Act Is More than Population Viability | BioScience | Oxford Academic (oup.com) This methodology for "conservation and survival" is in line with the WDNR mission to "protect and enhance natural resources" and as wolves are natural resources, they need to be protected, not hunted. This document refers to Resiliency in part as "population size: maintain higher abundance", which allows families (packs) to work together, each having their own "job" within the family. In "Among Wolves" by Gordon Haber and Marybeth Holleman, Karen Deatherage stated "They (wolves) weren't just individual animals, but a highly social, efficiently coordinated group." Haber states "The intimacy between wolves in a family group, which enables them to cooperate closely, also means that each is keenly aware of the identity and presence or absence of others. From what I have seen, the intimacy of a family group is often comparable to, and sometimes exceeds, the degree of intimacy found within a typical human family." All of this current scientific documentation directly contradicts multiple pages including 12 and 19 of the draft as you state that "regardless of mortality cause, wolf pack structure creates resiliency in the event of a pack member's death." I am concerned that you developed this draft utilizing outdated information and not taking the sentience of the individuals and therefore the family into account. Their resilience is dependent on the integrity of the family structure as stated above by Cassidy and others, but you have denied this scientific fact using information. Another problem is not focusing on the high degree of efficacy of non-lethal methods to avoid conflicts. "Nonlethal measures were effective at reducing or preventing sheep losses to wolves across a large landscape during the summer and early fall grazing periods. The most common factor that led to confirmed predation by wolves on sheep in the PA (protected area) was not having active deterrents in place". "Stable wolf packs are easier to manage with nonlethal deterrents than unstable packs because stable packs tend to hold and remain in their own established territory, which discourages new wolves from entering the area." "Comparative results between the Protected (nonlethal) Area and Nonprotected Area indicate that adaptive use of nonlethal methods reduced the number of sheep preyed on by wolves, reduced the need for lethal removal of wolves, and helped train and convince sheepherders that nonlethal methods can effectively manage wolf-sheep conflict." Adaptive use of nonlethal strategies for minimizing wolf–sheep conflict in Idaho | Journal of Mammalogy | Oxford Academic (oup.com) We found that: (1) lethal control and translocation were less effective than other measures, (2) deterrents, especially fladry which is a fence with ropes marked by hanging colored flags that sway in the wind and provide a visual warning signal, were more effective than guarding dogs; (3) deterrents, fencing, calving control and herding were very effective" "and (4) protection of cattle was more effective than that of small stock" The effectiveness of livestock protection measures against wolves (Canis lupus) and implications for their co-existence with humans - ScienceDirect Future generations deserve to benefit from wolves on the landscape and the balance they confer to the ecosystem, but wolf killing policies preclude the rights of		

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
				future generations to experience these benefits. Lethal "management" along with hunting, trapping, snaring and hounding of wolves is completely unnecessary and steals future generations' ability to experience awe moments that wolves inspire as well as wolves' keystone species contribution that future generations deserve. Eliminating predators including wolves, bears and cougars without whom our natural balance is destroyed, indicates a serious lack of understanding about species interdependence. Biodiversity depends on keystone species, apex species, and prey species as do food webs; ecosystem balance is destroyed without these vital components. (99+) Quantifying the effects of delisting wolves after the first state began lethal management | Adrian Treves - Academia.edu We also know that allowing a hunt increases poaching and current occupancy model estimates underestimate wolves killed by poachers as Adrian Treves et al documented in 2017 (99+) Mismeasured mortality: correcting estimates of wolf poaching in the United States | Adrian Treves - Academia.edu "With evidence from 4 endangered wolf populations in the United States, we showed the miscalculation biased estimates substantially upwards for legal killing and biased them substantially downwards for other human causes (mainly poaching and vehicle collisions; Fig. 3 and Supplementary Data SD3). The error is non-random (systematic bias) and will increase under several common conditions: high rates of legal killing (Fig. 1B), high proportions of unknown fates (Fig. 2A), and high rates of cryptic poaching (i.e., unreported killing associated with destruction of evidence; Fig. 2B)." The wolf hunt quota should be ZERO, which would be publicly acceptable as well as recognized biologically, ecologically, and morally appropriate. Another issue with the 'scaled occupancy model' is that it grossly overestimates the wolf population. Because you are using unverified methods and permitting hunting and therefore poaching, you are clearly ignoring current best science and common sense: how can you permit killing a species when you don't even know how many are there and, as stated above (see Cassidy) killing one family member has devastating effects on the entire family. I am also concerned about the lack of biologists, scientists and field professionals. These are the people who should be used in an oversight committee to keep current, best science at the forefront of all wolf regulations, interactions and education. Adrian Treves fits the bill on all levels and would give credence and balance to protocols which have here to for been biased in favor of the hunting community which actually only represents 11% of Wisconsin residents. The plan ignores survey results in which the majority opposed another wolf/trapping season. 64% oppose specific methods of harvest by hounds and 70% oppose traps. 62% feel wolf hunting is unnecessary and 57% say it's culturally offensive to Native Americans. It is offensive to continue to ignore the very residents you are supposed to be serving. Excluding the vast amount of scientific, evidence- based documentation that wolf hunting is unnecessary, ecologically, biologically, and morally unsound, demonstrates a lack of understanding and integrity that people expect you to have. On pages 51-53, you acknowledge the importance of the Wolf's cultural significance: Ma'iingan- brother and The Wolf is sacred to the Menominee people and the wolf's cultural and spiritual connection, in many ways, still exists today. But this plan completely tramples these sacred beliefs. The fact is that the majority of Wisconsinites also value wolves and their right to live without being hunted. This draft fails to include a plan to overturn PA 169 and stop payments for hounding dogs who are killed by the wolves they are sent to kill. Hounding is cruel, inhumane and should be banned. Training hounds to hunt wolves is abhorrent; there are too many wolves being slaughtered without hounds, so allowing it just adds another dimension to cruel, unethical, and abusive and they should never be reimbursed for their own ignorance and cruelty. We know that 2 million wolves roamed much of North America, but federal and state wolf extermination programs which were short-sighted, ignorant, and cruel left very few in Minnesota and Michigan. Wolves, bison and Native Americans have all suffered severely from this cruel mentality. We have learned so much about wolves, wildlife and ecosystem balance and the ease with which it becomes unbalanced that even considering killing wolves in any manner indicates an inability to learn and or choice to ignore new knowledge. Egregious errors of the past should not be repeated. The fact that wolves' populations have been seriously diminished also means their genetic diversity has been significantly reduced. The higher the genetic diversity of a species, the better the chance of long-term survival. It increases their ability to adapt to nonanthropogenic hazards and stressors such as climate change, disease, injury, and habitat loss. Wolf pup survival rate is only 30% so, again, killing them in any manner is short-sighted, ignorant and cruel. I am also concerned that the Impacts of Regulated Harvest on Wolf Dynamics beginning on page 20 is focused on		

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
				why and how "harvest"/killing wolves is supposed to be acceptable. However, not only does best current science state the exact opposite, but the very premise of killing wolves is antithetical to conservation and this is in part because many wolf killers/hunters/commissions and others reference The North American Model of Wildlife Conservation (NAM) when purporting reasons to kill wolves. NAM, however, lacks current, peer-reviewed science and a basic understanding and focus on species and ecosystem balance and interdependence. While hunter license purchases have helped some game species, such as deer and elk, recover from over hunting, they overstate the impact of these contributions. Bighorn sheep, pronghorn and bison have only recovered to 5%, 2% and less than 1% respectively from their mid-19th century numbers. One problem with NAM supporters is their focus on carnivore eradication and being especially antagonistic against wolves. The model is not used to halt the massive decline of many species that are not hunted and yet, these species are vital to ecosystem balance. Another issue NAM fails to recognize is the non-hunting community's contributions in protecting wildlife, education, and work towards ecosystem balance including our recognition of the value wolves, cougars, bears and other species contribute to a balanced system/food web. We value all species, created and helped get the Endangered Species Act passed which is actually responsible for preventing the extinction of about 291 species since 1973 and has saved more than 99% of the species under its' protection. We continue working to protect all of them, unlike the hunters who pay to "replenish" only the ones they are going to kill. We have radically different paradigms: one focused on balance and biodiversity, the other on killing species they don't value and refusing to recognize as vital for balance. Considering the vast amount of current, peer-reviewed scientific data on ecology, biodiversity, ecosystem balance, species interdependence- how nature works- NAM is as outdated as a rotary phone and less effective. NAM also ignores the fact that as of 2020, 95.4% of Americans are non-consumptive (89% of Wisconsinites don't hunt) and yes, we are stakeholders- these animals belong to the public trust and we are the public. We enjoy wildlife viewing, hearing and photographing them, but this is excluded because of the killing focus. Wildlife is of more value to more people alive-this too should be obvious- but is ignored by NAM, hunters and commissions such as WDNR. Most people appreciate the intrinsic value of wildlife and respect their right and necessity to be here. The fact is that hunter interests are antithetical to conservation because they only value the species they hunt do anything they can to eliminate the others. You need only look at Montana's goal to kill 85% of their wolves in spite of the $82 million boon they bring in to the economy annually, as well as the remarkable recovery Yellowstone made after wolves' reintroduction. Idaho's stated goal is to kill 90%. You get the picture, they are not conserving nor following best, current science, nor adhering to the majority of their constituents, nor being ethical. These are places Wisconsin does not want to follow, and Wisconsin has an incredible opportunity to lead the country in conservation with its' true meaning "preservation, protection, or restoration of the natural environment and of wildlife." NAM's tenet "wildlife should only be killed for legitimate purposes" is abused by the same people who usually support killing contests, trophy hunts, trapping and other abhorrent behaviors that the vast majority of Americans oppose and never consider legitimate. NAM supporters seem to ignore the "elimination of markets for wildlife"/" the commercialized use of wildlife should be prohibited." Very clearly, outfitters, trappers, private land tags and commercial fisheries are all for-profit and commercialization by definition: "the process of managing or running something principally for financial gain." NAM's primary use these days is for propaganda; many people don't know what it actually says and how it's used, yet the public trusts that when commissions and other wildlife associated organizations use the word conserve, they follow its' dictionary definition, instead of the hunting community's definition "search and destroy." More personally, I do not have the opportunity to see wolves if they are killed; I can't share the experience of listening to them and watching them with my grandchildren if they are dead; I cannot hope this keystone, apex icon, about 2 million of whom once roamed our country (along with bison and Indigenous people), will be able to recover with the current draft plan. We like to see our society as learned especially in comparison to previous generations, but when the focus is on predator killing be it lethal control or hunting, I fear we have ascertained nothing.		
Charles R Peeters	All of it	Yes	None	The lack of a specific population goal of 350 wolves as we have been promised for the last 20 years	0	It is imperative that future population counts are accurate towards a total pack count.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Barb Switzky	All of it	Yes	First off, my address is Madison WI but I would like you to know that I grew up in Upper Michigan where we had wolfs, I also frequent Price County and Onida county remote areas so I am not responding as someone who has been exposed to wildlife in the wild. I accept and regret that there is going to be a wolf hunt and zone specific seems to be far better than statewide. I do think the harvest numbers are too high and the DNR should start slowly with any planned reduction. There are still too many variables that are not known, such as how the last hunt and the increased use of bear hound training and hunting, as well as how it is going to affect wolf populations and health. I like that DNR is not going to let individuals keep wolf carcasses and using them for education, though I think that should be written in law. I like that there is some minor consideration given to individuals who appreciate wolves in their natural habitat and perhaps expanding ecotourism. The Boundary Waters have keen examples of the benefit of ecotourism. I also appreciate a level of respect for our Tribes and their wisdom. Thank you for the plan's educational element. Educate, educate, educate. As with our political divide, there is no way that some people will change their attitudes toward wolves. Strong educational programs to younger individuals and citizens in general. Those who live in the city should know some of what the farmers are experiencing, as well and those rural individuals should learn more about their wolf neighbors. Adding the deer/car impact costs, possible control of CWD, and reforestation, and how often wolves are not successful, why, and the real toll they take on deer herds which is far less than rumored. It is also helpful to know how many reports are determined not to be wolf damages and the cause and the reporter.) Historically, wolf are considered big and bad, from nursery rhymes to prescription medication ads the are portrayed that way. The stigma of this amazing creature can only be changed over time. If there ever is an opportunity to assist with some citizen educational opportunities, I would be willing to possibly give it a try.	I dislike that the wolf numbers do not include the pregnant wolves killed by cars, number of poached wolves, and other human caused mortality. (2018 60% of mortality of only radio collared wolves was human caused.) I also am very concerned by the grip bear hunting groups has on the DNR. There is a enormous divide among ethical law abiding hunters and a growing bear hunter population that, at any cost or inhumane action, wants to rid our state of wolves. I believe there is no need for me to elaborate on attitudes. This can only be addressed head-on with non-emotional driven science and laws. The situation has been created and can't be taken back but is out of hand. The dog training time allowed is while bears have their cubs and wolves have their rendezvous sites. It is a natural instinct to protect their partners and young and there are going to be subsequent attacks caused by the first. 32 states allow bear hunting and 14 ban dogs. Wisconsin's is the longest by a long shot. Heat stresses the bear and separates sows from cubs. It's the longest of any state, bait piles are a nuisance and attract conflict. A cooperative study done by Michigan Tech in 2014 involving similar populations of wolves and bears in both states - WI and MI looking at wolf dog interactions found that Wisconsin, because of the much longer dog training and bait piles had a 2-7x higher dog loss. (see the research at MI Tech) As you know, in WI, by State Statute, dogs are considered property by law and the ACV of the dog is what an average dog of the same breed, sex and age may costs; though the analogy is unpleasant, it's sort of like your car, you don't necessarily get the same car and the fact that the dog may know some tricks this doesn't make it more valuable. It is unfathomable that the State of WI pays hunters $2,500 per dog and vet bills to even those who are breaking hunting laws, hunting in known wolf/dog conflict zones or zones where there are a concentrated number of wolves. These owners say their "dogs are like their kids" or it was "just bad luck", and "smoke a pack a day" (these are quotes). This is obviously not the case; if it were, they would not jeopardize them as they do. I think the dogs should be licensed, be up to date of their vaccines to prevent the spread of disease, remain in close proximity to their owners while hunting like other game hunting dogs must, and when applying for a license, the hunter should be required to accept the risk, agree to only run the allowed number of dogs, agree to share their dogs GPS if killed or injured, be prohibited to hunt in conflict zones, if breaking a DNR law or being punished for breaking a law then forfeit reimbursement, and they should attest to this as part of getting the privilege to hunt. Only WI hunters should be allowed to collect and it should be a one-time reimbursement that would be accompanied with a educational material on how to prevent the deaths in the future. WI has set us up for failure as the only state with any payment, what's more $2,500. In 2021 there was a concerted effort to wait as long as possible to report their wolf kills to keep the hunt going. Only bear hounds that follow scents should be allowed, and any larger breed that chases anything that runs and will fight with their prey should be banned. This would be allowing legal dog fighting. Any payment for dogs should be as property and if the vet bill is greater than the dogs value the owner should only get the value of the dog with a cap. Since this most certainly not going to happen, then the DNR must start to rachet down the payouts as either/or and maybe starting at $1,250 (1/2 of prior), observe the effect and ratchet down further. Because the money paid out is troublesome, it's a huge hunk of money for a small number of individual, and repeaters and these practices are harmful to both the dogs and wildlife. (Note: As an aside, I suggest you review the Wisconsin Bear Hunters Alliance Mission Statement. It is contrary to their actions.) There are many other uses for this money that would benefit wildlife and land stewardship. Farmers are experiencing challenges and I think that some of the money saved from reducing the payment for dogs could be used to help them with measures to further prevent depredation; for example, if a farmer has an animal loss and implements a specific number of measures and has another, the DNR should increase the payment by 1 1/2x the value of the animal if they undertake further measures with the help of their local DNR and the DNR Representative and farmer would be required to work together for a specified time period. This would create a working relationship which is necessary for success, and again, the extra cost for the Representative could come out of the lowered dog loss payment.	3	My rating was based upon current conditions and the possibility that there is so much to do. Continue research on the possibility that carnivores may be able to play a greater role in CWD management and reforestation. FINALLY - On this survey, as well as on the Conservational Congress questionnaires and others related to wolf and reported in this Plan. I think that it is absolutely necessary the individuals identify themselves and sign on that they are being truthful on whether or not they are from WI; if not what state. This would be helpful for ecotourism as well, and on this Plan's feedback whether or not they live in a rural area. The DNR should then separately compile and report the responses by Residents/Non-Residents. Last year in Price County on the weekend bear hunting started, my family and I observed 8 trucks with hounds traveling down the road past us. They stopped at the edge of the National Forest and released all their dogs. This is shameful. I used respect most bear hunters, my dad and brother hunt bear in MI. I have lost my respect for many when they use dogs, electronic devices, bait piles, and vengeance; this, to me, is no longer hunting, where both the hunted and the hunter are challenged. I hope that you will consider my views and continue to strive for science based decisions. It's tough, I'm sure. Well, I do thank you for accepting my feedback and, as you probably can guess, I certainly have a lot more to say! Barb Switzky, [redacted] Madison Wi 53718
	Most of it	Yes	The amount of time dedicated to this wolf problem.	The control that the federal government has on a state issues.	5	The population goals are too high.
Lee Vanden Heuvel	Most of it	Yes		I really want to see a population number goal in the plan and then manage the population accordingly.	5	

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Jack Saltes	Just the parts I am interested in	Yes	Its specific area by area , state pack territories and populations, and science based approach in trying to establish hunting quotas by area. (wolf management zones)	The very few TAC meetings (over just a few months) and lack of population research time and efforts to properly and accurately accomplish no.4 above.	4	In the sands of time, I'd like to see WDNR slow down and take the next 3-5 years to really take the time and efforts through hiring project or LTE Wolf staff (" pack and package the staff to study the packs") to fully assess the populations of our state wolves , in size, growth or decline, health and other population ecology dynamics BEFORE setting premature and tenuous hunting quotas. Three to five years will go fast and our wolves deserve that " accountability". Thank you. JgS
Sa Rei	All of it	No	We appreciate the efforts of all WDNR staff involved in updating the state's wolf management plan. Although we believe the current plan needs significant updating (see next section), we recognize the efforts and improvements made to the previous plan, including: ● Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. ● There is much greater recognition of the ecological role of wolves ● The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves ● The adoption of proposed buffer zones around tribal reservations (i.e., previously no	The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on (see reference list below): ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution ● The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. ● The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ○ A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings. Hounding or hound training, which are akin to allowing legalized dogfighting, should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public. ● The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. ○ Despite Act 169, which mandates a wolf hunting season, the department can still restrict the implementation of lethal methods by setting minimal quotas, including a quota of '0' wolves, restricting timing and methods. ○ Several studies have proven a proactive non-lethal approach leads to better conflict mitigation. ○ Lethal management often fails to provide a long-term solution to wolf predation and has the least consistent success rates when compared to non-lethal practices. In addition, there is significant evidence showing that lethal wolf management may be less functionally effective at mitigating subsequent livestock losses than non-lethal deterrents. ● The plan should require the implementation of abatement measures as well as the use of non-lethal conflict minimization techniques by domestic animal owners for the latter to receive compensation for confirmed predation. ● The plan also runs contrary to public values towards wolves (and omits mention of such majority values from the plan), despite department surveys evidencing that the broad public cares about wolves as individuals (and not just for the viability of the population). Given the recent liberalization of killing wolves by the state, it would be incredibly informative to note majority support of the following reasons for opposing a regulated wolf hunting/trapping season (which are all omitted from the plan): opposition to specific methods of harvest like hounds (64%) or traps (70%), feelings that hunting wolves is unnecessary (62%) or culturally offensive to Native American tribes (57%). ○ All such reasons convey majority disagreement with practices currently promoted and endorsed by the legislature and the WDNR, and such a conflict between managers and the public should not only be acknowledged, but foregrounded and carefully considered in policy (instead of dismissed). ○ Such decisions to omit literature or downplay evidence (e.g., such as majority opposition to killing wolves and their reasons) are contrary to principles of scientific integrity (e.g., present all relevant scientific evidence to the public) as well as ethics (e.g., disguising ethical decisions, such as recreational wolf killing, as robustly supported by science). ● Conflicting agency objectives (e.g., optimizing public hunting and conflict mitigation) are not only not acknowledged, but even misunderstood as harmonious, against the body of scientific evidence. That culminates in the prioritization of consumptive values and policies; e.g., according to the body of scientific literature, use of lethal methods, and especially public hunts, are contrary to most objectives relevant to: harm mitigation, the wellbeing of wolves, their ecological roles, and their non-exploitative enjoyment (i.e., Objectives A, B, D and F). ● There is a stark lack of consideration for individual wolves, wolf population health (including wellbeing), and measurable indicators for assessing any harms barring disease prevalence (e.g., accounting for cortisol levels or other stress hormones, measures of pair/pack persistence) ● There is an inappropriate understanding and consideration of tribal worldviews about wolves. Tribal worldviews of wolves are misconstrued as 'cultural	1	In general, all omissions of scientific literature, the arbitrary prioritization of policy objectives, the rhetoric of the plan and the dismissal of public values and concerns for wolves point towards a biased, unscientific and instrumental view of wolves that promotes values contrary to broad public perspectives on wolves. ● 'SOM' wolf estimation methodology – From a recent critique: "The new methods sacrifice precision, but are believed to retain adequate accuracy and sensitivity to changing conditions for reliable decision-making. We review evidence for the accuracy, precision, and sensitivity of the new 'scaled occupancy model' (SOM) applied in Wisconsin. We conclude that the Wisconsin method would systematically overestimate wolf abundance by large (but currently incalculable) margins. Because Wisconsin, similar to other states, not only changed to unverified methods but also implemented widespread wolf killing, shortcomings in their estimates of wolf abundance may have far-reaching consequences for population viability and confidence in state wildlife managers. We discuss findings from Wisconsin alongside similar findings for other states' occupancy models being insensitive to human causes of mortality that have recently increased. Overall, Wisconsin's proposed method for estimating wolf abundance shows significant departures from best practices in scientific measurement. Verification will require independent replication and unbiased tests at multiple scales in multiple habitats under different human-induced mortality rates, and peer review before the new methods are considered reliable." (Treves & Santiago-Ávila, 2023)

(Treves & Santiago-Ávila, 2023)		
	Most of it	Yes		I do not like the idea of having No population goal.	3	Wolves should be managed to the original socially acceptable number of 350 animals.
Roxana Martillo	All of it	No	● The elimination of a number/target population ● The importance of the ecological benefits of wolves and inclusion of tribal values and knowledge. ● The attempt to minimize the impacts of a recreational hunt by adopting buffer zones around tribal lands, shortening reporting requirements and making hunting licenses zone specific. ● Emphasizes the use of non-lethal methods to reduce conflicts.	● Absent is a commitment by DNR to work with the legislature to overturn PA 169 and remove payments for hunting hounds, killed by wolves ● Hound training must be stopped! ● The plan should establish a zero hunting quota to protect wolves in our national forests and other areas prime habitat. ● The recreational hunting/trapping to reduce conflicts has no scientific basis. ● At a minimum, DNR should ban the use of dogs to hunt wolves in our national forests. ● There is considerable uncertainty in estimating wolf populations based on the occupancy model and should not be used solely to determine population. ● The plan should include an oversight committee which is comprised of biologists and professionals.	7	It seems to me that the Committee was overrepresented by hunting organizations even though they represent the minority opinion of Wisconsinites. I think it's important that there is representation of the non-hunting community Too much emphasis was placed on the killing of wolves rather than co-existence. Wolves should not be killed in national forests! The use of hounds should be banned. You must establish am oversight committee which is comprised of biologists and professionals.
Jason Rabuck	Just the parts I am interested in	Yes	Science based management moving away from arbitrary numeric population goals. Focusing on ecological benefits of wolves. Pubic input and opinion has been incorporated into the plan.	Probably needs to be more regulation for hound hunting and training in wolf zones. Need a plan to cut down wolf-hound conflicts. No plan for regularly updating the plan.	9	
Ann McLellan	All of it	No	Increase public understanding of wolves Involving tribal nations. Plan acknowledged wolves as a keystone species, to keep the ecosystem in balance. Acknowledge that wolves are family packs and they are social animals and killing disrupts this. Wisconsinites had favorable attitudes towards wolves. Many Wisconsinites have never had an encounter with wild wolves, and few had experience with wolf attacks on domestic animals. I agree with this, because I was born and raised in the country in Wisconsin where there are wolves and I never saw a wolf (I wanted to see them). We had dogs and were in the woods all the time and never encountered a wolf. People and wolves can coexist. I live 2 miles from the Wisconsin border in Minnesota so I regularly visit Wisconsin and I have never seen a wolf (even camping) so I do not believe that there is human wolf conflict. People generally wanted about the same or more wolves as the current level across the same or more area of the state. Wolves are important Non-lethal methods Zone system, even though I am against any hunting and trapping of wolves Increase Public Understanding of Wolves in Wisconsin. Show the	The WMPC has more anti-wolf members than pro wolf members. I do not like the word "harvest". The word harvest implies that they are a crop. Wolves are animals and they are killed not harvested like plants. Where the plan says that current research says that 24 to 29% of wolves can be removed via human-sourced morality before the wolf population will decline. If that is true, then there should not be any hunting of wolves, because wolves will be killed by cars, by climate change, by loss of habitat. Most people would worry for the safety of their pets and children when recreating in areas. I disagree with this statement because I was a child and had dogs when I grew up in the country in Wisconsin where there are wolves and I never saw a wolf. 2022 survey results showed that support (46%) for a regulated hunting and trapping of wolves is higher than opposition (29%); one-quarter of Wisconsinites were undecided. So 53% of Wisconsinites are not for hunting and trapping of wolves is what this really is saying. I disagree with lethal conflict mitigation strategies. I only agree with non-lethal conflict mitigation. I know Wisconsin farmers who are pro-wolf. Where the word "overpopulation"is said, as there will never be in over population of wolves. There should be no maintenance of wolf numbers as wolves regulate themselves; climate change, loss of habitat, people accidentally killing them (I saw a wolf killed by a car). There should be no use of hounding. (Only Wisconsin allows this).	6	I would like to see a regional perspective as I live 2 miles into Minnesota on the Wisconsin border and I go to Wisconsin regularly. I am against hunting and trapping of wolves. Education should be communicated to the public on how to coexist with wolves and the importance of wolves. Education about wolves should be required for every deer hunter.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
			importance of wolves as keystone species and how they keep the ecosystem in balance.			
steve s ripp	Most of it	Yes	having a hunting season for them. As they have no natural predation and disease and other factors will not contain their numbers.	putting equal consideration to residents that do not live in wolf territory- with those that do.	7	If the plan is going to work, the federal judicial system should stay out of it. currently we have a plan but can not use it. therefore it is not effective when used occasionally.
Maureen Baron	Most of it	Yes				I'd like to see the depredation charts to include farm animals lost vs elk and deer and also showing a map of the packs in those areas. I don't know what to make of what seems to be wolves really going after farm animals.
hukar	Just the parts I am interested in	Yes	I like the importance of wolves' ecological benefits, elimination of a numerical target population, inclusion of tribal knowledge & values, adopting buffer zones to minimize recreational hunt impacts, emphasis of non-lethal methods to reduce conflict.	Dislike hound training and lack of DNR effort to remove payments for hunting hounds killed by wolves. Dogs to hunt wolves is cruel & irresponsible. Ban it esp. from our national forests. The occupancy model shouldn't solely be used to determine wolf population.	7	Need an oversight committee with biologists. Plan was mostly represented by hunting organizations, a minority of the population. Would rather see ways to exist with wolves and not just kill them.
Tom Evans	Just the parts I am interested in	Yes	not mush	no minimum number 350 is enuff	1	I think there are way more now than what you saying and you know it.
	Just the parts I am interested in	Yes	Having many different stakeholders involved is very important to have a more fair plan; it's important to use science to keep the population stable. Education is very important to help the public have a better understanding.	It looks like very young wolves can be hunted, which I don't approve of. Predation compensation should require that non-lethal steps must have been taken first.	5	The plan helped me understand better the complexities of the whole issue.
	Just the parts I am interested in	Yes	I support the elimination of the outdated, unscientific, and non-transparent population goal of 350 wolves in late winter of the 1999 plan. I support continued use of winter snow-tracking because field-based ground-trothing is the only way to sort out the mess created by the inappropriate use of the scaled occupancy model explained next.		1	
Brian Graykowski	All of it	Yes	None	Going away from specific population to an ecological one.	0	Wolfs were eradicated for a reason. Period. Should they exist? Yes. A wolf doesn't care about man's laws nor boundry lines. Point being there should be only One hundred wolfs allowed to exist in the Great Lakes Region. Period. Also, more bear tags.
Steve	Most of it	Yes	none	all. how the hell can there be a plan with NO NUMBERS????? pre wolf - we had a few deer. now with wolves-9 days and see 1 deer. and DNR wonders why hunter numbers are going down?? bunch of geniuses running the show, all leftist anti hunting anti gun from the looks of it/		millions spent on the wolf bs that could have gone for something that WI hunters and fishers actually want what a waste of our license dollars!
Tomek	All of it	Yes	Getting rid of the population max	Allowing for dogs statewide as long as any zone is open for hunting. The questionable and highly likely overestimation of the current population. The absence of best available science, there is strong evidence that calls into question benefits to livestock or social acceptance through lethal management. Selectively ignoring inconvenient facts calls into question the integrity of the report, either through gross negligence or deliberate malfeasance the report doesn't present a truthful and factual picture to the public.	2	The integrity and trustworthiness of the WDNR will become highly suspect if this draft becomes the final report without addressing glaring and obvious holes in the information presented. Even a rudimentary search for related peer reviewed articles shows evidence of strong arguments that should be explored but are completely absent from the report. After reading it I feel it was put together to meet a predetermined conclusion rather than something that objectively presents the currently best available science.
Kathy Simonik	All of it	No	I like that it is being at least DISCUSSED, after seeing all.the turmoil that has been going on.	There is only one answer after following all the wolf massacres in several states. Wolves need to be relisted as Endangered.	1	I have been closely monitoring all the wolf hunting and poaching. It is a mass murder scene driven by politicians that are NOT pro-wolf. A strong group of Ranchers and rich politicians in strategic positions of power are running everything. Example being, Montana The home of Yellowstone. Why? Why kill Wolves and Wildlife that visitors come to see. The answer is there are too many hunters/poachers not reporting their kills and hiding information. There is proof of all this mass cold Blooded Murder. Call it what it is. Wolves must be relisted and protected immediately. Wolf cubs are even being shot to death in their dens! Again..Why? These are fun kills by psycho people. The evidence is all available. Please can someone stop all these killings. Help desperately needed or the lands will run silent...
Trish King	Just the parts I am interested in	No	I like the collaboration effort. I encourage information that covers the use of non lethal methods with livestock conflicts. This is so important! Strong laws should really enforce these values.	I don't want wolves taken for any reason unless it was a personal attack of which this would be most unlikely. I do not support hound hunting on wildlife, or trapping, snaring, or chasing down. No contests or trophy hunting either. Livestock producers need to be required to provide non lethal protection to their investment or else they pay hefty fines. Wolves need federal, state and county protection. Information for wolf protection, eco wolf friendly business and revenue from tourism to view them should be encouraged. Programs containing info on how to maintain farms and ranches in wolf country should be made a priority .	4	I do not support trophy hunting! Please do not allow wolf hunting to be legal. Enforcement to poaching crimes must be strong and upheld! We can't allow what happened in 2021 to ever repeat.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Jake Levy	Most of it	Yes	This plan appeared to take many viewpoints into consideration which was appreciated. There was also considerable thought about not reinventing the wheel and keeping policies in place that make sense. Liked the mention about supporting wolf research. Would like to see effort go into wolf education in the k-12, undergrad, and graduate research. Enjoyed that adding and supporting peer reviewed literature is a goal. Happy there was a sub objective about law enforcement. While education is the best enforment tool It is hard to thread the needle of education vs enforcement when issues come up with a species with numbers so delicate to shifts due to illegal activity. Hope the department works on keeping the public happy with the DNR while still decreasing violations.	I think the plan could use additional details in how this plan will interact with other State wildlife populations. There was some mention of how this plan and the Elk management plan / Elk population interact, but less information on other species. This directly extends to deer but should also extend to indirect species relations such as how wolf presence will impact vegetation, fish, and small mammals. Would like to see more effort placed on objective A and less in objective B in zone 6. This plan makes Zone 6 seem like a loss for being able to support a quality wolf population and any wolves that are in the zone should be removed. In fairness, zone 6 has a different land use makeup then the other zones which figure 36 shows. Further the high farming and urban centers will have the highest negative human wolf interactions). However, zone 6 is where wolf population may be needed most from an ecological standpoint. Urban areas have some of the highest deer populations, most invasive species, and lack of diversity. While it may not work out where wolf population can be maintained naturally in zone 6, it feels like this plan does not make a reasonable effort give zone 6 a fair shot to support a population.	8	Plan makes no mention of the quality of Act 169. While it is noted that this law requires a wolf hunting season, should this law exist. This plan should have provisions about the DNR studying the impact of Act 169 and asking our legislature to repeal or replace the law if it does not meet the objectives of the plan. Does the DNR support Act 169 and if not what can the department do about making a change. I agree that keeping farmers and hunters who lose cattle and dogs to wolves compensated is critical to maintaining their support of a wolf population to begin with, however, over time it may be good to decrease the physical compensation. The money that is paid out may have better uses in the department and the burden of these losses may better be handled by private insurance. As figure 3 notes, Wisconsin as a whole was once home to the range of wolves. Farmers came second and are on the wolves' home turf, not the other way around. Further, losing a dog when hunting is part of the risk of having a hunting dog and occasional losses should be expected. In the long term, the State should not carry the burden of paying compensation claims, even if the money comes from hunting license fees. This money is much better spent on conservation.
Oliver Starr	All of it	No	These additions represent improvements to prior plans: The elimination of a numerical target population ● The importance of the ecological benefits of wolves and the inclusion of tribal values and knowledge. ● The attempt to minimize the impacts of a recreational hunt by adopting buffer zones around tribal lands, shortening reporting requirements, and making hunting licenses zone specific. ● Emphasizes the use of non-lethal methods to reduce conflicts.	There are still numerous areas where the plan is seriously flawed. In particular, I object to the following elements of the plan or failures to address the following issues: Absent is a commitment by DNR to work with the legislature to overturn PA 169 and remove payments for hunting hounds, killed by wolves. ● Hound training must be stopped. ● The plan should establish a zero hunting quota to protect wolves in our national forests and other areas of prime habitat. ● Recreational hunting/trapping to reduce conflicts has no scientific basis. ● At a minimum, DNR should ban the use of dogs to hunt wolves in our national forests. ● There is considerable uncertainty in estimating wolf populations based on the occupancy model which should not be used solely to determine population. ● The plan should include an oversight committee which is comprised of biologists and professionals.	3	Hounding is despicable. Paying hounders for the death of their dogs when they loose them on wolves - essentially legalized dogfighting - is a disgrace. The wolf committee lacks ethical oversight, includes individuals with massive conflicts of interest, and does not represent the general population.
Jason Neton	Most of it	Yes	I like that there is recognition of the value of wolves to the environment, that is important. Also, I am very much in favor of non-lethal approaches to the issue so I like that as well. And given the unknowns still, glad to not put a number or what is the right number of wolves in our lands.	We should eliminate the use of hunting dogs in this process and not train dogs to hunt wolves. Sure, have hunters use dogs in traditional duck and other hunting but not for this. Definitely not compesating hunters for the loss of their dogs in such a danger and unwarranted approach to wolf management. One other suggestion is how about engaging biologists and professional conservationists on this important matter. Perhaps a consultative committee for this topic?	4	Thank you for soliciting public input on this, that is very important.
Michael H. Schultz	Most of it	Yes	I like very little of this plan.	The areas that wolves should be allowed in. I would suggest no wolves south of highway 10. Eliminate all 1B zones. Establish a population goal of no more than 35. Hold public hearings in EVERY county where there are wolves.	1	
Alex Graeff	I have not read any of the draft plan	Yes	I wish I had more time to read and evaluate the plan, but alas		5	I think WI in general does a pretty good job at stuff regarding natural resources. Quick opinions: I am a plant ecologist and a huge proponent of preservation (as opposed to management or conservation) There's no need for a recreational wolf hunt. Mitigation for livestock take or other human conflicts? Sure. Otherwise let the land support however many wolves it can support. Please never allow recreation wolf hunting... like, why? We should be actively encouraging wolves (and native humans, but that's way different conversation) as a part of ecosystem preservation and restoration. We should be doing all we can to promote the "natural state" for as much of our forests and landscapes as possible. It's very upsetting to go into a high-quality habitat and see it completely ravaged by deer. Would wolves fix that? Maybe not, I can't pretend that I've done the research to find studies that demonstrate that. But it makes a lot of sense. Got a swamp with rare plants and too many deer? Would be real interesting to see what wolves could do. We know from Yellowstone that wolves simply altering the behavior of prey animals has cascading effects on landscapes and vegetation. I admire your efforts to inform the public and dissuade the propagandist "big bad predator" views that somehow still persist.
Tom Kuklinski	All of it	Yes	The thoroughness and detail. Held biases of all involved.	I did not like the influence of urbanization on determining quotas in rural areas such as Barton County. I prefer that counties with wolf populations have more voice in determining wolf management. Seems like urban populations are having a strong. Influence on policy but they don't live here among wolves.	6	I would like to see a review happen every year and adjustments to quotas being made often as the wolf populations increase or decrease.
William Walter	Most of it	Yes	The emphasis on the value of our wolf population and the buffer zones around native lands. Also making hunting licenses zone specific.	No specific demands to overturn PA 169. Nothing specific about making the use of dogs in hunting prohibited.	6	
DEBORAH	All of it	No	PLEASE SAVE ALL WOLVES FROM BEING HUNTED, JOY KILLINGS, MONEY MONEY KILLINGS, ETC....STOP THE HARMING &/OR KILLING ALL WOLVES, PLEASE!!!!!!!!	TURN IT ALL AROUND TODAY, TO STOP THE MURDERING OF ALL WOLVES, PLEASE!!!!!!!!!!!!		SAVE ALL WOLVES!!!!!!! PLEASE STOP THE HORRIFIC KILLINGS TODAY, AS SOON AS POSSIBLE.....THANK YOU 🙏

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Robert Jaeger	Most of it	Yes	Wolf population should be based on science and ecological benefits, not an arbitrary number. The plan reflects recent public opinion surveys. The realization that wolves are a keystone species. I'm very glad the plan acknowledges the requests of Native American's for a low quota zone.	I am against hound training for hunting in general, so would like to see at least a reduction of the hound training activities. I would like to see non-lethal recommendations for wolf-livestock conflicts emphasized.	9	Would like to see scientific oversight for plan reviews which should be more frequent.
Lynn Sommers	All of it	Yes	Historical background and letters from Tribal groups. The overall plan is clearly stated with objectives well identified. I appreciate the goals of improved public education for this keystone species.	While I appreciate wolf stewardship may be necessary, current or future, I cannot tolerate a $2,500 compensation for the depredation of a hunting dog. I am also dubious that the wolf conflict strategy, B3 (assistance) + B4 (funding) are attainable.	5	Thank you for the incredible effort it took to produce this plan.
Mark Consigny	Most of it	Yes	Managing the wolf population rather than simply leaving it to its own devices.	It looks to me as if the plan endorses a much higher population of wolves than was originally proposed for WI and higher than I personally believe to be acceptable. It also appears to endorse continued acceptance of the need to spend wildlife funds to compensate for depredation rather than reducing populations through legalized hunting to a point where depredations are reduced both due to no need to hunt domestic livestock and a learned fear of humans. I also don't think there is enough emphasis on maintaining populations of prey species sufficient for human hunting, an important socioeconomic benefit to this state. As the Western states have learned, if wolves reduce prey populations too much, people will no longer travel and pay for licenses to hunt those areas. I also think the whole zone/subzone issue is obtuse and typical of government regulation.	5	
			The eliminating of a numerical target population. The importance of the ecological benefits of wolves and inclusion of tribal values and knowledge. The significant attempt to minimize the impacts of a recreational hunt by adopting buffer zones around tribal lands, shortening reporting requirements and making hunting licenses zone specific. The emphasis on the use of non-lethal methods to reduce conflicts.	There needs to be a real commitment by DNR to work with the legislature to overturn PA 169 and remove payments for hunting hounds, killed by wolves and stop hound training! The recreational hunting/trapping to reduce conflicts has no scientific basis. There needs to be a zero hunting quota to protect wolves in our national forests and other areas of Because there is considerable uncertainty in estimating wolf populations based on the occupancy model and should not be used solely to determine population. The plan should include an oversight committee which is comprised of biologists and professionals.	7	Thank you for the serious hard work and inclusion of stakeholders please no more dog involvement and continued emphasis on non lethal solutions. Deer hunting, although important in Wisconsin, should not be the driver of wolf policy in the northern portion of the state.
JAMES SAUER JR	Most of it	Yes	NONE OF IT	NONE OF IT	0	I LISTENED TO THE POD CAST OF ITS ENTIRELY OF THE PUBLIC IN PUT WITH THE WOLF PLAN I TRIED TO GO INTO WITH A OPEN MIND WHAT I CAME ANY WITH IT WAS A FEW THINGS ONE THE PUBLIC IS FED UP WITH DOG HUNTING BE IT WOLFS OR BEAR I AGREE I HAVE TO DEAL THEM YEARLY ON MY PROPERTY I AGREE ALOT OF PEOLPE CANT UNDERSTAND WHY MY DOLLARS ARE PAYING FOR WOLFOR BEAR DOGS WHEN THERE USING THEM TO HUNT THEM JUST SEEMS ASS BACK WORDS ..I WISH THE STATE WOULD JUST BAND THE USE OF DOGS FOR WOLFS AND BEARS NOW LETS GET INTO IT .. LISTEN TO THE 3 + HOURS POD CAST OF PEOPLE CALLING IN ABOUT 5 MINS WHEN I HERD WERE THE PEOPLE WERE CALLING FROM AND IF THEY WERE HUNTER S YOU COULD TELL WHAT SIDE OF THE FENCE THEY WERE ON .. WHAT A JOKE THE PEOPLE THAT ARE NOT LIVEING IN THIS ARE NORTHERN WI FOR NUMBER YEARS ARE CLUELESS IF YOUR NOT LIVING HEAR OR BEEN HERE FOR 25 YEARS HAVE NO IDEA WHATS HAPPEN WITH THE WOLF PROBLEMS JUST LIKE I DONT GO TO THERE BIG CITIES A FEW TIMES I A YEAR AND TELL THEM HOW THERE LIVING LIKE AMINALS AND HOW TO FIX THERE PROBLEMS THEY SHOULD HAVE VERY LITTLE WEIGHT ON HOW TO MANAGE THE WOLF OVER POP PROBLEM .. IM FOR WOLFS IN N WI BUT KEEP IN CHECK AND RIGHT HOW THERE WAY OUT CONTROL . ALSO I NOTICE LISTING WAS MORE ONE SIDE BECAUSE MOST OF THE PEOPLE WHO TOOK THE TIME TO COMMIT WERE OUT OF STATE OR A CLUB ASSOCIATION THAT WERE PRO WOLF ..ALSO I JUST SICK OF MY TAX DOLLARS PAYING FOR WOLF DAMAGE IF THE STATE ISNT ALLOWED TO MANAGE AND CONTROL THE OVER POPLATION .. ALSO WHAT THE HELL TALK ABOUT AN ON FAIR COMMINIT SESON WHY WAS THE NATIVE RESERVATION GOT TO GO FIRST AND NOT ONLY THAT EVERONE ELSE GOT TO SPEEK FOR 2 MIN WHILE THE MONITOR ALLOW THE NATIVES TO SPEEK FOR 5 MIN EVEN LONGER ..AND IF I OWNED LAND IN WHAT THE STATE WANTS TO CALL A BUFFER ZONE ON MY OWN LAND WICH I PAY TAXES EVERY YEAR WHICH WAY TO MUCH BUY THE WAY THEY CAN STICK THAT WERE THE SUN DONT SHINE WHAT A JOKE THAT IS WE DONT GET TO TELL THE SOVERICE NATION RESVERVATION WHAT THEY CAN DO ON THERE PROPERY THERE SURE HAS HELL ARENT GOING NOT TO TELL ME ON MINE THE DAM PROPERTY LINE IS THE PROPERTY LINE ONE SIDE IS RES AND ONE SIDE INSNT ..... IN CLOSEING IM AM SO SICK OF LIBERALS SOUTH OF HYW 8 THAT ARE CLUELESS GOVERING THINGS UP HERE THAT NO VERY LITTLE ABOUT N WI BUT FROM WHAT READ IN A BOOK OR SAW ON TV

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
JR Hecht	Most of it	Yes	Hard data, science-based facts and history. Information regarding population estimates with a new approach, especially if it helps understand population dynamics.	Lack of a specific population goal. Seriously, did you think that the sportsmen and other hunters would accept leaving a subjective goal in place? This was an embarrassing omission, in my opinion that lacked credibility.	1	As a concerned citizen, environmental educator and sportsman of over 50 years, you must measure population accurately and have numeric goals for management purposes. I believe the following: -current tracking method undercounts portions of wolf range -lone wolf numbers were not taken into account when estimating overall wolf population. -the accuracy of wolf counts is questionable, even with the new scaled occupancy model and stating a “minimum count” over winter is a tacit admission that population numbers are likely higher -current wolf population estimates do not count numbers within the boundaries of reservation lands in Wisconsin. Since they travel greatly in search of prey and are not hunted by the tribes, it is likely that these areas contain high numbers of wolves that should be considered as they move through non-reservation territory or nearby states (Minnesota, Upper Peninsula of Michigan) -previous hunting seasons for wolves has not caused a catastrophic population crash. Arguing it puts the wolf population in jeopardy of extermination is simply a fear tactic. Minimum counts subsequently have shown a resiliency in the population in a short period of time -without numeric goals, management is more subjective and will create a lack of confidence in DNR and lead to potential illegal kills as social carrying capacity and conflict increases Buffer zones around reservations are not realistic because: -they restrict management options and create tensions -wolves travel great distances daily and while greatly respected by them, they do not “belong” to the tribes -Minnesota has an estimated 5,000 wolves and they will disperse into NW Wisconsin as packs compete and individuals disperse as is their nature -There is little to no consideration of what a sustainable wolf population is for the long-term. Conflict with residents, farmers with livestock and those who live and work in wolf territory must be taken into account. -Indian tribes will not harvest wolves and should not be considered when setting goals for harvest when hunting seasons are re-established I'm very concerned about a tropic cascade in deer and elk population when all predators are considered: -wolves, bear, bobcat, coyote -cumulative effect devastating deer and soon, elk population in the northern forest region -previous predator study in northern Wisconsin is almost 10 years old and indicated a very low survival rate for whitetail fawns. This creates an unsustainable recruitment rate and leads to low hunter satisfaction and generally less wildlife observation opportunities for residents or visitors to the area Social carrying capacity is stressed, especially in areas not suitable for wolves, such as an increasingly fragmented wolf habitat because it: -creates negative interactions with domestic animals/farmers -limits hunting opportunities for those with dogs (black bear, upland birds) -stress on cattle and other livestock from wolf presence impacting productivity -greater representation from residents in wolf areas introduced potential inequities in the survey weighting Financial implications are important for various reasons as follows: -a lack of viable game populations, namely deer will reduce license sales which provides significant funding for DNR management and research -younger hunter recruitment will decline, creating budget challenges for the agency -wolf predation payments will increase with higher wolf numbers and is rising most recently, indicating that numbers are unsustainably high and will cause further lack of confidence in management staff -DNR elk reintroduction efforts are paying to bolster the elk herd in Wisconsin, however, wolves have learned to hunt and kill them. This is the equivalent of artificial feeding of wolves by bringing the grocery store to them. The Endangered Species Act has created a situation where technical aspects of the law have to been used to protect wolves in the Upper Great Lakes where their recovery has been well established. I know the WI DNR isn't responsible for this status, but isn't it time to acknowledge their recovery and begin managing population of wolves to a more realistic number to address all parties. Wouldn't it be a powerful statement if the WI DNR would actively encourage the US Fish & Wildlife Serves to begin delisting again? Any silence on this issue only indicates to those advocating population goals and a reduction of wolf numbers that the DNR is actually opposing such moves to placate special interests. Two things can be true at the same time: -wolves are an important apex predator with a role in the ecosystem -wolves can decimate wildlife populations because each kills an estimated 20 deer per year The study indicated a potential correlation with wolf presence and fewer car crashes, CWD and Lyme Disease and other wildlife tourist benefits. I'm not aware that Wisconsin has the equivalent of the Hayden Valley in Yellowstone, however, I'm sure there are people who would travel to hear wolves howl. As for the other possible positives, I think this is wishful thinking and came across as a rather thin veneer to support higher wolf numbers. Human population per square mile in Wisconsin wolf territory are high relative to Minnesota or other states with high wolf numbers. This can create undesirable social capacity conflicts, not to mention potential predation upon family pets. Population goals

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
						should consider suitable habitat and provide enough area to avoid wolf pack territorial conflicts. It is not compassionate to introduce wolf pack social conflict, leading to deadly rivalries. Yellowstone wolf pack fatal interactions have been well documented given their territorial nature and how they viciously defend it. Wolves are not a significant factor in controlling CWD in Wisconsin's deer herd. The prevalence of the disease, where tested, does not indicate a high infection rate in wolf territory compared to downstate regions where wolves are scarce. This is a specious argument in favor of high wolf numbers, unless of course the predation pressure continues to increase without population control and there are few, if any huntable prey populations remaining. Anecdotally, I've hunted for 50 years and have noticed a steady decline in deer sign in southern Ashland County over the last 10 years where wolf sign and observable kill sites on our property have increased. The last two years, I've only observed 2 deer sightings in 8 days of bowhunting for significant portions of the day. The lack of sightings does not engender future generations interest in hunting and will ultimately result in less license revenues. There have been few, if any young deer tracks in the snow indicating fawn recruitment is suffering across the landscape where I hunt. I don't believe my experience is unique when talking with local residents and other hunters in the area who are ready to give up and stop buying hunting licenses until things improve radically. I know there are multiple factors including severe winters and other predators, however, it's time to take a hard look at managing the most successful predator when it comes to adult deer. Harvest - according to a study (Fuller-2003) and later updated by others, wolves could withstand human-induced losses of 25-35% annually without a decline in population. Using the most recent population estimate from the new scaled occupancy model indicated most likely population at 972 wolves. This would equate to a harvest quota of approximately 250-350 wolves. A reduction in the current population would reduce human-wolf conflict and would also serve to balance the needs of all interested parties, both the proponents of expanded wolf population and those who desire lower wolf populations. In fact, the management plan acknowledges that wolves are "remarkably resilient to human-caused losses, including regulated hunting. Experience with regulated wolf hunting in Wisconsin has largely supported this finding". As an added benefit, it would provide additional revenues from application and license sales to fund further wildlife research and management activities. Depredation payments have increased regularly since 2017-18, indicating greater conflict and wolf-confirmed losses. This is a clear indicator of human-wolf conflict, however, it fails to take into account loss in productivity from livestock who are stressed from wolf presence. This economic cost is a significant consideration when determining wolf population dynamics and the resulting impact to families operating businesses in or near wolf habitat. Consultation with tribal parties regarding wolf population and harvest goals while noteworthy, is not a relevant issue since there is no measurement in the population model on reservations, nor are the tribes supportive of harvesting wolves due to their belief system. Wolf harvest licenses, when legal under the ESA may have been applied for by those who have no intention to hunt wolves given their preference to protect them. The quotas for actual licenses were reduced based on a 10% success rate, however, not all individuals eligible to purchase a license actually did so. Based on the 2021 hunt data, only 65% purchased a harvest license who were invited to do so. This additional factor must be considered when determining license quotas for future hunting seasons as it is likely this trend will repeat. The number of farms experiencing verified depredation losses increased almost 100% from 26-48 in 2021. This indicates a significant level of wolf-human conflict. When you add that to the rapid closing of the most recent hunt in 2 days, it argues strongly that the wolf population is not only robust, but likely is being undercounted. Use of the scaled occupancy model is brand new and may not accurately or faithfully represent the actual numbers of wolves on the landscape. Given the increase in the number of wolf packs, the model makes several assumptions regarding the size of each pack. The use of assumptions in any model needs to be validated and tested. With only 28 active GPS collars, it does not seem to be a large enough sample to extrapolate these types of pack size estimates. Furthermore, confirmation using winter tracking observations is incomplete due to lack of complete coverage in all transects. A quick view of pack distribution in Wisconsin indicates that the areas covered by wolves is nearly complete in the northern forest region of the state. Hunters who pursue upland game or other species, especially black bear would effectively put these dogs in heightened danger from wolf packs in one third of the state, prime hunting area for these species. The management plan also recommends a "buffer zone" surrounding tribal reservations, further limiting hunting opportunities. This is patently wrong and should be

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
						completely removed from the Plan as it limits public hunting areas and is possibly a violation of their constitutional rights and state law. The fact that the DNR did not fulfill its obligation to prepare for a wolf hunting season upon the elimination of ESA restrictions and had to respond to a lawsuit by Hunter Nation brings into question the true intentions of DNR management. Added to this most recent Plan that clearly avoided any numeric population goals has created an atmosphere of distrust by the public. I would also mention that recent harvest quotas designated half in the ceded territory for tribal purposes, knowing full well this quota would not be utilized. This is especially true of hunters who view the current wolf population as detrimental to game species such as whitetail deer, elk and other prey species. The ongoing conflict between the Natural Resource Board and the DNR is further evidence of a political bias where science-driven management action must control. A huge credibility problem exists in my opinion with the stated goals of the DNR and actual practice as evidence by their actions or lack of action. In summary, I disagree strongly with any Plan that lacks a numeric population goal or range of population for the wolves in Wisconsin. It is my belief that the Gray Wolf belongs in the ecosystem and I'm respectful of this species and have enjoyed hearing them howl, mostly recently as I was returning to my hunting cabin in the Chequamegon NF after dark. In fact, I howled back and listened to the three wolves in different locations around me, never fearing for my safety. Like most things in life, balance matters and wildlife must be managed and cannot become a hostage to the political whims of one group or another. The recent actions and tenor of this Management Plan has caused me to lose confidence in the Wisconsin DNR's prior history of objective, science-based approach to managing our precious resources. Please take my comments into consideration and understand that I am seeking a respectful balance between the groups who love and protect all wolves and those who see the practical reality of needing to manage the population of this very powerful apex predator. Thank you.
Donna Gasbarro	Most of it	Yes	Having input from tribal members, using non lethal methods to reduce conflicts, considering the ecological benefits of wolves to our environment, not using a specific # for population control.	Wisconsin residents do not need hunters using hounds to train or hunt wolves or any other wildlife in our forests or anywhere in our state. Wisconsin taxpayers should never have to contribute to reimburse hunters if their hounds are killed by wolves or any hound death from hunting. Oversight committee should be from Biologists & professionals not hunters.	5	Wolves or any other wildlife don't need humans to control their population. Good attempt at a plan & to include public comments, the citizens of Wisconsin need more representation from non hunting point of views.
	Just the parts I am interested in	Yes	I believe that there is a place for wolves in Wisconsin as long as there is a numbered population goal. Almost every township where I live have passed a resolution on a wolf population of 350.	The management units. Why would there be a unit in southern Wisconsin? Also, the units within the unit are ridiculous, 1a & 1b.	1	I believe that the people that reside where the wolf population is highest should have more say on this issue. After all we are the ones most affected. From attacks on our pets and cattle to driving miles in the national forest without seeing a deer track. I know people who own land around the national forest that haven't seen a deer during the last two gun seasons. Why would would anyone from southern wisconsin want to deer hunt up north any more.
Gloria Navan	Just the parts I am interested in	No	I like talk of a buffer zone around tribal reservations. I like that a more positive spin is put on ecological role of wolves and more positive views of wolves realizing they are important and should not be decimated as a species or regated to zoos.	I do not like discussion of eliminating them by hunters who wish only to kill and don't care how they do it or how dishonest or unfair it is. I don't like no discussion of non- lethal management. I don't like that there seems to be little scientific study of this and the effect on the species when the wolves are relentlessly hunted and destroyed with no regard for their young. I don't like it that Wisconsin seems ok lining up with other states who are becoming known as "wolf killers."	3	
Lynne Irvine	Most of it	No	Overall, the thorough and focused attention to pulling all these facts together is fantastic, then presenting plans to help the wildlife of Wisconsin. Particularly, I support completely eliminating the illegal hunting of bear in public lands, including state and national parks. It endangers not only bear populations, but wolf pack survival. Bear and wolf are not frequent predators of each other, in fact, the predator is man injecting his hounds into the natural mix. Hunters bait for bear, which draws wolves and pups into conflict with hounds. Hunters are reimbursed $2000 for a killed hound. Obviously, these human hunters are willing to sacrifice "man's best friend" for sport. And, they have no regard for these public shrines to preserve what little nature we have left. Stop any kind of hunting for wolves, especially this artificial and gruesome fight to the death for three species that could live in perfect harmony without...us, mankind.	This is a great step in the right direction. But, humans need to realize how we have squeezed an apex predator that roamed the entire United States into a few areas, and they still adapt and survive. They are not after livestock, but prefer wildlife. Give them the space to manage themselves, and manage your own farms and lands with mother nature in mind. These are not just Wisconsin's wolves; these are American wolves belonging to everyone in every state. And I will support that with words and funds for Wisconsin and other state to uphold these laws. A few hundred wolves is not enough to allow them to keep our ecosystems healthy. We all know about the reintroduction to Wyoming and what great things it brought to the rivers and meadows and mountains and all the wildlife. Please read the article about Arctic wolves from 2015 National Geographic, it is a study in a huge wolf population with almost no human interaction. Wolves are family oriented and even mate for life in most cases. They are more like us than we realize, and very close to our own dogs that sit on our laps at night.	7	Wolves are as American as apple pie. I want my grandchildren to know them and enjoy them. I have sat with wolves in a rehab center, after being chased by helicopters in a mass Alaskan hunt including pups, ones who were tortured by college students in a dorm and kept in a cage, and ones who were beaten just because they are a wolf. These wolves were huge and proud and tender. Only man can save them. Only man can ultimately destroy them. God gave us intelligence to protect and look over the animal kingdom. We have not done a good job with wolves. We need all apex predators in all environments, including sharks in the ocean, for the same reasons! Let's be smart, kind and protect wolves while we still can. They are no threat to man, at all. Just give 'em some space!

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
	Most of it	Yes	not much	it needs to have a population goal of 350 or less. There shouldn't be any extra safety zones around reservations	1	
Becky Oftedahl	Most of it	Yes	I like: *that the plan and decision making is science based *that prioritize management practices will be used in response to existing conditions as observed in the field and scientific data to help find an effective balance between competing objectives *that various management practices will be used for different management zones *the change in management zones and subzones *that the subzones can be managed differently than the main zones *that if hunters cannot fill their tag in the zone they are designated, and the zone closes, that they cannot go to another zone *that there is no reimbursement for dogs killed while hunting wolves *that the plan will pursue administrative rulings to prevent the intentional destruction of dens * that it will pursue more and new kinds of conflict management for farms * that there will be more and new kinds of education outreach for the public and hunters * that the tribal nations knowledge and history and rights are taken into consideration *that a science based wolf summit will be pursued *that no one can possess a wolf or wolf/dog hybrid unless licensed	That even though it is managed, dogs and trapping are still allowedI I feel there should be no reimbursement for bear hunting dogs killed by wolves. These hunters have decided to risk their dogs to hunt wild predators and so we should not have to pay for a decision they have made. Those are the consequences and that's too bad. You know what the outcome might You can choose not too.	10	In the plan it mentions that there is a rich history of using dogs for hunting. We have a rich history in a lot of things that we don't do anymore because they are not good for us or the earth They were terrorizing and using animals in ancient times and the middle ages. We would hope we have evolved beyond that by now. Terrorizing wild animals, with dogs, who are part of our ecology is a blood thirsty, sadistic sport that should be discontinued. Other states are slowly fazing out this type of hunting and we should be too. I am not sure if wolf hunting is allowed in this state when females are pregnant but if so and if dogs are allowed that is just wrong. And it is unfair to the dogs also. I feel the same about trapping. Even though there are supposed to be humane traps now it is still inhumane. These animals still suffer. My husband is a hunter and I am not antihunting but I feel it should be done in a humane and fair way. The animals should have a chance. Lastly there should be no politics involved in management decisions. Our Wisconsin congress has messed things up royally in the past with interfering with management decisions and should not be allowed. They know nothing and for sure don't look at the science.
Alice Thompson	Just the parts I am interested in	Yes	I appreciate the effort to not put a specific number to the Wisconsin wolf population.	I do not support using dogs to hunt wolves. Using a canine to kill another canine is really horrific. I do not support the numbers of wolves killed that have violated treaty rights of the Ojibwe in the ceded territory. I cannot read a 178 page document in the time since I was aware of this issue. I have hopes that it is better than our current approach. But I am guarded as I don't have the full details. More public information earlier would have been very helpful to me. I care deeply about the wolves place in our ecosystem and honestly hate wolf hunting. I support wolves.	5	The plan did not get much attention- I only heard about it yesterday and don't have time to figure out exactly what I do and do not like. I have seen some positive comments, so I am hopeful. But I want the WDNR to honor the Wisconsin tribes rights to NOT kill wolves that their "quota" be left to live. I really am not in favor of wolf hunting unless there is a specific wolf that is too close to humans.
MM	Most of it	Yes	mass amounts of information, Maps and explainations are good.	So much information.	8	We need to have a plan to manage which should include a season.
	All of it	Yes	I support/like the following: The goal of a self-sustaining, self-regulating, and genetically diverse wolf population that maintains connectivity with wolf populations in neighboring states and fulfills their ecological roles. Consultation with Tribes and adjustment of zones around tribal land that help protect treaty-protected documented wolf-packs. Being responsive to the cultural significance of wolves to the indigenous people whose lands we inhabit. Commitment to science based research to guide biological and ecological viability of healthy ecosystems along with sensitivity to Tribal Nation's cultural relationship with the wolf. Reducing the time required to report wolf kills. I prefer this to be more stringent -- within 4 hours. And making the destruction of occupied wolf dens illegal The research included in the draft plan document. THANK YOU! Increasing public education regarding wolves.	I would like to see modifications to this plan in the following ways: To support the goal of self-sustaining genetically diverse wolf population, the DNR should put in place an emergency action plan to halt hunting and trapping if population crashes or crashes in breeding success rates could result in biologically non-viable wolf populations. Any number of natural or human caused events might trigger a crash, e.g. extensive forest fire, extreme flood events, disease or an extraordinary over-take during hunting season. Scientifically predetermined metrics would trigger an immediate pause on hunting and trapping. Increase the number and perimeter of Zones around Tribal Lands and limit the number of wolves harvested to one wolf per zone. If legislative changes are not made that allow the DNR to make decisions in alignment with goals of the wolf management plan, the plan will not function effectively and could result in an unmitigated massacre of wolves in Wisconsin. The DNR should have the right to impose population goals to protect the viability of the species in Wisconsin if the Legislature does not take action allowing the DNR to make these decisions. The use of dogs for hunting wolves should be eliminated and no training of dogs to hunt wolves should be allowed in Wisconsin. There must be a provision to update the plan at minimum every 5 years and to have Emergency Action Plan metrics in place that can trigger an immediate halt to hunting and trapping if natural or human-caused events occur that threaten the long-term viability of a healthy wolf population in Wisconsin. The state should recognize the use of Guardian Animals as a non-lethal option to reduce wolf –livestock conflicts and payment should be provided to implement this and other non-lethal options to reduce conflicts. The DNR should remove payments to owners for depredation on dogs being trained to hunt wolves.	7	The plan will not work without support of the legislature. Do not get us into the situation whereas an approved plan that does not have guardrails in place to protect the wolf!
Bobbi R	Most of it	Yes	I appreciate the strong science that went into this. The graphs and charts make it easy to understand.	Anything that has to do with 'harvesting' wolves. I am a hunter but nobody eats a wolf. They just kill for the sake of killing.	7	Wolves that create hardship for ranchers and farmers are the only ones that should be killed.
Robert Fohey	Most of it	Yes	I wish it would be more specific on harvest goals	It's taking way too long to get this implemented and it doesn't go far enough.	2	

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Michael ZBrandt	All of it	Yes	Elimination of numeric population goals.	I have no strong objection to any element.	9	Please record these comments as an enthusiastic endorsement of the proposed Wolf Management Plan. I reside in a rural township and am highly aware of the contending interests which need to be addressed by any wildlife initiative. I believe the draft plan does just that, carefully weighing the costs and benefits of a viable wolf population from the perspectives of not only those who admire wolves from a distance, but those who make their homes and living in wolf territory. I wish to stress the importance of excluding from the plan any numeric population goals. Future goals should be subject to the most current research and scientific data, rather than precedent. Given existing Federal protection for the species, full implementation of any DNR plan can only occur sometime in an uncertain future. Establishment of specific goals must apply to the wolf – and human – population size and regional distribution which exists in that future time.
James	Just the parts I am interested in	Yes	wolf seasons	no wolf season.	6	do not drop program, ethical wolf conservation needed
Alex Mehedinti	Most of it	No	I appreciate the more in-depth analysis into the ecological value provided by wolves as a species, and subsequently believe that the removal of the "350" target number, as well as the establishment of buffer zones, are important steps in the right direction.	Ultimately the proposed management plan fails to address a number of significant issues surrounding wolf management: first and foremost, the continued reliance on lethal management methods belies an inflexible attitude which is inconsistent with the plan's stated goals (mainly in this case the twin goals of reducing conflict while still maintaining a healthy population of wolves in the state), insofar as several recent studies have found that consistent implementation of proactive non-lethal management practices is significantly more likely to achieve the desired outcome. Secondly, the existing draft does not explicitly prohibit the practices of hounding and trapping, which is simply unacceptable from an ethical standpoint and furthermore runs counter to the general public sentiment regarding these practices. Thirdly and finally, the plan as it is currently written ignores the value of wolves as individual animals in favour of focusing exclusively on their ecological and instrumental value as a species - this is an omission that cannot be left unaddressed, as there is robust evidence regarding wolf sentience, sapience and autonomy which raises significant questions regarding the ethics of lethal management practices. Furthermore, the value that the general public attributes to wolves may be tied to the value of each individual wolf as much as to wolves as a species, a fact which is not reflected in the current draft.	4	In my opinion, scientific evidence as well as basic morality both demand that the practice of managing wolf populations via public hunts must be discontinued. In fact, use of lethal methods in general is unjustifiable unless it is done in the unlikely scenario of an immediate risk to life, especially given that - again - non-lethal alternatives are demonstrably more effective without contravening any widely-held moral principles.
	Most of it	Yes	I like the fact that the dnr is considering a wolf hunting season	Not putting a number on the population goal isn't acceptable. The dnr sold the public on the roughly 350 wolf population goal. It has far surpassed that now. The other part of the plan thats unacceptable is the buffer zones around the reservations. I understand not hunting wolves on the res but the buffer zone is laughable. The dnr is saying you can hunt wolves but not where the wolves are a problem. If i have a tag it's not right that the tribes and dnr can tell me i can't hunt them on my own land.	1	The dnr needs to drastically reduce the wolf population state wide or the hunters will just do it for them. Remember, you work for us
Joan Beldin	Just the parts I am interested in	No	1. The omission of setting a numerical target population 2. I like the emphasis on the use of non-lethal deterrents to decrease conflicts. 3. The addition of buffer zones around tribal lands 4. The inclusion of the ecological benefits of wolves, including CWD, the elks landscape of fear, benefits to biodiversity, etc.	1. There should be no wolf hunting in the national forests and in prime wolf habitat. These are lands where wolves belong and are needed as keystone species in the ecosystem. Hunting of these wolves destroys the pack social structure which is vital to their ablity to hunt, raise pups and protect their territory. 2. The use of dogs to hunt wolves should be banned. This is not only unethical, but it is equally a danger to the dogs. there should be no reimbursement of hound hunters at any time for any reason. 3. Do not rely only on the occupancy model when estimating the wolf population. This model of estimating wolf populations is not accurate enough and can lead to an overestimate of wolf numbers. This could lead to over hunting of wolves and could imperil the stability of wolf recovery. 4. I oppose the recreational hunting of wolves. It should not be used as a means to control wolf conflicts. If left alone, wolves will self-regulate their population. In addition, scientific research has shown that indiscriminate wolf killing disrupts the pack stability and can leave either an inadequate number of wolves needed to successfully hunt their natural prey or will leave younger wolves who have not yet learned adequate hunting skills. This results in increased rather than decreased depredation. 5. The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence.	6	It's important that out of state voices are heard and considered since a significant number of wolves live on and are killed on Wisconsin's public lands. Public lands belong to all citizens. How these lands are used and managed is of concern for all, not just the minority of hunters. I repeat my request that no recreational hunting be allowed on these lands.
Rod Sharka	Most of it	Yes	The thoroughness of background that is presented.	Delineation of hunting methods. I am very much opposed to hunting wolves with dog packs. I am of the opinion that this hunting method is inhumane and should not be allowed.	9	I compliment the DNR staff for a very thorough and thoughtful wolf management plan.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Josef Anderson	Just the parts I am interested in	No	Nonlethal management	Wolf hunting seasons	5	Please let wolves live and listen to the majority
Marla	Just the parts I am interested in	No	That wolves control, more effectively than humans, diseases that weaken fauna.	It is good that numerical status of the wolves is removed	4	Many Wisconsin residents may not know the ecological value of the wolf. Although they are favorable towards the species in general. The voices of hunters and those who solve problems with deadly force are too often the most heard in determining solutions. Through indiscriminate hunting wolf families are greatly disturbed and lose the teachings of their elders. The pack hunts wildlife effectively and can be kept away from livestock with guards and deterrents applied. However, raising and extending livestock into wolf territory is very tempting to them. Wolves could use management through vaccination to prevent rabies and distemper contracted through domestic animals. Otherwise, they are sentient beings and deserve a plan of co-existence.
	I have not read any of the draft plan	Yes				I did not read the plan but there are stats & points that could be debated forever. The bottom line though is there are too many wolves in WI. They need to harvest them. Each state must have the right to regulate. The animal rights activists are not in touch with reality. I am sure if they had to confront one face to face, they would think differently. I know, I have. Too many wolves is not acceptable, period.
	All of it	Yes	Not much to slanted to political interests of non hunters	No population goal is criminal. No harvest plan for if and when they are delisted is a mistake. Actual affect on the northern deer herd should be addressed. Not aggressive enough plan to cut wolf population way back in the north.	1	We absolutely must take more wolves out in the north. Deer sightings in Rusk county are horrible, wolf sign up deer sign down. Getting to the point that its not worth owning the land and buying a license.
Naomi Heiman	I have not read any of the draft plan	No	Relist wolves. They should not be hunted at all. They are essential to healthy and balanced ecosystems.	Relist wolves. They should not be hunted at all. They are essential to healthy and balanced ecosystems.		Relist wolves. They should not be hunted at all. They are essential to healthy and balanced ecosystems.
Jeff Crumbaugh	Just the parts I am interested in	Yes	Nearly all of Section 1. I am glad that you included a section on trophic cascades.	Even though I am impressed that you included the section on trophic cascades, there are some flaws that need to be addressed. The in text references of Brice et. al. 2022 and Kauffman et. al. 2013 are not present in your References at the end of the report, so I could not go and read these. The Fleming (2019) reference is weak and should not be included. It is an opinion piece, and does not represent any empirical research conducted by Fleming. Moreover, he is from Australia and studies dingos, not wolves. He works for the Vertebrate Pest Research Unit in Australia whose aim it is to prioritize industry interests, not wildlife systems. This also weakens his criticism of the influence of wolves on trophic cascades.	7	Consider increased academic rigor when writing and referencing background information. Also, in the section on trophic cascades, the author incompletely characterizes the influence of anthropogenic influences on trophic cascades. Apex predators can have a profound influence on trophic cascades, even in small numbers, but in anthropogenically influenced environments this is stated to be less clear. Perhaps, but clarify anthropogenically influenced enviroments - I interpret this to be cities, towns, villages. This is not clarified and if it was, then it would not be an issue. Forest land and wolf habitat in Wisconsin is not a "National Park" like Yellowstone, but it has minimal anthropogenic influences (forest roads).
Dan Thompson	Most of it	Yes		You can't manage wolves in northern Wisconsin based on what liberals in southern Wisconsin would like you to do. You must have wolf harvests in the north and you must have population goals. The plan is fantasy.	2	The DNR was once a respected agency. Between deer and wolf management is has become an embarrassment. You are losing the respect and support of outdoorsmen(and women).
T Tilotta	Just the parts I am interested in	No	Having tribal input to the management of Wisconsin endangered species Gray Wolf in Wi.	The gray wolf is an important keystone species for a healthy ecosystem. The WI wolf plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. No sport wolf hunting seasons ever. Wolves rely on packs and a self regulating social order in order to survive. Indiscriminate sport killing of any single wolf can irreparably harm the packs and the overall survivability of the endangered gray wolf species in the long term. No trapping of wolves. Do not allow inhumane and dangerous trapping of any kind in Wisconsin.	5	Ban sport wolf hunting and trapping. Keep the packs intact. Endangered species and hunting of any kind do not belong together. Thank you for allowing public comment.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Janine Proctor	Just the parts I am interested in	No	● Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. ● There is much greater recognition of the ecological role of wolves ● The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves ● The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed)	The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on (see reference list below): ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution ● The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. ● The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ○ A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings. ○ Hounding or hound training, which are akin to allowing legalized dogfighting, should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public.	4	The plan should require the implementation of abatement measures as well as the use of non-lethal conflict minimization techniques by domestic animal owners for the latter to receive compensation for confirmed predation. ● The plan also runs contrary to public values towards wolves (and omits mention of such majority values from the plan), despite department surveys evidencing that the broad public cares about wolves as individuals (and not just for the viability of the population). Given the recent liberalization of killing wolves by the state, it would be incredibly informative to note majority support of the following reasons for opposing a regulated wolf hunting/trapping season (which are all omitted from the plan): opposition to specific methods of harvest like hounds (64%) or traps (70%), feelings that hunting wolves is unnecessary (62%) or culturally offensive to Native American tribes (57%). ○ All such reasons convey majority disagreement with practices currently promoted and endorsed by the legislature and the WDNR, and such a conflict between managers and the public should not only be acknowledged, but foregrounded and carefully considered in policy (instead of dismissed). ○ Such decisions to omit literature or downplay evidence (e.g., such as majority opposition to killing wolves and their reasons) are contrary to principles of scientific integrity (e.g., present all relevant scientific evidence to the public) as well as ethics (e.g., disguising ethical decisions, such as recreational wolf killing, as robustly supported by science). ● Conflicting agency objectives (e.g., optimizing public hunting and conflict mitigation) are not only not acknowledged, but even misunderstood as harmonious, against the body of scientific evidence. That culminates in the prioritization of consumptive values and policies; e.g., according to the body of scientific literature, use of lethal methods, and especially public hunts, are contrary to most objectives relevant to: harm mitigation, the wellbeing of wolves.
	Most of it	No	Having a plan to manage wolves.	Having a plan that is not legally required as the Federal Plan supersedes the State Plan. Not having to kill or destroy wolves.	1	
Donald Medenwaldt	All of it	Yes	emphasis on co-existence, science and technology based decision making and include social science. Reliability on stakeholders input based on the above items.	Lack of reliability on number of wolves this has been a contentious issue since the original plan and we have not done our job on this job to satisfy enough stateholders.	0	Numbers need to be a part of the plan with a parameter being established and we should have a save haven for the species when it comes to establishing time of hunt. We need to have flexibility when it comes to reimburse ment for losses by farmers especially dollar amounts & source.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
	All of it	Yes	I appreciate the responses from Wisconsin Tribal leaders were solicited and that they were included verbatim, that buffer zones were implemented around tribal lands, the outline of non-lethal options and their use and history as well as proposed avenues for funding, that there is a recommendation to implement regulations to protect wolf dens, that the time for submitting a "harvest" is recommended to be reduced to 8 hours, I'm unsure about the "wolf dog training season" as it seems there is already the ability to train hounds on bear, if it is less than that season is currently I would be more in favor. I was thrilled the specific number (350) for a population was thrown out. Overall, I appreciated the how involved and detailed the plan was with many aspects of how to handle people in relationship to wolves was approached, history, biology of wolves as well as their prey, diseases, causes of mortality, social surveys, etc. a lot of information was included!	There were some statements and recommendations that I am curious about or upset me. I am against contracting private trappers to collar wolves, this should be handled by highly trained department staff as it can be lethal or at least stressful to the wolves involved. The statement at end of the paragraph on pg. 21: "Nevertheless, numerous wolf populations exposed to harvest and other sources of human-caused mortality have been studied over the last several decades and collectively have suggested that wolf populations are remarkably resilient to human-caused mortality, including regulated harvest. Experience with regulated wolf harvest in Wisconsin has largely supported this finding." To make this statement without citing actual peer reviewed studies seems irresponsible to me. Since the double-quota hunt of 2/21 the long-terms effects to the population with regard to mortality of secondary pack members after losses due to the breeding season hunt cannot be accurately assessed, especially when now using a model where only known numbers are plugged in instead of the on-the-ground howling surveys or trap camera evidence. I would've also liked to see it stated in the plan that zero is a valid option as a "harvest quota." I question the validity of the '22 statewide social survey. Were the recipients chosen from a pool of the general public? I find it highly unlikely that 49-58% of the public have seen a wolf in the wild and 45-60% have seen wolf tracks. I was unclear if wolves are allowed to be used in captive penning hunting training businesses. I would also like to have policy changed so that if a livestock owner receives compensation for depredation they should not be forced to allow public hunting on their land. That will discourage many from seeking help. I would also like to see an end for reimbursement for hunting dogs, especially in national forests and in known wolf caution areas. Instead, use that money to fund non-lethal prevention methods for livestock owners. Unlike farmers, hounders have a choice where and whether or not they let their dogs loose, they should be 100% responsible for their choices. I would like to see a breakdown of how much money is used implementing a potential and actual wolf "harvest" season compared to using those funds to implement non-lethal methods, educate the public and compensate livestock owners. When discussing the ideal of having educational outreach to schools by conservation groups on pg. 139, the Wisconsin Trappers Association should not be included. They are a consumptive organization and are biased against protection, therefore I feel they should not be given the status of this position by the department and be able use it to manipulate the public against wolves. The list of stakeholder groups permitted to comment on this plan shows that consumptive groups are favored and outnumber protection groups. A more balanced view could be achieved by having the same number of representatives in each of the four categories outlined on pg. 137. Overall, the plan seemed to be missing references to many peer-reviewed studies that have been conducted, especially more recently.	8	It is an improvement on the previous plan and I applaud the direction toward a more balanced, inclusive view of how to manage people as they relate to wolves. I hope the plan can evolve to remove any recreational public hunting or trapping, increase proactive measures to protect wolves from poaching and cruelty and be impeccable in transparency and responsibility to the general public.
Shawn Winters	All of it	No	not as much hate propaganda against wolves	would like to see a total ban on recreational wolf hunting	4	
Tom Heinrich	Most of it	Yes	teaching the public about wolves, the study that included numbers of pets/dogs killed by wolves and how that related to hunting, overall the numbers that show conflicts with wolves/people...	While I appreciate the study and the need to educate the public and the effort of the DNR to set up wolf management, I still struggle with hunting wolves...I would think that the question of baiting/feeding deer needs to be addressed...personal observations in Bayfield/Douglas Counties show wolf concentration/tracks with deer feeding...also, habitats/roads and clear cut would increase conflicts/concentration of wolves with human activity/easier hunting...similar to studies done around Lake Nipigon/Wabakimi regions of Ontario: wolves/caribou...	10	thanks for the efforts...I travel often/2-3 days a week, in areas where wolves live/snowshoes/skis/foot traffic...I enjoy being part of a landscape with wolves...I realize wolf/dog encounters are possible...it is part of being in Wisconsin/wolf habitat...thanks for your time...
Barb Kellermann	Just the parts I am interested in	Yes	Let population fluctuate,end arbitrary population goals. Educate public about wolves,their biology, as intelligent ,benefits. Work with Tribal and conservation groups. Allow to stay in suitable habitats to deter conflicts. Promote non-lethal livestock depredation measures,buffer zones. I agree with Great Lakes Wildlife Alliance that shouldn't even be hunting wolves.	No lethal traps,baiting,sport hunting,use of dogs or motor vehicles,not in breeding season.	5	Keep the public apprised.
Tim McD	All of it	No	Improved planning process; including the ability to capture input from non-WI stakeholders.	-Lack of non lethal mgmt methods -Lack of cultural understanding e.g. tribal view of individual creature vs pack -Lack of cultural balance in population mgmt i.e. who benefits, over what timeframe and how that contemplates long-term impacts -Lethality of hunting/mgmt methods -Economic impact of poorly considered environmental and tourism centric models, i.e., views of WI as an environmentally diverse, and supportive destination to visit	4	

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Terence Galka	Just the parts I am interested in	Yes	Buffer zones around native tribes. Shorter season, if there has to be a hunting season.I like non-lethal removal of wolves.	Lethal removal of wolves. Concept of trapping. Lack of scientific data to support the data. Opinions are not the same as scientific data.	3	
Patricia Jursik	Most of it	Yes	Specifics in terms of numbers to harvest and protect	like most of the report	8	Find a way to protect the tribe's quota. The DNR must not let other hunters "Poach" on the unharvested wolves that the tribes are protecting.
AL LOBNER	All of it	Yes		My major dislike is the open ended suggestion to the population goal. I believe there should be a numerical goal and I feel it should remain at 350 wolves. There was a negligible amount of depredations at that number and the farther we went past that number the more damage continued to increase.	1	I don't feel there needs to be a buffer around the reservations. It will be increasingly more difficult to control the damage wolves inflict and keep them under control.
Wellington Wert	All of it	Yes	The overall comprehensive inclusion of all stake holders.	I still have reservations about not giving a stronger voice to those actually living in area's where wolves are present.	4	I realize that wolves are potentially a very devisive subject. And many of the studies seem to be inconclusive or at odds with each other to some degre
ernie meyer	Most of it	No	some good points on resolving conflict	needs more work on avoiding conflict	7	I believe the numbers are a bit low for sustainability.
	Most of it	Yes	Sections 1 & 2 were interesting	I do not like the overall direction this draft is taking	1	1) there must be a population goal for effective management 2) I believe the original goal of 350 should be maintained as it provides the best socio-economic balance 3) a 350 animal goal would also eliminate the need to expand management areas or add buffer zones 4) it does not appear that local and county governments has any voice in the plan... they should! 5) hunting with dogs should continue to be allowed
	I have not read any of the draft plan	Yes				I didn't review the 167 page plan...anything that long seems more complicated then it needs to be. Up until the past few years I have never felt unsafe hunting public land in Clark, Chippewa and Jackson counties. I spend most if not all Fall weekends in one of these counties hunting whitetails. I'm seeing more wolves...not singles, but a few packed together. I've never thought of carrying a firearm while bow hunting, but after the past few years of small packs not being shy and getting curiously close I and seriously considering purchasing. (I've never wanted a handgun in my household with small children, now grandchildren). Also, I may be one of few that have felt the hair on their neck stand as a mountain lion circled my tree (saw less than 20 yards away). I've heard the high pitch screeches too. I don't run nor climb trees as quick as I did 40 years ago. I believe I'm preaching to the choir. The heard is getting braver or maybe just hungry!! Singed Defenseless in the Woods!!
Marya Bradley	All of it	Yes	I am relieved to find that this draft plan for Wolf management in Wisconsin is no longer guided by an arbitrary and unscientifically based numerical goal for the wolf population. I am also encouraged by the plan's greater recognition of the ecological role of wolves and a somewhat larger inclusion and recognition of the tribal knowledge and understanding of the importance of wolves in the larger context of the living matrix of species and the environment. I am glad to see that the plan includes a social survey that acknowledges a more positive and "mutualist" understanding of the the critical ecological role of wolves as well as the broader public opposition to the killing of wolves for motives other than absolute necessity and to methods or means of killing that are ethically and ecologically unsupported. Finally, I think the plan's adoption of proposed "buffer zones" around tribal reservations is an improvement over the lack of any such zone and represents a step towards greater respect for tribal concerns and principles.	At the broadest level, I am greatly disturbed by the plan's failure to shift away from a perspective that views wolves as a species we are entitled to dominate or "manage" in some way that we perceive to be "useful" and our right both to assert and determine. This perspective informs the very language of the plan and its unacknowledged commitment to gratify and perpetuate a culture of human domination over the species so that the hunting, trapping and hounding of wolves remain central to the plan's objectives despite the scientific evidence that such activities conflict with the stated goals of "ensuring a healthy and sustainable wolf population to fulfull its ecological role" and to "address and reduce wolf-related conflict". This unacknowledged and perhaps unconscious bias leads to an incoherence in the plan: it cannot embrace out-dated practices that are ecologically unsound and ineffectual if not counter-productive and unsupported by the broader public and, at the same time claim to be a truly representative, inclusive and scientifically driven plan. More specifically, I am concerned by the lack of adequate scientific information about the highly evolved social character and structure of wolves and their packs, their sensitivity and intelligence and the wisdom the species surely demonstrates in its extraordinary capacity to survive and adapt and endure and interact with the ecosystems in which it has flourished over millenia. This inadequacy in the plan leads to a failure to take adequately into account the deleterious effects of the out-dated views and resulting lethal methods of "managing" wolves that the plan yet advances and continues to support. I also found the commentary framing of the survey of public views about wolves contaminated throughout by the constant insinuation that those who hold, what the plan describes as a "mutualist" perspective in relation to wolves, as being essentially ignorant and sentimental and apt to have only a "romanticized" vision of wolves and nature. This sort of contempt fails to respect the very real basis as well as need for a mutualist understanding and approach to any species but this species in particular given the ecological necessity of wolves and, even if one fails to appreciate the intrinsic value of wolves and clings to their purely instrumental value, their importance in relation to curbing the spread of CWD and Lyme disease. In addition, though I am glad the draft gave direct voice to the tribes who rightfully have the greatest claim to knowledge about the necessary mutual survival of wolves and humans, I believe that the inclusion in the draft	6	I want to support the effort of the plan to shift towards a plan based truly on science and the reality of a changed and changing public understanding of the importance and intrinsic value of wolves. I urge the DNR to make a deeper commitment to respecting science, tribal wisdom and the broader public as it works to realize its stated aim of supporting a healthy and self-sustaining wolf population in Wisconsin. I applaud the intention to commit to educating the public about wolves and their integral role in the balance of the ecosystems in which they are native and to promote a mutualist approach to supporting the presence of wolves in Wisconsin. I thank you for the opportunity to comment on this draft plan.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
				failed to demonstrate an adequate respect for the wisdom and understanding embedded and embodied in the statements given by the tribes and the policies that derive from that wisdom and understanding. It would be of far greater benefit to the draft plan to learn from those statements and the tribal wisdom they express how best to adapt the "management" of wolves to that more sustainable and respectful an understanding--a more "mutualist" understanding. Lastly, as all that I have so far written suggests, I believe the plan should not include providing hunting "opportunities" of any kind in relation to wolves as there is no scientific support for any form of hunting as being conducive to the plan's central aim of supporting a healthy and self-sustaining wolf population in Wisconsin. The only time lethal methods of conflict resolution should be permitted, is in individual cases that are life-threatening and all other non-lethal methods have failed. The DNR has the power to restrict implementation of the out-dated but still standing Act 169, by setting a quota of "0" wolves. The whole matter of predation compensation also should be made contingent upon the proven use of non-lethal methods to mitigate conflict. In the case of hounding, it is abundantly clear that no compensation should be granted as this is a matter of irrational and unethical willful endangerment of dogs and permitting such endangerment is a failure to protect dogs and protect wildlife from unnecessary harm and death. These comments all indicate that the draft has yet to make the fundamental shift away from working at cross purposes with science, ethics and the broad popular sentiment in its unstated but clear bias towards perpetuating an instrumentalist view of wolves and one that supports the domination of wolves and the culture of hunting, trapping and hounding of wolves. I urge the DNR to shift away from this allegiance and perspective and to fully and efficiently commit to plan actually based on science and thereby necessarily a far more "mutualist" understanding of and respect for wolves and one truly more aligned with and respectful of the tribal wisdom and practices in relation to wolves.		
Jeremy	Most of it	Yes	The fact that they are addressing this issue.	Any reference to lethal management.	5	
Vikki Carbonari	Just the parts I am interested in	Yes	Having a hunting and trapping season.	No set management #'s. Appears to be little science behind the plan and much more emotion.	1	The Department needs to take Politics out and the emotions of the people who suffer losses from wolfs in. The compensation rate is disgustingly pitiful. Perhaps if you people suffered wolf depredations to your pets, you would have a different attitude.
	Most of it	Yes		No population goal	1	There are too many wolves in Wisconsin. If animal activists truly want them why doesn't wisconsin trap and move the excessive population to southern states.
	Most of it	Yes	Compensating for wolf depredation of livestock, hunting dogs and pets	Going to a management system without a single numeric guideline for management; the thought that managing to avoid depredation scenarios is enough control over the population; a lack of concern for deer depredation and the impact of wolves on deer hunters and property owners who have invested in forestland for deer hunting; disregarding the 350 population goal that helped sell the entire wolf program to Wisconsin farmers, ranchers and hunters; targeting future harvest seasons toward depredation areas instead of the overall wolf population; etc. etc.	1	This does not really qualify as a management plan because you are supporting a self-sustaining wolf population with little regard for its impacts on deer hunters, farmers, ranchers, pet owners and property owners who hunt deer on their forested lands. This is not the controlled yet sustainable wolf population model that most of us signed up for, and with federal court interference in everything involving wolves today, we need to do a better job of lethal control when we get the opportunity. This plan needs to be modified to include a stricter numeric measurement of wolf numbers with a maximum population target of around 400 to 500 animals. That's what I believe will work longterm for both sustainability and future public support of wolves in Wisconsin, considering the modern society in which we live. When this population expands into farm country in central Wisconsin, there better be a maximum number or we'll be over 2000 animals in a hurry.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Alex Madorsky - Associate Director of Government Relations, The Nature Conservancy in Wisconsin	All of it	Yes	Please see document below at Question 7.	Please see document below at Question 7.	8	February 27, 2023 Wisconsin Department of Natural Resources Randy Johnson, Large Carnivore Specialist Randy.Johnson@Wisconsin.Gov Also submitted via DNR Public Comment Website Dear Mr. Jonson and DNR Wolf Plan Team: Thank you for the opportunity to comment on the 2022 Wolf Management Plan. For over 60 years in Wisconsin, The Nature Conservancy (TNC) has collaborated with landowners, businesses, and communities to protect more that 233,000 acres of lands, waters, ecosystems, and species, including threatened species like the Gray Wolf. TNC is also the world's largest conservation nonprofit operating in all 50 states and 79 countries around the globe, and here in Wisconsin we work closely with other environmental groups, sporting groups, agricultural groups, and Tribal nations to implement natural resources stewardship to the benefit of all. As an initial matter, TNC would like to extend our deep gratitude to you, your team, and all your colleagues at DNR for the tremendous amount of thought and effort put into the 2022 Plan. Your efforts are especially appreciated given the fluctuating protection status of wolves in federal court decisions. It is laudable that such a worthwhile plan was put forward during a time of great judicial and regulatory uncertainty. DNR deserves kudos for focusing on this work amidst often contentious debates. The Plan's proposal to move beyond a numerical quota for wolf hunting and to instead take a more holistic approach to the issue is most welcome. Numerical quotas are an extremely blunt instrument to address the very complex set of issues involved in any future wolf hunt. Adaptive management is a much sounder approach already utilized for critically important Wisconsin species like deer and wolf. Drastically reducing the number of Gray Wolves in our state through hunting without regard to regional distinctions based on the newest available data would be a grave mistake. Without adaptive management approaches, there is also no guarantee that a high-quote hunt would actually result in the decreased depredation events which many cite as the need for a wolf hunt in Wisconsin. Occupancy modeling, volunteer surveys, and an emphasis on combating illegal wolf kills are crucial tools in future management of the wolf population. TNC partners with many Tribal nations throughout Wisconsin on land Stewardship. Many Tribal leaders have movingly spoken about the spiritual significance of the wolf to their people throughout the Plan process. Some Tribes regard the wolf as a brother and a family member, and this means a wolf hunt is viewed directly as an attack on their family. DNR's extensive efforts to consult with Tribes while formulating the Plan are deeply appreciated, as are proposals to create buffer zones between Tribal lands and hunters. As DNR continues work on the Plan and on the Gray Wolf, it is TNC's hope DNR will consider some commonsense changes to the draft Plan. These changes include, but are not limited to: specific metrics for assessing wolf health and sustainability in each proposed hunting zone, shortening training periods for hunting dogs when a particular zone is open, and practical timelines for hunting and trapping seasons, Plan implementation, and guidance on how the Plan will be funded. TNC takes a data-oriented, purposeful approach to public policy on wolf hunting as on all other issues which impact wildlife. We remain concerned that there is simply insufficient data to demonstrate that there can be a "safe" hunt of this iconic apex predator, and if the 2022 Plan recommended a specific quota, it is likely TNC would have instead recommended a zero quota for a new wolf hunt at this time. This position is arrived not arrived at hastily or lightly, but instead after lengthy consultation with large animal biologists, other scientists, conservation allies, and our nearly 25,000 members in the State of Wisconsin. For this reason, we believe U.S. District Court Judge Jeffrey White's decision re-listing the Gray Wolf as an Endangered Species is correct. The revival of Wisconsin's Gray Wolf population, as others have noted, is a true conservation success story, one that should never be reversed. TNC again thanks and applauds the Department of Natural Resources for its creation of the 2022 Plan and for the continuing outreach to stakeholders and the public at large to ensure any future wolf hunt provides as much protection for the species as possible. If you have any questions about TNC's views on the Wolf Plan, please do not hesitate to contact me by email or cell at any time. Alexander R. Madorsky, Associate Director of Government Relations [redacted]
Linda Gaalaas	Most of it	Yes	The statements related to the importance of wolves to the ecology of the forest, as well as the value of wolves to tribal existence and history. The significance of data collection and science in determining hunting quotas and monitoring breeding. Wolves only kill deer that are injured/ ill and not for sport, but feeding as predator animals. Over harvesting, such as the 2021 hunt was	I feel dogs should not be allowed to be part of any hunt, nor traps or lures that assist the hunter to locate wolves.	8	Thank you for the phone comment period. Many comments from 100+ people with varying opinions was worthwhile to hear. I'm sorry I was unable to comment by phone, but so appreciate your time and patience with so many people providing their input. I value science and at a collection in determining the current number of wolves in our State, and your examination of how to monitor and establish wolves in our environment. I

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
			devastating for the wolf population and breeding structure. Education for the public is necessary, and a scientific understanding of wolves' habitat and breeding structure is essential to maintaining a healthy wolf population.			
	All of it	Yes	working to keep the public informed	Hunting wolfs with dogs	8	Hunting with dogs has no sportmanship
Virginia Jach Richards and Bob Richards	Most of it	Yes	That it's science based, the need for coexistence and balance. As a landowner we use these practices ourselves.	I believe it is time to end all hound hunting as our neighbor states have. They do not fit with the peace and tranquility of our northwoods.	10	I want to thank everyone who was involved with this plan, it covers so much and involved a lot of labor.
John Carbonari	All of it	Yes	none of it	No set population goal. Too much tribal influence. Not enough regular person influence.	1	Its 15 years overdue. It is by no means a reflection of what people that actually have to live with wolfs and suffer their effects want. The department does the wolfs no favors with their protectionist methods.
Mrs. H. Virginia Gerstmeyer	Most of it	No	introduction of wolves	allowing hunting of wolves, especially w/dogs	8	
	Most of it	Yes	Not much of it	Most of it not having a population goal buffer zones around reservations	1	This management plan is a slap in the face to the people that live in northern wi
	All of it	Yes		no population goals--what is the purpose of having wolves in wisconsin--we got rid of them once--lets get rid of them again	1	get rid of all wolves--they are only good for killing elk, deer and domestic animals--put the bounty back on them and they will be gone soon--before they kill some humans--if they haven't already
Fred Paulson	Most of it	Yes	None	All of it.	1	Wolves have a place in Wisconsin but only with a single numeric population goal. These numbers can be changed with respect to harvest success.You cannot reach your population goal without a number and this number will not be maintained with all the politics involved in game management today. If you have a harvest goal why is it a big deal to be so concerned about harvest registration time? This is over reacting by the anti hunting public. Keep the number of tags issued closer to your goal. Tribal buffer zones are ridiculous. Why should landowners who pay major real estate taxes each and every year be told they cannot hunt or trap their own property if it's subject to these buffer zones?This is going to involve almost all of northern Wisconsin. Surprised they don't want the entire ceded territory. Focusing wolf harvest in livestock conflict areas only isn't going to solve anything. No matter how many you remove they will be back each and every year. Revising wolf management zones to reflect distribution and habitat creates too many problems with ever increasing human population growth in northern Wisconsin. In conclusion nothing is going to work unless wolves are returned to state authority. There will always be conflict in northern Wisconsin as human occupancy continues to increase. There are way too many special interest groups involved in this issue that are trying to dictate what goes on in northern Wisconsin, just listen to all three plus hours of the DNR call in earlier this month. Do northern Wisconsin residents want all of these anti hunting groups from Madison/ Milwaukee, Florida, California, Colorado and elsewhere tell us how to run wildlife management? I can only hope that the DNR will start to increase its interest in the people who support them, and not all of these special interest groups. Cut the politics and start using common sense. Thank you for your time.
Travis Dahlberg	Most of it	Yes	Not much of any of it	The plan to "control" the population which isn't really going to help control the population. You need to have a actual season to harvest wolves every year	1	

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
	Most of it	No	I appreciate the efforts of all WDNR staff involved in updating the state's wolf management plan. Although I believe the current plan needs significant updating (see next section), I recognize the efforts and improvements made to the previous plan, including: ● Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. ● There is much greater recognition of the ecological role of wolves ● The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves ● The adoption of proposed buffer zones around tribal reservations	The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on (see reference list below): ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution ● The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. ● The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ○ A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings. ○ Hounding or hound training, which are akin to allowing legalized dogfighting, should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public. ● The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. ○ Despite Act 169, which mandates a wolf hunting season, the department can still restrict the implementation of lethal methods by setting minimal quotas, including a quota of '0' wolves, restricting timing and methods. ○ Several studies have proven a proactive non-lethal approach leads to better conflict mitigation. ○ Lethal management often fails to provide a long-term solution to wolf predation and has the least consistent success rates when compared to non-lethal practices. In addition, there is significant evidence showing that lethal wolf management may be less functionally effective at mitigating subsequent livestock losses than non-lethal deterrents. ● The plan should require the implementation of abatement measures as well as the use of non-lethal conflict minimization techniques by domestic animal owners for the latter to receive compensation for confirmed predation. ● The plan also runs contrary to public values towards wolves (and omits mention of such majority values from the plan), despite department surveys evidencing that the broad public cares about wolves as individuals (and not just for the viability of the population). Given the recent liberalization of killing wolves by the state, it would be incredibly informative to note majority support of the following reasons for opposing a regulated wolf hunting/trapping season (which are all omitted from the plan): opposition to specific methods of harvest like hounds (64%) or traps (70%), feelings that hunting wolves is unnecessary (62%) or culturally offensive to Native American tribes (57%). ○ All such reasons convey majority disagreement with practices currently promoted and endorsed by the legislature and the WDNR, and such a conflict between managers and the public should not only be acknowledged, but foregrounded and carefully considered in policy (instead of dismissed). ○ Such decisions to omit literature or downplay evidence (e.g., such as majority opposition to killing wolves and their reasons) are contrary to principles of scientific integrity (e.g., present all relevant scientific evidence to the public) as well as ethics (e.g., disguising ethical decisions, such as recreational wolf killing, as robustly supported by science). ● Conflicting agency objectives (e.g., optimizing public hunting and conflict mitigation) are not only not acknowledged, but even misunderstood as harmonious, against the body of scientific evidence. That culminates in the prioritization of consumptive values and policies; e.g., according to the body of scientific literature, use of lethal methods, and 2 especially public hunts, are contrary to most objectives relevant to: harm mitigation, the wellbeing of wolves, their ecological roles, and their non-exploitative enjoyment (i.e., Objectives A, B, D and F). ● There is a stark lack of consideration for individual wolves, wolf population health (including wellbeing), and measurable indicators for assessing any harms barring disease prevalence (e.g., accounting for cortisol levels or other stress hormones, measures of pair/pack persistence) ● There is an inappropriate understanding and consideration of tribal worldviews about wolves. Tribal worldviews of wolves are misconstrued as 'cultural benefits' tribes receive from the existence of a wolf population, when in fact tribal worldviews consider each individual wolf as a person and relative. Cultural respect and sensitivity towards such views, shared by many non-tribal members, demand the strict mitigation of lethal measures, especially recreational killing, as opposed to their current promotion in the plan. ● In general, all omissions of scientific literature, the arbitrary prioritization of policy objectives, the rhetoric of the plan and the dismissal of public values and concerns for wolves point	4	

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
				towards a biased, unscientific and instrumental view of wolves that promotes values contrary to broad public perspectives on wolves. ● 'SOM' wolf estimation methodology – From a recent critique: "The new methods sacrifice precision, but are believed to retain adequate accuracy and sensitivity to changing conditions for reliable decision-making. We review evidence for the accuracy, precision, and sensitivity of the new 'scaled occupancy model' (SOM) applied in Wisconsin. We conclude that the Wisconsin method would systematically overestimate wolf abundance by large (but currently incalculable) margins. Because Wisconsin, similar to other states, not only changed to unverified methods but also implemented widespread wolf killing, shortcomings in their estimates of wolf abundance may have far-reaching consequences for population viability and confidence in state wildlife managers. We discuss findings from Wisconsin alongside similar findings for other states' occupancy models being insensitive to human causes of mortality that have recently increased. Overall, Wisconsin's proposed method for estimating wolf abundance shows significant departures from best practices in scientific measurement. Verification will require independent replication and unbiased tests at multiple scales in multiple habitats under different human-induced mortality rates, and peer review before the new methods are considered reliable." (Treves & Santiago-Ávila, 2023) Rating: 4-5 Reference list (studies not integrated into the current draft wolf plan Adams, L. G., Stephenson, R. O., Dale, B. W., Ahgook, R. T., & Demma, D. J. (2008). Tanya Kern	All of it	No	I like that you are paying close attention to what the public wants in regards to wolf management and I love that you have included statements from all of the Native American tribes about their relationships to wolves. These statements reflect that all of the tribes regard individual wolves as their family members.	I am worried about the use of lethal control. The majority of the public does not endorse killings of wolves. There are more studies available that were not included in the report that show livestock depredation events may be more common after lethal control. Also it has been reported that any liberalizing of lethal control can contribute to increase in illegal killing of wolves. I would like to see the plan require the use of abatement strategies. Since many local tribes consider each individual wolf to be a family member, it is insensitive to consider lethal control in all but the most extreme circumstances.	7

	All of it	Yes	Hopefully a Wolf Season in near future	No limits on population is not good. Creating buffer zones around reservation land. I own land in buffer zone according to map. I should have every right if giving a wolf Harvest permit to fill it on my own land. The population is way to high right now. I spend 365 days a year in the outdoors. I'm a guide and outfitter for several different animals in our State. There has to be sum Management of wolves. The 350 number is what I feel the number should be. Rural Wisconsin is taken the a hit for the over population of wolves in our state	1	There has to be a population reduction of wolves in our state. I spend a lot of time hunting across northern WI in several counties. The population the DNR says there is in our state right now is way short of what it actually is We need to sign something that takes wolf managment away from the federal and make it state managed, like sum western states. People in Oregon or California shouldn't have a say in Wisconsin wolf plan, Especially the people like me that live in wolf country and have to put up with loosing pets. I've personally lost 3 hunting dogs on 3 different incidents. There needs to be a population goal of 350 in the state. The last season lasted 3 days????? That should tell something right there that population is out of control. Rural Wisconsin needs a voice here.
	All of it	Yes	Having a management plan to reduce population. Even if its a lie, like the first management plan when it all began. Going from wanting a 350 goal to well over 1000. All you have done is manipulate people with all your propaganda. You have and had a agenda for the beginning. A based on lies.	You keep referring to the population opinion of the wolf, witch most is in the southern part of the state. Population densities that have no knowledge or interaction with wolves except of what you tell them or what they see on TV. A opinion that is most definitely slanted.	4	I find it gross that the southern side of the state has such a favorable opinion, when then never have to deal with the problem. I have zero faith in our DNR.
Monica Gardner	Most of it	Yes	Thank you for the wealth of information. It allows me to make informed responses to this survey. I learned a lot and I hope others will as well. Comprehensive information should always be available on your website- it is a logical place for people to access it.	I am COMPLETELY opposed to ANY use of hounds in hunting wolves. This plan should be about managing the population in order to keep it HEALTHY, not minimize it and not for the purpose of gratification of hunters/trappers and trophy seekers. It should be reviewed/improved every 2-3 years, or at least, every 5.	3	The emphasis should be on what's best for the wolves, and not what makes hunters happy. They have an ecological purpose, and they should be able to fulfill that. Lethal means aren't usually necessary when it comes to livestock/wolf issues. Please explore and encourage other options. Most of all, DOGS should not be used to hunt wolves. It's dangerous for the dogs, unfair to the wolves, and just plain unethical.
	Just the parts I am interested in	Yes	* Honoring the stance that First Nation peoples take. We give a lot of lip service to this without actually doing anything. * Reducing conflicts without killing any living being.	* Allowing hunting/trapping of wolves.	7	It's a big ask to have us read the whole plan before taking a survey. In the future, could you provide a shorter summary of a report? Or a better survey, which links to the specific points you would like us to rank? I believe the vast majority of Wisconsinites prefer to NOT allow hunting/trapping wolves, but we'll never know as a result of this survey, since most people will be turned off by the large commitment required before taking the survey. A survey with a simpler, balanced explanation up-front would encourage a greater response.
Constance Bessa-Rittler	All of it	Yes	Wolf management system is necessary. In order to do that there must be a season and tags.	1)The "sub-zone" proposal, What is the reason for doing this? This is not specified in the treaties so why are we doing this? This appears to be an extension of tribal reach beyond what they already enjoy in the ceded territory. If wolves are not hunted on tribal lands then wouldnt it follow that wolves would gravitate toward those lands where they know they are not hunted? Thus fulfilling the tribe's preservation of their sacred animal? Why allow their religious preference to be extended into ceded land? 2)Further, who is going to enforce the "sub-zones"? The tribes or the DNA/local municipalities? And will there need to be some statutory clarification?This seems to be a confusing nightmare. 3)Lack of disclosure regardng funding for wolf management. State vs donations, gifts, etc column should be broken out for full transparency. What portion from license/tags, what from tribes, what from taxpayers what from conservation organizatios, and so on. 4)Lack of disclosure on break down of how tags are to be dispersed 5)What is to prevent other tribes from demanding "sub-zones" as wolf populations increase, which they appear to be doing at about 5% per year. Or, even more, from more speciies to be added, i.e., bear, elk, etc.? These things never seem to "unravel" usually the opposite happens, they accelerate. 6)from the spreadsheet on the last page it appears there is some discrepancy between payments for dogs vs. cattle. Why are dogs worth so much more than cattle?	4	
Wm. Haenel	Just the parts I am interested in	Yes	not much		1	what are the wolfs going to eat when the deer are gone?
Gary and Theresa Stanke	Most of it	Yes	We like the fact that there is finally talk of a plan so a harvest season can take place.	too vague and there are no specific numbers. The 350 or less goal that was originally established is not there. Harvest goals or numbers.	1	First of all lets get some common sense involved here. We manage all the species of wildlife and game in the state except for the wolf. They need to be managed like everything else, especially since the have no predators preying on them. Next is to keep politics out of the whole procedure. It has no place in game management. Enough said.
	Most of it	Yes	Easier registration	The extended buffer zones around the reservations. The lack of a population goal. I feel the plan needs an established goal and harvest to reach that goal.	3	I feel there are too many wolves and a set population goal is needed and a harvest quota to reach that goal. Without this I feel the back and forth will be a continued battle as we go forward
John OBrien	Most of it	Yes	Recognizing the need for smaller management zones. However, I don't think the plan goes far enough in this area.	No specific number goals. While I don't agree with a statewide goal, I believe there needs specific Wolf Management Zone number goals.	2	Zone 1 is too large. I believe that Zone 1 and all other Wolf management zones should be similar to the pre 2014 Deer Management Zones. This will allow better wolf management that takes into account the ecosystem of specific areas.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
	Most of it	Yes	see below	see below	0	I know this will not be useful to you but I need to say it. I find the whole concept of "managing" wolves arrogant and inhumane. Wolves are intelligent, social beings who have just as much right to inhabit Wisconsin as we do. Maybe more: they were here first. The idea of "harvesting" wolves, whatever utilitarian purpose it may serve, is abhorrent. Wolves are not carrots or cabbages. When we allow wildlife populations to find their own sustainable levels, everyone benefits (i.e. overabundance of deer destroying the woodlands and carrying diseases). Let nature do the managing. If people can't fence in their livestock to protect them, that's not my problem as a Wisconsin taxpayer. And if people want to shoot and kill things for pleasure (since no one eats the wolves they "harvest"), may they find more socially useful ways of spending their time.
	Most of it	Yes	entire plan seams to be well done and thorough		7	good luck with the plan, it will be in court before anything can be implemented, and the courts will side with the wolf proponents.
Carol Lynn Anderson	Most of it	No	There is a greater recognition of the ecological role of wolves which is vital to our ecosystems You included a survey of changing and positive societal views of wolves today With the increase of science and understanding of how all beings are living here on the planet in a unified system- the public has increased its positive views of wolves, The acknowledgement of increased opposition to the motives and methods of and for killing wolves I especially appreciate the proposed buffer zones around tribal reservations which did not previously exist.	The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on wolf ethology, sentience, sapience, sociability, agency and wellbeing Your current draft does not explore or express the effectiveness of non-lethal interventions, especially relative to lethal ones It does not address the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution not to mention its affects on human beings who participate in these killings and the long term effects on family and society of these killers.A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings. Your promotion of "sustainable" recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. It also begs the question.. What type of culture and what type of humanity considers killing as an optimal solution for anything? As space for all of the animals- human and otherwise lessens- we the so called " intellectually advanced" species, MUST for our own survival.. use our creativity, timely science and our very hearts to come up with alternatives that allow for the life of all. ● The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. Hounding or hound training, which is akin to allowing legalized dogfighting, should be illegal. Its practice is self evidently extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public. Wolf Protections should be the PRIORITY and look to non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. Act 169, which mandates a wolf hunting season, can be restricted through the department by setting minimal quotas, including a quota of '0' wolves, especially restricting timing and methods. AND prosecuting violators. Several studies have proven a proactive non-lethal approach leads to better conflict mitigation. Killing as management of wolf populations fails to provide a long term solution to wolf predation and has the least consistent success rates when compared to non-lethal practices. This cannot be dismissed and must be preeminently considered. In addition, there is significant evidence showing that killing wolves as a "management" effort less functionally effective at mitigating subsequent livestock losses than non-killing deterrents. The implementation of abatement measures as well as the use of non-killing conflict minimization techniques by domestic animal owners should be the primary method utilized for the latter to receive compensation for confirmed predation. Of Vital significance is that this plan runs contrary to public values towards wolves and does not mention these majority values in the plan.; despite department surveys evidencing that the broad public cares about wolves as individuals (and not just for the viability of the population). Given the recent liberalization of killing wolves by the state, it would be incredibly informative to note majority support of the following reasons for opposing a regulated wolf hunting/trapping season (which are all omitted from the plan): Please note: Opposition to specific methods of harvest like hounds (64%) or traps (70%), feelings that hunting wolves is unnecessary (62%) or culturally offensive to Native American tribes (57%). These demonstrate majority disagreement with practices currently promoted and endorsed by the legislature and the WDNR, and such a conflict between managers and the public should not only be acknowledged, but foregrounded and carefully considered in policy, rather than being ignored and dismissed. Decisions and actions that omit literature or downplay evidence (e.g., such as majority opposition to killing wolves and their reasons) are contrary to principles of scientific integrity (e.g.,	1	PLEASE... A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
				present all relevant scientific evidence to the public) as well as ethics (e.g., disguising ethical decisions, such as recreational wolf killing,as robustly supported by science). The agency's objectives are conflicting- e.g., optimizing public hunting and conflict mitigation) not acknowledged, and misunderstood as harmonious, against the body of scientific evidence. This culminates in the prioritization of consumptive values and policies; e.g., according to the body of scientific literature, use of lethal methods, and especially public hunts, are contrary to most objectives relevant to: harm mitigation, the wellbeing of wolves, their ecological roles, and their non-exploitative enjoyment (i.e., Objectives A, B, D and F). There is a disturbing lack of consideration for individual wolves, wolf population health (including wellbeing), and measurable indicators for assessing any harms barring disease prevalence (e.g., accounting for cortisol levels or other stress hormones, measures of pair/pack persistence) There is an inappropriate understanding and consideration of tribal worldviews about wolves. Tribal worldviews of wolves are misconstrued as 'cultural benefits' tribes receive from the existence of a wolf population, when in fact tribal worldviews consider each individual wolf as a person and relative. Cultural respect and sensitivity towards such views, shared by many non-tribal members, demand the strict mitigation of killing measures, especially recreational killing, which is in opposition to your current promotion of such actions in the plan. The current plan's omissions of scientific literature, the arbitrary prioritization of policy objectives, the rhetoric of the plan and the dismissal of public values and concerns for wolves displays a biased, unscientific and instrumental view of wolves that promotes values contrary to broad public erspectives on wolves. 'SOM', wolf estimation methodology – From a recent critique: "The new methods sacrifice precision, but are believed to retain adequate accuracy and sensitivity to changing conditions for reliable decision-making. We review evidence for the accuracy, precision, and sensitivity of the new 'scaled occupancy model' (SOM) applied in Wisconsin. We conclude that the Wisconsin method would overestimate wolf abundance by large (but currently incalculable) margins. Because Wisconsin, similar to other states, not only changed to unverified methods but also implemented widespread wolf killing, shortcomings in their estimates of wolf abundance may have far-reaching consequences for population viability and confidence in state wildlife managers. We discuss findings from Wisconsin alongside similar findings for other states' occupancy models being insensitive to human causes of mortality that have recently increased. Overall, Wisconsin's proposed method for estimating wolf abundance shows significant departures from best practices in scientific measurement. Verification will require independent replication and unbiased tests at multiple scales in multiple habitats under different human-induced mortality rates, and peer review before the new methods are considered reliable." (Treves & Santiago-Ávila, 2023		
shirley Cooksley	Most of it	No	I appreciate the efforts of all WDNR staff involved in updating the state's wolf management plan. Although I believe the current plan needs significant updating (see next section), we recognize the efforts and improvements made to the previous plan, including: ● Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. ● There is much greater recognition of the ecological role of wolves ● The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves ● The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed)	What I don't like: ● The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on (see reference list below): ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behaviour, wellbeing, social dynamics, ecological relationships and evolution ● The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. ● The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defence of life. ○ A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killing. Hounding or hound training, which are akin to allowing legalized dogfighting, should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public. ● The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. ○ Despite Act 169, which mandates a wolf hunting season, the department can still restrict the implementation of lethal methods by setting minimal quotas, including a quota of '0' wolves, restricting timing and methods. ○ Several studies have proven a proactive non-lethal approach leads to better conflict mitigation. ○ Lethal management often fails to provide a long-term solution to wolf predation and has the least consistent success rates when compared to non-lethal practices. In addition, there is	0	While other countries and other states in America value the biodiversity of our planet it seems to me that Wisconsin is determined to destroy iconic key species like the wolves . My family and I have visited Yellowstone and were fortunate enough to see wolves. I have since boycotted the USA because of your determination to destroy ecosystems and wildlife. Shame on you!

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
				significant evidence showing that lethal wolf management may be less functionally effective at mitigating subsequent livestock losses than non-lethal deterrents. ● The plan should require the implementation of abatement measures as well as the use of non-lethal conflict minimization techniques by domestic animal owners for the latter to receive compensation for confirmed predation. ● The plan also runs contrary to public values towards wolves (and omits mention of such majority values from the plan), despite department surveys evidencing that the broad public cares about wolves as individuals (and not just for the viability of the population). Given the recent liberalization of killing wolves by the state, it would be incredibly informative to note majority support of the following reasons for opposing a regulated wolf hunting/trapping season (which are all omitted from the plan): opposition to specific methods of harvest like hounds (64%) or traps (70%), feelings that hunting wolves is unnecessary (62%) or culturally offensive to Native American tribes (57%). ○ All such reasons convey majority disagreement with practices currently promoted and endorsed by the legislature and the WDNR, and such a conflict between managers and the public should not only be acknowledged, but foregrounded and carefully considered in policy (instead of dismissed). ○ Such decisions to omit literature or downplay evidence (e.g., such as majority opposition to killing wolves and their reasons) are contrary to principles of scientific integrity (e.g., present all relevant scientific evidence to the public) as well as ethics (e.g., disguising ethical decisions, such as recreational wolf killing, as robustly supported by science). ● Conflicting agency objectives (e.g., optimizing public hunting and conflict mitigation) are not only not acknowledged, but even misunderstood as harmonious, against the body of scientific evidence. That culminates in the prioritization of consumptive values and policies; e.g., according to the body of scientific literature, use of lethal methods, and especially public hunts, are contrary to most objectives relevant to: harm mitigation, the wellbeing of wolves, their ecological roles, and their non-exploitative enjoyment (i.e., Objectives A, B, D and F). ● There is a stark lack of consideration for individual wolves, wolf population health (including wellbeing), and measurable indicators for assessing any harms barring disease prevalence (e.g., accounting for cortisol levels or other stress hormones, measures of pair/pack persistence) ● There is an inappropriate understanding and consideration of tribal worldviews about wolves. Tribal worldviews of wolves are misconstrued as 'cultural benefits' tribes receive from the existence of a wolf population, when in fact tribal worldviews consider each individual wolf as a person and relative. Cultural respect and sensitivity towards such views, shared by many non-tribal members, demand the strict mitigation of lethal measures, especially recreational killing, as opposed to their current promotion in the plan. ● In general, all omissions of scientific literature, the arbitrary prioritization of policy objectives, the rhetoric of the plan and the dismissal of public values and concerns for wolves point towards a biased, unscientific and instrumental view of wolves that promotes values contrary to broad public perspectives on wolves. ● 'SOM' wolf estimation methodology – From a recent critique: "The new methods sacrifice precision, but are believed to retain adequate accuracy and sensitivity to changing conditions for reliable decision-making. We review evidence for the accuracy, precision, and sensitivity of the new 'scaled occupancy model' (SOM) applied in Wisconsin. We conclude that the Wisconsin method would systematically overestimate wolf abundance by large (but currently incalculable) margins. Because Wisconsin, similar to other states, not only changed to unverified methods but also implemented widespread wolf killing, shortcomings in their estimates of wolf abundance may have far-reaching consequences for population viability and confidence in state wildlife managers. We discuss findings from Wisconsin alongside similar findings for other states' occupancy models being insensitive to human causes of mortality that have recently increased. Overall, Wisconsin's proposed method for estimating wolf abundance shows significant departures from best practices in scientific measurement. Verification will require independent replication and unbiased tests at multiple scales in multiple habitats under different human-induced mortality rates, and peer review before the new methods are considered reliable."

	Most of it	Yes	Plan appears to very encompassing, thought out, and non-biased. Keeping the public well informed helps keep the trust between the agency and the general public.	I greatly appreciated seeing the elk mortality break down. I would've liked to have seen an estimate or something similar on the deer-wolf mortality break down. I understand the lower elk population helps provide more accurate and easier to study data, yet if an estimate was applied to deer in wolf range vs non wolf range, I believe this would further help public knowledge and also show the economic impact when it came to deer hunting and wolves. I believe deer management plans in wolf range areas may need to be adjusted vs non wolf ranges and the data could help show the differences. Antler-point restrictions like Michigan has may help cultivate a better deer heard in wolf ranges. It may create a better relationship between wolves and hunters, improving the wolf perception amongst the public.	7	
Ji Montgomery	All of it	No	Non lethal methods	Using snaring and dogs	10	Packs are 73% more likely to dissolve if the pack leader dies of human- related causes. DESTABILIZED PACKS LEAD TO INCREASED LIVESTOCK DEPREDATION. DEPITE THERE ONCE BEING AN ESTIMATE 2 MILLION WOLVES IN NORTH AMERICA ONLY 6,000 WOLVES ARE ESTIMATED EXIST IN THE CONTINUOUS US TODAY. AS ECO- SYSTEM GUARDIANS WOLVES ACT AS A KEYSTONE SPECIES, KEEPING ECOSYSTEM IN CHECK AND FACILITIATING BIODIVERSITY. CLIMATE CHANGE HAS SHIFTED SCINCE OF SPECIES RECOVERY AND ESA RECOVERY GOALS SET IN 1978 ARE WOEFULLY INADEQUATE.
	Just the parts I am interested in	Yes		More wolf tags should be given out.	2	All cases of wolf attack self defense should be approved without review.
	Just the parts I am interested in	Yes	nonethings really caught my eye	giving the indians rights over private lands owners ship ,and the DNR is not keeping the wolf population at 350 standard their more wolfs out there then was the DNR saids	1	we have to keep the wolf populate under control
	All of it	Yes	I like that it attempts to take into consideration all public concerns.	The lack of a target/set quota. Either keep the previously established quota or increase it to no more than 500. There is no logical reason for changes to the current zones other than to appease tribal and opposition attitudes. The proposed zones do not take into account private landowner rights.	2	I know a lot of work went into it; however, it misses the mark. More weight/representation should be given to the people most impacted. I hunt and have seen wolves on numerous occasions and it is a beautiful animal to see; however, the current population numbers are way too high and create conflict and an imbalance of predator to prey as long as there are also hunters and private land with livestock. Hunters are also predators - a very regulated predator and that creates conflict.
	All of it	Yes	Hunting and trapping are allowed to control population levels.	Sub-zones around reservation lands.	9	The plan is good overall. I hope wildlife management science will be the driving factor and not politics.
	Most of it	Yes	I support regulated hunting of wolves when the population can sustain it.	Overall, I support the proposed draft.	10	
	Just the parts I am interested in	Yes			2	
Rich	All of it	Yes	Not having the artificial population cap is positive.	Dogs should not be allowed to hunt wolves. This should be explicit in the plan.	6	The plan is a big improvement, but more can be done. Wolves are a great natural resource for Wisconsin and can effectively manage their own population. Hunters, poachers and out of state monies have poisoned this issue. We can only truly recognize that previous administrations have severely hindered the DNR's ability to protect our wildlife. This includes adequate funding for the department.
Tom Podlesny	Most of it	Yes	Eliminating the numeric method(350) of planning Wolf Mgnt. Wolf populations like deer,bear, turkey will vary now and in the future.	Use of hounds to hunt wolves as well as hunting wolves in February.	9	Eliminate compensation for hounds killed by wolves. Hound hunting is poorly controlled for all animals and hounds hunt coyotes,bobcats, bears and will hunt wolves leading to hounds dying when they enter pack territory. Sad but let's not condone it by paying hound hunters killed by wolves. Eliminate hound hunting practice in July as wolf pups and packs cannot co-exist in the same territory. Common sense, one has to go.
Robert Sorenson	Most of it	Yes	Considering input from diverse groups, demographics, and geographical areas.	You cannot possibly keep all parties satisfied: You face a constant battle between those who oppose any form of lethal control versus those who feel that lethal means are essential. Low deer herd numbers in the north result in many frustrated deer hunters. I feel that lethal management methods are essential to control problem wolf concerns. Yet I feel that opposition from those against any form of wolf harvest will prevent us from reaching that objective.	7	Good science. Good ethics. But it sounds like a pipe dream wish list. I see greatest your greatest challenge obtaining an adequate budget and staffing level that enables you to meet all of these objectives in a timely manner and provide a wolf harvest in the near future.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
	Most of it	Yes		The wolf management 1B subzones are too small	9	Wolves should be managed based on science. Politicians should be kept out of the decisions. Trapping wolves is cruel and unnecessary. Wolves are not dangerous to people (except in bizarre situations). People should be educated about wolves so the don't fear. Hunting wolves is not a "right" and is not necessary. We have a problem with too many deer in Wisconsin. We need more research on tick borne diseases, deer and wolves, Tick borne diseases are a terrible problem that is not being addressed in Wisconsin. Dog owners should not be compensated for wolf kills, the owners put their dogs in that situation. This plan is a step in the right direction. Keep the politicians out of wolf management.
Eric Hauke	Most of it	Yes	The state needs to aggressively manage the wolves to a reasonable population level. We do need to have a set population goal and manage to the number.		5	With the lack of management in the past few years and prior, the wolf in Wisconsin has destroyed the deer population and revenue associated with deer hunting in the northern third of the state. The wolf population needs to be managed and realistic population goals need to be held. We need a consistent realistic management framework.
Susan McMurray	Most of it	Yes	1. it removes numeric population goals; 2. it creates low quota zones around tribal lands, based on Tribes' input; 3. it focuses on ecological benefits of wolves; 4.it reflects a shift of public opinion in favor of wolves; 5. it focuses on science and research.	1. it addresses wolf/livestock conflicts with solutions based on improving farm practices and non-lethal options; 2. it ought to address hound training practices currently and if/when the wolf is delisted to restrict hound training being allowed only during wolf hunting; 3. it needs to make permanent the wolf management committee carefully established to include various stakeholders.	9	I appreciate the DNR staff who spent countless hours working with the committee, stakeholders, and the public to craft what I think is the best possible plan given the constraints of 2011 Act 169. This plan reflects core values reflected in an approach which protects, values, and sustains the wolf population.
	Most of it	No		Allows for killing wolves	1	
Peter Fee	Just the parts I am interested in	Yes	There is an emphasis on the wolves' role in ecology, and I appreciated facts such as fawns are primarily targeted by predators other than wolves.	"The breeding pair not only lead the pack but also take the lead on foraging for food, defense of the territory, and care and rearing of pups (Paquet and Carbyn 2003)". This statement could be followed by more information. I have read from Richard Thiel that breeding pairs teach the pack how to hunt. If a wolf pack is successful with wild prey and never kills livestock, they should be protected. Killing the breeding pair may cause the pack to depredate on livestock.	8	I have read from Richard Thiel that breeding pairs teach the pack how to hunt. If a wolf pack is successful with wild prey and never kills livestock, they should be protected. Killing the breeding pair may cause the pack to depredate on livestock.
	All of it	Yes	reintroducing a hunting and trapping season	I think the population goals are too high	5	
Wisconsin Chapter of The Wildlife Society	All of it	Yes	Removing numeric goals from the plan is appropriate given current wolf distributions and population numbers. This would create consistency with population objectives also used for deer, bear, wild turkey, and ruffed grouse management. We are pleased to see the Department move away from a population goal of 350 wolves, which is no longer consistent with estimates of potential carrying capacity or public attitudes toward wolves. ● Redrawing wolf zones across Wisconsin and the creation of buffer zones around tribal reservations will improve management effectiveness and help maintain viable wolf packs on Tribal Reservations and Lands. ● The plan appropriately includes a rigorous focus on wolf population monitoring, including using occupancy modeling to estimate wolf numbers. ● The plan stresses use of a science-based management approach for wolf conservation in an adaptive management framework. ● The plan continues to include mandatory harvest registration and require in-person verification. ● The plan strongly supports continued education and outreach efforts.		8	Core wolf areas in western Lincoln County were added to Zone 3 in transitional wolf range, but should be included to Zone 1, where there is greater emphasis on ecological fulfillment. ● More specific metrics of how wolf populations will be managed to achieve goals for each zone should be in the plan, including average pack size, wolf density, pack turn-over and persistence, dispersal among zones, disease spread, and livestock and pet depredations. Metrics should be quantifiable and be monitored to measure success. ● The plan needs to include a process to carefully balance numbers of permits issued for legal harvest to assure quotas can be met in a reasonable time period. The plan should acknowledge trade-offs between satisfaction for a small number of hunters and trappers over a long season versus providing opportunity for many hunters and trappers over a shorter season. Long seasons risk disruption of snow track surveys needed to adequately survey the wolf population and could disrupt wolf breeding activity. Completing seasons by early December would limit disruption of surveys needed to assess the wolf population. ● The plan should limit the training of dogs on wolves only during periods when wolf hunting or trapping is open in a specific zone. ● The plan should include a timeline for implementation.
Carolyn S	Just the parts I am interested in	Yes	Not using numerical limits. Adding buffer areas around Native American reservations	Ignores public opinion about wolves and their importance and that majority of residents are opposed to hunting wolves. Does not acknowledge scientific studies about wolf behavior, management, ecological impact, etc.	3	
	Just the parts I am interested in	Yes		There is no population target	2	
EB	Most of it	Yes	all protection of wolves and minimal and enforced hunting limits. the break out of zones. I really like the non lethal abatement strategies wking w ind farmers.	My worry is making sure that the plan is carried through and vigorously monitored	7	Truly I believe we need our wolf population and the focus on educating people to cohabit with the wolf is essential.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
M Browne	Just the parts I am interested in	Yes		Wolves should not be hunted in Wisconsin . I feel that the DNR is ignoring the prevailing opinion of the majority of Wisconsin residents in favor of the pro hunting minority.	1	It appears as though livestock owners and hunters have a louder voice than anyone else in this “discussion.” If the dnr really wants the majority opinion on this subject from Wisconsin-residents it needs to ensure that it is in a well publicized,state wide ,easily accessed format. By the time these surveys appear, the average resident has had little opportunity to voice an opinion about whether hunting of wolves should be allowed at all.. I feel that these questions are crafted to exclude an open survey of what percentage of total residents are in favor of any kind of wolf hunting.
	Most of it	Yes	The attempt to get all views of Wisconsin stakeholders.	No population goal, not even a density by wolf habitat range (good, marginal, poor). If it is to be managed like the deer season, and stake holders view of needing to increase, decrease or maintain this will be a yearly pissing match. I understand the tribes getting their fair share, but if they are not going to use their tags and the area needs to see a decrease it will be hard to do, either the tag number will need to be increased or the decrease in population will never happen. This is a set up to turn the landscape back to an ecosystem without humans hunting, the DNR is about growing the wolf population in my opinion. There needs to be a wolf population level, the agency has failed to find common ground between all parties and has failed the citizens of Wisconsin.	3	Use your field staff that have worked with citizens instead of your staff that hide in Madison behind a desk.
	All of it	Yes	Not much really. I doubt you can control the number of wolves. In my observation, numbers are controlled by the amount of deer left for them to prey on. In our area of Price County there are a few deer that have moved into towns for safety, but once you get a quarter mile out of town there are very few deer except for some more densely populated areas around lakes. "Sightseeing opportunities" for tourists are a joke. Unless you spend a lot of time in the woods hunting or trapping, none of these "city dwellers" are going to see wolves. On the flip side of that, we as hunters are seeing primarily wolves. I see 10 wolves for every deer I see. I do not understand what they are eating anymore although the packs do cover a lot of ground in their hunting. You folks at the DNR should get out from behind your desks and spend some time in the woods.	Unfortunately, you have reintroduced these wolves and the likelihood of you ever getting them "managed" is slim to none. Most of the people that want wolves in the state don't live where the wolves do so they don't have to deal with them. The real loss is the quality of deer hunting in northern Wisconsin. You've ruined it pretty much forever.	1	Thankfully there are still a few states where you can g
	Most of it	Yes		back to 1991 the total population was supposed to to held at 350 never done. Still don't have anywhere near a true number. never involved hunting groups in on the make up of this plan we make up 560,000 people. Appears to be a pet project of a minority of people. I would like to know how this is being funded.	1	I am a land owner in Vilas county. i spend quite a bit of time in the woods. When I visibly see and hear wolves more than i see deer which was not the case since owning this property since 1988 . Deer herds in this area have been devastated since the wolf has been planted here. The deer that are here are extremely skittish. Increased fawn mortality. Danger of walking and bird hunting with my dogs. The wolf is a constant threat just being in the woods with my dogs and the encounters I have had.
	Most of it	Yes	Nothing	Quit using "science, ", and eliminate tribal involvement.	2	A quota, is a quota. The dnr and its" scientists " have no clue whats going on. Population is supposed to be no more than 350 for years. You have no clue
Pam Sprecher	Just the parts I am interested in	Yes	the buffer zones around tribes not trapping, or less trapping hunting for recreation being curtailed or stopped	I did not see scientific evidence, I only saw "scientific" opinion survey showing that hunters and non hunters are on the opposite side of the issues	5	I am a non hunter and prefer more non lethal solutions.
Jan Lottig	Just the parts I am interested in	Yes	I like a no numbers cap on the amount of wolves in Wisconsin	I strongly strongly dislike the recreational hunting for control. Science seems to show that it doesn't work. Neither michigan nor Minnesota use that.	4	I strongly support anything that helps to find ways to let wolves thrive and still humanely keep them from hurting the domestic animals.
Penny Bunnell	All of it	Yes	Trying to give a better view of wolved	Any hunting of wolves, only under extreme circumstances should lethal options be used.	5	Wolves need to be better understood by the general public, no more “little red riding hood” rumors. The public needs to be aware that wolves are not taking all of the deer!
Edward Hummel	Most of it	Yes		I think wolf hunting should be off the table. The wolves contribute to a healthy deer population in Northern Wisconsin. I feel I don't have to kill a deer every year to gain satisfaction from hunting. An over population of deer may bring in more revenue from hunting but that has to be balanced but too many deer causing accidents on the road, destroying forest regeneration and decimating crops and endangered species/	2	Please see the "dislike" above
	Most of it	Yes			1	Don't know why you are wasting time taking comments, you are going to do whatever the hound hunters tell you to do. The last wolf season you had was an embarrassing joke because of the hound hunters.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
John	Most of it	Yes	Control, education, monitoring them.	Are the zones created for them too small?	9	You our are all in a tough spot balancing the needs and wants of various groups. Regardless of the decisions that are ultimately made please remember to remain flexible and continually evaluate if what we are doing is working. Good luck. FWIW, I am an avid whitetail hunter but also enjoy seeing wolves on occasion and understand there needs to be a balance.
Martin Kwiatkowski	All of it	Yes	Management through scientific info. With hunting and trapping as a tool and education.	I support compensation for livestock but not so much for pets and hunting dogs.	7	
	All of it	Yes				I would like to see mention of known public opinion on the different wolf management practices purposed. I would like to see the percentages of state residents who were for and against specific practices. In a state where the majority of people asked are not in favor of lethal mngmt. strategies, the management plan needs to reflect the priorities of the majority view. Those views make up the mandate. There are issues to coexistence with wolves, and the public is looking for more ecologically and humanely sound solutions than hunting/trapping can provide. Hounding is in direct conflict with the majority view.
Rich Hoch	Just the parts I am interested in	Yes	Making sure the wolf population continues to stay healthy and grows. They are the only natural predators in Wisconsin!	That they are hunted at all! Especially with dogs! The killing of pregnant females was absolutely horrible!	2	Please stop the hunting of wolves altogether, there's only about 900, with a deer herd of about 1.5 million. They are doing their ecological role!
Shirley Langford-Stauffacher	All of it	Yes	The draft plan takes into consideration all aspects of the possible impact of regulation of wolf populations. Some protections for the wolves but would like to see much more like no hunt season period.	Plan does not detail if a quota is set and a hunt is allowed how the DNR will successfully enforce that quota number. The last hunt season the quota was far exceeded within a few days . The public outcry was heard statewide. Also I did not understand the plan statement regarding how the coyote population would be affected since coyotes are hunted year round in Wisconsin. How would a wolf management plan affect their numbers? Does the DNR even know their numbers since you don't need a license to shoot coyote. Unfortunately a lot of hunters shoot them without thought to how they fit in to the eco-system. No limit on numbers there. And fox you can hunt for 5 months so I don't get any relative connection to a wolf management plan other than if you reduce the wolf population there would be more deer, elk, coyote, fox, etc. for hunters/trappers to take. A kill is a kill by wolf or person. Is one better or worse than the other?	4	I believe the decision has already been made to allow the hunting and trapping of wolves and that decision is pushed by in-state and out of state pro hunting and trapping groups with a lot of weight and money behind them to get what they want. And what they want is a wholesale slaughter permit and not just for wolves. The general public majority is against this hunt. Leave them be. Any perceived overpopulation problem will usually resolve itself in time. No need to always interfere with nature.
	Most of it	Yes	I like the planned adjustments and the scientific study. I think there is great value in understanding our environment including these apex predators and i think that our management should change the more information that we know about them.	I dislike the opportunity for wolf hunting that is mentioned in the management plan. It seems entirely plausible to me that, based on a natural ecosystem without human interference, wolves could manage their own populations. There are things in nature that will control their population once they reach carrying capacity so they do not need our interference.	7	I understand the worry about wolf and human accidents, but i do think human worry about wolves could be prevented or soothed by education and science. Wolves are a beautiful species that we have worked so hard to bring back and it would just be awful to see their population destroyed because humans could not stay out of it. We have already interfered in their world by laying downs roads and building cities and hunting deer, we do not need to damage it further by hunting wolves.
	Most of it	Yes	I am glad you are including indigenous tribes in the plan and respecting their desire to not have wolf harvesting on their reservations.	There are still plans to allow hunting dogs to go after wolves and paying for replacing predation losses. Both practices should be stopped.	7	I appreciate the work put into this, and I want to ensure the wolf populations can rebound throughout the time frame envisioned.
	Just the parts I am interested in	Yes	You need support from hunting organizations not animal rights activists hunters support the dnr with licenses sales	There are way more than a 1000 wolves we need a hunting season every year there should be no boundaries around the reservations	1	
Kathy Zimmerman	Just the parts I am interested in	No	1) Recognizing the ecological importance of wolves in biosphere; 2) Increasing the number of wolves in biosphere	1) The impact of killing wolves and how it affects the wolf pack, their social family group, the sustaince of the pack when an alpha male, alpha female, aunts, uncles, siblings are killed - endangrring the future of the pack;	5	Why is there a need for a management plan at all? You pick a number to cull, but do not take into account external factors - man, other animals, road kill - which contributes to numbers decline. Need to encourage conservation rather than annihialation. Rarely is a wolf killed for food.
	All of it	Yes				Wolves are killing all the fawns. Soon no one will bother buying deer tags for the northern half of the state.
	Most of it	Yes	None there was only supposed to be 350 wolves		0	Dog hunting should be allowed
Michael Dahlman	Most of it	Yes	The plan appropriately eliminates a targeted numeric population goal and acknowledges tribal interests by including low quotas in zones with treaty protections. This plan shows much greater recognition of the ecological benefits of wolves for Wisconsin's landscape. It is evident that public opinion supporting the presence of wolves has been rightly factored into this plan. Perhaps most	Wisconsin hunters should model the highest standards of ethics. The use of dogs to course wolves violates the tenets of fair chase hunting; its use should be strictly regulated and limited if not altogether eradicated. To avoid the gross overharvesting that occurred at the conclusion of the last hunt, reporting periods should be minimized to twelve hours to prevent a similar problem. In cases of depredation, proactive non-lethal methods should be promoted, recommended, and, if necessary, subsidized before lethal methods of conflict resolution are implemented after loss occurs.	9	Wolves were, are, and will likely remain a divisive and politically charged issue. This plan demonstrates concerted effort to overcome rancorous culture wars that have frustrated efforts to create a balanced and appropriate plan for all interested stakeholders. Where other states have chosen to pursue aggressive policies to all but eradicate wolves from the landscape, this plan demonstrates real and progressive efforts to respect and acknowledge the disparate perspectives of all Wisconsinites and their varied acceptance and appreciation of wolves.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
			importantly, this plan enables continued commitment to cutting edge science and continued research. This approach is much more nuanced and readily adjustable based on conditions on the ground to benefit both people and wolves.			
	Just the parts I am interested in	Yes	That there is at least some thought to the future of other animals that we actually care about in this state.	I am very sad to see that so many folks actually do not want to lower the wolf total. I have yet to meet someone that is in favor of more than a 100-200 wolves total in the state. I talk to many in western, central, and northeast Wisconsin on a regular basis.	2	Wolves need to be STRICTLY managed and only be allowed in very small areas of the north in very large areas of public land. I am extremely thankful that I do not have to deal with wolves near my farm so far. Unfortunately, I will not use any public lands in the county I live in because of wolves. There is no reason to try. So I leave the area. Bringing wolves back was one of the biggest mistakes we have made in my life of nearly 50 years. As a pro-DNR guy that has many friends working for the state including the DNR, I know that the all feel the same. It is too bad that real biologists and hunters cannot make the decisions. Instead politicians, tribes, and a bunch of people that never put any real money into conservation are making the decisions. RIDICULOUS!! END THIS NOW. If we cannot kill all wolves, then no more than 100 total. PERIOD!!!
Lindsey Ugaste	Most of it	No	Increase in wolf numbers beyond the previously limited 350, more positive ecological impact on wolves and the increase in social acknowledgements of the benefits of wolves.	Omitting and plan designed around the lack of scientific evidence made more recently to encourage and improve upon the necessity of wolves, especially to not be hunted as a form of limiting population. The abundant use of lethal measures against wolf populations that would look to be increased and allowed more freedom should not be encouraged and as such the lack of non lethal measures in the plan make it seem unlikely the plan is designed for wolf survival and longevity in the area.	3	
Rhonda Kay Witte	Most of it	Yes	Limiting the number of wolves to be harvested.		8	I do not like the harvesting of bonded families or wolf pups in the den.
	All of it	Yes	I like the buffers around the tribal reservations and that the plan doesn't specify a numeric population goal.	I am not in favor of wolf hunting and trapping.	9	
Caryn Treiber	Just the parts I am interested in	Yes	Acknowledgment of the ecological benefit of wolves	Allowing hound training during the hunt	9	We need wolves to manage the deer population which is threatening agriculture and forestry due to overpopulation.
Cynthia Allen	Just the parts I am interested in	No	Wolves will not have old goal of 350. Liked buffer zones around reservations. Ecological roles of wolves is acknowledged. More recognition of opposition of reasons and methods to kill wolves.	No info on newest science. What happens when wolves are killed (effect on ecology, other wolves, offspring, mates). No info on non-lethal control of wolves. Use of dogs to hunt/maim/kill wolves. Public values about wolves being aimed towards them being a lethal problem hindering environment. No consideration at all for wolves and their population.	3	This plan can be approached in a positive manner rather than negative.
Robin Cornell	Just the parts I am interested in	Yes	I appreciate the efforts of all WDNR staff involved in updating the state's wolf management plan. Although the current plan needs significant updating (see next section), I recognize the efforts and made to the previous plan, including: ● Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. ● There is much greater recognition of the ecological role of wolves ● The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves. ● The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed.	The plan doesn't reflect the best available science, including wolf ethology, sentience, sociability, agency & well-being. Also, it doesn't reflect the effectiveness of non-lethal intervention, especially compared to lethal intervention. It also doesn't mention the effect of killing on the wolves' social structure and their behavior. The plan still puts too much emphasis on recreational hunting as a management tool. The plan should sharply curtail lethal management of wolves. Research finds that allowing the liberal killing of wolves increases illegal killings as well. There should be no hound hunting at all. There is a lot of conflict between hound hunters and residents who just want to enjoy their property. Many residents think the hounders get away with too much and don't respect them. Hound hunting is cruel to wolves and the dogs. There should be no reimbursement to hunters for hounds killed by wolves, ever. They choose to put their dogs at risk. Wisconsin is the only state that has this misguided policy. Many Wisconsinites oppose hunting with hounds and trapping. This is not reflected in the plan. 62% think hunting wolves is unnecessary, and 57% think it's offensive to native Americans. There is a lack of regard for individual wolves. The concern should not be just with a healthy population. Each individual's life matters to him or her. Use of SOM wolf estimation methodology. The WI method would over-estimate wolf abundance. It shows significant departures from best practices in scientific measurement.	7	More consideration for the views of the vast numbers of Wisconsinites who don't hunt or trap. People care about individual animals, not just healthy populations.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Larry Oftedahl	Most of it	Yes	Unit specific wolf management. Science based decision making. Reducing wolf and human conflicts. Continued monitoring and public education.	Continue paying for hunting dogs killed by wolves. They should know and accept the risks, it's part of hunting in a natural environment. Also, one way to reduce human and wolf conflicts is by eliminating bear hunting with dogs. It's no longer a "rich" tradition but an old hunting method that has become morally unacceptable. I hope we have evolved and improved our wildlife values, and how we care for wildlife to the point where hunting anything with dogs is reprehensible and outdated. It is far from "fair chase". It's a bitter and sad end to a bear, or any other game animal when it is terrorized by dogs before being killed. I for one think much more highly of the game I hunt and would never want to inflict such terror and pain on that animal.	9	I am very impressed with the time and effort made to put together a well researched and thoughtful plan. Congratulations to all. I just hope this plan moves along well and does not get cut to pieces by political hacks and special interests that do not represent the vast majority of us.
Ben Thompson	Most of it	Yes	The draft was well put together. I liked the information from previous survey and how it was broken out between those who lived in wolf range those who lived outside of it.	No, It was well rounded and addressed the wolf management from many angles. It captured a lot of information.	6	Managed hunts must be one of the tools for managing wolves. I think we have plenty of wolves and do not see a reason to allow a higher population than Wisconsin currently has. There was reason wolves were killed off. That is because they like to eat the same food as humans both wild and domestic. Having the wolves help manage the old weak wild animals make sense. But when they affect the availability of game animals for humans to harvest. That is where I have an issue. That is balancing point of wolf management.
Todd Strassburger	All of it	Yes	The detrimation of deer and elk from wolves		10	
Elizabeth Temple	Most of it	Yes	Appreciating the role of wolves (or any carnivore) in balanced ecosystems. Taking out a population goal as a specific number. Paying attention to the wishes of WI Tribes. You did consider the views of the Public from the surveys. I liked the sections that dealt with Wolf Population Health and Captive Wolf Management. I hope the current science continues to guide you and better means of measuring and determining populations and packs is pursued.	A management plan really does not have to be so lengthy. The history is essential and needs to be maintained as a separate document but does not need to be in a plan. Section 4 is the most important and needs to be expanded. I don't like the idea that wolves need to be managed or hunted/trapped at all. Coming off the ESL should not be an automatic to allow hunting/trapping. This goes for any species. I was puzzled by the term "verified wolf depredation" as it referred to Wolf/Livestock Conflict. Who determines it? You used the term "tip of the iceberg" regarding costs to livestock producers. Why don't you know? Don't they submit reports to the DNR? The graph, p. 74, interestingly and puzzling, saw the highest number, 48 in the yr 2021 as representing farms with losses. This happened right after the WI gray wolf was removed from the ESL?!! Was this the justification to start hunting them? The premise needs to be that property owners/farmers must do what is necessary and absorb all costs to protect their flocks/herds from predation from everything short of killing anything. Chicken/egg farmers have to build stronger pens/buildings to protect their property from nature that will always "want a chicken dinner" from the air or field! Why should cattle/sheep farms be any different? If one chooses to have this kind of business, one has to absorb the costs of losses and not depend on government agencies and the taxpayer to compensate them. "...extra hrs spent on herd surveillance, repairing fences, attempting to locate missing calves and coordinating depredation investigations" IS THE COST OF DOING THIS KIND OF BUSINESS! Our publicly-owned vanishing precious natural resources should not be used and abused by individuals seeking profit. This goes for everything from water, soil, air, animals, forests, etc. Page 77-78 Abatement Options needs to be significantly expanded. LIkewise, hunting/training dogs injured or lost during the hunting of any animal, wolf or not, is the cost of the individual pursuing that activity and cannot be reimbursed by the governmental agency/taxpayer. 1991 perspectives, page 84, has evolved to the 2022 perspective to avoid lethal control of wolves. Please emphasize this since wolves are seen to go on and off the ESL!!! We have to change the $2500/hunting dog/pet and vet reimbursement! It is just wrong! As a taxpayer, I do not want my money going to justify hunting wolves! Does the DNR reimburse for any other wildlife/hunting domestic animal encounter?	8	A great start and I appreciate the work and research that this required. Thank you for including input from the public and tribes. I hope this is codified to make it less susceptible to major deleterious changes.
Nancy Stier	Most of it	No	There was an attempt to evaluate the population of wolves in different areas of the state.	Human fear should not be a factor in decreasing the wolf population. Wolves are not likely to harm humans but woyld rather avoid them	6	Killing wolves should not be treated like killing wildlife that consumed for food. Dead wolves are just treated like trash.
Aley Schiessl-Moore	All of it	Yes	-Not using the old number of 350 wolves -Better recognition of the ecological importance of wolves -proposed buffer zones around tribal reservations -the use of fox lights. I work for the Zoological Society of Milwaukee; members of our team have traveled to Belize to study jaguars and use fox lights to discourage jaguars from entering human or livestock areas and they are HIGHLY effective. These should be encouraged.	-It is missing scientific evidence of the effectiveness of non-lethal interventions and the way widespread killing of wolves impacts their physiology, behavior, social dynamics, and more. For example, the killing of wolves only encourages pack splintering, worsening the threat on livestock instead of making it better -Recreational killing runs contrary to scientific evidence. Furthermore, policies that allow the liberal killing of wolves leads to an increase in illegal killings. Lethal management does not lead to long-term solutions, and non-lethal means leads to better conflict mitigation. -Omissions of scientific literature, the dismissal of concerns for wolves is biased and unscientific.	4	studies that may be valuable: https://www.science.org/doi/full/10.1126/sciadv.aao0167 https://journals.plos.org/plosone/article?id=10.1371/journal.pone.0153808 Santiago-Ávila, F. J., Cornman, A. M., & Treves, A. (2018a). Killing wolves to prevent predation on livestock may protect one farm but harm neighbors. A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Shane Thiel	Just the parts I am interested in	Yes	The fact, that there is finally a management plan drafted...this should have been done years ago!	I dislike the fact that there is no population goal set!	2	In all honesty it sucks..how is anyone to know if the plan is working or not with no set population goal? The wolf population in this state is way higher than any of the guesses you guys have came up with..and your population estimate...is just that a guess! We need to have a set population goal! And we need to limit the control that federal judges have on the wildlife in our state! We as a state should have final say on our hunting rights, not a federal judge in California or D.C.
Charles Songler	Most of it	Yes	Hunting season to control population	Numbers are too high. Much much higher than promised by DNR when introducing wolves.	3	Why are numbers so high for Bayfield county. Most of the deer are chased off public property onto private land. This is dangerous for hunting and causes conflict with hunters and private land owners. More hunting of wolves should be aloud in Bayfield county and more wolves should be shipped to southern Wisconsin.
	All of it	Yes	That there is finally a plan after such a long time!	That there isn't a specific goal number for maximum wolf population!	4	There was a maximum wolf population number!!!
	All of it	Yes	None, we need to know the number of wolves there actually is to determine a good harvest controll, i do not believe anyone know how many there actually is, everywhere you go when there is snow on the ground you will see evidence of them, ther is no possible way anyone lnows how many there is.		1	I believe the deer hunters, bird hunters, bear hunters, would all have a better idea of how many there is and the dnr should seek the knowledge of the people who spend the time in the woods.i know as a hunter ive seen the deer heard diminish at a very alaming rate, when you go from seeing 24 to 28 deer everynight bow hunting to seeing 4 to 5 everynigh in a couple years and the only difference is the amount of wolf sign your seeing. Please get a accurate count on the wolves, there is more than anyone realizes.
Lori McCoy	Most of it	No	That you took the time to learn Native People's concerns/religion.	The tendency to kill wolves rather than relocate		The first sentence of your mission statement mentions protection, but scale of practice seems to favor cruelty and eliminating instead
	All of it	Yes	I like that you are recognizing the ecological significance of wolves, that you understand that the majority of Wisconsinites also recognize & appreciate the wolf & its positive impact on the eco system. I like that you are understanding the significance of the wolf by proposing buffer zones around tribal reservations.	There does not seem to be any reflection or use of scientific data or science in any of your proposed draft plan. I don't think it is possible to have a viable plan for the wolf without utilizing science. The wolf is a keystone species vital to nature, wildlife, climate how can you begin to understand them & protect them, the land, climate, eco system without any understand or implementing of the science?	2	This plan does not address non lethal wolf management. They are many viable non lethal methods in dealing with wolves & wildlife in general there is no sound reason to kill wolves. In fact killing them is not management but murder. That is not what we Wisconsinites want for our wildlife or wolves. There should be no hunting, with or without hounds... Hounds, dogs should never be set on any of our public lands hunting for their prey, that is not the intent of these lands. This barbaric tactic should never be used on our public lands. If you truly want a viable plan for the health & growth of all then you must understand the value of a healthy wolf population to the environment & implement the necessary tools to achieve this. Hunting, lethal methods, killing wolves is not a viable or acceptable draft wolf management plan.
Charlynn Fuller	All of it	No	I appreciate the evidence of benefits of apex predators. They're essential for a healthy ecosystem everywhere. Apex predators make for healthy prey herds. Also, personally, I appreciate the conversation with local tribes as well as a local survey. I'm glad residents have spoken.	I'm very concerned with the numbers the plan is quoting. The plan quotes an estimated 972 wolves over 23,313 square miles, but how can that be when in Yellowstone National Park supports 123 wolves (9 packs) over 3,468 square miles(found on yellowstoneparks.com). If you do the math (divide 23,313 square miles by 3,468–you get 6.7. Then multiply that by 123. This gives you 824 total wolves estimated to be in WI not 972). Since the plan uses its numbers of estimated wolves to determine how many are allowed to be killed, I question your numbers. They don't add up. You need better studies. Wolves take nominal numbers of livestock as numbers show. Indiscriminate slaughter of wolves will lead to more livestock deaths, because without the proper leadership in their packs, they won't learn. In all honesty, predators as a whole stabilize their own numbers. They have ebbs and flows in correlation with their prey and weather as well as disease.	2	You need to get actual numbers of the wolves. You shouldn't do an estimate and use the estimate to base your culling numbers off of. You could be wiping out your wolves without realizing it.
Mike Carlson	I have not read any of the draft plan	No				To complicated and long its not that difficult some management is ok to maintain healthy animals it takes a balance of hunting conservation trapping and some sightseeing this will keep everything in balance and some financial help as well .
Angie Arden	All of it	No	It is progressive and optimistic that the tribal voice will be considered and understood, reflected in this plan.	The consideration of a wolf hunt is a contradiction to the data and current science statistics, findings.	2	The current draft wolf management plan does not include non-lethal methods of conservation management and conflict resolution strategies. However, compensation for livestock is a reasonable, viable solution along with non-lethal methods. Review data and percentages.
	Most of it	Yes	Couldn't find any	Not having any numbers	1	What kind of a company would draw up a supposed plan for anything without the use of numbers! Pathetic. A laughing stock! Its now obvious that the DNR along with Evers is in bed with the bunny huggers
	Most of it	Yes			0	
Rosanne Repinski	All of it	Yes	read comments below	ditto above	1	I really feel farmers and those affected by wolf killing on property should be able to kill that wolf. I live in central WI and have SEEN more wolfs in the past 7 years than I did the rest of my life when I traveled northern WI and Michigan and witnessed 2. I know the uncanny feeling when walking outside my house and you know you are being watched by a wolf. We need control and keep the numbers in the 300 range.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Karen McFadzen	All of it	Yes	Many aspects. Especially the science based management approach, wolf population monitoring, redrawing wolf zones across Wisconsin and creation of buffer zones around tribal reservations, mandatory harvest registration and in-person certification requirements, removing numeric goals, continued education and outreach.	1- Eliminate the use of dogs when hunting wolves or bears. Eliminate training of dogs to hunt wolf or bear. 2- Do not compensate for loss of hunting dogs - only livestock loss. this promotes the "disposable dog" mentality. Using dogs promotes cruel injury/death to both the hunter and hunted species. 3. Eliminate all trapping - due to cruel and indiscriminate nature of trapping. 4. Carefully consider the composition of the Wolf Advisory Committee to ensure it is representative of the broad range of wolf concerns across the state, particularly tribal concerns, and adequately represent the science needed to properly manage wolves in Wisconsin.	7	Thank you for the comprehensive, thorough, and thoughtful work put into developing and producing the Draft Wisconsin Wolf Management Plan. I learned a lot while reviewing this plan and the Wisconsin Green Fire analysis dated Jan 2023. I have rural property in Oneida Cty and appreciate the fact that wolf are in the area. Public education is vital to help people understand the value of wolf and how to exist concurrently. The tribes input can provide valuable perspective. Please consider the additional Wis. Green Fire changes and additions outlined in their January 2023 Analysis. The WDNR should resist efforts to reduce or limit its power to establish harvest quotas and determine the timing,method, and form of wolf harvest. Wolf population monitoring and specific metrics for wolf population health and sustainability should be established and used across the state, and the Plan should include a clear plan for implementation, funding, and collaborative efforts across Wisconsin and the Great Lakes region to maintain a healthy wolf population. Thank You for extending the public comment period and for the opportunity to voice our opinions. (hopefully everyone does so in a civil manner).
Emily Volckmann	Most of it	No	The elements that I like are those that speak of the importance of wolves as a keystone species. It was confirmed that when wolves were reintroduced to Yellowstone National Park they balanced the ecosystem and it became a healthier habitat. I also like that the plan includes means of tracking packs to monitor populations changes.	Wolves have to battle with being hit by cars and finding room on the landscape that humans have not occupied. There should be no lethal management as part of a wolf "conservation" plan. Although there are protected packs in tribal areas, wolves do not understand those boundaries. Those packs will likely be affected by the wolf hunting permissions.	5	I believe wolves should be federally protected because the species has barely begun to recover from our past slaughtering.
James OBrien	Most of it	Yes	Objective to include Wolves and their role in a healthy ecological system.	I am a hunter, BUT allowing dogs to be used in wolf harvesting is flat out ridiculous.	7	Tough issue, but I tell the Wolf haters that the Wisconsin Woods would be a less special without them. Most don't disagree. Thanks
	Most of it	Yes	The fact you are considering to regulate wolves. Admitting (indirectly) that insurance companies want wolves around.	We felt the need to regulate the <300 elk in northern Wisconsin but when you finally admit there are over 1000 wolves, it literally takes an act of Congress to regulate them. Why so vague on the population you want? You don't have that much of a problem with bear.... Or any other animal really.	6	It probably goes without saying Wolves up Deer down Revenue down Tax payer hush money for pet and livestock death up
Trina Malone	Just the parts I am interested in	No	● Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. ● There is much greater recognition of the ecological role of wolves ● The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves ● The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed)	● The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on (see reference list below): ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution ● The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. ● The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ○ A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings. ○ Hounding or hound training, which are akin to allowing legalized dogfighting, should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public. ● The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. ○ Despite Act 169, which mandates a wolf hunting season, the department can still restrict the implementation of lethal methods by setting minimal quotas, including a quota of '0' wolves, restricting timing and methods. ○ Several studies have proven a proactive non-lethal approach leads to better conflict mitigation. ○ Lethal management often fails to provide a long-term solution to wolf predation and has the least consistent success rates when compared to non-lethal practices. In addition, there is significant evidence showing that lethal wolf management may be less functionally effective at mitigating subsequent livestock losses than non-lethal deterrents. ● The plan should require the implementation of abatement measures as well as the use of non-lethal conflict minimization techniques by domestic animal owners for the latter to receive compensation for confirmed predation. ● The plan also runs contrary to public values towards wolves (and omits mention of such majority values from the plan), despite department surveys evidencing that the broad public cares about wolves as individuals (and not just for the viability of the population). Given the recent liberalization of killing wolves by the state, it would be incredibly informative to note majority support of the following reasons for opposing a regulated wolf hunting/trapping season (which are all omitted from the plan): opposition	5	

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
				to specific methods of harvest like hounds (64%) or traps (70%), feelings that hunting wolves is unnecessary (62%) or culturally offensive to Native American tribes (57%). ○ All such reasons convey majority disagreement with practices currently promoted and endorsed by the legislature and the WDNR, and such a conflict between managers and the public should not only be acknowledged, but foregrounded and carefully considered in policy (instead of dismissed). ○ Such decisions to omit literature or downplay evidence (e.g., such as majority opposition to killing wolves and their reasons) are contrary to principles of scientific integrity (e.g., present all relevant scientific evidence to the public) as well as ethics (e.g., disguising ethical decisions, such as recreational wolf killing, as robustly supported by science). ● Conflicting agency objectives (e.g., optimizing public hunting and conflict mitigation) are not only not acknowledged, but even misunderstood as harmonious, against the body of scientific evidence. That culminates in the prioritization of consumptive values and policies; e.g., according to the body of scientific literature, use of lethal methods, and 2 especially public hunts, are contrary to most objectives relevant to: harm mitigation, the wellbeing of wolves, their ecological roles, and their non-exploitative enjoyment (i.e., Objectives A, B, D and F). ● There is a stark lack of consideration for individual wolves, wolf population health (including wellbeing), and measurable indicators for assessing any harms barring disease prevalence (e.g., accounting for cortisol levels or other stress hormones, measures of pair/pack persistence) ● There is an inappropriate understanding and consideration of tribal worldviews about wolves. Tribal worldviews of wolves are misconstrued as 'cultural benefits' tribes receive from the existence of a wolf population, when in fact tribal worldviews consider each individual wolf as a person and relative. Cultural respect and sensitivity towards such views, shared by many non-tribal members, demand the strict mitigation of lethal measures, especially recreational killing, as opposed to their current promotion in the plan. ● In general, all omissions of scientific literature, the arbitrary prioritization of policy objectives, the rhetoric of the plan and the dismissal of public values and concerns for wolves point towards a biased, unscientific and instrumental view of wolves that promotes values contrary to broad public perspectives on wolves. ● 'SOM' wolf estimation methodology – From a recent critique: "The new methods sacrifice precision, but are believed to retain adequate accuracy and sensitivity to changing conditions for reliable decision-making. We review evidence for the accuracy, precision, and sensitivity of the new 'scaled occupancy model' (SOM) applied in Wisconsin. We conclude that the Wisconsin method would systematically overestimate wolf abundance by large (but currently incalculable) margins. Because Wisconsin, similar to other states, not only changed to unverified methods but also implemented widespread wolf killing, shortcomings in their estimates of wolf abundance may have far-reaching consequences for population viability and confidence in state wildlife managers. We discuss findings from Wisconsin alongside similar findings for other states' occupancy models being insensitive to human causes of mortality that have recently increased. Overall, Wisconsin's proposed method for estimating wolf abundance shows significant departures from best practices in scientific measurement. Verification will require independent replication and unbiased tests at multiple scales in multiple habitats under different human-induced mortality rates, and peer review before the new methods are considered reliable." (Treves & Santiago-Ávila, 2023)		
	All of it	Yes	Creation of zone 1A as relates to livestock predation. Maintaining year round wolf population monitoring, and continued emphasis on radio-collared wolves, though I belive GPS collars would be a much better and modern technology to utilize.	1)Highly dislike creation of subzones 1B and 2B as relates to creating special zones for tribes 2) Lack of population goals as exists for other manageable game species 3) Zones are too large to quickly respond to harvest goals. Lone wolves or wolves dispersing from their home range and not counted in population estimate.		1)Tribes are not active participants in wolf management and special zones surrounding the reservations would extend tribal rights beyond their federally designated boundaries and penalize non-tribal people on non-tribal lands. This would take away constitutional guarantees and rights held by private, non-tribal citizens and will result in expensive/time consuming lawsuits in which the state will lose in court. 2) I do not have high confidence in a management plan that does not have a specific numbered goal, especially for those populations that live in the parts of the state directly impacted by wolf numbers. 3) I would have like to seen as much input from county and township governments as seen from other key input groups. 4) I would like more emphasis given as the wolf as a harvestable game species. It seems the DNR has not been overly enthusiastic as it should be on this point compared to the effort to manage other species by hunting. 5) Lastly, I believe the social carrying capacity of 350 wolves laid out in the 1999 wolf plan be the numeric population goal.
Richard Karow	Most of it	Yes	Allowingzone specific hunting for wolves	Not having number specific goals for population's of wolves	4	

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Daniel Lawrence	All of it	Yes	More control on number harvested.	Don't like that wolfs can be hunted with dogs and hunters driving wolfs.	7	I had drawn a wolf permit for the first time in the previous wolf hunting season. I took off work for going up north, on public land, to set a couple of traps and to try still hunting while calling. Had everything set up to go and the quota was met for the southern zone before i could even get into the woods. Something does not seem right when such a large number of wolfs are harvested with use of dogs and large hunter drives. Thanks for listening. Daniel
Sue Schneidler	Most of it	Yes	The plan does a good job by --eliminating the arbitrary wolf population number --showing the tremendous support that wolves have from Wisconsin citizens and how that favorable support has significantly increased -- including good scientific research, which recognizes that wolves are an important component of a healthy ecosystem --increasing acknowledgment and inclusion of Native American values and goals for wolves and creating buffer zones around tribal lands --shortening reporting requirements --and making hunting licenses zone specific	The report does NOT but SHOULD --include a plan to work with the legislature to overturn Wisconsin Public Act 169, which mandates a hunting and trapping season for wolves when they are not protected, and actually consider an end to recreational hunting of wolves in Wisconsin. --stop hounds from hunting wolves (such a cruel and barbaric practice that we are the only state to allow it!) --eliminate hound training --remove reimbursements for hounds killed or injured by wolves --stop using recreational hunting/trapping as a conflict resolution tool, which has no scientific basis Wolves operate as a group to take down large prey. When members of the pack are killed, it causes the wolves left to shift to easier domestic prey. The DNR should prioritize responsible farming practices and other non-lethal options to reduce wolf and livestock conflicts. In addition, the Occupancy Model, which relies on territory size, should not be the only way wolves should be counted. The model makes assumptions without facts and can be manipulated. The plan also needs to include a guide on how the final wolf plan will be regularly updated and reviewed by biologists and environmental professionals and specialists, not just hunting organizations, who were overrepresented on the committee even though they represent the minority opinion of the people in Wisconsin.	7	The law requiring a wolf hunt was created by hunters, some from even outside of Wisconsin, pressuring legislators during the Walker administration when a real estate agent was the head of the DNR. It was an especially low point for wildlife and the environment in Wisconsin. The requirements for the wolf hunt were set by the bear hunting groups in Wisconsin. That's why we have dogs hunting wolves. There was no scientific basis or public input for any of it. Dog fighting is illegal. We have so many dog lovers in Wisconsin that most people here are horrified by the idea. So why is it still allowed by the WI DNR? This law, PA 169, actually triggered the last slaughter of wolves in Wisconsin when 218 wolves were killed in 72 hours because an out-of-state group sued to force the immediate reinstatement of a wolf hunt. Control of the wildlife and natural resources in Wisconsin should in the hands of the Wisconsin DNR, not some outside group. There should not be a law that says something like killing a wolf must be done simply because someone wants a trophy pelt or bragging rights. The decisions that the DNR makes should be based on science and expert opinions for that particular species. Wisconsin Public Act 169 must be overturned.
Julie Harder	Just the parts I am interested in	Yes	1. The removal of a numeric population goal. It's important to be able to adapt the population numbers, based on circumstances and scientific updates. 2. The low quota zones around Tribal lands. 3. The focus on how wolves are beneficial to the ecosystem of the state. 4. It takes into account the opinions of the general public as well as specific stakeholders. 5. The commitment to using science to inform decisions.	1. The current draft allows hounds to chase wolves (for training) until the last hunting zone closes. This could be very stressful on wolf populations, especially during the late winter breeding season. A better plan would be: When each zone's hunting closes, the hound training within its borders should also close. 2. The draft does not plan for the next update--it should be amended to specify when the next review and update will occur. 3. There should be ongoing science committees to oversee wolf management, as well as ongoing stakeholder input.	9	In February 2021, the wolf kill exceeded the state quota by 83%. Further, this occurred during the breeding season. Any new plan should both guard against such an overkill and also ensure that hunting does not take place during vulnerable periods, such as the breeding season.
	Most of it	Yes	Supposedly based on science, real data & facts.	That Fred Prehen "over stayed his welcome" to skew this toward minimizing/eliminating Wolf Populations. Put a Republican twist on things.	5	Triple or quadruple the license costs/fees for anyone who is not a state resident to hunt/trap wolves during any hunt time. Fines for hunting wolves "out of season" triple them. All this is to "control" the population of "macho men/Rambo" types who come into this state to be a pain to any of us who own land and whom these outsiders think they can run over the top of during a hunt. Hunting wolves on reservations should be strictly and only controlled by the tribes - no one else. Population goals for the wolves in general should be almost doubled from today's in my opinion. Side Note: What about better control of coyote populations as well as cougar/Mt. Lion? Given a choice would much rather prefer to deal with wolves directly than coyotes or cougars.
John S. Thiel	All of it	Yes	Population Goal: I strongly agree with not setting a numerical goal. Wolves have essentially recovered in the upper Great Lakes and this no longer has meaning. During recolonization the establishment of numerical goals was useful. Wolf Management Zones: I totally agree with the creation of subzones 1A and 4A in addressing depredation hotspots. Also the buffer zones surrounding reservation boundaries. Wolf Occupancy Model: I support this with continued refinement and improvement. With smaller wolf territories in the central forest region the model needs to be refined. I also support the development of parallel means of determining wolf population with emerging technologies such as genetics. Wolf Conflict Management: I strongly support research and testing of new abatement methodologies and targeted lethal removal. Wolf Harvest Management: I strongly agree with reducing the reporting window to 8 hours. This would hopefully eliminate over harvest. I also support zone specific harvest tags. Wolf Advisory Committee: I strongly agree with establishing this committee and with a wolf science committee panel. Wolf Research and Education: I support a DNR science team on par with what	Wolf Management Zones: I am not in favor of removing Lincoln County from Zone 2 to 3. This is historically, and continues to be, core wolf habitat and should remain in Zone 2. Wolf Occupancy Modeling: More GPS monitoring is needed in the Central Forest. This and other monitoring methods would help refine the POM model in the area. Wolf Harvesting Management: I am opposed to the manipulation of permit issuance. This will interfere with breeding activities, track counts, coyote hunting, and eco tourism. I am also against hound hunting due to the biological and social similarities of this animals. Not good for either. I would like to see studies on injuries and deaths of dogs due to encounters with this hunting technique (not just wolves but bear hunting as well). Wolf Related Tourism: This does exist but to what extent? You would have to develop some kind of metric to demonstrate a financial benefit. It would certainly help communities in wolf occupied areas to have this information which might lead to better attitudes and values. Wolf Advisory Committee: Educational and Research groups should not be combined with wolf advocacy groups. The former are often at odds with advocacy groups as they are primarily focused promoting science based information whereas advocacy groups base a lot of their information on emotion often resulting in misinformation (not necessarily intentional).	9	This is very well done. An impossible job trying to provide for all groups concerned as well as the needs of the resource. Aside from some of my dislikes, I could definitely live with this with the understanding that this should always be a working document subject to revisions. Thank you for your hard work and for allowing my comments.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
			it once was prior to all of the political cutbacks. I also strongly support the collaboration and cooperation with NGOs.			
	Most of it	Yes	The fact we do need a management plan. They do serve a purpose in keeping the herd healthy.	It appears there is more interest in the wolf than in the fact that hunting tradition and hunter numbers in the north woods have declined greatly in the last 10 years. That greatly impacts the lively hood of countless people in the Northwoods.	2	The anti-hunters in the southern third of the state have an opinion on something they know nothing about. They have never had any contact with one, so have no idea what that is like. Like all creatures exposed to more human contact, they are losing their fear of us. I have experienced this on a couple occasions myself. Maybe the answer would be to introduce a pack to Madison or Milwaukee and see what the reaction would. They have been complaining about coyotes attacking pets on walks through parks for years. This woud be a notch up for them.
Don Kaldunski	Most of it	Yes	Stating all the studies that have been done and pointing out their findings and commenting on their strengths and potential shortcomings. Data and graphs.	It was all good.	10	Thank you for putting together such a comprehensive, factual, scientific proposal and making it available for the public to read.
Jennifer Burish	Most of it	Yes	Please stop the cruel torture and killing of wolves! You can tranquilize and spay/neuter to control the population.	When you kill them your destroying their family, there is other ways to control population and the safety of them and others.		Please have a heart and do what's humane and best for the wolves and their family packs. Thank you
	All of it	Yes	The emphasis on maintaining a healthy and sustainable wolf population, while recognizing the need to control the wolf numbers, especially in areas of human conflict.	1.) I strongly feel that the plan must include a science-based numeric population goal. 2.) The tribal "buffer zones" are a bad idea and may lead to other unintended consequences. Many areas adjacent to reservation lands are already dealing with serious tribal night "hunting" issues involving tribal members who can legally road hunt on reservation lands, insisting on illegally shining on state and privately owned off-reservation properties. Allowing tribes to protect "their" wolves off-reservation will set a terrible precedent. This restriction as proposed is a huge encroachment on private land owner rights. 3.) The tribal claim that protecting wolves is a viable method of controlling CWD in the deer herd is completely disingenuous, since tribal members continue to utilize bait extensively to facilitate night deer "hunting" on the reservation, although a baiting ban has been in effect for years in Vilas County. If they were honestly concerned with controlling CWD, they would agree to stop baiting. 4.) The proposed hound hunting restrictions are not acceptable and would likely result in further restrictions upon bear hunters as well. Many outside groups (PETA, et al) are working hard to eliminate all forms of hound hunting and see the wolf plan as an opportunity to accomplish that goal.	3	
Bill Munch	Most of it	Yes	Really none	There needs to be a goal number of 350 Wolves. The buffer areas around reservations are way too big.	1	The deer herds of the north have been decimated by predators and overharvest of does for over 20 years. We need to cut down the wolf numbers to let the herds rebound. Also, the people who reside in wolf areas should have more of a say in wolf management than those in the southern part of the state.
Leigh Coenen	All of it	Yes	Liked the way the areas are broken down by zones.	I dislike not having the numbers of wolves in each zones. Example: I have a hunting shack in Southern Bayfield County where there are too many wolves.	4	The process is moving too slowly.
Dr Rin Porter	All of it	No	The parts where the Wisconsin tribes explained their views of the wolf, and the parts where scientific research on wolves was presented.	The assumption (in Objective C) that people have the right to kill wolves, and specifically the term "harvest", which implies that the wolves will be eaten, which of course they will not. To harvest something is to obtain it for use or consumption. Wolves are killed simply because some men believe that it is right to kill animals for no reason. Hunting and trapping wolves (or any other animal that will not be eaten) is unethical and immoral, in my opinion.	5	The plan presents voluminous research in its first half that shows that killing wolves damages pack structure and behavior, and that killing wolves does NOT increase the numbers of deer or elk. Even though citizens of Wisconsin believe things that are not true, the DNR should not enable wolves to be killed just because of those erroneous beliefs. The DNR should advocate for ELIMINATION of wolf hunting and trapping, bear hunting and trapping, fox and coyote hunting and trapping, etc. These activities are barbaric and wrong in any society.
Ken Goldsmith	Most of it	No	1. The importance of the ecological benefits of wolves and inclusion of tribal values and knowledge. 2. The elimination of a numerical target population 3. The attempt to minimize the impacts of a recreational hunt by adopting buffer zones around tribal lands, shortening reporting requirements and making hunting licenses zone specific. 4. Emphasizing the use of non-lethal methods to reduce conflicts.	1. The plan should establish a zero hunting quota to protect wolves in our national forests and other areas prime habitat. 2. The recreational hunting/trapping to reduce conflicts has no scientific basis. 3. At a minimum, DNR should ban the use of dogs to hunt wolves in our national forests. 4. There is considerable uncertainty in estimating wolf populations based on the occupancy model and should not be used solely to determine population. 5. Hound training must be stopped. 6. The plan needs a commitment by DNR to work with the legislature to overturn PA 169 and remove payments for hunting hounds killed by wolves. 7. The plan should include an oversight committee which is comprised of biologists and professionals.	7	Overall, the plan is fairly good. However, too much emphasis is placed on the killing of wolves rather than co-existence. The Committee was overrepresented by hunting organizations even though they represent the minority opinion of Wisconsinites and Americans.
	Most of it	Yes	basicly none	bounderies for indian reservation	1	start by listening! to the people who have to deal with them.by the time we get a hunting season how many more wolfs will we have.it seems t so much put some in the cities.wheni let my dogs out i have to carry a gun o me that the dnr is holding hsnds with pro wolf people most never will have to deal with them.if they love the wolves so mu put some in the citych
	Most of it	Yes	Information on keeping the wolf population sustainable and healthy keeping in mind all the many groups that factor in to any decisions.	Too much scientific detail for the lay person. Hard to find the simple points of how will the wolf management work in order to not have over kill of the wolf population.	7	Important that education (which is defined in the report) continues so general population understand the importance of wolves to ecology and nor be guided by irrational fear often promoted by media.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
chris baird	All of it	No	less focus on a specific number of wolves.	needs to prohibit hunting of wolves	2	
	Just the parts I am interested in	Yes				The main purpose for my contacting through this survey is that I wrote an extensive letter to the email provided, only to find that the the email is apparently not a usable email address as it is continuously “rejected by the server” Very frustrating that the DNR does not want us landowners to be heard.
Dave Kolbenschlag	All of it	No	Removal of 350 wolf goal. Why have a goal? The ecological impact of wolves. Buffer zones. Social survey. Greater awareness of the public about these beautiful creatures.	Lack of best available science. Much needs to brought up concerning non-lethal interventions. More public information and education about wolves needs to be done. The use of dogs must be totally outlawed. Injury to both dogs and wolves occurs. This is a very cruel way to hunt. Hunters need to learn to use their own initiative in hunting. Hunting season should be severely limited and every wolf killed or wounded must be proven. The quota for wolves should be ZERO! In my opinion wolf killing should be outlawed completely, If a need for culling appears then it should be done by state and scientific professionals only, not by egotistical public hunters..	5	I have supported wolves all my 75 years of adult life. I believe if somehow education of the public about these basically harmless souls can be done it should be. Wolves do not carry away babies to eat, nor children or adults. Leave them alone they will leave you alone! Unfortunately videos, movies etc still film the Big Bad Wolf!
Nancy Brooker	Most of it	No	The buffer zones and the acknowledgement that wolves, like all species, have an important role to play.	Although an improvement, the plan does not go far enough to protect wolves or to help mitigate human-wolf collisions. Hounding is abhorrent. Hounding and other deliberately cruel methods should be illegal. Lethal wolf management is not the most effective means of minimizing livestock-wolf issues. Using SOM is basing policies on assumptions.	6	
	Most of it	Yes	Sustaining or even increasing the present wolf population. The wolf is necessary for the rest of the wildlife population.	In general, I don't think the deer hunting population should be the indicators of how the wolf population is managed. If people choose to have domestic outside pastured animals, then they should have the reliable dog protectors that have proven to be effective.	3	People who worry about wolf interaction regarding children and domestic animals need to be proactive. The same needs to be done for both even when living outside of wolf country.
Dianne Caspersen	All of it	Yes	I liked the clear an d precise graphing overviews. The document was extensive to read, but as a science educator, the information was highly interesting and clearly presented. All aspects were covered from historical to indigenous features. I was especially interested in the environmental balance data and the management plan on page 101 with stated objectives.	The length of the document does not lend itself to be read by the average citizen. Perhaps a shortened user friendly synopsis of data could be provided for use. However, the information presented is all necessary for the purpose here.	10	This is a beautifully written ,thorough document. I am highly interested in future education plans, beginning at the elementary level for schools to incorporate for awareness of the wolf population issue. If you ever need help with this I would gladly volunteer my time. I was a Conservation teacher of the year and have won many national teaching awards. I am currently retired and have moved from Pennsylvania to Wisconsin two years ago. Living on the Menominee River I have experienced much of the local wildlife. Thank you for your efforts with this informative and educational document. Dianne Caspersen- [redacted]
Robert Pacocha	Most of it	Yes	Being able to manage the Wolves through regulated hunting and trapping on a yearly basis.	Having the total number of wolves in Wisconsin exceed 350 statewide.	5	I truly believe the overall number of wolves in Wisconsin is grossly underestimated.
Bill moody	All of it	Yes	Taking input from public	Apart from input, residents are at the mercy of bureaucrats.	1	A “NO” vote from a northern resident should count more than a vote from a non-impacted southern city resident
Jane	Just the parts I am interested in	Yes	Looks to the future to preserve the Wolf for future GENERATIONS and respect the Indigenous People Nations.	Killing of the Wolves Wolves have to eat Elk is a good lunch for them.	5	Save as many Wolves as possible to many MEN just want to SHOOT to KILL such a beautiful BEAST. They can be a tourist Attraction in the WILD.
	Most of it	Yes	The chance to harvest a wolf if they are delisted is the best part. Tge wolves pretty much take care of themselves. Most apex predators do unless there's unregulated hunting.	I think the plan/DNR is making a big mistake in trying to eliminate a numerirical goal. I don't believe the courts or Federal gov. would go along with this if the state gets sued again. Your goal should still be 350 minimum. If they are drlusted and we have a season, we could harvest 200 a year and never get close to the 350 minimum. They reproduce too well and have plenty of target prey to stay sustainable. I believe tge population is much closer to 2000 than 1200. The only people (a social issue) will believe your population analysis is to have a numerical answer. Enough, need more, harvest less, won't cut it.	5	The people who live in wolf country should have more say in the plan than people who don't live with them everyday. The wolf committee put together to draft the plan had far too many individuals that would rather see more wolves than a balanced population the people who live with them would like to see. 350 minimum population should be the end goal.
	All of it	Yes	The word management. You are admitting there is a problem with the resource that knows no boundary, no containment, no distingquishment to its prey.	The fact you will not admit you sold the reintroduction plan on a population number of 380 or so and blew the doors off that. Not bringing it down to manageable packs that are past the plea of just let us have a few wolves were indian ceromonial practise and a few on the land scape for nostalgic reasons. If this was a fish blowing the population mark past its plan number it would be bigger harvest number and daily bag limit to bring it down.	1	No room for the wolf in a modern civilization, keep them in the parks where you have the responsibility for all its actions. Now the animal crosses private property lines and you say not are problem, they crossed containment line and are protected by gov. regulation. BULL. Their's a reason they where hunted and had a bounty by the settler's. They are a killing machine, eating little of their prey and moving on. It's a gang, if they where human the district attorney would be trying to take them down.
	All of it	No	● Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. ● There is much greater recognition of the ecological role of wolves ● The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves ● The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed)	The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. ○ Despite Act 169, which mandates a wolf hunting season, the department can still restrict the implementation of lethal methods by setting minimal quotas, including a quota of ‘0’ wolves, restricting timing and methods.	0	

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Anthony Rust	Most of it	Yes	I think the inclusion of affected groups and open public input is key to the success of this management challenge.	I didn't see a specific population goal. In my experience having fuzzy goals create a moving target. This leads to more conflict within the invested parties and the program loses focus. If the focus is broad and not clearly defined the path to achieve the goal is unclear and the group(s) cannot maintain focus. Every management plan is a journey. The plans change and focus is redirected based on the best knowledge at the time. The goals of this plan are so open ended I don't see how you will know if progress is being made? Does this plan have the support of someone with project management expertise? You will never make everyone happy when it comes to managing wolves. I think we all know that. I doubt you will have much success making anyone happy. But your best outcome is to show progress meeting the science based goals while accommodating some of the emotional issues. Without a defined plan and set goals/outcomes I don't see how you can demonstrate measurable progress and proof of the success of your plan. I wish you the best.	5	I think it outlines the needs of the resource and invested parties. It is just too open-ended to be very successful.
	All of it	Yes	It's sure seems all encompassing.	Not enough attention to the wolves decimating the whitetail postulation.	3	Simply look at the graphs of wolf population and depredation. The sharp rises in both need to be swiftly leveled out. Nothing in this plan suggest that happening.
Hannah	Most of it	No	I appreciate that wolves in Wisconsin will not be managed by reference to the old goal of 350 wolves. In addition, I think the ecological role of wolves is critical to informing decision making in management plans, so I was glad to see there was more focus on that in this plan. Another important aspect I liked was that there is a new adoption of buffer zones around tribal reservations when that had not been present in the past. Finally, I think it's critical to understand the social role that goes into management plans in regards to understanding that many people are having increasingly positive views of wolves, so it's important to take that into account when creating these plans.	I don't like that the current draft doesn't reflect the best available science. Science is continually evolving, so when new literature and research comes to light, it's extremely important to allow this new information to inform decison making and include it in these plans. By omitting ths science and emphasizing recreational killing as a main management straegy, we are failing wolves. This strategy rejects the most recent scientific evidence. Studies indiciate that lethal management simply isn't effective, and I believe it should be avoided unless it's an extreme case, like circumstances of immediate defense of life (which is a very rare circmstance as it is). Non-lethal management of wolves such as fladry, patrolling in horseback, guard dogs, etc. should be the first response to livestock loss (especially considering how rare it is for depredation to occur due to wolves--less than 1%). Finally, the plan should require the implementation of abatement measures as well as the use of non-lethal conflict minimization techniques by domestic animal owners for the latter to receive compensation for confirmed predation.	4	I appreciate that there were some decent changes, but I think more positive measures can be taken to better protect wolves and ensure they thrive as a species in Wisconsin.
bob grundl	All of it	Yes	it is nice to see comment on the impact of wolves on the elk population, this is only the second time I have seen this in all the discussion of wolf population numbers. I believe too much emphasis is put on growing wolf numbers, which are way above management goals and sustainability numbers over elk numbers which are not where they should or could be. I would venture to say deer and elk ecotourism is much greater than wolf ecotourism especially since the odds of seeing a wolf are quite small. elk numbers have always seemed to be an afterthought or not even mentioned in most articles I have read previously. the dnr needs to communicate better to the public, especially those living in urban areas that 300-500 wolves is above management goals and a very sustainable population. with well over 1000 wolves in wi a hunt with a harvest total of 200-300 animals is not goting to hurt the population.	i know it is difficult to get an accurate count of wildlife. my personal feeling from being in the woods is the deer count is inflated(due to economic pressure?) and the wolf count is undercounted(due to public and court pressure?) i also understand it is difficult to work with the wi legislature, most of whom don't know what they are talking about and the dnr is still recovering from the effects of scott walker. to me the plan seems to have a bias towards a higher number of wolves in the state, i think the dnr should be more neutral. wolves are here to stay and need to be managed and regulated like all other wildlife. i think the dnr made a mistake years ago saying the mgt goal was 350 wolves and then suddenly in the last year or so saying this was only a minimum number. even if this is a minimum 500 or even 600 wolves is a very sustainable number (just have lower harvest limits for a hunt, just like the low number of elk tags) I don't think the dnr does a good job of conveying to the public that this is a very sustainable number of wolves and the dnr shouldn't favor the wolf over the elk which I believe they do. wolf numbers are growing faster than elk numbers. when asking the public about the benefit of having wolves, do you also ask about the benefits of having deer and elk?? i think only a small weight should be given to the benefits derived from wolves from people out of state or living in urban areas, many who never are out in the woods. the dnr doesn't need to foster public support for wolves, they should stay neutral, wolves aren't the most important part of our wildlife and don't contribute the most economic impact(not that that is the most important factor) I do believe from my time in the woods (a hunter for over 40 years and I used to have land in adams county that I recently sold) that deer numbers are way down and wolves play a big part in that. this past deer season I didn't see a single deer on my property over 6 days. in adams county you used to be able to see 20 plus deer a day. also we were part of a quality deer management group and the group overall say less deer, again some seeing zero deer and many see wolves on their trail cameras. the plan talked about protecting wolf dens, hopefully you mean only on public lands and aren't trying to tell land owners what they can and can't have on their property. again i think any plan should take into consideration the input from those most directly affected, those in the wolve zones. again wolves are here to stay but i don't think we should continue protecting them at the expense of whitetail deer and espsecially elk who's numbers could and should be much greater.	5	continue to use science to manage all of wisconsin's wildlife. push back more on our uneducated legislature. in talking with the public educate them on the wolf and all wildlife but stress we do have a viable and self sustaining wolf population, well above initial dnr mgt goals. This isn't the 1800's, all wildlife must be managed, if people don't want to manage wildlife (including hunting) they can get rid of their house and car and phone etc and go back to living off the land. Just don't put the wolf above other wildlife like deer and elk.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
William Schoeneck	Most of it	Yes			0	why do you use the term the state of wisconsin when wolfs and bears are mainly in northern wisconsin? If it's so good for wisconsin and the people of wisconsin then they S/B in the whole state like deer, squirrels, birds, raccoons, and other wild life learning to exist with all humans. It's another example of the people who have to live with the issues are DICTATED to by those that have no idea what problems they have created. I love wolfs and bears along as there not by me!!!
	Just the parts I am interested in	Yes				Please continue to use scientific methods and tribal input to protect Wisconsin's wolves. Also, let's do what we can to discourage use of the term "harvest". Wolves are not crops. Thank you for the important work you do to manage and protect our wolf population.
	Just the parts I am interested in	Yes	Perspectives of Forest County Potawatomi, LCO, and Menominee tribes stating that the wolf is like a brother, the lives of wolves and people are intertwined, and our goal is to live well together. State maps of wolf pack distribution over time. Fascinating! Tables about causes of wolf mortality. Plan goal to balance the tradeoffs between the key objectives. Discussion of wolf carrying capacity.	None.	9	
	Most of it	Yes	Wolves are essential to the environment and sacred to the native American tribes. Educate ourselves.			
JOHN DOUCHA	Most of it	Yes	targeting permits in problem areas . not only livestock but new and growing elk area	getting away with the number estimation and keeping the goal at 300 or about	3	I do like that wolf are back in the state but they need to be regulated with a controlled hunts . good way for the department to rise money for other projects that are needed
	I have not read any of the draft plan	Yes	There is a lot of research into it	You are looking to deep into the whole deal you need to look at the basics of there population control and the amount of wolf kills vs anything in the state and how it has gone up over time to obviously show there is more wolves	4	I think you should have a hunt but do a very limited tag and mb make it a specialty hunt to make some money on it
Edward J. Frank	Just the parts I am interested in	Yes	The Flexibility it provides to realize the many values of having wolves,while addressing the concerns about damage to livestock and hunting dogs.	It doesn't deal aggressively enough with getting rid of or at least modifying WI Law(2011 Act 169) which caused the ill-advised Feb.2021 Hunt !	7	I whole heartedly support the detailed review & Recommendations of The WI Green Fire, Wildlife Working Group(Co-Chair, Adrian Wydeven), regarding this current draft! They improve it !
Karen Wyatt		No	We appreciate the efforts of all WDNR staff involved in updating the state's wolf management plan. Although we believe the current plan needs significant updating (see next section), we recognize the efforts and improvements made to the previous plan, including: ● Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. ● There is much greater recognition of the ecological role of wolves ● The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves ● The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed)	● The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on (see reference list below): ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution ● The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. ● The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ○ A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings. ○ Hounding or hound training, which are akin to allowing legalized dogfighting, should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public. ● The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. ○ Despite Act 169, which mandates a wolf hunting season, the department can still restrict the implementation of lethal methods by setting minimal quotas, including a quota of '0' wolves, restricting timing and methods. ○ Several studies have proven a proactive non-lethal approach leads to better conflict mitigation. ○ Lethal management often fails to provide a long-term solution to wolf predation and has the least consistent success rates when compared to non-lethal practices. In addition, there is significant evidence showing that lethal wolf management may be less functionally effective at mitigating subsequent livestock losses than non-lethal deterrents. ● The plan should require the implementation of abatement measures as well as the use of non-lethal conflict minimization techniques by domestic animal owners for the latter to receive compensation for confirmed predation. ● The plan also runs contrary to public values towards wolves (and omits		

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
