				mention of such majority values from the plan), despite department surveys evidencing that the broad public cares about wolves as individuals (and not just for the viability of the population). Given the recent liberalization of killing wolves by the state, it would be incredibly informative to note majority support of the following reasons for opposing a regulated wolf hunting/trapping season (which are all omitted from the plan): opposition to specific methods of harvest like hounds (64%) or traps (70%), feelings that hunting wolves is unnecessary (62%) or culturally offensive to Native American tribes (57%). ○ All such reasons convey majority disagreement with practices currently promoted and endorsed by the legislature and the WDNR, and such a conflict between managers and the public should not only be acknowledged, but foregrounded and carefully considered in policy (instead of dismissed). ○ Such decisions to omit literature or downplay evidence (e.g., such as majority opposition to killing wolves and their reasons) are contrary to principles of scientific integrity (e.g., present all relevant scientific evidence to the public) as well as ethics (e.g., disguising ethical decisions, such as recreational wolf killing, as robustly supported by science). ● Conflicting agency objectives (e.g., optimizing public hunting and conflict mitigation) are not only not acknowledged, but even misunderstood as harmonious, against the body of scientific evidence. That culminates in the prioritization of consumptive values and policies; e.g., according to the body of scientific literature, use of lethal methods, and 2 especially public hunts, are contrary to most objectives relevant to: harm mitigation, the wellbeing of wolves, their ecological roles, and their non-exploitative enjoyment (i.e., Objectives A, B, D and F). ● There is a stark lack of consideration for individual wolves, wolf population health (including wellbeing), and measurable indicators for assessing any harms barring disease prevalence (e.g., accounting for cortisol levels or other stress hormones, measures of pair/pack persistence) ● There is an inappropriate understanding and consideration of tribal worldviews about wolves. Tribal worldviews of wolves are misconstrued as 'cultural benefits' tribes receive from the existence of a wolf population, when in fact tribal worldviews consider each individual wolf as a person and relative. Cultural respect and sensitivity towards such views, shared by many non-tribal members, demand the strict mitigation of lethal measures, especially recreational killing, as opposed to their current promotion in the plan. ● In general, all omissions of scientific literature, the arbitrary prioritization of policy objectives, the rhetoric of the plan and the dismissal of public values and concerns for wolves point towards a biased, unscientific and instrumental view of wolves that promotes values contrary to broad public perspectives on wolves. ● 'SOM' wolf estimation methodology – From a recent critique: "The new methods sacrifice precision, but are believed to retain adequate accuracy and sensitivity to changing conditions for reliable decision-making. We review evidence for the accuracy, precision, and sensitivity of the new 'scaled occupancy model' (SOM) applied in Wisconsin. We conclude that the Wisconsin method would systematically overestimate wolf abundance by large (but currently incalculable) margins. Because Wisconsin, similar to other states, not only changed to unverified methods but also implemented widespread wolf killing, shortcomings in their estimates of wolf abundance may have far-reaching consequences for population viability and confidence in state wildlife managers. We discuss findings from Wisconsin alongside similar findings for other states' occupancy models being insensitive to human causes of mortality that have recently increased. Overall, Wisconsin's proposed method for estimating wolf abundance shows significant departures from best practices in scientific measurement. Verification will require independent replication and unbiased tests at multiple scales in multiple habitats under different human-induced mortality rates, and peer review before the new methods are considered reliable." (Treves & Santiago-Ávila, 2023)		
	Just the parts I am interested in	Yes	None	There are to many wolves in the state already	0	You expect people to buy hunting license for white tail deer and the want more wolves, I have been in these areas where these wolf packs are and the white tail population is decimated , increasing the wolf population is a bad idea
J.Ros	All of it	No	I like that you try to gather as much info as you can about the "subjected" animal	I dislike the idea that humans can control Mother Nature	5	People seem to forget that humans are the invasive species.
	Most of it	Yes	None	Not setting a number	1	The last plan was not followed so why would we think there will be any management in the future. People who do not live in the areas where the wolves are having a say on what others have to put up with. Let the county residents decide on population goal.

Max G Lagally	All of it	Yes	I am pleased to see that there is no longer a goal for the number of wolves that "should" reside in the state. I am pleased to see a rather comprehensive social survey. If heeded, that should help point the DNR in the right directions. I am pleased that the views of the native tribes are taken into greater consideration in this iteration of the management plan. I like, at the start of Section 4, the realization that numerical goals are misleading and that there are better ways of "management". I like the idea of "facilitating wolf-related benefits while minimizing wolf-related conflicts". I like the word "stewardship". I do not like the word "management"	The plan should establish a hunting quota for Wisconsin wolves that is zero in all zones Hunting/trapping to reduce conflicts has no scientific basis. There should be no killing; better methods of conflict resolution exist DNR should ban the use of dogs to hunt wolves and all associated issues with dogs should be stopped (training, compensation, etc.). Baiting should be stopped The occupancy model to determine wolf populations is in my opinion highly unreliable and should not be used solely to determine population. There should be a commitment by DNR to work with the legislature to overturn PA 169 and to eliminate payments for hunting hounds killed by wolves.	7	Comments on Wisconsin wolf management plan Max Lagally 2/25/23 Although I am commenting on the wolf management plan, not all the comments I am making are specifically relevant to the draft, in particular because the DNR is constrained by state law in what it can act on. Nevertheless, I believe it is worthwhile to express these views, as they are likely shared by a large majority of the citizens of the state and could be a blueprint of what the department could aspire to in the future. I have read the draft wolf management plan in its entirety. About Me: I have lived in Madison since 1963. I am a scientist, with a PhD in physics. I understand measurement science and statistics. We own land in Iowa County and a second home outside Sauk City. We are investing to restore the land to conservation status. Although I don't hunt and will never own a gun (a consequence of childhood trauma) I allow a small group of friends to hunt deer on the Iowa County property. Here are my comments: In these times it should be obvious that humans are not masters of the universe, that we cannot live without all other life and that we are simply a part of the whole. The words "natural resources" imply that everything is at the service of humans. That cannot be true. Therefore, efforts should be initiated to rename the Department to something like Department of Environmental Conservation or similar. The word "harvest" should not be used as a substitute for "kill". Please look up the etymology of the word "harvest" Nowhere does it historically refer to animals. We don't refer to school killings as harvesting children. We should not refer to wolf harvest or deer harvest or coyote harvest. Call it what it is: killing. A hallmark of capitalistic society is that it is basically beholden to and run by minorities, which are most generally motivated by greed or power. Pretty much does not matter what it is: hunters, drug prices, gun lobby, oil industry, education, prisons. These minority groups are highly motivated to get what they want, and the large majority of the public can't keep up. As a consequence we have a society governed by the desires of minority interests. Which does not make it right. As far as the DNR is concerned, its clients are not just the homo genus but all plant and animal life in the state, from orchids to bumblebees to butterflies to coyotes to wolves. And invasives like garlic mustard, buckthorn, lawn grass, etc. Luckily 95% of the human species is also on the side of support of conservation (with the exception maybe of lawn grass, one of the worst invasive monocultures), so if the DNR simply begins to manage its practices to be more in line with the views and desires of the general public, it would go far toward improving the balance of human vs the rest of nature, at least in the State of Wisconsin. I know that is perhaps simplistic thinking given the constraints imposed by the politicians driven by the greed minority. But then at least the DNR should spend much more effort on education, awareness, publicity, and conflict prevention. It should not take a miserably failed wolf hunt to arouse the public to litigate and finally to get the DNR to act. I also listened in on the listening session on Tuesday, February 7. So now I will make comments specific to the draft wolf management plan. Compliments, first of all, on the overall effort. This is a thorough draft, very informational. From a historical view, it is quite an advance. By that I mean based on the thinking of 20 years or more ago, it is an advance. It still uses the old norms and standards and starts with those and defends them or modifies them. But we live in different times, in greater recognition of the environment, climate change, the interrelationship of all life, bioscience, genetics, and so on. From that perspective it is a disappointment. We need a bolder plan; one that begins with a new set of ground rules, as suggested above. I am pleased to see that there is no longer a goal for the number of wolves that "should" reside in the state. I am pleased to see a rather comprehensive social survey. If heeded, that should help point the DNR in the right directions. I am pleased that the views of the native tribes are taken into greater consideration in this iteration of the management plan. I like, at the start of Section 4, the realization that numerical goals are misleading and that there are better ways of "management". I like the idea of "facilitating wolf-related benefits while minimizing wolf-related conflicts". I like the word "stewardship". I do not like the word "management" As for the number of wolves currently residing in Wisconsin: first, I agree with the view of the native tribes that the wolf should be thought of as a brother, rather than a "resource" to be "harvested". If one takes that as the starting point, there is no need for determining the number of wolves residing in the state; there is no need to have a hunt or ever to trap them; there is no need for discussion about carrying capacity: all sorts of scientific evidence points to the fact that wolves will regulate their number – much better than humans do. The "management" then reduces to conflict resolution and education or increasing awareness of wolf behavior and coexistence strategies. The DNR would be a much kinder and gentler organization; and not so beholden to minority interests. But as that is not going to happen in my lifetime, let me

						comment on wolf count and statistics. People don't understand statistics. The media doesn't understand statistics; and those few who do have to dumb things down for the public. You should never quote a number. Google "how many wolves are in Wisconsin?" and it comes right up with 972. No matter what else you say, that's what people hear and remember. So don't quote a number. The range quoted indicates you believe that the distribution is Gaussian – symmetric or nearly so. You have not defended that and it is almost surely not true because of the factors you have neglected. Adrian Treves has provided a nice analysis. There are many factors that are neglected in the simulation that, if considered, would lead to a lower wolf number, and no countervailing factors that would lead to a higher wolf number. Hence your distribution is not Gaussian but skewed and a most-likely number is meaningless. In my business we call this "garbage in, garbage out". Without a proper analysis of the inputs the output is meaningless. You should go back to physical counting, so you at least have a reasonable estimate of the minimum. Still not perfect but at least reasonably defensible. If one considers the tribal perspective of wolf as brother, there is no need to hunt them. Given that this view is unrealistic in the current environment (with the wolves safe only because of protections), at least hunting with dogs, use of bait, and trapping should not be permitted. Compensation for injured or killed hunting dogs is simply an outrage. A complete ethical and moral outrage. I understand it is state law, promulgated by totally unethical and immoral politicians. Nevertheless, all efforts should be made by DNR to fight against this law and to put up as many barriers as possible and to make it as difficult as possible to collect, for example by making paperwork so onerous that hunters give up. There are many ways that could be accomplished. Management plan: the draft says nice words up front but basically it seems just a cover for management = quotas= hunting Propose a webinar series to educate the public – over and over again, with a particular set of sessions for legislators to explain the benefits of wolves. Elk vs wolves: before humans interrupted the balance, the wolves and elk worked it out. You seem to indicate that where they interact the situation is stable. Why bother managing? Totally against lethal abatement methods. Not necessary Wolf damage compensation program. On the basis of fundamental ethics, fairness, and balance, the whole idea of compensation is untenable. It is as always people centric. After all, humans encroached on the wolf territory. Some risks and losses should be expected. Russians invade Ukraine, expect some losses. This problem should be primarily handled via education and prevention measures. At minimum, the plan should require the implementation of abatement measures as well as the use of non-lethal conflict minimization techniques by domestic animal owners for the latter to receive compensation for confirmed predation. Wolf hunt is not needed. It is murder of our brothers and should be illegal. DNR should simply not condone it. Catering to this small vociferous minority who seem to know no ethical bounds is not in the broader interests of the DNR. Absent is a commitment by DNR to work with the legislature to overturn PA 169 and remove payments for hunting hounds, killed by wolves.
Scott Rupnow	Just the parts I am interested in	Yes	I like that you made a plan. Not making a plan over the past 15 years was a guaranteed way to fail at managing the wolf population in Wisconsin.	I feel that it is a mistake that a state-wide population target was not set for wolf management. I believe that this will make it harder to manage wolves moving forward. I believe that a science based target could be set by the well trained and educated professionals in the DNR and that this would make it clearer on how we should manage wolves in this state.	4	
	All of it	Yes	That it is only a draft and can still be changed	No set goal number. 350 should be the number.	0	This is not a wolf management plan. This is a wolf expansion plan both in numbers and area. This plan does nothing for Wisconsin and should be scrapped. Adopting this "plan" will only fuel the distrust of the DNR that unfortunately continues to grow.
Dan and Judy Aughey	All of it	Yes	I appreciate that the DNR conducted a social survey for public opinion and listening to our concerns. 75% of Wisconsinites are in favor of wolves. It's positive that this is acknowledged by the DNR and positive changes are being made. For instance, removing the 350 for population goal. I was very happy to that the DNR sees that wolves play a very important role to the ecology.	After the wolf "hunt" that was forced on to our state from outside sources such as Hunters Nation in Feb. 2021, we all saw what an abomination that turned out to be. You are aware of exactly what I mean. We cannot, ever allow that to happen in our state again! I say no wolf "hunt" like that is ever allowed to happen again. It has been proven that the wolf population controls itself. If resources are hard there will be no mating. Man does not need to interfere with nature that God has given us. Wolves are an asset to our environment to control deer, CWD...the weak and the sick. Ban the use of dogs to hunt wolves and any other canids. Ending hounding for hunting except for bird dogs, period.	5	please listen to the majority of the people in WI. who want wolves on our landscape. Stop the killing of our wolves from outside sources only to bring income to WI. DNR, protect and preserve our natural resources including our most valuable, our wolves. It is not mans duty to control. It's to look to after all species and protect, not destroy.
	Most of it	Yes	Much of the data seems relevant to the plan outline.	Too much input from non-range ownership and residence.	2	

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Mark Schuh	All of it	Yes	I don't like any of it.	I believe there are many more wolves in Wisconsin than what the DNR estimates. I have owned land in Forest County since 1992, the deer herd has been decimated by wolves and hard winters. Wolf numbers need to be reduced and controlled by annual hunts. There needs to be a accurate count of wolf numbers as present system is a guess. Wisconsin law calls for an annual hunt and this needs to happen. We no longer allow children to walk our trails without an adult as we have many wolves on trail cameras. This is not only a deer issue but now more importantly a safety issue for people. Wolves are no longer afraid of people. If urban people want unlimited numbers of wolves they should be trapped and moved to Madison and Milwaukee.	1	Very disappointed in how wolves are currently managed in WI. Sadly politicians and urban dwellers manage the program, its time for biologists and common sense to lead the wolf management in WI. Spend some money to get this right.
R H	All of it	Yes		Leaves to much open for killing wolves	1	Wolves are part of the ecosystem and we need to learn how to live around them. In Yellowstone the wolves kept the elk herd healthy and kept the from overgrazing the grass.
	Just the parts I am interested in	Yes		prefer much lower population goal	2	I am a fairly typical livestock farmer. I would have another $500 in my retirement fund if it weren*t for wolves.
Mike Raether	All of it	Yes	Management/population/harvest quota	Nothing about deer population vs. wolf population is mentioned, studies are based on elk population.	4	Whitetail hunting is a staple in Wisconsin, the whitetail population in northern Wisconsin is way down from what it was 10 or 20 years ago. I am okay with wolves in Wisconsin BUT we need to keep tabs on the wolf population and balance it so the deer population in northern Wisconsin can rebound. When you go out bow hunting for deer and see more wolves than deer it is very disheartening.
	All of it	Yes	The plan provides exhaustive reference to the history of the wolf and its habitat, etc. A nice way to fill the document with fodder, if you want a plan to look in-depth, scientifically based and professional - while deflecting from the true motive, which is to slow walk any real data on quotas, or harvesting of wolfs. I admire the way the plan asks us to trust the science, while denying what we have witnesses with our own eyes over the 20 years; the fundamental change of whitetail hunting in the Northwoods due to wolf predation.	The PLAN, refuses to give any firm projection of quotas for harvest, or, the ration of tags to animals projected to be used in the future. In reality, it reads more like a Wikipedia than a scientific plan. I admire the twisted elements inherent in the wolf strategy - such as automatically allotting 50 percent of all quota harvest to natives tribes, which effectively taking out harvest of the table as a real "scientific" tool for management. How can you manage a statewide resource, with less than 3 percent of the population? How is that based in science? The plan, is a long bureaucratic "word salad" on paper. When will a hunt to harvest start, under what terms, and how many tags? If you can not answer than in 5 pages, its just a lie.	1	The "plan" is not a plan at all. Instead, it goes into unnecessary detail about history of the wolf, etc. It professes, almost too loudly, to be based in "science" while then suggesting there are a myriad of different interests that must be taken into account. The reader is left to believe the DNR is really focused on a plan, "grappling" with the science, struggling to appease....in the end, it is well edited word garbage that says nothing about an actual harvesting process that makes sense long term in a state over run with wolves.
	Just the parts I am interested in	Yes	The draft plan does not put a cap on the number of wolves — a number that when hit provides a rationale to kill wolves by the hundreds so that the state can keep them below an artificial ceiling. That “cap” was always arbitrary and it again and again set the stage for wolf killing. The management plan takes Native American tribal concerns into consideration and establishes buffer zones around tribal lands to protect wolves in those areas.	The population estimates leave far too much room for guesses about the wolf population. There is still far too much emphasis on recreational killing and providing "hunter opportunity" to kill wolves. More emphasis needs to be placed on the value of this species to non-consumptive users of our lands. The Wisconsin DNR is too quick to promote lethal responses to the rare conflicts that result between wolves and people.	5	We recommend that the DNR continue to not include a numeric goal, as these can and have been used against the species. We encourage the DNR to place less emphasis on “lethal management” and more on the value of the wolf to the ecosystem, indigenous culture, and to “non-consumptive users.” The reliance on USDA Wildlife Services is concerning as lethal options seem to take priority over non-lethal as shown by the numbers. We encourage the DNR to have separate committees for science and for stakeholders. This provides a buffer between the science and the politics and special interest agendas. We also recommend far more restriction on the use of hounds against wolves for hunting and “training.” We understand that the use of hounds is allowed under state law, but rules are almost nonexistent and their use should be minimized.
	Most of it	No	I appreciate the efforts of all WDNR staff involved in updating the state’s wolf management plan. Although I believe the current plan needs significant updating (see next section), I recognize the efforts and improvements made to the previous plan, including: ● Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. ● There is much greater recognition of the ecological role of wolves ● The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves ● The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed)	The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on (see reference list below): ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves’ physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution ● The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. ● The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ○ A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings. Hounding or hound training, which are akin to allowing legalized dogfighting, should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public. ● The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. ○ Despite Act 169, which mandates a wolf hunting season, the department can still restrict	4	

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
				the implementation of lethal methods by setting minimal quotas, including a quota of '0' wolves, restricting timing and methods. ○ Several studies have proven a proactive non-lethal approach leads to better conflict mitigation. ○ Lethal management often fails to provide a long-term solution to wolf predation and has the least consistent success rates when compared to non-lethal practices. In addition, there is significant evidence showing that lethal wolf management may be less functionally effective at mitigating subsequent livestock losses than non-lethal deterrents. ● The plan should require the implementation of abatement measures as well as the use of non-lethal conflict minimization techniques by domestic animal owners for the latter to receive compensation for confirmed predation. ● The plan also runs contrary to public values towards wolves (and omits mention of such majority values from the plan), despite department surveys evidencing that the broad public cares about wolves as individuals (and not just for the viability of the population). Given the recent liberalization of killing wolves by the state, it would be incredibly informative to note majority support of the following reasons for opposing a regulated wolf hunting/trapping season (which are all omitted from the plan): opposition to specific methods of harvest like hounds (64%) or traps (70%), feelings that hunting wolves is unnecessary (62%) or culturally offensive to Native American tribes (57%). ○ All such reasons convey majority disagreement with practices currently promoted and endorsed by the legislature and the WDNR, and such a conflict between managers and the public should not only be acknowledged, but foregrounded and carefully considered in policy (instead of dismissed). ○ Such decisions to omit literature or downplay evidence (e.g., such as majority opposition to killing wolves and their reasons) are contrary to principles of scientific integrity (e.g., present all relevant scientific evidence to the public) as well as ethics (e.g., disguising ethical decisions, such as recreational wolf killing, as robustly supported by science). ● Conflicting agency objectives (e.g., optimizing public hunting and conflict mitigation) are not only not acknowledged, but even misunderstood as harmonious, against the body of scientific evidence. That culminates in the prioritization of consumptive values and policies; e.g., according to the body of scientific literature, use of lethal methods, and 2 especially public hunts, are contrary to most objectives relevant to: harm mitigation, the wellbeing of wolves, their ecological roles, and their non-exploitative enjoyment (i.e., Objectives A, B, D and F). ● There is a stark lack of consideration for individual wolves, wolf population health (including wellbeing), and measurable indicators for assessing any harms barring disease prevalence (e.g., accounting for cortisol levels or other stress hormones, measures of pair/pack persistence) ● There is an inappropriate understanding and consideration of tribal worldviews about wolves. Tribal worldviews of wolves are misconstrued as 'cultural benefits' tribes receive from the existence of a wolf population, when in fact tribal worldviews consider each individual wolf as a person and relative. Cultural respect and sensitivity towards such views, shared by many non-tribal members, demand the strict mitigation of lethal measures, especially recreational killing, as opposed to their current promotion in the plan. ● In general, all omissions of scientific literature, the arbitrary prioritization of policy objectives, the rhetoric of the plan and the dismissal of public values and concerns for wolves point towards a biased, unscientific and instrumental view of wolves that promotes values contrary to broad public perspectives on wolves. ● 'SOM' wolf estimation methodology – From a recent critique: "The new methods sacrifice precision, but are believed to retain adequate accuracy and sensitivity to changing conditions for reliable decision-making. We review evidence for the accuracy, precision, and sensitivity of the new 'scaled occupancy model' (SOM) applied in Wisconsin. We conclude that the Wisconsin method would systematically overestimate wolf abundance by large (but currently incalculable) margins. Because Wisconsin, similar to other states, not only changed to unverified methods but also implemented widespread wolf killing, shortcomings in their estimates of wolf abundance may have far-reaching consequences for population viability and confidence in state wildlife managers. We discuss findings from Wisconsin alongside similar findings for other states' occupancy models being insensitive to human causes of mortality that have recently increased. Overall, Wisconsin's proposed method for estimating wolf abundance shows significant departures from best practices in scientific measurement. Verification will require independent replication and unbiased tests at multiple scales in multiple habitats under different human-induced mortality rates, and peer review before the new methods are considered reliable." (Treves & Santiago-Ávila, 2023)

Christina L Gerber	All of it	Yes	I liked the idea of more committees for studies but beg you to make them balanced with people who want to preserve these animals as well as your hunters and farmers.	What I dislike from the draft plan is the fact that is still appears that the main concern is for hunters and recreational abilities rather than environmental cares if this state. When do we start to give back to the environment and the creatures that live here rather than how many recreational vehicles we can run all over these lands and guns we can fire. I don't recall reading anything on poaching of these animals. What happens to the animals that don't follow whatever laws and rules we set up for that??	4	Please put more thought into preserving the land and waters for future generations
Dean Weingarten	All of it	No	Areas of the plan which explained the costs of maintaining a wolf population in the state. Explicit explanation of the conflict between traditional views and "mutualism".	The plan starts with assumptions about the nature of maintaining a wolf population. Those assumptions drive the plan, and are highly debated. The assumptions support the "mutualist" view of reality. The plan refers to the "wolf's ecological role", and notes wolves have an immense impact on an area's ecology. This is entirely a subjective valuation. The plan accepts this "benefit" as an assumption, when it is far from clear the presence of wolves benefits the ecology generally. There are many disadvantages to the presence of large numbers of wolves in an ecological system. It is claimed by Theil that fur traders were indifferent to wolves, because they were not valuable. An easy search on the internet shows in 1749, wolf pelts were quite valuable, at 40 sols, or 2/3 of a beaver pelt. Theil seems to have been quite influential at the DNR. The lack of an upper limit to the wolf population in Wisconsin is a serious problem. The benefits of maintaining a wolf population are emphasized, even though the benefits are exceedingly small for the vast majority of people. The benefits are mostly psychological and would be satisfied with a small wolf population. Missing from the sources is the inciteful critique of wolf management written by Valerius Geist, the well known professor emeritus of the University of Calgary. "The Myth of the Harmless Wolf" is available on the Internet, if you care to look for it. It can be found with a search for works by Valerius Geist, PhD. Geist carefully explains how the myth of the harmless wolf was created, and the problems it creates. Geist supports the idea of maintaining a wolf population, but points out the many difficulties of maintaining a wolf population in a mixed agricultural area.	2	The largest, unspoken beneficiaries of maintaining a wolf population in Wisconsin are the people who create the wolf management plan. They have an enormous conflict of interest, because, through salaries and grants, they receive most of the limited benefits of having wolves in the state. It appears the DNR has suffered from "advocacy capture" where advocates for a particular species are, by their nature, drawn to work in the DNR. They then, through research and papers, transfer their personal advocacy for a species to policy within the DNR. This is a form of "regulatory capture", a well known process where administrative agencies have their resources diverted from providing for the public good to providing for select interest groups. In this case, the interest group which gets the most resources are the advocates in the DNR themselves. The large difference between the mythology of wolves created in the media, and the reality of wolves on the ground, is obvious in the large difference in those who want more wolves. Those who have to live with wolves do not want more of them. Those who do not want wolves are happy to transfer the costs of their fantasies to those who have to deal with the reality of wolves.
	Just the parts I am interested in	Yes	Wolves have a place in Wisconsin	The part that I don't like is that the DNR is not able to manage the wolves. Every state should manage their wolf packs (populations). Too much outside voice managing the wolves and Washington thinks that they our DNR isn't smart enough to manage such a species of animal. Wow, I always thought that the WI DNR did a great job at keeping our wildlife populations managed nicely.	5	You can plan all you want but I do not feel that you will come up with a plan that you can actually get to work. The feds won't listen to facts. I don't even believe that our own DNR has a true feel for how many wolves are actually in Wisconsin.
	Just the parts I am interested in	No	The emphasis on looking to science to understand how ecosystems operate & maintain health for all species, including benefits to humans (which can't always be measured easily). Also appreciated the part about media inflating the discussion, often causing more harm & spreading misinformation.	The fact that any wolf management needs to occur. We share this world with a diversity of species. Who are we to "manage" them, and set quotas on how many can be killed. These animals have complex relationships both within their pack dynamics as well as their role as predators. Attempting to maintain some ideal number that keeps everyone "happy," from ranchers, to hunters, to politicians, biologists and conservationists is not a great use of time or resources. There should be no wolf hunting, no wolf trapping, no management. They should exist because we exist. Ranchers have ranch land, farmers have farm land, wolves should have areas where they can exist, too.	5	While I do not agree with any hunting of wolves, since we all know that won't go away, at least consider bans or harsh limits or stronger rules for trapping. Trapping of any wildlife is outdated (it was outdated even during the fur trade) and should not exist. There is danger to domestic dogs as well as people, & with no need of subsistence for many of these individuals who trap, it's an inhumane way of killing. We should do better.
Joel Burow	Most of it	Yes	That you are following the science, not giving in to killing for the sake of meeting outdated and meaningless numeric population goals, and that you are doing everything you can to protect this beautiful species. The hunt that occurred in 2021 or 2022 should NEVER be allowed to happen again.	It needs to be stronger to protect the wolves in instances where people complain that they are a nuisance. There needs to be more emphasis on requiring people to change their behaviors to help the situation, so both people and the wolves can live harmoniously. Killing the wolves to "solve" people's complaints never should be the first step.	9	Thank you for following the science, and for doing everything you can to protect this beautiful species and its habitat, for generations to come.
	Most of it	No	I appreciate the efforts of all WDNR staff involved in updating the state's wolf management plan. Although I believe the current plan needs significant updating (see next section), I recognize the efforts and improvements made to the previous plan, including: ● Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. ● There is much greater recognition of the ecological role of wolves ● The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves ● The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed)	● The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on (see reference list below): ○ wolf ethology, sentience, sapience, sociability, agency and well being ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, well being, social dynamics, ecological relationships and evolution ● The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. ● The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ○ A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings. ○ Hounding or hound training, which are akin to allowing legalized dog fighting, should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public. ●	4	

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
				The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. ○ Despite Act 169, which mandates a wolf hunting season, the department can still restrict the implementation of lethal methods by setting minimal quotas, including a quota of '0' wolves, restricting timing and methods. ○ Several studies have proven a proactive non-lethal approach leads to better conflict mitigation. ○ Lethal management often fails to provide a long-term solution to wolf predation and has the least consistent success rates when compared to non-lethal practices. In addition, there is significant evidence showing that lethal wolf management may be less functionally effective at mitigating subsequent livestock losses than non-lethal deterrents. ● The plan should require the implementation of abatement measures as well as the use of non-lethal conflict minimization techniques by domestic animal owners for the latter to receive compensation for confirmed predation. ● The plan also runs contrary to public values towards wolves (and omits mention of such majority values from the plan), despite department surveys evidencing that the broad public cares about wolves as individuals (and not just for the viability of the population). Given the recent liberalization of killing wolves by the state, it would be incredibly informative to note majority support of the following reasons for opposing a regulated wolf hunting/trapping season (which are all omitted from the plan): opposition to specific methods of harvest like hounds (64%) or traps (70%), feelings that hunting wolves is unnecessary (62%) or culturally offensive to Native American tribes (57%). ○ All such reasons convey majority disagreement with practices currently promoted and endorsed by the legislature and the WDNR, and such a conflict between managers and the public should not only be acknowledged, but foregrounded and carefully considered in policy (instead of dismissed). ○ Such decisions to omit literature or downplay evidence (e.g., such as majority opposition to killing wolves and their reasons) are contrary to principles of scientific integrity (e.g., present all relevant scientific evidence to the public) as well as ethics (e.g., disguising ethical decisions, such as recreational wolf killing, as robustly supported by science). ● Conflicting agency objectives (e.g., optimizing public hunting and conflict mitigation) are not only not acknowledged, but even misunderstood as harmonious, against the body of scientific evidence. That culminates in the prioritization of consumptive values and policies; e.g., according to the body of scientific literature, use of lethal methods, and 2 especially public hunts, are contrary to most objectives relevant to: harm mitigation, the well being of wolves, their ecological roles, and their non-exploitative enjoyment (i.e., Objectives A, B, D and F). ● There is a stark lack of consideration for individual wolves, wolf population health (including wellbeing), and measurable indicators for assessing any harms barring disease prevalence (e.g., accounting for cortisol levels or other stress hormones, measures of pair/pack persistence) ● There is an inappropriate understanding and consideration of tribal worldviews about wolves. Tribal worldviews of wolves are misconstrued as 'cultural benefits' tribes receive from the existence of a wolf population, when in fact tribal worldviews consider each individual wolf as a person and relative. Cultural respect and sensitivity towards such views, shared by many non-tribal members, demand the strict mitigation of lethal measures, especially recreational killing, as opposed to their current promotion in the plan. ● In general, all omissions of scientific literature, the arbitrary prioritization of policy objectives, the rhetoric of the plan and the dismissal of public values and concerns for wolves point towards a biased, unscientific and instrumental view of wolves that promotes values contrary to broad public perspectives on wolves. ● 'SOM' wolf estimation methodology – From a recent critique: "The new methods sacrifice precision, but are believed to retain adequate accuracy and sensitivity to changing conditions for reliable decision-making. We review evidence for the accuracy, precision, and sensitivity of the new 'scaled occupancy model' (SOM) applied in Wisconsin. We conclude that the Wisconsin method would systematically overestimate wolf abundance by large (but currently incalculable) margins. Because Wisconsin, similar to other states, not only changed to unverified methods but also implemented widespread wolf killing, shortcomings in their estimates of wolf abundance may have far reaching consequences for population viability and confidence in state wildlife managers. I discuss findings from Wisconsin alongside similar findings for other states' occupancy models being insensitive to human causes of mortality that have recently increased. Overall, Wisconsin's proposed method for estimating wolf abundance shows significant departures from best practices in scientific measurement. Verification will require independent replication and unbiased tests at multiple scales in multiple habitats under different human-induced mortality rates, and peer review before the new

Michelle Wilson	All of it	No	None of it	all omissions of scientific literature, the arbitrary prioritization of policy objectives, the rhetoric of the plan and the dismissal of public values and concerns for wolves point towards a biased, unscientific and instrumental view of wolves that promotes values contrary to broad public perspectives on wolves.	0	Wolves do not need "management" by people. People need to co-exist and use other methods to deter predation (to the extent it actually occurs) such as fencing and stop compensation for alleged livestock deaths from wolves. Please use more up to date science

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Kim	I have not read any of the draft plan	Yes			8	
	Most of it	Yes	I agree there should be some wolves in Wisconsin. The original goal of 300 some wolves is fine but the current population is way to high .	We need a harvest season to get to the original goal of 300 some wolves	2	
	I have not read any of the draft plan	Yes	Shoot them all	Shoot them all	0	You can't even live with your number of keeping only 650 so since you can't control it Shoot them all
	All of it	Yes			5	I would like to see wolves relocated to parts of the state that don't have any. What better way to help the population of wolves grow along with more people being able to enjoy them.
	I have not read any of the draft plan	Yes			0	Shoot them to many wolfs are killing the deer an an other animals they can
Daniel Novacek	All of it	Yes	Very detailed	Too long ...get to the basics. How many people are going to invest the time to read 175 pages?	2	
	Most of it	Yes	Taking into consideration the cultural aspects of the wolf in relation to the tribal beliefs	Any aspect of hunting the wolves for the sake of culling.	6	I oppose killing wolves unless they are a clear threat to livestock or have become so habituated to people that they are dangerous and a safety concern. I strongly oppose re-imbursing hunters for dogs that are killed by wolves.
Debra DeVries	Most of it	Yes			1	Wolves scare me; last summer at our cottage on Pardee Lake a black wolf was watching me until I called my husband & he came out of cottage.
Janet M. Wall	Most of it	Yes	The plan removes a number for the population goal. This is important to ensure that the numbers of wolves are adaptable and are based on changes in the ecology and are also based on the best science we have at this time. The plan creates low quota zones for tribal lands where they have requested it. these lands are protected by treaties with documented wolf packs. Making this update is an important and welcome addition to the plan. Ideally, the plan would expand these zones beyond just the few that are listed. The plan is justly focused on all the many benefits of wolves in the ecology. The plan reflects public opinions in the survey that was released along with the plan. the survey found that public opinions and sentiment have grown remarkably more favorable. There is expressed commitment to science and continued research and sets forth that keystone species such as wolves are such a very important part of a healthy ecosystem.	The DNR should be involved in better regulating hound training on wolves if it has to be. I would like to see hounding permanently banned. I feel it has no place in fair hunting. Have a guidance plan in place for next review or update. This would eliminate the use of a plan that is used for decades and could become obsolete. There should be permanent stakeholder and science committees to oversee wolf management in Wisconsin. This is just simply critical. Place a much higher PRIORITY on the teaching and training to and for farmers/ranchers of NON LETHAL options to reduce wolf depredation on livestock and on wolf/livestock conflicts. Many in other states have found this to be successful. The accounting of these successes are enlightening, educational, and forward-thinking toward the goals of conflict resolution.	9	I want to thank the Wisconsin DNR for formulating this wolf management plant that promotes and utilizes public input, science, and the Tribal involvement and engagement. These are core tenets of the best way to protect, conserve, and sustain our precious natural resources, especially that of the gray wolves in our state of Wisconsin. Again, thank you and keep up the good work!
mark christopherson	Just the parts I am interested in	Yes	I found it to be very useless to me. It should be simple	most of it why do we care about the elk	0	Have a wolf hunt like a couple year's ago. There were four killed within a mile radius of my house in two days
Diana C. Smith	Just the parts I am interested in	Yes	Based on science, not fears. Detailed data. Incorporation of tribal concerns. Incorporation of non-lethal controls. Time/seasonal restrictions on dog training for a wolf hunt. Public input. Appreciate the acknowledgment that wolves can and should be a resource to be enjoyed by all and are critical to an ecological balance.	The amount of funding for non-lethal controls is not listed, but I believe it was limited to approximately $60,000 a year or two ago. This $ amount is grossly insufficient to make any headway and should be significantly increased. Also, the concept that all of the citizens of the state have as great as or greater stake in the state's resources than a much smaller group of hunters is not acknowledged.	8	It was extremely upsetting to see the gross overharvest in the 2021 wolf hunting season. I appreciate the acknowledgement that strides will be taken to prevent that in the future.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Tom Meka	All of it	Yes	The amount of data, maps, survey's. Very detailed, scientific & informative.	Many of us hunters, specifically we who hunt in wolf populated areas/zones, doubt the accuracy/validity of the number of deer killed by wolves (18-20) per year per wolf. If would be good to see that refreshed/updated study to determine accuracy. Also would be good to see in the report, the total # of deer taken by wolves per year per zone based on the estimated wolf/deer population in each zone. Most of us understand (maybe not accept or like the competition) predation will impact deer populations but seeing the impact by zone might help us accept the impact. Break it down, deer per square mile in Forest vs. deer per square mile in Ag areas, wolf kills per year per area based on wolf population estimates in that area.	9	On the "Public Education" part of the plan, get that data front and center concerning the # of wolf/human encounters/deaths/attacks in North America & get specific concerning Wisconsin wolf attacks/deaths..., NONE. Its going to take decades to change public perception concerning the big bad wolf.
Erin Schneider	Most of it	Yes	I like the historical perspective of both the ecology and culture surrounding wolves in Wisconsin. I like elements of the plan that considers ecosystem management, public education. On p. 113. In general, I am in favor of objectives A, B (with the exception of compensating people for wolf/pet/hunting dog encounters) and DEF. I am mixed about objective C. I especially like the monitoring elements and citizen science participation that gets people outside in the winter. I am also mixed about objective B. I like the goal of reducing wolf-human conflicts, through outreach plans outlined and on page 131: Strategy: B4b: Continue applying for and securing federal grants to fund compensation and nonlethal abatement. Though I am not in favor of some of the strategies under this objective (see 5). I like elements of Objective C, eco-tourism strategies. I am in favor of implementation plan for Objective F, especially in having WI be part of :Product F2e: Apply for CITES (Convention on International Trade in Endangered Species of Wild Fauna and Flora) authority.	On page 113 I dislike objective C that states allowing for a sustainable regulated hunting season of wolves. Related to this on page 129, I DISLIKE Strategy B2: Administer a wolf damage compensation program. In general I dislike the administrative rules (though understand that this is legislative the fact that taxpayer dollars have to reimburse Hunting dog and pet owners as well as vet bills for the risks they take, especially if said owners don't implement fencing or are negligent (let their dogs go for miles and track via gps). As a hunter myself, I am baffled by the lack of accountability this rule allows for. On page 125, I am also unclear, not in favor of: Product A4e: Continue to not allow wolf rehabilitation. As noted in Wis. Admin. Code s. NR 19.80(1)(8), the department does not authorize the rehabilitation of wolves or wolf-dog hybrids in Wisconsin. Overall, I am not in favor of Objective C :Strategy C1: Provide a well-regulated wolf harvest season consistent with public preferences and management plan objectives. However, I am in favor of regulation and education if the state's consensus is hunting.	8	As a Sauk county farmer, hunter, and conservationist, I am in favor of most of the plan. I appreciate the graphics and maps to complement the narrative. I appreciate the focus on science based solutions, though I think outreach and education efforts could be expanded to include art and storytelling as you need to change peoples hearts as well as minds on this topic. I am not in favor of hunting wolves (why? if you're not eating the animal?) or compensation to individuals who lose their hunting dogs or livestock to wolves. In my opinion, that is a risk you take and is what insurance is for. I am in favor of reducing human/wolf conflicts, and I support non-lethal ways to do so. Thank you for the opportunity to comment.
Craig John Witte	Just the parts I am interested in	Yes		The plan lacks specifics ie goal #s, harvest #s etc. Use the Sturgeon plan a guide ie science based goals/ harvests etc	4	I hope you can put the political pressures and your own biases aside. Thank you

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Michele Just	All of it	No	. There is much greater recognition of the ecological role of wolves ● The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves ● The adoption of proposed buffer zones around tribal reservations.	Thank you for the changes on the plan. Here is what continues to need to be addressed: The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on : ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings. Hounding or hound training, which are akin to allowing legalized dogfighting, should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public. The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. Despite Act 169, which mandates a wolf hunting season, the department can still restrict the implementation of lethal methods by setting minimal quotas, including a quota of '0' wolves, restricting timing and methods. Several studies have proven a proactive non-lethal approach leads to better conflict mitigation. Lethal management often fails to provide a long-term solution to wolf predation and has the least consistent success rates when compared to non-lethal practices. In addition, there is significant evidence showing that lethal wolf management may be less functionally effective at mitigating subsequent livestock losses than non-lethal deterrents. The plan also runs contrary to public values towards wolves (and omits mention of such majority values from the plan), despite department surveys evidencing that the broad public cares about wolves as individuals (and not just for the viability of the population). Given the recent liberalization of killing wolves by the state, it would be incredibly informative to note majority support of the following reasons for opposing a regulated wolf hunting/trapping season (which are all omitted from the plan): opposition to specific methods of harvest like hounds (64%) or traps (70%), feelings that hunting wolves is unnecessary (62%) or culturally offensive to Native American tribes (57%).	1	
	I have not read any of the draft plan	Yes	None	All	0	Shoot every wolf seen, if tree huggers want wolves, trap them and release them in Madison and Milwaukee
Debbie Wall	I have not read any of the draft plan	No				I fear that any "management" plan is an attempt to manipulate numbers of prey animals for human hunters and is also done at the behest of ranchers. Since we've put a man on the moon, the human population has more than doubled while that of the wild animal nations has more than halved. The survivors, including wolves, deserve protection and have the right to live and raise their families in peace. Ranchers must do their research and work to become predator friendly. The general public needs to be educated as to the true nature of wolves and we must adopt peaceful coexistence and compassionate conservation strategies. Thank-you.
Kathleen Cooper	Most of it	Yes	Educating the public as to the importance of having a healthy wolf population	Even the consideration of a wolf hunt is repugnant to me. I think wolves provide balance in our ecosystem. Wolf hunting with dogs in particular is highly unethical.	3	Leave them alone
	Most of it	No	We appreciate the efforts of all WDNR staff involved in updating the state's wolf management plan. Although we believe the current plan needs significant updating (see next section), we recognize the efforts and improvements made to the previous plan, including: ● Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. ● There is much greater recognition of the ecological role of wolves ● The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves	● The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on (see reference list below): ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution ● The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. ● The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ○ A substantial body of research documenting human-caused	4	

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
			● The adoption of proposed buffer zones around tribal reservations	mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings. ○ Hounding or hound training, which are akin to allowing legalized dogfighting, should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public. ● The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. ○ Despite Act 169, which mandates a wolf hunting season, the department can still restrict the implementation of lethal methods by setting minimal quotas, including a quota of '0' wolves, restricting timing and methods. ○ Several studies have proven a proactive non-lethal approach leads to better conflict mitigation. ○ Lethal management often fails to provide a long-term solution to wolf predation and has the least consistent success rates when compared to non-lethal practices. In addition, there is significant evidence showing that lethal wolf management may be less functionally effective at mitigating subsequent livestock losses than non-lethal deterrents. ● The plan should require the implementation of abatement measures as well as the use of non-lethal conflict minimization techniques by domestic animal owners for the latter to receive compensation for confirmed predation. ● The plan also runs contrary to public values towards wolves (and omits mention of such majority values from the plan), despite department surveys evidencing that the broad public cares about wolves as individuals (and not just for the viability of the population). Given the recent liberalization of killing wolves by the state, it would be incredibly informative to note majority support of the following reasons for opposing a regulated wolf hunting/trapping season (which are all omitted from the plan): opposition to specific methods of harvest like hounds (64%) or traps (70%), feelings that hunting wolves is unnecessary (62%) or culturally offensive to Native American tribes (57%). ○ All such reasons convey majority disagreement with practices currently promoted and endorsed by the legislature and the WDNR, and such a conflict between managers and the public should not only be acknowledged, but foregrounded and carefully considered in policy (instead of dismissed). ○ Such decisions to omit literature or downplay evidence (e.g., such as majority opposition to killing wolves and their reasons) are contrary to principles of scientific integrity (e.g., present all relevant scientific evidence to the public) as well as ethics (e.g., disguising ethical decisions, such as recreational wolf killing, as robustly supported by science). ● Conflicting agency objectives (e.g., optimizing public hunting and conflict mitigation) are not only not acknowledged, but even misunderstood as harmonious, against the body of scientific evidence. That culminates in the prioritization of consumptive values and policies; e.g., according to the body of scientific literature, use of lethal methods, and 2 especially public hunts, are contrary to most objectives relevant to: harm mitigation, the wellbeing of wolves, their ecological roles, and their non-exploitative enjoyment (i.e., Objectives A, B, D and F). ● There is a stark lack of consideration for individual wolves, wolf population health (including wellbeing), and measurable indicators for assessing any harms barring disease prevalence (e.g., accounting for cortisol levels or other stress hormones, measures of pair/pack persistence) ● There is an inappropriate understanding and consideration of tribal worldviews about wolves. Tribal worldviews of wolves are misconstrued as 'cultural benefits' tribes receive from the existence of a wolf population, when in fact tribal worldviews consider each individual wolf as a person and relative. Cultural respect and sensitivity towards such views, shared by many non-tribal members, demand the strict mitigation of lethal measures, especially recreational killing, as opposed to their current promotion in the plan. ● In general, all omissions of scientific literature, the arbitrary prioritization of policy objectives, the rhetoric of the plan and the dismissal of public values and concerns for wolves point towards a biased, unscientific and instrumental view of wolves that promotes values contrary to broad public perspectives on wolves. ● 'SOM' wolf estimation methodology – From a recent critique: "The new methods sacrifice precision, but are believed to retain adequate accuracy and sensitivity to changing conditions for reliable decision-making. We review evidence for the accuracy, precision, and sensitivity of the new 'scaled occupancy model' (SOM) applied in Wisconsin. We conclude that the Wisconsin method would systematically overestimate wolf abundance by large (but currently incalculable) margins. Because Wisconsin, similar to other states, not only changed to unverified methods but also implemented widespread wolf killing, shortcomings in their estimates of wolf abundance may have far-reaching consequences for population viability and confidence in state wildlife managers. We discuss findings		

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
				from Wisconsin alongside similar findings for other states' occupancy models being insensitive to human causes of mortality that have recently increased. Overall, Wisconsin's proposed method for estimating wolf abundance shows significant departures from best practices in scientific measurement. Verification will require independent replication and unbiased tests at multiple scales in multiple habitats under different human-induced mortality rates, and peer review before the new methods are considered reliable."		
Susan Barakat	All of it	Yes	It was good to see that the draft was, in many ways, being an advocate for the wolf. I believe this is the responsibility of the DNR, especially with the persecution that these animals face. Thank you for including the tribe's statements. The report seems balanced & I learned much. I agree that the protection of wolf dens needs to be paramount. Thank you for debunking misinformation- ie that wolves are a threat to the deer population. Educating the public on how they can possibly help with controlling CWD seems to be an excellent plan. I agree with Product A6a for many reasons- the more roadless areas the better for the health of the forests and the wolves. Promotion of ecotourism. Support the ownership of larger tract of land by public & private owners to address the need to give wolves "their space"- support science based management. Apply for CITES. Use educational outreach. Thanks.	I stand with the Natives, that "managing' wolves is objectionable & problematic, especially with their constantly changing status federally. Having a hunting season where every means possible of killing them doesn't seem reasonable, nor "fair" I object to using dogs to hunt them. That seems particularly barbaric, but, then, so do traps. The use of hunting dogs may have a tradition in this state, but now that our lands are so fragmented, this model seems past it's time. We own 400+ acres and have to deal with dogs trespassing. The buffer zones around the reservations should be "No harvest" zones. Zones 3 & 4- all zones - should firstly be management A- ecologically for the wolfs. Everything else is secondary, your surveys show Wisconsinites want the wolves here. While the report suggests that laws to protect wolves should be enforced, the current way the DNR is managed doesn't seem to allow for this. What can be done to stop the poaching? You mention that elk populations aren't growing as fast as anticipated, and yet you let hunters take them- animals that are basically tame beasts. Again, dogs should not be allowed to hunt wolves.	8	Plan is impressive, well rounded.
	Just the parts I am interested in	Yes			1	Wolves are pests like coyotes and should be treated as such
Russ Bachman	All of it	Yes	I appreciate the tremendous amount of research that wet into creating the draft.	If i read it correctly, it looks like a proposed season would allow a concurrent hunting and trapping season. In my opinion this would not be fair as documented by the overwhelming success rates of using dogs versus trapping.	10	I sincerely believe sportsmen/women should be the primary population control agent with target numbers supported by science vice politics. I also believe trapping should be allowed a time advantage over other harvest methods, i.e. earlier season.
	Just the parts I am interested in	Yes	Eliminate all wolves	Having wolves	1	No wolves
gary hendricks	Most of it	Yes	the court case stopped for now the inhumane killing in WI	tried to ok inhumane hunting tactics	3	
	Just the parts I am interested in	Yes	Should have no wolves	Have wolves	1	Eliminate them again
	Most of it	Yes			3	When there was wolf hunting poaching was low, No hunting and the wolves are shot like coyotes . Please get hunting at reasonable levels to keep wolf population down to the orginal 385 wolf level which now is over 1000
Dan Barth	Most of it	Yes	As a keystone predator species I LIKE the linkage of the wolf to its role in keeping prey species strong, healthy and moving. This emphasis on improving habitat is important, should be researched and public education increased. In particular, having long suspected the beneficial role a healthy wolf population would have on CWD, possibly even eliminating it should be studied and publicized. The Colorado research on mountain lions is worth duplicating here with wolves if possible. I also like requiring hunters to register within 8 hours of recovery. Hopefully that will lessen the likelihood of of overkill.	I am in favor of allowing wolves to repopulate most of Wisconsin, and do not like low quotas from Hwy 8 south. The Wolf Advisory Committee's 4 At Large groups have the potential to be unbalanced in favor of members in opposition to a healthy wolf population. Ag and Hunter groups will argue for smaller regional quotas and larger hunting quotas. The unaffiliated group could easily bring in more people opposed to the wolf. I'd like to see that group designated for people who view wolves positively.	7	A lot more public education about wolves is needed. Since no humans were killed by wolves in Wisconsin in the 20th Century that needs to be made more prominent in our minds. The fact that our domestic dogs are the dangerous canines also needs more coverage. Wolves, not us are the animals in danger.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Julie Zeidel	Just the parts I am interested in	No	Buffers around tribes	Allowing hound hunting and traps - unsportsmanlike. Focus on non-lethal control instead!	2	We enjoy hearing and seeing wolves in Northern MN near our cabin, and we enjoy all the wildlife we observe when we visit our daughter in Eau Claire.... please use science to determine wolf management!
Robert Bernard	Most of it	Yes	Numbers have to be controlled! As a retired farmer I've seen the damage that they do!		10	
	Most of it	Yes	Killing some wolves	Not killing enough wolves, that eat too many livestock, dogs, and deer	2	350 should be maximum goal, for these monsters that ruthlessly torture their kills
Tom Lager	Most of it	Yes	The completeness of the documentation could not be better from ecological knowledge, the history of management and the interplay of people and wolves. I most like to Section four starting on page 97 - pages 139. I agree with the logic of "An alternative to numeric population goals". I like the rationale for the zones and subzones and how the parameters of the goals flex zone by zone.	None to speak of	9	I want the legislature to stop directing how the DNR professionals do thier jobs.
[redacted]	All of it	Yes	The research was excellent and should continue	The numbers I believe are under reported with limited data under estimating the population a has always flawed the data results	7	The need to protect the elk calf's and deer are vital as well as pets hunting dogs. The morality of these animals are under reported with the current data. It is an embarrassment that Wisconsin DNR had failed to have successful elk populations and eastern states actually have elk hunting not just a pathetic lottery draw. Hunting the wolve has been legally suppressed by liberal judges and everybody suffers as funding for wildlife programs are mostly suppported by hunting dollars and the DNR knows this but remains passive and does not advocate for hunting just money hunters provide. The decline in hunting interest is directly correlated to these facts about Wisconsin . Why do other Midwest states have better fishing and hunting with fewer natural resources us they support hunting and fishing as hunters are great conservationslists as we have to because of too highly regulated harvests.
John W Johnson	Most of it	Yes	Really, none of it. I feel it is manipulated to make the wollf population a non-issue in the state.	That wolves seek the sick, old and weak. This has been documented to be untrue by biologists in the western states. Wolves will kill for thrill. As far as tribes not killing them because of sacred belief's, how did they use there hides to cover themselves to hunt? I feel the tribe uses to be against the non-tribe people, same with spearing walleye and musky.	1	I've hunted deer in this state for 48 years. I've seen bad winters kill large populations of deer. But, within a couple years the herd rebounds. Now with the larger than stated wolf populations the deer herds in the large forest areas do not rebound at all and keep getting smaller. We as hunters have a voice in this also. Deer are required in all areas, especially public lands to hunt. With our current wolf population, the hunting quality has dropped to basically a non huntable deer population on public lands. This is a serious problem and needs to be corrected.
Robert Theim	Most of it	Yes	I thought the information was well presented and fairly inclusive in data from numerous studies from historic relevance of wolves in Wisconsin, to the impact on Wisconsin's elk population, to the breakdown of tolerance differences between those routinely in contact with wolf effects vs those who have no regular interaction. (I could write pages naming specific things I liked about the report, let it suffice that I felt it was fairly well inclusive of various graphs and surveys and studies)	I dislike that the proposed strategies really didn't focus controlling the wolf numbers and reflect what was reflected in the studies.. Instead, they seem to simply fall back on a politically based series of strategies rather than going off the science.	2	It seems that this is an attempt to please the masses of people, who realistically have little interaction with the wolves and really don't understand the ecological impact the wolves are generating. Instead they look as them as simply being a majestic and beautiful animal (which they are) but the management of the ecology needs to take presidency over the political side of allowing the ecology to be disrupted simply based on a "feeling" of how pretty an element of it is. The opening statement "To protect and enhance our natural resources: our air, land and water; our wildlife, fish and forests and the ecosystems that sustain all life. To provide a healthy, sustainable environment and a full range of outdoor opportunities " needs to be adhered to. The way our wolf population is now DOES NOT provide for a healthy sustainable environment. By ignoring the people who routinely interact with wolves and the results of their carnivorous daily activity, in favor of those who sit back and are not exposed to what the reality of allowing the wolves to continue their destructive natural activities, only causes a rift in the attitudes and forces people to take things into their own hands. It truly is a shame when people talk about gut shooting the animals because proper management practices are not employed.
Dan Henderson	All of it	Yes	I thought the whole plan was very thorough and well written.	I dislike that it is accepted that the majority of WI wants more than 350 wolves...the stated population goal listed when WI voted to allow wolf reintroduction. Reintroduction was allowed based upon a 350 population goal. This should NOT be disregarded without the ok of those living in wolf country.	7	I enjoy having wolves and other large predators, despite being a northern WI deer hunter. I also believe in active management of predators thru hunting/trapping. I believe the stakeholders who live among the wolves, should have a greater say in population goals than people, like me, who do not live in wolf country.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Colonel Don Hamilton	Most of it	Yes	First three sections...very thorough. Almost too much information	Fourth section. By creating a perpetual "circle" of managing the management of the Wolf Management Plan, nothing will ever accomplished. Creating a "suite" of strategies objectives, strategies, and products to guide wolf management, WITHOUT a specific BCC is a major fail. We know long term viability is tied to road density and non-ag lands. We know primary and secondary habitat will not increase. Previous plans have BCC. This one should too.	2	A lot of good/great info in sec's 1-3. Conversely, in sec 4, it's disappointing to see how the "science" of managing the wolf has been marginalized/reduced down by politics and the litigious nature of anti-hunters from science-based BCCs and actual harvest quota numbers to a 178 page "plan" that does not establish/publish a current, science based BCC. Look no farther than the the graphic on pg112: 75% of Plan is Adjust, Learn, and Evaluate. The Plan's unlimited amount of wolf management objectives and strategies guarantees only 25% of your management time is allotted to actually "Do"-ing any managing of this resource. This Plan is the culmination of - and clearly reflects - the overmanagement of the managing of the Wolf Management Plan. (If there ever was a "self-licking ice-cream cone," this is it.)
	Just the parts I am interested in	No	We appreciate the efforts of all WDNR staff involved in updating the state's wolf management plan. Although we believe the current plan needs significant updating (see next section), we recognize the efforts and improvements made to the previous plan, including: ● Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. ● There is much greater recognition of the ecological role of wolves ● The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves ● The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed)	The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on (see reference list below): ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution ● The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. ● The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ○ A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings. ○ Hounding or hound training, which are akin to allowing legalized dogfighting, should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public. ● The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. ○ Despite Act 169, which mandates a wolf hunting season, the department can still restrict the implementation of lethal methods by setting minimal quotas, including a quota of '0' wolves, restricting timing and methods. ○ Several studies have proven a proactive non-lethal approach leads to better conflict mitigation. ○ Lethal management often fails to provide a long-term solution to wolf predation and has the least consistent success rates when compared to non-lethal practices. In addition, there is significant evidence showing that lethal wolf management may be less functionally effective at mitigating subsequent livestock losses than non-lethal deterrents. ● The plan should require the implementation of abatement measures as well as the use of non-lethal conflict minimization techniques by domestic animal owners for the latter to receive compensation for confirmed predation. ● The plan also runs contrary to public values towards wolves (and omits mention of such majority values from the plan), despite department surveys evidencing that the broad public cares about wolves as individuals (and not just for the viability of the population). Given the recent liberalization of killing wolves by the state, it would be incredibly informative to note majority support of the following reasons for opposing a regulated wolf hunting/trapping season (which are all omitted from the plan): opposition to specific methods of harvest like hounds (64%) or traps (70%), feelings that hunting wolves is unnecessary (62%) or culturally offensive to Native American tribes (57%). ○ All such reasons convey majority disagreement with practices currently promoted and endorsed by the legislature and the WDNR, and such a conflict between managers and the public should not only be acknowledged, but foregrounded and carefully considered in policy (instead of dismissed). ○ Such decisions to omit literature or downplay evidence (e.g., such as majority opposition to killing wolves and their reasons) are contrary to principles of scientific integrity (e.g., present all relevant scientific evidence to the public) as well as ethics (e.g., disguising ethical decisions, such as recreational wolf killing, as robustly supported by science). ● Conflicting agency objectives (e.g., optimizing public hunting and conflict mitigation) are not only not acknowledged, but even misunderstood as harmonious, against the body of scientific evidence. 				accounting for cortisol levels or other stress hormones, measures of pair/pack persistence) ● There is an inappropriate understanding and consideration of tribal worldviews about wolves. Tribal worldviews of wolves are misconstrued as 'cultural benefits' tribes receive from the existence of a wolf population, when in fact tribal worldviews consider each individual wolf as a person and relative. Cultural respect and sensitivity towards such views, shared by many non-tribal members, demand the strict mitigation of lethal measures, especially recreational killing, as opposed to their current promotion in the plan. ● In general, all omissions of scientific literature, the arbitrary prioritization of policy objectives, the rhetoric of the plan and the dismissal of public values and concerns for wolves point towards a biased, unscientific and instrumental view of wolves that promotes values contrary to broad public perspectives on wolves. ● 'SOM' wolf estimation methodology – From a recent critique: "The new methods sacrifice precision, but are believed to retain adequate accuracy and sensitivity to changing conditions for reliable decision-making. We review evidence for the accuracy, precision, and sensitivity of the new 'scaled occupancy model' (SOM) applied in Wisconsin. We conclude that the Wisconsin method would systematically overestimate wolf abundance by large (but currently incalculable) margins. Because Wisconsin, similar to other states, not only changed to unverified methods but also implemented widespread wolf killing, shortcomings in their estimates of wolf abundance may have far-reaching consequences for population viability and confidence in state wildlife managers. We discuss findings from Wisconsin alongside similar findings for other states' occupancy models being insensitive to human causes of mortality that have recently increased. Overall, Wisconsin's proposed method for estimating wolf abundance shows significant departures from best practices in scientific measurement. Verification will require independent replication and unbiased tests at multiple scales in multiple habitats under different human-induced mortality rates, and peer review before the new methods are considered reliable." (Treves & Santiago-Ávila, 2023)		
	Just the parts I am interested in	Yes	The fact that the state and not a federal judge will be deciding how we will manage the wolf populantion.	For a while now the number of wolves in the state has been a joke in the determining process. The political and special interest groups should not create a problem to determine an Accucrete wolf count. Our DNR has done this with deer for the past 20 years and hunting has gotten worse each year. You cant manage when you dont know what you are managing.	7	Wolves are spreading all over the state and will cause even more damage in agriculture areas if not properly controlled. The original goals when the wolf was introduced was 175 in the state we have 10 to 20 times that number today.
	All of it	No	cultural respect to native Americans	include a "satisfactory" hunt for hunter and trappers this is NOT science based	2	just to satisfy the hunter groups is not science based but politically motivated? and using dogs is not mentioned as to if included or not ...no on hunting and no on dog use
jeff schmelzer	Just the parts I am interested in	Yes			1	Wasn't even going to comment. But, don't believe anything the general public says means anything .Too many wolfs. No deer. to many bears. Hunted Iron and Price county for over 40 years. To many doe tags. Ridiculous now. Wolf count way low. Pretty simple. But just goes on and on. Bla. Bla. Bla. Doesn't matter what People who live and / or hunt up there think. Could go on actually about plan, not worth it.
Gloria	All of it	Yes	Science based, wolves are an important part of the ecosystem. Also, appreciated input from Native Americans.	Dislike use of dogs and bait.	9	Wolf hunting season needs to end/close in early to mid December so breeding season is not included.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Anne-Marie Hewitt	All of it	No	Wolves will no longer be managed by referral to the old numerical goal of 350. There is much greater recognition of the ecological role of wolves. The inclusion of a social survey (which notes increased positivity towards wolves, as well as knowledge of their ecological roles, and increased opposition to the motives and methods for killing wolves). The adoption of proposed buffer zones around tribal reservations.	The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on (see reference list in Other Comments) wolf ethology, sentience, sapience, sociability, agency and wellbeing, effectiveness of non-lethal interventions, especially relative to lethal ones, and the impact of widespread killing on wolves' physiology, behaviour, wellbeing, social dynamics, ecological relationships and evolution The above omissions, combined with the emphasis on (and promotion of) 'sustainable' recreational killing and consumptive users as a main management strategy, results in a biased plan that is in opposition to scientific evidence, despite much of the omitted scientific evidence being more recent, numerous and of stronger inference. The plan should strictly limit any lethal management of wolves, except in extremely rare circumstances of immediate defence of life. A substantial body of research documenting human-caused mortality in North American wolves (including Wisconsin wolves) has found that policies allowing liberalised killing of wolves result in a direct increase in the hazard and incidence of illegal killings. Hounding or hound training, which are essentially legalised dogfighting, should be illegal or severely restricted, as this practice is extremely cruel to wolves and hounds alike, and is not supported by the majority of hunters, or indeed the general public. The plan should prioritise wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. Despite Act 169, which mandates a wolf hunting season, the department can still restrict the implementation of lethal methods by setting minimal quotas, including a quota of '0' wolves, restricting timing and methods. Several studies have proven a proactive non-lethal approach leads to better conflict mitigation. Lethal management often fails to provide a long-term solution to wolf predation and has the least consistent success rates when compared to non-lethal practices. In addition, there is significant evidence showing that lethal wolf management may be less functionally effective at mitigating subsequent livestock losses than non-lethal deterrents. The plan should require the implementation of abatement measures as well as the use of non-lethal conflict minimization techniques by domestic animal owners for the latter to receive compensation for confirmed predation. The plan also runs contrary to public values towards wolves (and omits mention of such majority values from the plan), despite department surveys evidencing that the broad public cares about wolves as individuals (and not just for the viability of the population). Given the recent liberalisation of killing wolves by the state, it would be incredibly informative to note majority support of the following reasons for opposing a regulated wolf hunting/trapping season (which are all omitted from the plan): opposition to specific methods of harvest like hounds (64%) or traps (70%), feelings that hunting wolves is unnecessary (62%) or culturally offensive to Native American tribes (57%). All such reasons convey majority disagreement with practices currently promoted and endorsed by the legislature and the WDNR, and such a conflict between managers and the public should not only be acknowledged, but foregrounded and carefully considered in policy (instead of dismissed). Such decisions to omit literature or downplay evidence (e.g., such as majority opposition to killing wolves and their reasons) are contrary to principles of scientific integrity (e.g., present all relevant scientific evidence to the public) as well as ethics (e.g., disguising ethical decisions, such as recreational wolf killing, as robustly supported by science). Conflicting agency objectives (e.g., optimizing public hunting and conflict mitigation) are not only not acknowledged, but even misunderstood as harmonious, against the body of scientific evidence. That culminates in the prioritization of consumptive values and policies; e.g., according to the body of scientific literature, use of lethal methods, and especially public hunts, are contrary to most objectives relevant to: harm mitigation, the wellbeing of wolves, their ecological roles, and their non-exploitative enjoyment (i.e., Objectives A, B, D and F). There is a stark lack of consideration for individual wolves, wolf population health (including wellbeing), and measurable indicators for assessing any harms barring disease prevalence (e.g., accounting for cortisol levels or other stress hormones, measures of pair/pack persistence) There is an inappropriate understanding and consideration of tribal worldviews about wolves. Tribal worldviews of wolves are misconstrued as 'cultural benefits' tribes receive from the existence of a wolf population, when in fact tribal worldviews consider each individual wolf as a person and relative. Cultural respect and sensitivity towards such views, shared by many non-tribal members, demand the strict mitigation of lethal measures, especially recreational killing, as opposed to their current promotion in the plan. In general, all omissions of scientific literature, the arbitrary prioritization of policy objectives, the rhetoric of the plan and the dismissal of public values	4	Reference list (studies not integrated into the current draft wolf plan) Adams, L. 				and concerns for wolves point towards a biased, unscientific and instrumental view of wolves that promotes values contrary to broad public perspectives on wolves. 'SOM' wolf estimation methodology – From a recent critique: "The new methods sacrifice precision, but are believed to retain adequate accuracy and sensitivity to changing conditions for reliable decision-making. We review evidence for the accuracy, precision, and sensitivity of the new 'scaled occupancy model' (SOM) applied in Wisconsin. We conclude that the Wisconsin method would systematically overestimate wolf abundance by large (but currently incalculable) margins. Because Wisconsin, similar to other states, not only changed to unverified methods but also implemented widespread wolf killing, shortcomings in their estimates of wolf abundance may have far-reaching consequences for population viability and confidence in state wildlife managers. We discuss findings from Wisconsin alongside similar findings for other states' occupancy models being insensitive to human causes of mortality that have recently increased. Overall, Wisconsin's proposed method for estimating wolf abundance shows significant departures from best practices in scientific measurement. Verification will require independent replication and unbiased tests at multiple scales in multiple habitats under different human-induced mortality rates, and peer review before the new methods are considered reliable." Lynn Buske	I have not read any of the draft plan	Yes	I didn't read it and I know I didn't but my largest concern is respecting the need for the wolves in our ecosystem. I saw that was considered in the description so I appreciate that part. Some wolf species are endangered. Countering the hate with respect is good.	I know there is a need to alleviate issues with the wolf, and I didn't read the draft, but I hope hunting, killing or harmful trapping is not part of that management. I am not clear on wolf population numbers but I am aware of in how wolf hate can skew perspective.	5	Wolves are special. I appreciate the DNRs approach and for including public comment. So important to engage the public thank you!
	Most of it	No	There is much greater recognition of the ecological role of wolves. The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves and the adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed)	The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence and should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. The plan should also require the implementation of abatement measures as well as the use of non-lethal conflict minimization techniques by domestic animal owners for the latter to receive compensation for confirmed predation. The draft does not include these important matters.	3	Same as dislike
Michael J. Vandervest	Most of it	Yes	the amount of science and study is amazing. I agree with the proposed management numbers.	Its a little convoluted. It should be simplified. More info should be included on the process on how the public can help to get the plan implemented	8	the plan is obviously solid. that being said it needs to be fluid. not static. implementation should now be the priority.
Ronnie C Gray	Most of it	Yes	I don't like any of your plan	I don't want you to authorize ANY kill. Wolves are sacred to our family; tribal members. They are considered family.	1	Leave our brothers and sisters alone!!!

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Yolanda St Germaine	All of it	Yes	I don't like any of your plan.	We should NOT be killing wolves. I am a tribal member and the wolf to me is sacred. He is considered my brother and I believe what happens to him, will happen to me.	1	Please do not plan to kill my brother or sister!!!
Mary Bittner	Most of it	Yes	Watching over the health of the wolves.	Still harvesting plan using traps, snares, dogs, baiting, snowmobiles also hours for training dogs on wolves This must Stop!	5	Keep wolves on the Federal Endangered Species Act to protect them from the terrible way of harvesting them. Move the whole wolf family to another area maybe to another state who would like and need wolves instead of slathering them in painful deaths.
Jeff Wagner	Most of it	Yes	The idea that people and wolves can coexist. The fact that wolves are sacred to Nativd Americans.	Trapping should be elicited. It's inhumane.	10	Eliminate trapping. It's an inhumane way to die.
L J Neuman	Just the parts I am interested in	Yes	Cultural significance of wolves to tribes		8	
Joe Peterson	Most of it	Yes	Not much	Not having a goal for the number of wolves for the state is an issue. Also when setting numbers for take if the tribes are not going to use there tags then the wolves should be allowed to be harvested by non tribal members. There is not enough use of real science as the western states are taking good numbers of wolves every year without overall reduction in numbers. Look at studies I believe were done on coyotes and the more you killed the larger the litters were and the fewer taken tended to result in smaller litter size. Also what about the conflict with farm animals and peoples pets/hunting dogs. This is all due to the over abundance of wolves and the fact they have no reason to worry about trying to avoid humans because they do not see us as a threat as they would have hunted.	1	See above. This whole wolf issue has become political and also based on the amount of money that animal activist groups can raise to try to fight the delisting and opening of a season. They make millions of dollars from supporters that know nothing of the real facts about living with wolves. Yet they can fight in court and have all their costs paid for by tax payers. That isn't fair either. Also, I read everywhere that people are killing wolves anyways and the shoot shovel and shout up philosophy which means that wolves are being killed anyways. Why not make them a legal and fulfilling hunting/trapping animal and bring more income into the state from the legal sale of licenses. Also why not change seasons to allow for good trappings/ hunting like in the short season we just had. That seems like a good way to allow for people to enjoy the harvest but also have the best pelt available for the trophy. Also bring back our deer numbers. I wouldn't be surprised to find you are conducting studies on cwd where you allow wolf numbers to be high to control or eradicate the deer herd that isn't being done by hunters. Remember your first attempt at controlling cwd where you wanted hunters to kill everything and there was a giant backlash. Please get away from the politics and manage the resource they way it should be done.
	All of it	Yes	Adaptable and science based. It appears that all citizens desires including tribes are represented. I like the shorter 8 hour kill reporting time. Also, any hunting allowed in only one zone with no moving to another zone to hunt. Important not to have a population cap but to focus on areas that are problematic with farmers .	I believe much more needs to be done regarding nonlethal measures. No farm with chronic depradation should have financial reimbursement without using nonlethal measures first. The state should help with this cost. Most citizens in this state want wolves to exist and to exist in their prime habitat where they belong. These areas should be off limits to hunting especially hounding. It's too invasive to every animal that has a right to exist in their natural habitat. Zones 1, 2 should be off limits especially the Chequaumegon/Nicollet forest. I dislike hounding at all and feel that this needs to be discontinued as a practice. The WBHA shouldn't have final say on what occurs with our wildlife in this state. Bear Bait should be limited and registered to minimize conflict with other wildlife. Night hunting using Lazer technology and snaring should not be allowed. Over 7 resolutions were rejected by the WCC recently including the 3-2 rule. Democracy is not happening with the WCC and it needs to be disbanded. The public is not being heard.	7	I would like to see the new NRB Board involved with the new plan, not the board in which Prehn sat. It's well known that he sat in his seat illegally and as the open record requests came in, that he was working with lobbying groups etc and that's why he stepped down. We need new blood and all folks at the table, including the tribes to officially determine the new wolf plan.
Jeanne Rasmussen	All of it	No	● The elimination of a numerical target population ● The importance of the ecological benefits of wolves and inclusion of tribal values and knowledge. ● The attempt to minimize the impacts of a recreational hunt by adopting buffer zones around tribal lands, shortening reporting requirements and making hunting licenses zone specific. ● Emphasizes the use of non-lethal methods to reduce conflicts.	At a minimum, DNR should ban the use of dogs to hunt wolves in our national forests. ● There is considerable uncertainty in estimating wolf populations based on the occupancy model and should not be used solely to determine population. ● The plan should include an oversight committee which is comprised of biologists and professionals.	4	Hounding must stop. It is cruel to bears, the hounding dogs, and the wolves.
Brandon Weinhammer	Just the parts I am interested in	No		I'd like to see the wolf population managed like stated before (350) not the over 1,000 we have now.	5	
	Just the parts I am interested in	Yes				I dont want any wolf's killed

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
	Just the parts I am interested in	Yes	Data summaries are nice. May not like the data but the data helps one understand. Figure 16. Changes in Wisconsin overwinter gray wolf population 1980-2021 Table 6. Summary of all detected wolf mortalities Figure 14. 2015 overwinter wolf pack distribution. (208 packs, 746 wolves)	Page-59 quote "count grew at an annual rate of 22%" Your document should show and summarize the decline of deer population and deer hunting tourism dollars in these areas. An overlaying map or table showing multiple variables. Wolf population, deer populations, tourism dollars. I dislike that the document buried and hides the cost of wolves. That should be highlighted in the executive summary and the summary tables or charts. Wolves influence more than what is summarized in this document, please tell all the statistics please, please, please.	2	In your executive summary you should highlight the cost of wolves and not hide it on page 86 of a 178 page document. I wish we had spent $3M on other wildlife benefits and projects. Quote "Between 1985 and 2021, the department has paid out over $3 million for reimbursements of confirmed or probable wolf damages."
	All of it	No	We appreciate the efforts of all WDNR staff involved in updating the state's wolf management plan. Although we believe the current plan needs significant updating (see next section), we recognize the efforts and improvements made to the previous plan, including: ● Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. ● There is much greater recognition of the ecological role of wolves ● The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves ● The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed)	The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on (see reference list below): ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution ● The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. ● The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ○ A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings. ○ Hounding or hound training, which are akin to allowing legalized dogfighting, should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public. ● The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. ○ Despite Act 169, which mandates a wolf hunting season, the department can still restrict the implementation of lethal methods by setting minimal quotas, including a quota of '0' wolves, restricting timing and methods. ○ Several studies have proven a proactive non-lethal approach leads to better conflict mitigation. ○ Lethal management often fails to provide a long-term solution to wolf predation and has the least consistent success rates when compared to non-lethal practices. In addition, there is significant evidence showing that lethal wolf management may be less functionally effective at mitigating subsequent livestock losses than non-lethal deterrents. ● The plan should require the implementation of abatement measures as well as the use of non-lethal conflict minimization techniques by domestic animal owners for the latter to receive compensation for confirmed predation. ● The plan also runs contrary to public values towards wolves (and omits mention of such majority values from the plan), despite department surveys evidencing that the broad public cares about wolves as individuals (and not just for the viability of the population). Given the recent liberalization of killing wolves by the state, it would be incredibly informative to note majority support of the following reasons for opposing a regulated wolf hunting/trapping season (which are all omitted from the plan): opposition to specific methods of harvest like hounds (64%) or traps (70%), feelings that hunting wolves is unnecessary (62%) or culturally offensive to Native American tribes (57%). ○ All such reasons convey majority disagreement with practices currently promoted and endorsed by the legislature and the WDNR, and such a conflict between managers and the public should not only be acknowledged, but foregrounded and carefully considered in policy (instead of dismissed). ○ Such decisions to omit literature or downplay evidence (e.g., such as majority opposition to killing wolves and their reasons) are contrary to principles of scientific integrity (e.g., present all relevant scientific evidence to the public) as well as ethics (e.g., disguising ethical decisions, such as recreational wolf killing, as robustly supported by science). ● Conflicting agency objectives (e.g., optimizing public hunting and conflict mitigation) are not only not acknowledged, but even misunderstood as harmonious, against the body of scientific evidence. That culminates in the prioritization of consumptive values and policies; e.g., according to the body of scientific literature, use of lethal methods, and 2 especially public hunts, are contrary to most objectives relevant to: harm mitigation, the wellbeing of wolves, their ecological roles, and their non-exploitative enjoyment (i.e., Objectives A, B, D and F). ● There is a stark lack of consideration for individual wolves, wolf population health (including wellbeing), and measurable indicators for assessing any harms barring disease prevalence (e.g., accounting for cortisol levels or other stress hormones, measures of pair/pack persistence) ● There is an inappropriate understanding and consideration of tribal worldviews about wolves.	4	Reference list (studies not integrated into the current draft wolf plan) 3 Adams, L. 				Tribal worldviews of wolves are misconstrued as 'cultural benefits' tribes receive from the existence of a wolf population, when in fact tribal worldviews consider each individual wolf as a person and relative. Cultural respect and sensitivity towards such views, shared by many non-tribal members, demand the strict mitigation of lethal measures, especially recreational killing, as opposed to their current promotion in the plan. ● In general, all omissions of scientific literature, the arbitrary prioritization of policy objectives, the rhetoric of the plan and the dismissal of public values and concerns for wolves point towards a biased, unscientific and instrumental view of wolves that promotes values contrary to broad public perspectives on wolves. ● 'SOM' wolf estimation methodology – From a recent critique: "The new methods sacrifice precision, but are believed to retain adequate accuracy and sensitivity to changing conditions for reliable decision-making. We review evidence for the accuracy, precision, and sensitivity of the new 'scaled occupancy model' (SOM) applied in Wisconsin. We conclude that the Wisconsin method would systematically overestimate wolf abundance by large (but currently incalculable) margins. Because Wisconsin, similar to other states, not only changed to unverified methods but also implemented widespread wolf killing, shortcomings in their estimates of wolf abundance may have far-reaching consequences for population viability and confidence in state wildlife managers. We discuss findings from Wisconsin alongside similar findings for other states' occupancy models being insensitive to human causes of mortality that have recently increased. Overall, Wisconsin's proposed method for estimating wolf abundance shows significant departures from best practices in scientific measurement. Verification will require independent replication and unbiased tests at multiple scales in multiple habitats under different human-induced mortality rates, and peer review before the new methods are considered reliable." 	All of it	Yes	Good update to the plan, not perfect but includes background, analysis and input from a diverse group. I like that the basis is science based. That is how wolves and other wildlife need to be managed in WI.	While much of the plan is science based, I'm disappointed there are political activist groups you've allowed to joint the committee since the 1999 plan. HSUS has no business being part of this committee nor any other wildlife management committee. They are political activists, with a horrible reputation with deceptive practices. What have the native american tribes contributed to the wolf reintroduction in terms of dollars and time/labor, whether in the field or in the office? What benefit do they provide wolves and other wildlife management across the state of Wisconsin for the greater good besides on their own reservation? They are net takers whereas Wisconsin residents including ranchers, farmers, hunters, trappers (hunters and trappers being true conservationists) are net providers. Reintroduction was cautiously supported by the sportsmen and sportswomen, only to get stabbed in the back throughout the process. There has been a lot of trust lost and Goodwill that needs to be earned back from the WI DNR and leadership in WI. If not for hunters and trappers there would not be the wildlife resources we have today. I'm disappointed the plan moves away from an overall quota. An overall quota and quota by zones needs to be part of the plan. We also need to reduce numbers <500 animales. We need hunting and trapping tools to manage numbers and offset management costs through license fees. We need hunting and trapping seasons soon to manage wolves. Once wolves are exposed to hunting conficts with livestock will diminish, as many western states have learned. Wolves are smart animals, they will not be very easy to hunt in future years, and we need trapping to help manage numbers. We have well-regulated trapping methods where target and non-target animals can be released unharmed using foothold and cable-restraint devices. These methods are not harmful to animals.	7	
Arnold Blomberg	Most of it	Yes			3	We need less wolves. Mostly they are cross breeds not gray wolves. The number is not accurate, we have way to many around in my view.
	All of it	Yes	Get the DNAR had a listening session and that people can Comment online	The DNR has not Gone to the 350 wolf Management. And there has not been a scheduled wolf hunt. The 12 mile From the reservations is not acceptable to me That you can't hunt. Too much input from the Indians.	1	There should be a wolf hunt in 2023
Robert Lewerenz	Most of it	Yes	"Product F1c: Convene the department's Wolf Advisory Committee at least annually and regardless of listing status." "Strategy F2: Support science-based wildlife management" "Product F2b: Promote intergovernmental collaboration on wolf management."	it the "science-based wildlife management" does not include numerical quotas, is it just an exercise in futility? Also, concerning "Product F2c: Maintain partnerships with colleges and universities to support collaborative research on Wisconsin's wolf population." I suspect the schrools would have us never kill a wolf.	7	IF "science-based wildlife management" is the criteria used, Wisconsin will manage wolves by hunting and trapping down to a sensible NUMERICAL quota. For this to happen, the federal government would have to get out of the way of science-based wildlife management". Currently city dweller judges protect the wolves because they are pretty, which is disgusting. Although it won't happen, it would also help if the tribes killed their quota, so the packs are managed. Sooner or later, aren't the areas the tribes control going to be over populated with wolves?
Michelle Hyllested	Most of it	Yes	Most important is including the benefits of wolves to our eco system and the use of non lethal methods to reduce conflicts. Giving tribal values and knowledge importance in the plan are essential with the buffer zones around tribal lands. I also applaud the elimination of numerical target population. Wolves self regulate their population. They are a keystone species that create healthy populations of deer and other prey animals.	I detest for so many reasons that Wisconsin is the only state that allows hounds to hunt wolves and coyotes. It is basically legalized canine fighting for sport. A few who having no regard for their dogs safety put them in harms way against wolves and coyotes. Hound hunting should be eliminated. Dogs trained to kill are a danger to people and other dogs. My city has had several dogs killed by hunting hounds roaming loose and attacking other dogs being walked by their owners. Hound training and hunting should be stopped. Second, giving a reward for putting your dog in harms way by payment from the DNR for hounds killed by wolves is a great way to encourage abuse by hound hunters. Overturn PA 169 the majority of Wisconsinites do not want their tax dollars used to encourage abuse of animals or hunting wolves. Giving a small group of hunters so much power over a species and policies for killing them is undemocratic.	7	I live in NW Wisconsin. I do not support a wolf hunt that caters to a few trophy hunters. I do support non lethal means to reduce conflicts with farmers. The killing of wolves is scientifically proven to increase predation on livestock due to weakening a family unit of wolves ability to take down large prey. Wolves have a hard time surviving in the wild as it is. The Wolf is a keystone species and should be treated as such.
	All of it	Yes	None	Set limt at 350	0	
	All of it	Yes	100% of it. It is based on common sense, good science, and tribal input, quit thorough and a very good documentation of the history as well as collected data.	I do not find anything to dislike.	10	Thank you to all the Department staff, field as well as management, it putting this report and plan together.
	Most of it	No	● Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. ● There is much greater recognition of the ecological role of wolves ● The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves ● The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed)	● The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on (see reference list below): ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution ● The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. ● The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ○ A substantial body of research documenting human-caused	3	

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
				mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings. ○ Hounding or hound training, which are akin to allowing legalized dogfighting, should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public. ● The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. ○ Despite Act 169, which mandates a wolf hunting season, the department can still restrict the implementation of lethal methods by setting minimal quotas, including a quota of '0' wolves, restricting timing and methods. ○ Several studies have proven a proactive non-lethal approach leads to better conflict mitigation. ○ Lethal management often fails to provide a long-term solution to wolf predation and has the least consistent success rates when compared to non-lethal practices. In addition, there is significant evidence showing that lethal wolf management may be less functionally effective at mitigating subsequent livestock losses than non-lethal deterrents. ● The plan should require the implementation of abatement measures as well as the use of non-lethal conflict minimization techniques by domestic animal owners for the latter to receive compensation for confirmed predation. ● The plan also runs contrary to public values towards wolves (and omits mention of such majority values from the plan), despite department surveys evidencing that the broad public cares about wolves as individuals (and not just for the viability of the population). Given the recent liberalization of killing wolves by the state, it would be incredibly informative to note majority support of the following reasons for opposing a regulated wolf hunting/trapping season (which are all omitted from the plan): opposition to specific methods of harvest like hounds (64%) or traps (70%), feelings that hunting wolves is unnecessary (62%) or culturally offensive to Native American tribes (57%). ○ All such reasons convey majority disagreement with practices currently promoted and endorsed by the legislature and the WDNR, and such a conflict between managers and the public should not only be acknowledged, but foregrounded and carefully considered in policy (instead of dismissed). ○ Such decisions to omit literature or downplay evidence (e.g., such as majority opposition to killing wolves and their reasons) are contrary to principles of scientific integrity (e.g., present all relevant scientific evidence to the public) as well as ethics (e.g., disguising ethical decisions, such as recreational wolf killing, as robustly supported by science). ● Conflicting agency objectives (e.g., optimizing public hunting and conflict mitigation) are not only not acknowledged, but even misunderstood as harmonious, against the body of scientific evidence. That culminates in the prioritization of consumptive values and policies; e.g., according to the body of scientific literature, use of lethal methods, and especially public hunts, are contrary to most objectives relevant to: harm mitigation, the wellbeing of wolves, their ecological roles, and their non-exploitative enjoyment (i.e., Objectives A, B, D and F). ● There is a stark lack of consideration for individual wolves, wolf population health (including wellbeing), and measurable indicators for assessing any harms barring disease prevalence (e.g., accounting for cortisol levels or other stress hormones, measures of pair/pack persistence) ● There is an inappropriate understanding and consideration of tribal worldviews about wolves. Tribal worldviews of wolves are misconstrued as 'cultural benefits' tribes receive from the existence of a wolf population, when in fact tribal worldviews consider each individual wolf as a person and relative. Cultural respect and sensitivity towards such views, shared by many non-tribal members, demand the strict mitigation of lethal measures, especially recreational killing, as opposed to their current promotion in the plan. ● In general, all omissions of scientific literature, the arbitrary prioritization of policy objectives, the rhetoric of the plan and the dismissal of public values and concerns for wolves point towards a biased, unscientific and instrumental view of wolves that promotes values contrary to broad public perspectives on wolves. ● 'SOM' wolf estimation methodology – From a recent critique: "The new methods sacrifice precision, but are believed to retain adequate accuracy and sensitivity to changing conditions for reliable decision-making. We review evidence for the accuracy, precision, and sensitivity of the new 'scaled occupancy model' (SOM) applied in Wisconsin. We conclude that the Wisconsin method would systematically overestimate wolf abundance by large (but currently incalculable) margins. Because Wisconsin, similar to other states, not only changed to unverified methods but also implemented widespread wolf killing, shortcomings in their estimates of wolf abundance may have far-reaching consequences for population viability and confidence in state wildlife managers. We discuss findings from Wisconsin alongside similar findings for		

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
				other states' occupancy models being insensitive to human causes of mortality that have recently increased. Overall, Wisconsin's proposed method for estimating wolf abundance shows significant departures from best practices in scientific measurement. Verification will require independent replication and unbiased tests at multiple scales in multiple habitats under different human-induced mortality rates, and peer review before the new methods are considered reliable." David Shramek	Most of it	Yes	the go around of the real issue.	no set goal. original set at 350, keep it there. and get started	2	get a plan going, wolves are getting to close to my house

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Joseph France	Most of it	Yes	Only the fact that we are trying to have a plan!	Allowing tribal protection of the species. Nowhere do the original treaties allow for tribal people to protect a species! They only call for the right to, hunt, fish and gather. No maximum pack sizes! Increasing the protection area.	1	There are many more wolves than you report, your numbers are not even close! Our forefathers eliminated wolves for a reason, the same reasons exist today. Human population increase has made it even harder to have an uncontrolled species like the wolf, and to make it worse mountain lions!
	All of it	Yes	Science based, taking tribal concerns into account, please push non-lethal methods of managing farm-wolf interactions.	Compensation for hunting dogs killed is ridiculous, and ridiculously high. But then I don't believe dogs should be used to hunt mammals. Trapping is barbaric and should be eliminated. Killing wolves for recreation makes no sense to me, but I seem to be in the minority in Wisconsin.	5	Timing of hunting season is not mentioned? Please don't ever run a February hunt again. We were ridiculed all over the world for that debacle a couple of years ago.
MICHAEL NELSON	Most of it	Yes	The plan is based on science and was assembled by a cross functional panel. It allows for the specific handling of problem wolves without setting a numerical cap on population. It contains a buffer zone around existing reservations.		10	There is no mention of how wolves help contain the spread of CWD. Why isn't this being pursued with more energy?
Greg Banaszynski	All of it	Yes	You are interested in all interested groups input	You didn’t specify a number or narrow range of how many wolves should be in Wisconsin	2	I believe we need to be closer to the previous goal of 350 wolves
	Most of it	Yes	Zone management seems intuitive	The inability afforded to landowners to protect their livestock from depredation. Far too much credence has been given to individuals who live hundreds of miles away from where depredation issues occur.	3	The number of wolves in our state has grown exponentially since I testified in the 90's, when the original plan was to maintain approximately 350 wolves.
Kevin W Stoddard	Just the parts I am interested in	Yes	Using hunting seasons to control the population.	The inaccuracies of the population estimate. The fact that I did not see anywhere in the document that the goal was to go back to 350 wolves, the total that was agreed upon when the wolves were reintroduced.	5	It's a lot of political conservatism when what we need is a simple plan to get the wolves back to 350 in the entire state. That number is a successful reintroduction and could be maintained. Any higher number just results in more conflicts, with humans and domestic animals.
	All of it	Yes	Continued depredation payment for wolf damage.	Continued expansion of wolf range into the southern 1/3 of WI. Far to many stake holders who have shown in the past, no tolerance for managing the wolf population, with zero harvest objectives. Harvest objectives should be expressed in the total of harvested animals. Not which group in successful or not. The 8 hour in person registration requirement, is not realistic in many locations in wolf country. I might recommend a hybrid of call-in or on-line harvest reporting within 12 hours followed up with in person registration within 36 hours of harvest.	3	Far too much emphasis on expanding wolf population for non consumptive users than protecting the deer and elk herds in WI
Rick viergutz	Just the parts I am interested in	Yes	Human attitudes toward wolves and the real difference between urbanites and those who live in wolf territory	No real criticism. Very comprehensive. The only way to effectively manage is with the comprehensive study of the real world reality of a healthy population. Trying to please or satisfy the wolf haters and the wolf lovers is a daunting task. Trying to present a reasonable plan to those whose opinion is not based on reason is impossible.	9	
	Most of it	Yes		Maximum 350 limit. Allow sportsman to kill wolves	0	Northern people versus southern city people
	Just the parts I am interested in	Yes			3	
ronald d henke	Most of it	Yes	research, public input ,tribal info	reduction of deer herd in some areas specifically central forest baiting ban . had one small buck i n shooting range 100 hrs hunting	5	hunted the central forest over 40 yrs worst year in 20yrs
Brian Ryczkowski	All of it	Yes	None of it	You need to have management target goals. Without that this plan is a waste. And no extra buffer around reservations.	0	
Katy	Just the parts I am interested in	Yes		The delisting of endangered . The fact you want to slaughter them once again.	0	
	I have not read any of the draft plan	No	None	LEAVE THE WOLVES ALONE! They are a NECESSARY part of Nature. Read "Never Cry Wolf" by Farley Mowat, and learn the truth about wolves.	0	
	Most of it	Yes	listen to your input from the people.	84 percent of it.	1	

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Pau Heath	Just the parts I am interested in	Yes	That there I'd a proposal to manage population	Seems to lack specific numbers for the state	5	In order to maintain balance preditors need to be hunted similar to any other successful management program. Any preditor that loses its instinct and fear of humans or other animals is bound to have more conflicts. Science would tell you there is a number either state wide or specific to a set area
Mike Cholko	Most of it	No	I like that both wolf haters and wolf enthusiasts are being considered in the drafting the plan. Despite the polarized opinions on wolf existence, the plan is going to focus primarily on science instead of hyperbole.	I dislike the arbitrary quantification of an appropriate number of wolves to hunt. The best approach would be to only hunt specific problem wolves after alternative non-lethal methods have been exhausted.	7	I would like a stipulation to be inserted which outlines that a wolf will not be killed until all non-lethal deterrents have been exhausted. I also think the team needs to explore the economic benefits of having wolves. Wolf watching, guided tours, camera traps will bring in a lot of money and create eco-tourism that has occurred in Montana, Idaho, Wyoming. Besides the ecological benefits, the economic benefits of wolves needs to be addressed.
	Most of it	Yes	The fact that we do understand Wolves need to be managed	Any proposal of wolf management that does not include reducing the population	5	
Travis	I have not read any of the draft plan	Yes	Don't want them here	Don't need them here	0	
	All of it	Yes	truthfully trash it all	all of it	0	Get rid of the wolves. A good wolf is a dead wolf.
Penny Davies	All of it	No	Whilst I believe that the current plan is not there yet, with more to be the team are to be congratulated on all their efforts and improvements put in this far, including: ● The removal of the reference point or 'goal' of '350 wolves'. ● An improved understanding and importance of the ecological role of wolves. ● The inclusion of a public social survey indicating greater and improved public positivity towards wolves, their ecological role and greater hostility/opposition to the rationales often used to support motives for killing wolves. ● Proposals for buffer zones around tribal reservations. These are all very good aspects which I support.	● The draft does not yet reflect the best science, and is missing out on substantial scientific literature on (see reference list below): ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing; ○ effectiveness of non-lethal interventions, especially relative to lethal ones; ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution; ● These omissions combined with the emphasis on promotion of sustainable 'recreational killing' and consumptive users as a central strategy of management, means a flawed/biased plan which ignores best and most recent scientific evidence. ● The plan should prohibit lethal management of wolves unless, exceptionally and only, to preserve life. ○ Much substantive research analysing human-caused mortality in North American wolves (including Wisconsin wolves), has identified that policies liberalising the killing of wolves result in a direct increase in illegal killings. ○ The cruel practice of 'hounding' should be prohibited and is not supported by the majority of hunters or wider public. ● For response to conflicts between farmers/livestock and wolves, non lethal solutions ensuring wolf protection must be the default to ensure ethical coexistence with neither livestock nor wolves compromised. This is supported by studies proving a proactive non-lethal approach leads to better conflict mitigation. ○ Lethal management often fails to provide a long-term solution to wolf predation and has the least consistent success rates when compared to non-lethal practices. In addition, there is significant evidence showing that lethal wolf management may be less functionally effective at mitigating subsequent livestock losses than non-lethal deterrents. ○ The department can legally restrict the implementation of hunting/killing of wolves under Act 169 by setting minimal quotas (including '0' wolves) and/or restricting timing and methods. ● The plan should require the implementation of abatement measures and the use of non-lethal conflict minimization techniques by domestic animal owners as a precondition for eligibility to compensation for confirmed predation. ● The plan runs contrary to public values towards wolves and fails to mention this despite department surveys evidencing that the broad public cares about wolves as individuals (and not just for the viability of the population). Given the recent liberalization of killing wolves by the state, it would be incredibly informative to note majority support of the following reasons for opposing a regulated wolf hunting/trapping season (which are all omitted from the plan): opposition to specific methods of harvest like hounds (64%) or traps (70%), feelings that hunting wolves is unnecessary (62%) or culturally offensive to Native American tribes (57%). ○ All such reasons convey majority disagreement with practices currently promoted and endorsed by the legislature and the WDNR, and such a conflict between managers and the public should not only be acknowledged, but foregrounded and carefully considered in policy (instead of dismissed). ○ Such decisions to omit literature or downplay evidence (e.g., such as majority opposition to killing wolves and their reasons) are contrary to principles of scientific integrity (e.g., present all relevant scientific evidence to the public) as well as ethics (e.g., disguising ethical decisions, such as recreational wolf killing, as robustly supported by science). ● Conflicting agency objectives (e.g., optimizing public hunting and conflict mitigation) are not only not acknowledged, but even misunderstood as harmonious, against the body of scientific evidence. That culminates in the prioritization of consumptive values and policies; e.g., according to the	3	The plan represents a good start but please consider all of the other points above which, if adopted, will benefit both humans and wolves. Coexistence and flourishing of both need not be seen as a zero-sum gain.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
				body of scientific literature, use of lethal methods, and especially public hunts, are contrary to most objectives relevant to: harm mitigation, the wellbeing of wolves, their ecological roles, and their non-exploitative enjoyment (i.e., Objectives A, B, D and F). ● There is a stark lack of consideration for individual wolves, wolf population health (including wellbeing), and measurable indicators for assessing any harms barring disease prevalence (e.g., accounting for cortisol levels or other stress hormones, measures of pair/pack persistence) ● There is an inappropriate understanding and consideration of tribal worldviews about wolves. Tribal worldviews of wolves are misconstrued as 'cultural benefits' tribes receive from the existence of a wolf population, when in fact tribal worldviews consider each individual wolf as a person and relative. Cultural respect and sensitivity towards such views, shared by many non-tribal members, demand the strict mitigation of lethal measures, especially recreational killing, as opposed to their current promotion in the plan. ● In general, all omissions of scientific literature, the arbitrary prioritization of policy objectives, the rhetoric of the plan and the dismissal of public values and concerns for wolves point towards a biased, unscientific and instrumental view of wolves that promotes values contrary to broad public perspectives on wolves. ● 'SOM' wolf estimation methodology – From a recent critique: "The new methods sacrifice precision, but are believed to retain adequate accuracy and sensitivity to changing conditions for reliable decision-making. We review evidence for the accuracy, precision, and sensitivity of the new 'scaled occupancy model' (SOM) applied in Wisconsin. We conclude that the Wisconsin method would systematically overestimate wolf abundance by large (but currently incalculable) margins. Because Wisconsin, similar to other states, not only changed to unverified methods but also implemented widespread wolf killing, shortcomings in their estimates of wolf abundance may have far-reaching consequences for population viability and confidence in state wildlife managers. We discuss findings from Wisconsin alongside similar findings for other states' occupancy models being insensitive to human causes of mortality that have recently increased. Overall, Wisconsin's proposed method for estimating wolf abundance shows significant departures from best practices in scientific measurement. Verification will require independent replication and unbiased tests at multiple scales in multiple habitats under different human-induced mortality rates, and peer review before the new methods are considered reliable." Ref: (Treves & Santiago-Ávila, 2023).		
Manuel Lopez	Most of it	No	That you guys also want to take science into consideration	That u guys are considering lethal methods of wolf management	1	You guys could use non lethal methods of managing wolves
RICHARD RIEMER	Most of it	Yes	Basically, I like most of the plan because there is enough that all interested parties should be mostly satisfied except for the anti-hunting segment which will probably never be satisfied. As a hunter and trapper my entire life I consider the plan fair to all parties. I think the plan is good for all species as well.	I don't like the fact that there are no specific population goals in the plan. I think there should be wolf population levels established for all zones and sub-zones which could be adjusted after each hunting and trapping season.	9	In my humble opinion the wolf should be treated as a trophy animal, and I would not allow non-residents to apply. I tagged along with a group of hunters one day during the last wolf hunting season. I was surprised to see so many wolf tracks and opportunities that resulted in success. There was and still is a very healthy wolf population. Hunting with dogs is a lot of fun so I hope that continues. I also firmly believe that a hunting season for wolves teaches a wolf to not be quite so brave in a populated setting and also in agricultural areas. They should mostly stay in less populated areas and hopefully have less conflict with humans.
Ron & Jan Eckstein	All of it	Yes	Management Zones, no set population goal, using biologists and research information to make management decisions. The survey of people's perceptions of wolves and wolf management was well done and appropriate.	Need to change state law mandating seasons, repeal use of hounds in wolf hunts, and allow state biologists and NRB to set management.	10	Well done.
Michael Sorenson	Just the parts I am interested in	No	The draft plan is well written and it's obvious a lot of time and effort was invested in developing this document.	I think there should be a specific number in the goals section, starting on page 98. I believe the original goal was 350 for Wisconsin. Perhaps, 750 would be a good goal to sustain wolf population in Wisconsin.	6	I watched the Youtube video and the majority of callers were against harvesting wolves to control their numbers. Non-lethal methods will not work on private land that's used by deer hunters. The DNR didn't manage the short notice Feb 2021 hunt very well and too many wolves were killed. I think the 8 hour harvest reporting will help prevent over harvesting in the future.
Ji Montgomery	Most of it	No	Non lethal methods	Belaying on scince to do the work to recover the wolves	10	In Montana, Wyoming and Wisconsin there been widespread incidents of wolves being chased by automobile, dogs and helicopter and trapping and slaughtered
	Just the parts I am interested in	Yes	None of it.	Please do not allow the murder of wolves. They live in family packs and and care about each other.	0	Please leave the wolves alone.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
	Most of it	No	There is much greater recognition of the ecological role of wolves	The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence.	0	
	Most of it	Yes	I do like the idea of management zones being established that buffer the tribal lands. Predators DO migrate/travel to access additional resources.	I still don't see the point to financially compensate dog owners (both hunting dogs and pet dogs) for damages incurred by wolves, or any other natural predator for that manner. It seems like it should just be an accepted risk by the dog/pet owners. If your out in the woods, there's a chance your dog/pet may be attacked. Do I feel like i need to be compentated for my vet bills when my dog tangles with a porcupine? No, its a risk I should be expected to be aware of when in the woods and i dont think others should be financially on the hook for the results of the risks I decided to take.	9	It does seem like the people putting this plan together made a very honest effort to include all groups and stakeholders. This process seems to be quite transparent, and I appreciate all the efforts those have put forth.
John F. Barker	Most of it	Yes	I like the reliance on science based field information such as radio tracking and snow tracking to determine wolf populations. The plan is comprehensive that includes wolf biology, human interaction, wolf history and consideration of native american input. I don't know what the optimal wolf population should be, but this plan should help determine that. I have helped build the Ice Age Trail which is often located on public land and have wondered about the safety of hikers especially in remote areas. Management plans like like this can be helpful in assessing such concerns.		10	
	Most of it	No	Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. ● There is much greater recognition of the ecological role of wolves ● The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves ● The adoption of proposed buffer zones around tribal reservations	The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on: ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution ● The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. ● The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ○ A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings. ○ Hounding or hound training, which are akin to allowing legalized dogfighting, should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public. ● The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. ○ Despite Act 169, which mandates a wolf hunting season, the department can still restrict the implementation of lethal method by setting minimal quotas, including a quota of '0' wolves, restricting timing and methods. ○ Several studies have proven a proactive non-lethal approach leads to better conflict mitigation. ○ Lethal management often fails to provide a long-term solution to wolf predation and has the least consistent success rates when compared to non-lethal practices. ● The plan should require the implementation of abatement measures as well as the use of non-lethal conflict minimization techniques by domestic animal owners for the latter to receive compensation for confirmed predation. ● The plan also runs contrary to public values towards wolves. ○ All such reasons convey majority disagreement with practices currently promoted and endorsed by the legislature and the WDNR, and such a conflict between managers and the public should not only be acknowledged, but foregrounded and carefully considered in policy (instead of dismissed). ○ Such decisions to omit literature or downplay evidence (e.g., such as majority opposition to killing wolves and their reasons) are contrary to principles of scientific integrity (e.g., present all relevant scientific evidence to the public) as well as ethics (e.g., disguising ethical decisions, such as recreational wolf killing, as robustly supported by science). ● There is a stark lack of consideration for individual wolves, wolf population health (including wellbeing), and measurable indicators for assessing any harms barring disease prevalence (e.g., accounting for cortisol levels or other stress hormones, measures of pair/pack persistence) ● There is an inappropriate understanding and consideration of tribal worldviews about wolves. Tribal worldviews of wolves are misconstrued as 'cultural benefits' tribes receive from the existence of a wolf population, when in fact tribal worldviews consider each individual wolf as a person and relative.	6	Wolf management plans should prioritize the wolves and their health first and foremost. The needs of humans should be the second consideration. Manage the humans and minimize their desires if they harm the wolf populations which a majority of people love and support.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Lynn kurth	All of it	Yes	That CWD and other factors were included in the study	I do not think you are considering the Benefit of wolves reducing CWD as much as you should at a time CWD has shown obvious spread throughout the state. Studies in Yellowstone illustrate the benefit of increasing predators when the prey is diseased. Wisconsin's deer population is due to crash unless the diseased animals are better managed.	4	Please error on the side of limiting the Number of permits. There are more "illegal" wolf kills than You are aware of.
	Just the parts I am interested in	Yes			1	If you have no idea how many wolfs have been killed illegally and not reported your numbers on mortality and reproduction mean nothing. With the amount of people that have claimed they have killed an animal illegally and still do every year deems your report mostly a guess at best. Sorry for the poor response but the illegal killing has been going on for years and will continue. I believe this has a greater affect on your numbers making your report more of a guess than fact.
	I have not read any of the draft plan	Yes	Lowering the wolf population.	Anything to do with wolf population maintaining or increasing in the state of Wisconsin.	5	This is almost 200 pages long. Cut the [redacted] and make a plan people will actually read.
	Most of it	Yes	None of it	Playing down the treat to wildlife	0	
	All of it	Yes	Having a hunt.	Having to flexible of a quota.	1	Stick with the 350 goal and get on board with a hunt/management plan. If you don't, you'll lose control and money while citizens take matters into there own hands.
	Most of it	Yes	I did not realize there were so many positive things related to having wolves in the state. I thought that all the wolf's did was kill deer and livestock.	Even with the benefit's wolves can have I believe there are way too many in Wisconsin and they should be hunted or relocated to other states. I also think politics' play way too big of a part of the management which should be done by wildlife agencies with input from hunters, ranchers, farmers etc.	5	
Michael Baker	Just the parts I am interested in	Yes	Using data/science to manage the population for a healthy ecosystem.	None	8	Manage the wolf for a long term survival of the wolf population and for other wildlife they wolf preys on. Maintain a healthy ecosystem for all wildlife.
John	Most of it	Yes	Having a wolf season	The inaccurate wolf population estimates	3	There are 5 thousand wolves in Wisconsin, not 937. They are destroying deer hunting.
Phil Nona	Most of it	No	Any draft for wolf management is not a good one. I prefer to rely on predator/prey balancing out populations.	Any draft for wolf management is not a good one. I prefer to rely on predator/prey balancing out populations.		
	All of it	Yes	I am very interested in the wolf draft plan staying on top of the ever changing wolf population year to year. Saving the deer herd comes before saving more wolves than the state can afford.	Living in vilas cty near the LacDu Flambeau reservation concerns me in the fact wolf nos. may be controlled by the tribes demands for a particular area that is high in wolf nos.	2	I understand the difficulty of trying to please every one on the correct or accepted wolf population in the state. My concern is the deer population is so low in most of northern wi now . This fact in itself will be the deciding factor whether the wolf lives or dies.
Jim Angresano	Most of it	Yes	Please note that I completed the survey earlier today, but I have one more suggestion.			In the plan you included Promote non-consumptive recreational opportunities and wolf-related tourism May I suggest having a photography contest with the objective being to take and submit photographs of Wisconsin wolves? You might consider naming the wolf in the winning photograph - naming a wildlife creature has been an excellent way to gain public support for that creature. Thank you for considering my suggestion.
P. Clark	All of it	No	I like that the plan acknowledges the values and worldview of Native American tribes, as well as proposes creating buffer zones around tribal lands. The Ojibwe revere the wolf (Ma'iingan) as a relative, rather than a resource to be managed, and have a deep and advanced understanding of wolves as they have coexisted with them for thousands of years. The plan also considers and details the ecological benefits of wolves on the landscape, such as their potential to reduce CWD in deer. The plan eliminates the unpopular population cap of 350 wolves. The results of the social survey are included in the plan and reveal that many residents have very positive views of wolves.	Recreational hunting is ineffective at reducing wolf conflicts because it splinters packs and kills wolves at random. The use of hounds to hunt wolves is not fair chase hunting and should be, at minimum, banned within national forest lands in Wisconsin. The draft plan includes no oversight committee. The current committee greatly overrepresents hunting and trapping organizations and should be more inclusive of the interests of tribes and the majority of Wisconsin residents who value wolves.	8	
	All of it	Yes		Lack of population goal	1	
Joshua Carlson	Just the parts I am interested in	Yes	I like the idea of taking them off of the endangered and threatened species list and make them open to hunting in the near future.	I dislike the amount of wolf population that we estimate. I believe that we are way over the 250 population.	3	I think that hunting them should be legal. I think that they should be similar to hunting coyotes. I see them all of the time deer hunting and am scared to walk out at dark sometimes.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
	Most of it	Yes	Mainly the area that addresses what they prey upon and when.	The random statewide dispersal of surveys.	1	I don't feel that the economic impact of the gray wolf has been addressed. If only science is to be considered the necessary population for the wolf to be self sustaining should be addressed. Unfortunately emotion is being applied.
Miles Narveson	All of it	Yes	Comprehensive	Not sure how a wolf hunting season would be triggered. Does not appear to have a concrete path to allow a wolf harvest.	7	Not a fan of the management options of increase, maintain, or decrease. Seems too wishy washy. Current wolf population is way to high, a reduction is needed. This plan does not appear to offer a clear path for that to
	All of it	No	That you're including the public AS IT SHOULD ALWAYS BE STOP ALL KILLING OF OUR WILDLIFE	There should be NO WOLF HUNTING TRAPPING OR KILLING OF ANY KIND ITS THE YEAR 2023 & this world hasn't evolved from Neanderthal thinking! Males are destructive, unsympathetic & have a h---d on for killing wolves	1	Wolves are our top predators! HAVE ANY OF YOU PEOPLE EVER READ THE AMAZING STUDY ON HOW GREATLY WOLVES HELPED THAT NATIONAL PARK????? Males need to stop these old white male archaic ways of doing & thinking concerning especially wolves & our environment! HAVE HUMANS NOT LEARNED OR CARE ABOUT THE ATROCITIES IF THE PAST?!!
	Just the parts I am interested in	Yes	Not much	No population goal number,(stay with 350.) Extra zones, Boundary around reservation	1	Need a population goal and a hunting season. Too many wolves
		Yes				Remove 75percent of the wolf's in Wisconsin they're devastating the the deer heard in the northern part of the state
Dan Scudder	Most of it	Yes	Continuing study/research No numeric goals - outcome based		8	
	Just the parts I am interested in	Yes	Nothing	No numerical population goal, too much emphasis on the native American tribes and not enough on farmers and sportsmen who pay the bills for this wolf management.	1	The property owners across the northern half of Wisconsin should file a class action lawsuit against the state for the continued decline in property values of their wooded lands due to the high wolf population and no deer left on their lands.
Dale Heeringa	All of it	Yes		Need to remove the Grey Wolf from Endangered Species list as soon as possible. A controlled hunting/trapping season should take place soon to control wolf numbers.	2	Wolf population needs reduction in numbers through controlled hunt to keep population in check. With out population check Wolf will be reduced to poor outlook by people living in Wolf County and will be removed from the landscape.
	All of it	Yes	None need to shoot more wolves	Not enough wolfs shot	1	Do you guys know how to count Think about the last hunt that many killed in that short of time, your numbers are off there are more than you think!
	All of it	Yes			0	Higher harvest numbers
Ron Gilson	All of it	Yes	I like that you acknowledge the importance of our wolves and the important role they play in our ecosystem. I like that you're making an attempt to include the public and tribes who hold wolves sacred.	That you think wolves need to be hunted, real hunters don't hunt wolves. That the hunt if allowed will unleash hounds , traps, snares and baiting to kill wolves. That you use a method to count wolves that seems to assume there are more wolves than what may be actual. That you need to lean toward a number to set quotas without taking into account what the killing does to a pack and science has proven depredations occur more frequently after killing the elders of the pack. That hunt could be set at zero as zero is a number. To allow hounds to run down and kill wolves is by far the very worse part of this plan. Dismiss the possibilities wolves could bring to states tourism. Dismiss the majority of the public who want them on the landscape . no plans to fund farmers when depredation happens to their livestock and getting them non lethal methods to protect their livestock .	3	I grew up living next to a state park in wolf country , I come from a family of hunters and have been a hunter myself and never have any of our groups ever wanted to kill wolves or mistreat and terrorize wild life. I grew up respecting wild life and the landscape of their habitat , never did I see such reckless bills as today to dismantle the safety and sacred ecosystems to cater to reckless sporting groups .These wolves and the habitat they call home belong to all of us. There is no need to hunt wolves .
	All of it	Yes	Nothing	Why do wolves have to be MANAGED AT ALL! LEAVE. THEM. ALONE!!!!!!!!	0	STOP MESSING WITH AND KILLING WOLVES. LEAVE THEM ALONE!!!!!!! MAYBE IF WE HAD MORE PREDATORS LIKE GOD INTENDED, WE WOULDN'T NEED ALL THE HUNTERS OUT THERE KILLING DEER!!!!
tom wiensch	Just the parts I am interested in	Yes		Please end the hunting of wolves, coyotes, and bears with dogs.		
Cheryl Campbell	All of it	Yes	A very well written and balanced document. As a researcher, I was extremely impressed with how thorough, clear and organized this material was. Kudos to all involved.	ABSOLUTELY AGAINST promoting hunting activities that increase wolf/dog interactions, including bear hunts and wolf hunts utilizing dogs. Aside from being barbaric, the compensation costs to dog owners who choose to subject their animals to damaging interactions is a cost tax payers should NOT have to bear. Over a million spent to compensate users of hounds when their owners intentionally place these animals in wolf habitat, whether to pursue bears or wolves, for "fun".	8	It is extremely important that the Wolf Committee truly be representative and inclusive and not heavily weighted toward the loudest or most influential organizations. Please, also, take into consideration potential wolf mortalities in the future due to the potential for Covid in canines and the current spread of bird flu in mammals. Set hunting limits flexible enough to compensate for a future unexpected and devastating mortality event, however remote.
	Most of it	Yes	Inclusion of tribal nations in the workgroup, good general background on the species/habitat, letters from the tribes stating their position against wolf hunting, surveys on WI residents opinions	I question the use of a 30+ year old "recovery goal" as a minimum count of wolves to protect in the states of WI/MI. In general I dislike the entire plan, as I strongly disagree with hunting wolves at all. Not only is it a slap in the face to the tribes who share our state, but morally wrong.	1	I urge the DNR to lobby the WI legislature to repeal the laws mandating a wolf hunt. WI residents are overwhelmingly against it, it projects a negative image of our state and our hunters/sportsmen and women. It also strains relations with our tribal nations.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
	Just the parts I am interested in	Yes	The history of the Grey wolf.		9	
george gfall	All of it	Yes	zones for harvest	native adjacent boundaries	4	higher reimbursement for livestock and hunting dog losses
Stephen Napp	Most of it	Yes	The plan seems to try to represent all viewpoints.	I do not believe any wolf packs should be allowed to establish in zone 6. Wolve will be in the zone from dispersion but I don't think that can be stopped. I think that the wolf damage section underestimates damage. I have raised cattle and I am sure there is more damage than your methodology catches.	6	While I think a few wolves in state may be tolerable I support hunting wolves to keep the numbers low. Maybe problem wolves should be moved to the arboretum in Madison when people object to lethal control.
Brian Rice	Most of it	Yes	Specifics of believed wolf numbers and information on packs in Wisconsin	The history while important to understand could be short because the historical context is not equal to today's population.	4	To me any plan that does not include hunting and trapping of wolves is not a conservation plan. Wolves and all species of animals must have a comprehensive hunting and trapping plan in place to control overpopulation and indicates a lack of comprehensive conservation.
Brett Deringer	All of it	Yes	NONE... too divisive and gives voice to the loonies and nut's out there... shame on you!	Elevating the wolf type of special animal that has more meaning than the tradition of deer hunting.It also appears that most of groups that provided feedback were/are the same ones that take the DNR to court over all previous attempts to manage wolves. This plan reeks of politics and not science. On prior drafts, it was reported by DNR science that Sawyer county has 20 deer per square mile and that wolves have minimal impact on deer populations. This is B.S. although I'm sure it's true down in Madison and Milwaukee. The bottom line for me is that this new plan places Wisconsin's deer hunting tradition soooo far on the back burner that you alienate the very people you represent. It appears the special interest and fringe groups wrote this for you and you're taking all of the joy out of deer hunting like it is an intended result. P.S. Sight seeing wolves... really, have you ever been to the northwoods. That's some funny stuff there!	1	Why does it appear that most if not all of your interest groups Do not pay taxes or purchase a license which pays for this boondoggle?
Mark	Just the parts I am interested in	Yes	Wolf Harvest Management	I question the legitimacy of the science used to calculate wolf populations.	5	Please, if there ever is another season, allow trappers and predator callers to have the first few days or week of the season before the dog runners begin hunting. Just like bear season; every other year sitters and dog runners alternate. The same policy needs to be emplaced for wolf season, so the trappers and other non-dog runners have a chance to participate before the quota is met and the season closed. I did not see mention of this in the draft plan.
	All of it	Yes	tribal input reducing harvest registration time	Zone specific permits are not needed. With no "designated number", who is deciding "when the population is healthy and sustainable"? (too subjective). Tribal buffer is too large. I want to respect the tribe but I live near tribal land which I can not hunt, and wolves have killed hunting dogs near tribal land. There shouldn't be a lower harvest rate in zones 1,2, and 5. That's where most of the wolves live and they are preventing humans from enjoying the outdoors - I no longer feel safe walking by myself or with my dog. Hunters can't put dogs out for fear of them being killed by an overabundance of wolves. This is where most of the state's public hunting land is but we are not able to safely hunt there.	4	Perhaps wolves involved in conflict could be sent to zoos instead of being relocated to cause issues somewhere else in the state.
Michael Multhauf	All of it	Yes	0	no population goal	1	wolf populion in central forest has hinderd deer recovery and forceing elk into ag areas and BRF industial park
	I have not read any of the draft plan	Yes			9	
	All of it	Yes	none	all	1	sucks
	Most of it	Yes	Literally nothing you are sticking more money into the biggest problem that is causing the decline of outdoor participation the proposed 350 wolves was more than enough and your numbers are not even close as it is I spend a tremendous time in the woods managing properties for deer, turkey, grouse and the amount of wolves is far greater than your number is suggesting	Everything you are listening to nonresidents and people from areas of the state that don't contribute anything to the dnr and the management of out wild life wolves do have a place in our state I have no problem with them here but I was part of the last wolf hunt we hunted in you new 4 and 5 zones and in the 2 days we hunted we found over 25 seperate wolf tracks in a few square miles that were not part of packs just singles and doubles so we need to reduce numbers severely before we begin managing them to be a healthy population	1	Start over
tom wiensch	Just the parts I am interested in	Yes	That it doesn't call for extirpation	I believe that there should be no wolf killing. As an alternative, I believe there should be no: trapping, hunting with dogs, hunting in the winter when snowmobiles can be used, and no hunting during mating and birthing season.	2	

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
	I have not read any of the draft plan	Yes				Lots of hunters want zero wolves, likely the same hunters that can't get over the crossbow season as they are simply greedy and want to hoard all the deer for themselves. FYI I also am a hunter and a private landowner in WI AND I do plant food plots for the deer/etc BUT I understand wolves are as needed on this landscape as deer are and as trees are and I have no problem sharing "my deer" with other hunters or wolves! The WDNR does good work keep it up!
	All of it	Yes	We are very encouraged that the draft plan does not put a cap on the number of wolves — a number that when hit provides a rationale to kill wolves by the hundreds so that the state can keep them below an artificial ceiling. That “cap” was always arbitrary and it again and again set the stage for wolf killing.	There is still far too much emphasis on recreational killing and providing "hunter opportunity" to kill wolves. More emphasis needs to be placed on the value of this species to non-consumptive users of our lands.	5	Some parts are fair and some still need work. Too much emphasis is given to "hunters" who only want to kill - anything and everything just for fun. That is truly sick.
Aaron	Most of it	Yes	Having an annual wolf harvest to limit wolf population.	Nothing in your plan suggests reducing the amount of wolves in Wisconsin.	2	I spend a lot of time in the forests of Douglas and Bayfield County. I am an avid outdoorsman. I enjoy scouting, bow hunting and gun hunting whitetail deer. I've noticed a drastic drop deer off in encounters recently compared to 90's and early 2000's when I started participating. It's disappointing because whitetail are a resource I enjoy and a great way to get our youth to value our natural resources. It has gotten much more difficult to harvest deer with the rapid 22% annual growth of this grey wolf population. I've had multiple encounters with wolves while in a deer stand in the last 10 yrs. They howl almost every night and have even had them follow me out of the woods. I believe mostly out of curiosity but the experience isn't an inspiration to get back out there. I feel that the increase difficulty to harvest whitetail deer and the felt presence of excess large canine predators in our forest is going to greatly reduce an already declining youth interest in our sport. I believe it is in our best interest to greatly reduce the grey wolf population in Wisconsin through harvest tags. I think you should take the accounts of residents that purchase whitetail tags into careful consideration when approaching your future management plans.
	Most of it	Yes	The various graphs, tables, stats on pack and cub dynamics were interesting.	The fact it is too long, should be about a 40 page document. Only government could bloat it out this much I feel like this is a smoke screen made 178 pages to confuse and intimidate. Written by folks with too many degrees that don't get out from behind their desks very often. It kowtows to tribes (how can the wolf be your brother when you spear walleys to decimation), out of state do-gooders, liberals and bambi types. It appears to run away from any hunting or trapping amnagement. It greatly understates any population estimate and in fact says that there won't be much emphasis on population numbers. Let's not forget that the head of the DNR when this was written had a degree in urban forestry. Sure qualifies him to be a wolf expert I guess.	1	This is mostly political nonsense and fluff. It is designed to appease the tribes, liberals, tree huggers and democrats everywhere. It ignors the residents of Wisconsin especially the north, who, by the way foot the bill for all of this.
Shane Kray	Most of it	Yes	That we are discussing it and there is support for a wolf hunt in WI	We are not doing enough, the population needs be managed, we need to allow more tags.	7	
Maureen Schiener	Just the parts I am interested in	No	I am pleased to see recommendation of non-lethal methods for reducing conflicts. Too often the response is "just shoot it". As the human population increases, encroaching on wildlife habitat we need to learn to co-exist if wolves and other species are to survive.	Why were so many hunting groups involved in this draft plan?	5	Even though I'm not a Wisconsin resident, the issue of protecting wolves is very important to me. I appreciate the Dept. of Natural Resources giving the opportunity to comment. I trust you will take everyone's comments into consideration while formulating a plan. I've seen the surveys where a majority of Wisconsinites want the wolf protected and are especially abhorred by hound-hunting of wolves. If Wisconsin chooses to protect wolves it will be a great example for other states to follow. Even though wolves are federally recognized as endangered, the federal government has yet to relist them. That's why it's imperative for states to protect wolves from recreational hunting and trapping. Thank you.
	Most of it	Yes	That there will be a kill to keep wolves in check.	zones around reservations	7	
	All of it	Yes		Not having a set quota. Please reinstate goal of 300 wolves for Wisconsin or at least set a northern limit and southern Wisconsin limit. 200 north of Hwy 29 and 100 south		
	Most of it	Yes	wolves should be totally eliminated south of US hwy 70	feeding wollves carrion	1	hunting season every year to eliminate all wolves south of US hwy 70
Brett Hazard	Most of it	Yes	I liked the background information on the historical wolf management in Wisconsin, as well as the information around First Nation tribal perspective.	N/A	8	

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Brittany Ricci	All of it	Yes	I would like to recognize the efforts and improvements made to the previous plan, including: - The elimination of a numerical target population. The previous plans referred to an old numerical goal of 350 set when the Wisconsin wolf population was much lower. The elimination of a target number is reflective of a new direction for wolf management in the state. - The importance of the ecological benefits of wolves and inclusion of tribal values and knowledge. More than ever before, the DNR has taken consideration into the ecological benefits of wolves, including CWD, landscape of fear, etc. This should be priority #1 over all other goals. - The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves. Overall, most Wisconsinites somewhat or strongly agreed that predators like wolves keep nature in balance (77%), wolves are culturally important (71%), and wolves are special animals that deserve our admiration (75%). Similarly, a majority of Wisconsinites agreed that people and wolves should be able to coexist (75%) and that it is important to maintain a wolf population in Wisconsin (80%). - The attempt to minimize the impacts of a recreational hunt by adopting buffer zones around tribal lands, shortening reporting requirements and making hunting licenses zone specific. While I stand firm against recreational hunting of wolves, I think the zone system and shortening of reporting is a step in the right direction. I support buffer zones. We CANNOT allow what happened in 2021 to ever occur again when quotas were recklessly exceeded with no consequence. - The new plan emphasizes the use of non-lethal methods to reduce conflicts. While I oppose lethal control, I am very pleased to see more discussion about nonlethal abatement to reduce conflict.	- Absent is a commitment by DNR to work with the legislature to overturn PA 169 and remove payments for hunting hounds, killed by wolves. - Please BAN hounding and hound training. This practice is akin to allowing legalized dogfighting, and should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public. I live in Birchwood, WI where hounding is rampant. I don't feel safe walking my dog or camping out in the woods, stray hounds wander onto my yard and hounders are constantly being caught trespassing on my land. They park their trucks all over the road as if they own the place and their baying dogs ruin the peace and tranquility I seek from nature. There should be no reimbursement of hound hunters for any reason when they are willingly putting their dogs in combative situations with wild animals out in wilderness purely for the sake of "sport". Hounding is an outdated, barbaric practice which has no place in modern society. At a minimum, the DNR should ban the use of dogs to hunt wolves in our national forests. - The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on (see reference list below): ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution - The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. Recreational hunting/trapping to reduce conflicts has no scientific basis. There is also plenty of scientific evidence documenting the harms that may come from wolf hunting. Wolves self-regulate their populations, without any need for human intervention. Given their internal regulation, an "overpopulation" of wolves is scientifically unheard of, and clearly a value judgment by humans who would simply rather have fewer wolves on the landscape. Wolves know what they need and live sustainably; it is a fallacy that their numbers need to be "maintained." The majority of Wisconsin citizens do not support wolf hunting. It is cruel especially with the use of dogs. Until that law is changed, a hunt being mandated is against the public trust. The DNR has the responsibility to establish a zero hunting quota to protect wolves in our national forests and other areas prime habitat. - The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. There is no evidence that wolf hunting decreases wolf-human conflicts. On the contrary, wolf hunting will likely create problems that did not exist in the first place. Wolf killing disrupts the social stability that allows for their cooperation and self-regulation. Hunting causes the break-up of wolf family groups necessary for taking down large wild prey, which in turns leads to some wolves shifting from wild to easier domestic prey. Hence, wolf hunting would increase harms to wolves, domestic animals and their guardians. Wolf conflict is highly exaggerated. - The plan should require the implementation of abatement measures as well as the use of non-lethal conflict minimization techniques by domestic animal owners for the latter to receive compensation for confirmed predation. - The plan also runs contrary to public values towards wolves and omits mention of such majority values from the plan, despite department surveys evidencing that the broad public cares about wolves as individuals. - There is considerable uncertainty in estimating wolf populations based on the occupancy model and should not be used solely to determine population. - The committee was overrepresented by hunting organizations even though they represent the minority opinion of Wisconsinites. The plan should include an oversight committee which is comprised of scientists and biologists. The makeup of that very committee will have huge impacts on this plan. In the plan you state that you will monitor expectations and outcomes. I have a hard time supporting that not knowing who will be on this committee going forward? When will these assessments take place? I would like this committee formed before approval of the plan. - Too much emphasis is placed on the killing of wolves rather than coexistence.	6	The reason I live in Northern Wisconsin is to be near the peace of wilderness in coexistence with all wildlife. I have always had a spiritual connection with wolves. They are an incredibly intelligent, sentient, family-oriented species that are not all that much different from you and me. Over centuries, the wolf has evolved to play a crucial role in regulating its ecosystem, from the survival of trees and riverbank vegetation to the health of the populations of their prey. It is a beautiful, complex tapestry that shows the level of interaction that must happen between apex predators and their environment for the full health of the system. Allowing them to exist unthreatened on this landscape is top priority to me.
	All of it	No		No hunting, trapping, or killing wolves.	3	Protect them.
	Just the parts I am interested in	Yes		The goal of 300 wolves in Wisconsin should not be removed from the plan. You are opening to door for anti hunting organizations to increase the sustainable amount of wolves in Wisconsin. Deer hunting brings the revenue not the wolves.	2	

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Bob Spoerl	Most of it	Yes	That you have a plan!	That you don't set goals; at least in regions within the state. Also, how is it that you don't allow single wolf observations to be part of the total population?? That's not sound science.	1	The state breaks down the goals for deer and turkeys by area why not the same with wolves? Yes, they have a large range but you can have even 3 sections across the state at a minimum.
A Sportsman	All of it	Yes	The Draft took into account a number of affected parties and attempted to discern their collective issues.	There is almost zero (0) true consideration given to the actual danger that wolves present to lone human beings while in the wild. I have personally been stalked by wolves in a forest road within 440 yards of my home. VERY UNSETTLING & SCARY EXPERIENCE to say the least. It is simply a matter of time that someone is KILLED by a lone wolf or wolf pack. This will be a great tragedy not only for the decedent's family & friends but for the WDNR. It is simply a matter of time...	6	Try basing wolf population management on the Wold Damage $$$ amounts paid to verified claimants. $100,000 worth of annual damages paid may be the best barometer of credible & sustainable wolf populations. The following wolf population management season can be based upon the prior year's total damages paid.
	Most of it	Yes	It seems like the DNR is trying to turn Wis. back to the Indians. We live in a different world today and ir seems cancel culture is now the norm, so why do we care?	The need to set a target goal in the short term is not there. We need to manage these killers of our dogs and cats and stock because we aren't living in the Indian past.	0	Let the sportsmen and women have their say in the management of these animals not a few people who pretend to be God.
Richard Hansen	Most of it	Yes	I like actual data detail such as wolf population over time, wolf locations, specific depredation activity. wolf damage expense, wolf - deer interaction	What well meaning citizens "think" when answering questions and completing surveys about best scenario wolf populations probably doesn't align with what experts "know". I discount citizen surveys because of course an animal lover wants nothing killed and a farmer or dog owner who lost animals to wolves want lots of wolves removed.	8	I does need to be updated.
	Most of it	No	The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves	The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life.	5	
John B Yonash	I have not read any of the draft plan	Yes				Protect with common sense laws!
Leonard A Vetsch	Just the parts I am interested in	Yes	You are correct that people who do not have to live with wolves have a much higher opinion of them.	There is no real summary. How many wolves are acceptable? How accurate is the counting of wolves. What is the impact of wolves on Wisconsin elk. I don't care how they impact wildlife in Spain.	1	I'd like to see a plan that disperses wolves in the neighborhoods that really support them. i.e. suburban Madison, they are already complaining about the deer eating their flowers. I'd like to see a study of the impact the wolves have on Wisconsin elk. It's a pretty expensive wolf feeding program. The program to compensate damages of wolf predation needs to be fully funded. I don't believe that wolves need to be completely exterminated, but they number of wolves needs to decrease. Just because they were a native species is not a good argument for an unlimited number of wolves. Poison ivy, mosquitoes, and wood ticks are also native to Wisconsin. I don't see the DNR trying to increase their populations in the suburbs of Madison...
	Just the parts I am interested in	Yes	The charts that show the significant growth of winter packs.	I think it's unclear as to the direction the plan is leading up to. Lots of nice information but, without control there are problems looming.	7	Take away the politics and the cultural impowerment. Do the right thing and control the population.
	I have not read any of the draft plan	Yes			1	For all the people who love this majestic animal we should start moving wolf packs all over the state so they can have the same benefits that the northern part of Wisconsin has. It wouldn't take very long and they would change their mind. The old adage I love em as long as there not in my part of the state.
	All of it	Yes	Leave the wolves alone.	I dislike the idea of having a "hunt" for wolves. It shouldn't be a "sport".	5	Harvest (not hunt) as many wolves as absolutely necessary. Hunting them shouldn't be a "sport".
	Most of it	Yes		Need to have a better understanding of the number of animals in the state	2	
jim gibson	All of it	Yes	Not much of it at all.	I'd like to see the original goal implemented of a Maximum of 350 wolves.	0	I'd rather not.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
	Most of it	No	* The Mission Statement sounds good ... but when you delve into the actual plan … not as much. :-(But I'm glad to see that the public in general is taking a kinder view toward wolves and their priceless ecological value — and especially that more folks recognize our responsibility to protect their habitats. * The DNR's scientific attempts to map and report wolf populations and conflicts vs humans. It is also heartening that there seem to be few conflicts & depredations and even fewer lethal conflicts than some would have the public at large believe -- though that is of course not true for those animals involved on either side of the tragic encounters. (Of course, that is only IF these conflicts are well-documented -- which closer examination of the plan makes doubtful.) The plan mentions the value of wolf-based tourism, but needs to follow up & make it a reality. Living just over the WI-IL border as I do, I hope a time will come when I can take part in similar ecological efforts in my state. We are already living with coyotes, lynx and cougars (and no DNR denials please -- our neighbor's wildlife cam clearly shows them passing thru, and we have so many turkey & deer (i.e.,prey items!), the local community sadly has to cull the deer annually.) More local predators would make a few humans nervous, but would be beneficial overall -- though I acknowledge it will likely be even harder to find public acceptance for that idea in more populated areas here farther south. OTOH, it is heartening to note the upswing in public education and acceptance of wolves and other predator species.	+ This is supposed to be a NEW plan for the future, "to protect and enhance" WI's wolves and biodiversity. Instead, it's still about the USE and exploitation of wolves and nature for human "benefit" (prioritizing livestock and human "recreation", i.e. hunting) and, as usual Nature "just has to suck it up and deal with" the many harms humans are still choosing/preferring to cause instead of changing OUR behaviors and mentality to *actually* protect and enhance WI's wolves & biodiversity... + Wisconsin's wolf hunters/ lethal management advocates are decidedly in the minority. So WHY are their fingerprints still all over this plan, while important findings of scientists and pro-lobos wildlife managers are barely mentioned or seemingly even consulted? More scientific research about wolves and wolf-friendly viewpoints MUST BE INCLUDED in anything calling itself a fair and ecologically beneficial plan. + Where is a comparison of the management success of lethal to non-lethal methods? I consider it dishonest and unethical to prioritize lethal methods, hunting/trapping and licenses as primary forms of control and funding, when non-lethal measures are increasingly proving to be more effective AND more popular among wider swathes of the population. + Continuing to prioritize lethal over non-lethal measures is NOT wolf "management", it is subsidizing the same old Little Red Riding Hoodlums looking to perpetuate the machismo factor of slaughtering predators without mentioning the dire need for the presence of this extremely intelligent and social species in optimally functioning ecosystems, which human encroachments have only harmed, never helped. Enough with the 18th-century, "shoot it if it scares you" mentality. + Wolf tourism is mentioned, but not actually factored in — a short-sighted mistake that could be rectified, again, by rethinking the preference for lethal measures and fairly considering more complex issues. + The public has consistently advocated for more discussion and implementation of non-lethal options. Information about their successful implementation exists, but these aspects are left on the table in favor of same-old, "It's easier just to kill 'em" convenience. + OVERALL: Because many of the folks compiling this plan own guns and/or hunt (i.e. own Hammers), this plan turns far too many issues into Nails. + Think OUTSIDE the "Shoot First, Apply Scientific Knowledge & Ethics Later" box! + If we are trying to minimize the number of illegal wolf killings, then it makes sense to implement methods and mentalities that minimize/avoid as many total wolf killings as possible. THAT is what brings any plan into the realm of actual, ecologically beneficial "management", IMHO. + Better management of human behavior = better, easier wolf management. Actual application of the latest scientific and popular majority findings means MANDATING MORE NON-LETHAL MEASURES. + The American government as a whole and WI specifically needs to start respecting *and implementing* indigeonous populations' views and practices. More folks need to ask themselves, "Who Was Here First?" Answer: 1) Wolves and 2) indigenous tribes. Mother Nature knows far better than humans do what is best for properly functioning ecosystems -- without which none of us could survive. + Pro-active measures (abatement, non-lethal conflict-avoidance measures) should be given higher priority. E.g., if, in spite of the known presence of wolves, zero pro-active abatement measures are taken, why should those recalcitrant humans receive compensation for losses they could have prevented? Again -- an 18th century, predator-eradication-first mentality permeates this well-meaning but sadly inadequate "plan". Sure, it's more complicated to coexist, but coexist we MUST. This means that the pro-lobos shift in the local and nationwide human populations needs to be ackowledged AND adopted by the decidedly anti-wolf authorities trying to manage them with short-sighted, half-hearted ideas. Again, this WDNR plan clearly prefers using lethal, "Hammer-Nail" hunting/trapping measures, even though recent findings have proven them to be far less effective than more humane, non-lethal measures, which are in fact more popular with the public at large. + I'm shocked at the map from 2013 designating "Suitable Wolf Habitat" in tiny, isolated pockets of the lower continental U.S. What unrealistic, non-ecological malarkey. I didn't discover an updated map that reflected today's less fearful, more educated viewpoints, but am hopeful a 2023 map would include far more of wolves' historic habitat and reflect their roaming behaviors.	5	Despite my criticisms, I THANK YOU for your many efforts. But if you're going to make a new plan, it should go as far as possible, because it has to reflect your BENEFICIAL intentions for years to come. Best regards from Galena, IL
	Most of it	Yes	The fact that they are recognizing that they are the main reason of elk kills.	It was made long and kept repeating itself so people would get sick of reading.	2	We need to agree on the fact that there are way too many wolfs in our state, and 1000 wolfs is a great starting number for tags.
	All of it	Yes	That wolves eat deer and elk like they should eat .	That people have negative views about them just because they are scared of them.	0	I think no wolves should be killed. I've never seen one yet in my life while living here for over 30 years.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
	Just the parts I am interested in	Yes	parts regarding wolf management harvesting etc	i feel this plan is definitely to long winded lots of basis facts/history/habits etc that does not pertain to the subject of how to manage the overpopulation of wolves for those of us that live up close and personal with wolves and have sustained repeated property damage from chasing large game and have had a dog killed by wolves its really pointless to read the whole draft to get to the point of a plan i honestly couldn't finish it to many words and no power points	1	please summarize the wolf management plan instead of page after page of non relavant facts
	Most of it	Yes	Nothing	Everything	1	I'm totally sick of everything being political and the dnr is siding with the ultra liberals plus science is no more than one person's opinion maybe we should go back to old science and kill them all
Timothy Ryan	All of it	Yes	Historical information, factual information provided such as Wolf behavior, population dynamics, ecology and biology. Provide well-regulated wolf harvest season; establish a wolf advisory committee and be sure to follow their recommendations!	Plan is well written; however, very lengthy and too scientific for the average person. Too much emphasis on returning wolves to their natural historical range cart blanch. Wisconsin's landscape and people population does not allow for a wolf population of more than a few hundred animals. Obviously ungulate populations have changed since the 1800s and we no longer have wild Buffalo and Caribou to support a large wolf population.	6	Emphasis should be given to this part of the plan "Ensure a sustainable wolf population to fulfil its ecological role and follow strategy A1b of the wolf management plan "Ensure the late-winter wolf population abundance is reasonably maintained above federal and state listing thresholds utilizing a late-winter count of 250 animals". In this scenario, the conflicts with people are minimized while allowing a healthy wolf population! We own a rather large parcel of land in Northern Vilas County with family members. We purchased this property in the 1980s primarily to establish a family deer hunting camp/tradition and to preserve our property in its natural state for future generations. We had excellent hunting from the day of purchase until the early to mid 2000s. Then we began to notice a dramatic increase in the wolf population on our land and a dramatic reduction in the deer herd. Most family members don't even come up to hunt anymore and our dream of a family deer camp on our property has all but evaporated. Hunters were the apex predators of deer on our property and now wolves have supplanted that role. As a tax paying property owner, this is very disappointing to us, that the state and federal government have allowed this to happen by not properly managing the wolf population!
Jayne L Belsky& Michael Belsky	Most of it	Yes	Goals: Increase public understanding of wolves! The overall information provided in your draft plan is valuable and an effort to disseminate this information to the general public should be a high priority!! Science based management is so important. We also like the fact that you will not set a firm number of wolves allowed to live. We are also happy that the Tribes were allowed to have a say. Thank you for the effort everyone put into this.	Depredation funding: We do not agree that hound hunting should be allowed, and we do not agree that hounders should get paid for a hound depredation. We agree with depredation payments for livestock and pets. We didn't see anything here about pursuing other funding from the general public. We would gladly purchase a wolf sticker if the moneys went directly to livestock depredation compensation. That should be a consideration! We didn't see any clarification that The Necedah National Wildlife Refuge is closed to wolf hunting? Maybe someone should take the time to contact the Refuge Manager and clarify that.	8	We have lived in wolf territory for over 25 years. Both of us were lifelong hunters. Last wolf hunting season we had a small pack of 4 on our property that we loved seeing and hearing, Opening day the hounders killed 3 of those wolves not far from us. They left one but it wasn't long before she disappeared too. Something that we cared deeply about was stolen from us. We were volunteer wolf trackers for 15 years and donated over 2,000 hours and hundreds of dollars in gas money to the cause. We resigned as trackers in 2012 and I quit hunting. We feel to this day that we were taken advantage of. We no longer were allowed a voice and all the hunting and trapping factions took over. We feel that to this day the general public is not included enough in the decision-making process. I hope that changes in the future. We also hope you will set your kill quotas low and that someday the use of hounds will no longer be allowed. It's barbaric and shame on Wisconsin. At the very least we hope that you will greatly reduce the "training" time for hounds and the number of wolves killed will be minimal.
	I have not read any of the draft plan	Yes				I don't need a plan to know that killing the best of the best, whether it be wolves or deer is a stupid thing to do, and the violation of all ethics .
		Yes			0	Wolves kill to many deer.Let hunting control the herd through real herd size,not the fake estimates the dnr comes up with
Richard Scot Stewart	All of it	Yes	I think the department did a very thorough job with the plan and I like that.	The department did not weigh in on population goals. This should be done by unit or unit type. The department did not weigh in on chasing wolves with dogs. That is what allowed the last season to overshoot the quota. I think chasing wolves with dogs also leads to the problem we have with cats, which is group hunting. I think special harvest opportunities such as cats and woves should be done by the permit holder, not a group of people stationed around a pack of dogs. that seems like it lessens the special nature of the harvest.	4	I would like to re-state that you need to set goals for management units and address group hunting by hound groups.
		Yes	The Biological data of the wolves was interesting	The plan needs to place a number on the accepted population in the state. 350 wolves statewide, etc.	1	The needs to place a set number or goal for mangement. 350 was used in the past and many people in the state would agree that number was too high!
Robert Beam	All of it	Yes		There is not a specific number of wolves set as a goal. I strongly believe you should stick to the 350 wolve goal you originally promised!	0	
John Wilde	All of it	Yes	Not a fan of plan, as I view current wolf population is far over goal in northern regions of state.	I do not believe that current population is sustainable unless range is allowed to increase. Populations should be reduced in current range and increased in the central and southern portions of state.	1	Results seem to based of some fairly old studies, as well as studies done in different states with vastly different conditions. Results do not even consider allowing wolves to expand range, which shows people are just fine until they have to host a pack of wolves. If these wolf populations are good for northern landowners, they are good for central and southern landowners.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
	All of it	Yes	Nothing	Numbers of amounts of wolves is terribly wrong	1	People that make decisions who sit in offices or courts outside of the state don't know anything!
	Most of it	No				There should be no hunting of wolves in Wisconsin. The illegal killings of wolves in the northwoods is openly discussed by residents. It is wrong and our government should not aid in this horrendous practice.
Craig Galloway	Just the parts I am interested in	Yes	That the DNR has a plan so we can have a season .Finally	The zone management plan.	3	Tribal estimates are too high.
Andrew Rhinehart	Most of it	Yes	Management through legal harvest	Specific zones for harvest	2	Impact on the deer herd here in northwest Wisconsin is the most important to me.
Dan Seibert	All of it	Yes	We have to many wolf as it stands		3	You need to look at how many we have I took the class an we have to many
	Just the parts I am interested in	No	I like that wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. This is outdated, bad science.	The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on: ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution ● The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. ● The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ○ A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings. Hounding or hound training, which are akin to allowing legalized dogfighting, should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public. ● The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. ○ Despite Act 169, which mandates a wolf hunting season, the department can still restrict the implementation of lethal methods by setting minimal quotas, including a quota of '0' wolves, restricting timing and methods. ○ Several studies have proven a proactive non-lethal approach leads to better conflict mitigation. ○ Lethal management often fails to provide a long-term solution to wolf predation and has the least consistent success rates when compared to non-lethal practices. In addition, there is significant evidence showing that lethal wolf management may be less functionally effective at mitigating subsequent livestock losses than non-lethal deterrents. ● The plan should require the implementation of abatement measures as well as the use of non-lethal conflict minimization techniques by domestic animal owners for the latter to receive compensation for confirmed predation. ● The plan also runs contrary to public values towards wolves (and omits mention of such majority values from the plan), despite department surveys evidencing that the broad public cares about wolves as individuals (and not just for the viability of the population). Given the recent liberalization of killing wolves by the state, it would be incredibly informative to note majority support of the following reasons for opposing a regulated wolf hunting/trapping season (which are all omitted from the plan): opposition to specific methods of harvest like hounds (64%) or traps (70%), feelings that hunting wolves is unnecessary (62%) or culturally offensive to Native American tribes (57%). ○ All such reasons convey majority disagreement with practices currently promoted and endorsed by the legislature and the WDNR, and such a conflict between managers and the public should not only be acknowledged, but foregrounded and carefully considered in policy (instead of dismissed). ○ Such decisions to omit literature or downplay evidence (e.g., such as majority opposition to killing wolves and their reasons) are contrary to principles of scientific integrity (e.g., present all relevant scientific evidence to the public) as well as ethics (e.g., disguising ethical decisions, such as recreational wolf killing, as robustly supported by science). ● Conflicting agency objectives (e.g., optimizing public hunting and conflict mitigation) are not only not acknowledged, but even misunderstood as harmonious, against the body of scientific evidence. That culminates in the prioritization of consumptive values and policies; e.g., according to the body of scientific literature, use of lethal methods, and especially public hunts, are contrary to most objectives relevant to:	3	The omissions of scientific literature, the arbitrary prioritization of policy objectives, the rhetoric of the plan and the dismissal of public values and concerns for wolves point towards a biased, unscientific and instrumental view of wolves that promotes values contrary to broad public perspectives on wolves.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
				harm mitigation, the wellbeing of wolves, their ecological roles, and their non-exploitative enjoyment (i.e., Objectives A, B, D and F). ● There is a stark lack of consideration for individual wolves, wolf population health (including wellbeing), and measurable indicators for assessing any harms barring disease prevalence (e.g., accounting for cortisol levels or other stress hormones, measures of pair/pack persistence) ● There is an inappropriate understanding and consideration of tribal worldviews about wolves. Tribal worldviews of wolves are misconstrued as 'cultural benefits' tribes receive from the existence of a wolf population, when in fact tribal worldviews consider each individual wolf as a person and relative. Cultural respect and sensitivity towards such views, shared by many non-tribal members, demand the strict mitigation of lethal measures, especially recreational killing, as opposed to their current promotion in the plan.		
Joan Leuck	Most of it	Yes	The research that supports ethical provisions for the existence of wolves. Also the compensation to landowners that may have loss at livestock due to wolves.	The continued allowance of "culling" by hunters and hunters utilizing dogs. The limited amount of $ allocated to the preservation of this species.	2	
	I have not read any of the draft plan	Yes	None.	None. You do not need to kill any more wolves. They are a necessary part of the eco-system.	0	If there are too many wolves. Try a trap and release plan instead of murder.
Allan	All of it	Yes		You have chosen to ignore the increasing population of wolves in Wisconsin, as evidenced by dropping the population numbers from policy development considerations. This means that every policy that you adopt will be based on political pressure rather than what's actually happening to the population of wolves in Wisconsin. Good policy cannot be developed without the most important data being considered, and you know it !	2	Certain groups of folks freaked out when the harvest #s were exceeded in the last wolf hunt, but the population of wolves in Wisconsin was not damaged. The wolf population is still way beyond the 300 wolves that your own experts considered a good, sustainable target number in recent memory. It's quite evident that you are blatantly giving voice to these anti wolf population control people at the expense of critically needed wolf management tools. Your proposed plan is, in my view, not really management at all.
Mike Buss	All of it	Yes	duct A5c: Consider elk population objectives in relation to wolf management objectives Product A6a Product A5c Strategy C1	too much info for the average person- I do not see many reading all of this Strategy C	6	I am on the side of less wolves the better so this is allot of planning and money spent on something I am unable to hunt.
James Fandrich	All of it	Yes		Since the major funding of the WI DNR budget is related to deer hunting, and the northern deer herd is being demolished by the wolves, I feel we are in danger of a complete collapse of our northern deer camp tradition and a total collapse of funding to the DNR because of this. Much more emphasis needs to be given to deer hunting and the wolves impact on it.	3	
Scott Freer	Just the parts I am interested in	Yes	Creating a hunting and trapping season	Using scientific info to twist the true amounts of wolves to make the public believe there is less wolves then there actually is.	2	Looking forward to the day when they will be honest with us and release the actual estimated number of wolves that occupy the State and not the amount they use to keep us from getting a trapping or hunting season.
Mike Schmalz	Just the parts I am interested in	Yes	The bureaucratic baloney involved with wolves is overwhelming. Getting on with wolf hunts is consistent with the 12000 years of history here in North America. Those tribes that hitch themselves with the Idea that they "lived in harmony" with wolves are ignorant of animal / man dichotomy that has been part of history for the ages.	Not enough wolves are removed from the landscape.	5	Get on with it.
	Most of it	Yes	Not much	Almost all of it, really meaningless if Wolves aren't taken off the ESL	2	I'm not a scientist but, it's like anything in the world when the balance gets out of alignment then something will break, the numbers of wolves is probably 4 or 5 times more than even the DNR wants the time for management is long over due.
Elizabeth Levings	Most of it	Yes	I like that you are including input from the tribes.	I dislike any and all language that could be manipulated into ANY future wolf hunt. Also, any references to wolves fighting with hunting dogs who terrorize our forests due to being allowed there for bear hunting. These dogs do not BELONG in our woods here in Wisconsin.	3	Please remove any language about a potential future wolf hunt. I live on 80 forested acres in northern Wisconsin and am still deeply traumatized by that last illegal hunt. Wolves belong here and do not need to be "managed" by us. Plus, we open up our state to psychopaths on high-voltages snow machines that are so scary. Seriously. The wolves in my woods do not scare me. The killing frenzy does. Wolves are pack animals and when they lose even one member, the oftentimes do not recover. Please consider my comments of compassion.
Jacob Mathews	Most of it	Yes	Specifically I like the models and graphics used to help provide clarity throughout the draft.	I don't think DISLIKE is the right word because it's not that I necessarily DISLIKE anything. I specifically disagree with the range of the wolf population model based on conversations I've had with hunters. I believe their range pushes much further South in Wisconsin than is acknowledged.	8	Personally I would prefer to be more aggressive on reducing the overall population/ range goals. I've just seen deer populations plummet so much in my lifetime in wolf country that II would hate to see the wolf range expand anymore in the state.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
	Most of it	Yes	I like that the draft plan does not put a cap on the number of wolves. Historically, that number provides incentive for killing wolves to keep the state below an artificial ceiling. The cap was arbitrary and incentivized killings. I also like that the plan takes into consideration indigenous tribal concerns, and buffers will protect wolves within.	Do NOT use a numerical goal - it's used against the species. Place less emphasis on 'lethal management' and more on the value of wolves to the ecosystem, indigenous culture, and to 'non-consumptive users.' The reliance on USDA Wildlife Services is concerning as lethal options seem to take priority over non-lethal as shown by the numbers. Have a separate committee for science and for stakeholders. Create a buffer between politics, science, and special interest agendas. Create more restrictions on the use of hounds against wolves for hunting and 'training.' The rules are essentially nonexistent and their use should be minimized.	2	The population estimates leave far too much room for guesses about the wolf population. There is still far too much emphasis on recreational killing and providing "hunter opportunity" to kill wolves. More emphasis needs to be placed on the value of this species to non-consumptive users of our lands. The Wisconsin DNR is too quick to promote lethal responses to the rare conflicts that result between wolves and people.
	Most of it	Yes	We are very encouraged that the draft plan does not put a cap on the number of wolves — a number that when hit provides a rationale to kill wolves by the hundreds so that the state can keep them below an artificial ceiling. That "cap" was always arbitrary and it again and again set the stage for wolf killing. The management plan takes Native American tribal concerns into consideration and establishes buffer zones around tribal lands to protect wolves in those areas	The population estimates leave far too much room for guesses about the wolf population. There is still far too much emphasis on recreational killing and providing "hunter opportunity" to kill wolves. More emphasis needs to be placed on the value of this species to non-consumptive users of our lands. The Wisconsin DNR is too quick to promote lethal responses to the rare conflicts that result between wolves and people.	3	We recommend that the DNR continue to not include a numeric goal, as these can and have been used against the species. We encourage the DNR to place less emphasis on "lethal management" and more on the value of the wolf to the ecosystem, indigenous culture, and to "non-consumptive users." The reliance on USDA Wildlife Services is concerning as lethal options seem to take priority over non-lethal as shown by the numbers. We encourage the DNR to have separate committees for science and for stakeholders. This provides a buffer between the science and the politics and special interest agendas. We also recommend far more restriction on the use of hounds against wolves for hunting and "training." We understand that the use of hounds is allowed under state law, but rules are almost nonexistent and their use should be minimized.
	I have not read any of the draft plan	Yes				Please trap and move the WOLVES to areas in Wisconsin which have high CWD.
	Most of it	Yes		I oppose the removal of a numeric population goal, the elimination of proactive control zones, and the creation of subzones around tribal reservations.	6	
Dennis Campbell	All of it	Yes	I like the fact that-the plan is focused on a holistic and pragmatic approach to wolf management, conservation, and stewardship--it was time for a review of the plan	I can live with what I read.	9	
ayako firsing	Just the parts I am interested in	No	None	Too wordy, not to the point.	1	
Hilary	All of it	Yes	I like that's there's none specific numbers and room for doing nothing and leaving them alone even when not listed (which they should be).	Bias toward hunting.	8	Too long for this format.
Kory J. Scholze	Most of it	Yes	I like the idea of controlling the Wolf populations, this is much needed	I think the estimates of the current range are incorrect, wolves continue to migrate South. I disagree with the assessment of the fawn and bear mortality. I believe the wolf population estimates are too low.	5	I live and hunt in Southern WI and hunt in Northern WI. I have seen a huge decline in the Northern Deer herd and bear population due to wolves. We must decrease the number of wolves, especially in Northern WI. maintaining a smaller number of wolves and wolf packs would be ideal.
	Just the parts I am interested in	Yes	• We are very encouraged that the draft plan does not put a cap on the number of wolves — a number that when hit provides a rationale to kill wolves by the hundreds so that the state can keep them below an artificial ceiling. That "cap" was always arbitrary and it again and again set the stage for wolf killing. • The management plan takes Native American tribal concerns into consideration and establishes buffer zones around tribal lands to protect wolves in those areas.	1. We recommend that the DNR continue to not include a numeric goal, as these can and have been used against the species. 2. We encourage the DNR to place less emphasis on "lethal management" and more on the value of the wolf to the ecosystem, indigenous culture, and to "non-consumptive users." The reliance on USDA Wildlife Services is concerning as lethal options seem to take priority over non-lethal as shown by the numbers. 3. We encourage the DNR to have separate committees for science and for stakeholders. This provides a buffer between the science and the politics and special interest agendas. 4. We also recommend far more restriction on the use of hounds against wolves for hunting and "training." We understand that the use of hounds is allowed under state law, but rules are almost nonexistent and their use should be minimized.	5	
John	Just the parts I am interested in	Yes	maintenance	Little enforcement	1	Last years hunt was supposed to be 119 wolfs but 97 extra wolfs were killed. Clearly until you can guarantee that only legal number of wolfs are killed there should be no wolf hunt this year for sure and perhaps next year as well. Perhaps taxidermists could be fined for treating illegal wolfs or hunting licenses and vehicles confiscated for non permitted hunters?
Rita Zappen	All of it	Yes	Ensuring a healthy wolf population.	Zone specific harvest permits	1	Opposed to all killing of wolves unless a threat to livestock. I totally oppose reimbursing hunters for dogs that are killed by wolves.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
	All of it	Yes	The management of predators in the State of Wisconsin.	Overall, the low quota allowed to reduce the number of wolves in the State of Wisconsin.	1	The increase in the number of wolves in the State of Wisconsin have negatively impacted the whitetail deer population. Due to the reduction in whitetail deer, there have been a very negative impact on the economy in northern Wisconsin and I would go as far to say, land values have been adversely impacted due to the lack of whitetail deer and other game, once prevalent in northern Wisconsin. The estimated number of wolves far exceeds what was designated as an acceptable number of wolves in the state. Request: Significantly increase the wolf harvest quota and significantly reduce the number of wolves. Thank you.
Guy Peterson	All of it	Yes	None	All	1	Northern zones need wolf season. Hunted all my life and never saw so few deer, even worse than back in the 60's and 70's.
	Just the parts I am interested in	Yes	We are very encouraged that the draft plan does not put a cap on the number of wolves — a number that when hit provides a rationale to kill wolves by the hundreds so that the state can keep them below an artificial ceiling. That "cap" was always arbitrary and it again and again set the stage for wolf killing. The management plan takes Native American tribal concerns into consideration and establishes buffer zones around tribal lands to protect wolves in those areas.	The population estimates leave far too much room for guesses about the wolf population. There is still far too much emphasis on recreational killing and providing "hunter opportunity" to kill wolves. More emphasis needs to be placed on the value of this species to non-consumptive users of our lands. The Wisconsin DNR is too quick to promote lethal responses to the rare conflicts that result between wolves and people.	5	We recommend that the DNR continue to not include a numeric goal, as these can and have been used against the species. We encourage the DNR to place less emphasis on "lethal management" and more on the value of the wolf to the ecosystem, indigenous culture, and to "non-consumptive users." The reliance on USDA Wildlife Services is concerning as lethal options seem to take priority over non-lethal as shown by the numbers. We also recommend far more restriction on the use of hounds against wolves for hunting and "training." We understand that the use of hounds is allowed under state law, but rules are almost nonexistent and their use should be minimized.
Michael J Ruesch	All of it	Yes	That it finally got done!	I dislike the fact that the DNR staff are pro wolf and pro wolf protectionist groups. The department has lied to the people since before the reintroduction was started - telling us many of the access roads needed to be closed as wolves could not survive outside of total wilderness! They are also spineless when it comes to admitting there needs to be a numerical number of 300 max for a population goal.	2	The current plan is vague and has major affects on landowners and hunters in the Northern half of the State. The Southern half has the greatest human population density but the majority of them love wolves because they do not have them in their back yards. Why does this plan not push HARD for reintroduction of wolves throughout the ENTIRE state? Why does the DNR not move problem wolves or excess wolves to the lower half of the State? It certainly cannot be that wolves would not survive or that they never populated this region. The wolves have proven they can survive in areas with roads - which in the earliest days of discussions we were told needed to be shut off cause the wolf needed total wilderness to survive - LIE #1. Again, why doesn't this plan push hard for populations in all 72 counties if the wolf is so beloved and roamed the entire State at one time? Why is one region slapped across the face and kicked in the pants while the other has no skin in the game? This plan is nothing short of racist and is territory based racism. Where is the inclusion and equity as far as the most liberal part of the State taking on their fair share of giving the wolf full rights across all 72 counties and their cities. Prove the DNR and bureaucrats are not racist towards Northern WI folks or the wolves. Show the world that ALL of WI welcomes wolves anywhere within its borders!
Diana Lewis	Most of it	Yes		Lethal means of reducing the wolf population	1	We encourage the DNR to place less emphasis on "lethal management" and more on the value of the wolf to the ecosystem, indigenous culture, and to "non-consumptive users." The reliance on USDA Wildlife Services is concerning as lethal options seem to take priority over non-lethal as shown by the numbers
Dusty Hecimovich	Just the parts I am interested in	Yes	Reduce wolf related conflicts!! You should not have to worry about a [redacted] wolf killing our pets/animals. It has happened too much. They are killing machines. Ask yourself, how does a wolf quota get met within a couple days? Answer..there is WAY TO MANY. ITS A BAD PROBLEM.	Ensure a healthy wolf population or spend money on them. They are at the top of the [redacted] food chain. So it must be healthy.		We have too many wolves in Northern WI. It has decreased our hunting and made people afraid being in the country. Bring wolves to southern WI or other places. Im fine with being some wolves but not how it is. Give out tags and have a season every yr. Wisconsin is losing lots of money because of the poor hunting now.
Kyle	All of it	Yes	We are very encouraged that the draft plan does not put a cap on the number of wolves — a number that when hit provides a rationale to kill wolves by the hundreds so that the state can keep them below an artificial ceiling. That "cap" was always arbitrary and it again and again set the stage for wolf killing. The management plan takes Native American tribal concerns into consideration and establishes buffer zones around tribal lands to protect wolves in those areas.	The population estimates leave far too much room for guesses about the wolf population. There is still far too much emphasis on recreational killing and providing "hunter opportunity" to kill wolves. More emphasis needs to be placed on the value of this species to non-consumptive users of our lands. The Wisconsin DNR is too quick to promote lethal responses to the rare conflicts that result between wolves and people.	6	We recommend that the DNR continue to not include a numeric goal, as these can and have been used against the species. We encourage the DNR to place less emphasis on "lethal management" and more on the value of the wolf to the ecosystem, indigenous culture, and to "non-consumptive users." The reliance on USDA Wildlife Services is concerning as lethal options seem to take priority over non-lethal as shown by the numbers. We encourage the DNR to have separate committees for science and for stakeholders. This provides a buffer between the science and the politics and special interest agendas. We also recommend far more restriction on the use of hounds against wolves for hunting and "training." We understand that the use of hounds is allowed under state law, but rules are almost nonexistent and their use should be minimized.
Juan	All of it	No	I liked the non lethal methods of control and more studies of the wolf population	I think the wolf population numbers are not properly tracked or have enough scientific backing to it. The metrics doesn't seem right neither it seems to expand the killing of the wolf population following the methods of other states. Seems like shortcuts were taken.	5	It is obvious that care was taken into the draft and it shows. Still needs a little more work in accounting for the wolf population and I do like non lethal methods implementations.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Myreya	I have not read any of the draft plan	No				No soy residente ni Ciudadana Americana, pero estoy enterada de la caza y matanza indiscriminada de lobos en algunos estados de la Unión Americana, con trampas helicópteros, cebos y demás, también argumentan la depredación de ganado por lobos, cosa que ya demostraron no es cierta, los lobos son necesarios, son esenciales, traen beneficios para este planeta, equilibran la cadena alimenticia, la ecología reforestación, y muchas otras cosas, no hacen daño a nadie, los humanos van a donde están a cazarlos, no es justo no es bueno para ellos ni para el planeta, la "diversión" humana no debe ser a base de matar y asesinar seres inocentes y necesarios para este mundo, detengan la matanza, analicen lo que significaría su extensión por capricho o negligencia. Es mi argumento, Gracias por escucharme.
	All of it	Yes	I agree with the fact that the mangement plan addresses how the DNR has to better manage the population with regards to having a healthy population with less conflicts between humans, their pets and the farmers.	I believe there too many wolves in areas and they are not regulated well enough.	5	
	All of it	Yes			10	
John	Just the parts I am interested in	Yes	The mere idea of being open minded to accepting suggestions from the people of Wisconsin though it's authenticity still needs to be revealed.	The original target goal of the wolf population is far exceeded resulting in the decimation of our deer herd in some areas. This was never in the plan that I'm aware of. What will we do now?	5	Wisconsin has dealt with this problem in the past. People don't seem to realize that there was once a bounty on wolves. We wanted white tailed deer instead of wolves which we succeeded in getting. Now that effort is reversed. What a shame. One more problem for our children to inherit.
Edward Blau	All of it	Yes	I like the scientific approach that sees where the Grey Wolves fit into the big picture.	I do not see any rational justification for hunting or trapping Grey Wolves.	8	I am in my 80s and have been hunting since I was 12. We live in Central Wisconsin and have a lake cabin just north of Land O Lakes and in both places, there are too many deer. They are a public health menace and destroy the flora. Wolves are one of the ways nature controls the deer population. Leave the wolves alone.
	Most of it	Yes		Your committee is all one sided don't see any public input plus tribes are hypocrites	0	Kill them all
	All of it	Yes	● The elimination of a numerical target population ● The importance of the ecological benefits of wolves and the inclusion of tribal values and knowledge. ● The attempt to minimize the impacts of a recreational hunt by adopting buffer zones around tribal lands, shortening reporting requirements and making hunting licenses zone specific. ● Emphasize the use of non-lethal methods to reduce conflicts.	● Absent is a commitment by DNR to work with the legislature to overturn PA 169 and remove payments for hunting hounds, killed by wolves. ● Hound training must be stopped. ● The plan should establish a zero hunting quota to protect wolves in our national forests and other areas prime habitat. ● The recreational hunting/trapping to reduce conflicts has no scientific basis. ● At a minimum, DNR should ban the use of dogs to hunt wolves in our national forests. ● There is considerable uncertainty in estimating wolf populations based on the occupancy model and should not be used solely to determine population. ● The plan should include an oversight committee which is comprised of biologists and professionals.	5	Overall, the plan is good; however, the Committee was overrepresented by hunting organizations even though they represent the minority opinion of Wisconsinites. Too much emphasis was placed on the killing of wolves rather than co-existence.
	Most of it	Yes	I agree there needs to be a balance but the original goal was established for a reason. I did not purchase property to feed wolves.	Keep control in the landowner's hand. This is what happens when big government gets involved.	3	Remember who and what brings income to the state of Wisconsin
Mik lemke	All of it	Yes	Honestly not allot because I think there should be a way lower density of wolfs in the north woods. When they start coming in your yard around your children, I think you could agree.	Wolf density plan is way too high. Have you hunted in the north woods or have had wolfs in your yard?	1	
Erik Brynildson	All of it	Yes	More consideration to non-lethal alternatives than previous proposals. Still far too slow & steeped in archaic "game management" approaches.	Not enough respect for the spiritual beliefs & philosophy of native people. No genuine understanding of the priceless & inherent value of indigenous sentient life... Focus on PEOPLE MANAGEMENT!	3	Get rid of all utilitarian & even corporate terminology! e.g. "products" p. 100, "extinct" & "harvest" p. 21, "furbearer" p. 125, etc. And it's absolute barbaric insanity to use canines to cruelly pursue wild canines! SHOOT THE WOLF & PET THE DOG... That's pathological if anything is... The DNR has a very long way to go to truly embrace the 21st Century.
Tom Weidert	All of it	Yes	Admitting that managing the population is a priotity. Permits by zone where most complaints come from.	I doubt there will be a lot of "sightseeing" for wolves. We are not Yellowstone. Also not a fan of all the people who don't have to deal with the problem, having such a strong opinion that we have to cater to. If you don't live among the wolves, I really don't want to hear how great they are. This problem could get out of hand quick. Hunting with hounds and trapping are the way to control them.	6	Although I support hunting with hounds, as a taxpayer, I am against us reimbursing hunters when their hounds are running through the wolves bedroom.That's a risk they pay for their sport. I do appreciate the DNR's work on this project. But I get mad when people from the city come up North and tell residents affected by wolves, how they should think or act towards wolves. Personally I don't care if I ever see one. I never saw a Sabertooth tiger either and my life turned out pretty good! 😉 Thanks
	I have not read any of the draft plan	No	It fairly points out the flaws in the unscientific, inhumane approach that authorizes the killing of wolves.		7	

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Steve	Just the parts I am interested in	No	The balance of using science to protect wolves, while also educating the public about wolves in general along with their management. I also liked how it covers the low numbers of depredation to livestock, and how non-depredation has a higher impact on livestock.	I couldn't find anything I didn't like. It's a thorough recant of the economic, environmental, and overall scientific contributions wolves have to society	10	
natalie battistone	Most of it	No	I like that there is increased recognition of the important and significant roles wolf populations play ecologically.	The primary issue I have with the plan is the lack of concern for dispersing/individual wolves.	8	Thank you for your work and concern for this species!
john	Just the parts I am interested in	No			1	Thin the packs out.
	Most of it	Yes	Managing the wolf number	The fact the DNR is lying about the current wolf population, it's much larger than they're saying	5	Wisconsin DNR needs to stop letting liberal judges from other states dictate how it's conservation plan needs to be
Shelli Dubay	Most of it	Yes	The objectives are really specific with mechanisms to assess success included. I like that the registration time might be shortened to 8 hours - this will help overshoot quotas. Creating wolf zones based on vegetation zones seems logical.	Over 40% of the respondents to the survey wanted about the same number of wolves in the state. I think that goal can be achieved by shortening the wolf season so that it will not coincide with breeding in spring. I did not see specific dates mentioned (but i did not read the entire document).	8	
Mark	All of it	Yes	Very detailed, thoughtful and well written. Much information was obtained from a wide variety of persons and organizations and now seeking feedback from the general public. Nicely done.	Hunting dogs killed by wolves, the owners should never ever be compensated. Shame on the hunter to allow their dogs not to be within their control...bear hunting or not. The DNR does not compensate boaters when they destroy a prop on their boat when they hit something in the water. This is so so wrong. Harvest: there needs to be X amount of tags that goes to hunters using dogs and X amount that goes to trappers.	5	See #5 Thank you for all of the work that you do.
RS	All of it	No	Likes the data and details of kills	No management for the northern units, their are way to many wolves, and your numbers are way off there more wolves then you think.	5	Need to kill more wolves north of 29, poor deer and elk are taking a pounding. Big woods have lost 90% of the deer population since the 80 and 90s do to wolves and T zones and doe tags. Need to manage the wolf better, but I belive you know that.
	All of it	Yes	I like the move away from a numerical goal. I like the plan's goal of "ensuring a healthy and sustainable wolf population to fulfill its ecological role."	I dislike the use of sport hunting to try to reduce conflicts around livestock operations. I think targeted trapping and removal is more effective.	9	
Paul Gabriel	Most of it	Yes	All of the plan objectives, A-F, are appropriate, well thought out and make sense to me as an informed lay person and state resident.	None stick out. In objective C., the statement "ensuring regulated harvest does not jeopardize the security of the statewide wolf population" is critically important based on recent harvest/hunt experiences.	9	This is a good plan. It is counterproductive to argue based on seeking 350, 1000 or 1200 wolves in Wisconsin. The plan approach is better.
	Most of it	Yes	Public opinions were taken into account both in 2014 around the hunt as well as recently. While there are often going to be extremes on each end of the spectrum, the median responses (i.e. on a scale of -10 to +10, averaging % based off responses in the -5 to +5 range) give a better glimpse as to the general public consensus. The graphs provided from surveys do a fine job showing the majority of individuals opinions, both in the higher population wolf areas and areas where wolves exist but are not reported as being inhabitants of the area (to say wolves aren't capable of existing in every county, exception to Milwaukee county as being unlikely due to human population density, in the state in 2023 on some level at some point during the year is not truthful). I do like the transparency on how the public reported favorability to the DNR and it's wildlife management abilities even though, by me, it is perceived as a negative %. All-in-all, the transparency and details are there. Most of which the average person who prefers to see a healthy ecosystem could have deduced. The information is good, and the plans involve common sense objectives.	Among the survey information both from 2014 and the most recent, labels of "negative" or "positive" attitudes were placed and listed in this draft plan. While this may be only listed as verbiage towards the overall opinion towards a negative or positive trend towards outlook of wolves, it is nearly irrelevant information when it's not directly shown as a graphing tool as well. Similarly, separating three statements which were not included in 2014 from the index on overall favorability directly eliminates variables given to the public to accurately measure their favorability. These should absolutely be included as fact and there should not be a line drawn stating that overall favorability remains positive when it in fact is not based off the new data. I do not like how the DNR sees it as a positive that ONLY 65% of the public, which widely recreates at some level in and out of wolf areas, was favorable towards the DNR's ability to make decisions regarding the states wildlife management. That is a horrific showing of support for a non-elected state agency. The science has been done, the consensus has been concluded, and for those looking to find the answers... they've been available to view online. Most of the objectives are intrinsic in nature by striving for another objective, this is a way to make it seem as though the DNR is really striving to do "all of these things". 167 pages of science and data that could have been condensed down to 40-50 with instructions for allowing people to find the data on their own.	7	
Peg Zappen	Most of it	Yes				My comments are value based. I thinks wolves should be destroyed only when they are a threat to livestock and people. I really oppose reimbursing hunters for dogs that they think are killed by wolves. Thank you.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Ken Winkelman	I have not read any of the draft plan	Yes	Too long to read. Who has that kind of time.	Irrelevant for me to read as my wolf plan is to not have them period,	1	I am seeing fewer deer each year since wolves have been reestablished during our 9 day gun season. I fear taking our bird dogs out hunting grouse because of the chance encounter with a wolf. I have had friends lose hunting dogs to them. Recently a friend posted on Facebook 9 deer carcasses he found in 4 days of wolf predation. They don't just kill to eat. My encounters have shown me that they r pretty bold. No fear. When they were introduced I do not remember any survey asking us in the Northern part of the state if we wanted. Perhaps these people from the Southern part of the state that wanted the re introduction should have a few packs there. I am sure A couple packs in Milwaukee and Dane Counties would put a whole new outlook on the need for wolves. In summary I don't want them.
Sally Sorenson	I have not read any of the draft plan	Yes			1	I do not believe that because we are humans and we have created guns we have the right to forcefully "manage" other animals on this planet.
Brett	I have not read any of the draft plan	Yes		Anything other than total wolf eradication.		We don't need wolves in WI. They've cost taxpayers plenty already and they have destroyed the deer hunting tradition in Northern WI.
	Most of it	Yes	Addition of more management zones	The vagueness of the wording when it comes to management goals, specifically going away from a specific population number. (ex. 350). This leaves the door open to a large variety of interpretations on what exactly the management goal is. Now, I also understand that is the exact reason why it is left vague, I just don't agree with it. It feels too political rather than scientific.	3	
	All of it	Yes		They do not say anything about the 350 wolves or having season to keep them in check!	1	If you get rid of Baiting for deer(State wide)! That would help spread the Deer out making the wolves spread out!
	Just the parts I am interested in	No	Anything thst builds the wolf population in numbers for continued existence.	The idea that wolves are a threat to humans or livestock at this time in history. Properly handled, wolves can help humans	5	
Gary	Most of it	Yes	In depth figures/graphs on wolf impact on elk and human input. Interesting First Peoples take on origins	Eliminate federal legislation allowing interference with animal population control (Too much government/overreach)	8	When opening a season eliminate guide input help to give average hunters and trappers a level field to harvest a wolf.
Paul G Sinn	Most of it	Yes		Too wordy. I want less words, more action, and less wolves.	3	I want to see a plan that reduces the population to a minimal level, (500) or less. Tell the wolf huggers to let their children play in the woods. What? No response?
	Just the parts I am interested in	No	Wolves in WI will no longer be managed by reference to the target of 350 wolves Proposed buffer zone	Does not take into account new (or old) science re: wolf sociability, effective non-lethal intervention, wolf dynamics Does not limit lethal management methods unless as a last resort Does not prioritize wolf protections Does not require non-lethal management first Does not account for tribal worldview of wolves	4	
Dick Reilly	Most of it	No	Pg.98 Objective A: Ensure a healthy and sustainable wolf population to fulfill its ecological role. and, Objective D: Increase public understanding of wolves in Wisconsin. and, Objective E: Conduct scientific research to inform wolf management and stewardship		10	
William Waughtal	All of it	Yes	Moving away from a set number of animals that should be maintained.	I respect the tribal interest and considerations shown to them but question the fact if it's not more of a political issue.	8	Being a past member of the conservation Congress I sat in on many fish and wildlife meetings. The southern part of the state seems to get their views heard more than the northern people who are living with the animals. That has to change. Wisconsin public radio had a show on wolves and every guest was from Madison?
Harry Sweet	All of it	Yes	It seems to take in concern from everyone.	I dislike the fact that it doesn't take into account how high the wolf numbers REALLY are and how MUCH IT AFFECTS ELK AND DEER NUMBERS IN A NEGATIVE MANNER.	4	Delist, hunt and trap wolves and keep the numbers to less than half of present time.
	Most of it	Yes	Control of the numbers	Need to have number limits in order to maintain as needed	3	Not enough to get numbers down to where it needs to be
	Just the parts I am interested in	Yes	all good information, a lot of work went into the research. It appears the wolf population is increasing to a point where i believe is out of control and needs to be controlled.		3	I spend a lot of time in the northern Wisconsin woods year round and feel the wolf population is way to high and the proposed quotas are too low. I'd like to see the population reduced to 650 wolves.
	Most of it	Yes			10	

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Anthony Pautzke	All of it	Yes	Population distribution analysis. Sociological considerations. Analysis of who is in favor of wolf harvest and who is not.	Superficial treatment of wolf density and and types of habitat. And the affect on prey species. Harvest quota must not be shared by hunters and trappers. It should be separated. Very weak on proposed harvest structure. Trapping is far more effective harvest technique.	4	While the background provided is exhaustive, it does very little to evaluate harvest techniques. Spot and stalk, Calling, Dogs, and Trapping. The harvest plan is incomplete.
	All of it	Yes			7	
Joseph Allen	Most of it	No	I generally support much of the plan. I like that wolves are recognized as being part of a healthy ecosystem, that public preferences are being taken into account (not just the preferences of a certain segment of the public), and that the DNR is focused on following the best available science and data and obtaining more data as time goes on. Although I don't think it's strictly required for good wolf management, I'm fine with a limited, regulated recreational wolf hunting season, as long as it's conducted in a humane manner, following fair chase, and the population remains healthy and robust.	There should be some recognition that the February 2021 wolf hunt was a bad result, although I understand that was mandated by the court and not necessarily DNR's fault. There should also be more recognition of recent science illuminating the individuality of different wolves, with different personalities, as well as recent science on wolves from a neuroscience perspective (self-awareness, theory of mind, etc.).	9	Thank you very much for your service. I know this is a highly charged topic, and there is no way that any wolf plan will satisfy everyone (or even anyone), and this represents a great work product. I appreciate that your team is endeavoring to stick to the best available data and science as the path forward.
Marti Sowka	Most of it	Yes	- removal of an arbitrary population goal for wolves and basing decisions on the current science relating to wolf adaptability. The Voyageurs Wolf Project in northern Minnesota is gathering science-based data on wolves that should be helpful to the WiDNR moving forward. - recognition in the plan that wolves are part of a healthy ecosystem and provide many ecological benefits as apex predators -including tribal input in every facet of the plan and recognizing tribal ability to manage wolves on tribal land. -the repeated commitment to science and research as the plan is implemented. Well done!	Perhaps you should consider adding a timeframe for review and changes to the plan over the course of the next five years. Again, the Voyaguers Wolf Project in northern Minnesota, continues to gather and evaluate scientific data regarding wolves and will be a great resource for updating the plan. Also, the plan should prioritize working with farmers on responsible practices and non-lethal ways to reduce conflicts. The Voyaguers Wolf Project has data on the success of fencing in reducing livestock depredation.	9	The plan is based on science and the committee was huge, reflecting diverse stack holders. Well done!
Dona Doig	Just the parts I am interested in	Yes	Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. There is much greater recognition of the ecological role of wolves The inclusion of a social survey, which notes increased positive views of wolves The adoption of proposed buffer zones around tribal reservations	The current draft does not reflect the best available science The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life Hounding or hound training, which are akin to allowing legalized dogfighting, should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence The plan also runs contrary to public values towards wolves and omits mention of such majority values from the plan There is a stark lack of consideration for individual wolves, wolf population health and measurable indicators for assessing any harms barring disease prevalence The rhetoric of the plan and the dismissal of public values and concerns for wolves point towards a biased, unscientific and instrumental view of wolves that promotes values contrary to public perspectives on wolves	6	The Committee was overrepresented by hunting organizations even though they represent the minority opinion of Wisconsinites. Too much emphasis was placed on the killing of wolves rather than co-existence.
	Just the parts I am interested in	Yes	More localized control of the wolf population.	I am not certain that the wolf population numbers are accurate now or will be in the future.	5	I am not certain how this plan will work out. The most important issue is to reduce the wolf population, especially in the snow belt area in the northern part of the state. With low deer populations in several areas now, it is very upsetting to see so many wolf kills in the deer wintering areas. In the snowbelt areas, the deer heard cannot successfully be maintained with severe winters AND wolves. We cannot control the weather but we can control the wolves. Additionally, now days the north is not a vast untouched wilderness as some imagine, that can support a large population of wolves without conflict. There are farms, remote cabins, homes, camps, recreational trails, and roads scattered throughout. People use the land and can access it by various methods, so the wilderness of 30 years ago is not the same today. Tourism is highly encouraged and plays a huge roll in local economies. Recently on Facebook, I read dozens of comments about how much enjoyment people people got from watching deer on their property. There was not one single comment saying someone enjoyed watching wolves. My final comment is this: The people who love wolves don't have to live with them.
Jeremy Skaw	Just the parts I am interested in	Yes	Its thoroughness	How can you have a wolf management plan without including any hunting season conditions?	8	

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Lory	Just the parts I am interested in	Yes		#1 I do not agree that one of the main factors in developing the plan is the publics attitude towards wolves. This should serve 0 influence on the wolf management plan. Period. Right along with public input. There is a lot of grey area there. Many people who live outside of wolf populated areas feel there should be a large population of wolves. I live in Bayfield County. I am not sure there is a heavier wolf populated area in the country. I am all for having wolves on the landscape, but they must be managed at a sustainable number. There are currently thousands of wolves in WI and that number is a far far cry from what the original population goal was. Since then what has happened? We have logged an outrageous number of acres of county forest land right here in Bayfield Co alone. The number of WI residents is on the rise, cities are growing, there has been a HUGE influx of people moving to our county in the last 3 years. Which means the natural areas for wolf habitat are shrinking, and yet they want to make the population goal significantly larger than it has ever been. It doesn't take much sense to realize this will result in more human/pet/agricultural/hunting/recreational encounters with wolves. #2- They want to take away a numeric number on a population goal. This will take away any intrusions on having a wolf season (which the dnr obviously doesn't want) because no one can ever say they are "over populated" #3 They want to reduce harvest registration times- because too many wolves were harvested in a zone before the dnr had a chance to close the zone. This is literally scientific data stating that there is already an overpopulation of wolves if they can be harvested so effectively and efficiently. However instead of proclaiming that aspect of it, they are trying to change things to make it harder to harvest a wolf. #4 - The Dnr has had many many many years to come up with a wolf management plan. It took the Dnr getting sued before they decided to do something about it. Now they have made up this new wolf expansion plan. Not a management plan. It is time to take wildlife management out of the Dnr's hands. They have proven in many aspects that they are not qualified to manage Wisconsin wildlife. I used to have great faith in the Dnr. They have proven me wrong time after time. It is very disappointing.	1	Deer hunting used to provide small northern towns with all kinds of revenue. They wolves are eating the deer at a rate where there soon will be very very few deer around. This should be alarming to the Dnr as they make lots of money off of deer hunters alone. We see it in towns around here. Many places there are no deer where deer were once plenty. Wolves are migrating to where ever there is a food source for them. They decimate that population-then move onto the next. They are an apex predator, its what they do for a living. There is too much political jargon and hurt feelings standing in the way of just having a regular wolf season like any other game. It is a shame what this has come too. The wolves in Northern Wisconsin are heavily overpopulated. It is the Dnr's JOB to maintain a healthy population. They need to only take the law and scientific data in consideration for a wolf management plan. If the Dnr cannot manage wolves on their own as they have proven for decades, it should be put in the hands of an unbiased organization that will.
Linda Mort	All of it	Yes	The elimination of a minimum number of wolves on the landscape. A buffer zone around all reservations.	Hunting wolves with dogs. And trapping wolves.	4	We live in the Northwoods of Wisconsin in wolf country. We've spoken to many of our neighbors and no one has a problem with wolves in the area. We don't need conflicts with bear hunters running their dogs on or near our land. We pay taxes and deserve peace. Totally against trapping too.
Joel McVinnie	Most of it	Yes	The fact that these animals need to be managed!	I feel the DNR numbers are falsely reported.	5	Please do better with understanding the numbers of these predators. I own 160 acres in Bayfield County Wi. This land is infested with wolves, I have trail cam pictures with as many as 7 wolves in one picture. Beautiful animals, but they create havoc with deer and I personally carry a gun every time I go into my woods as these animals are becoming more bold towards humans, I have had several encounters while bird hunting with my dogs and while bow hunting. These animals should be a very rare encounter, not a normal situation. The DNR have no idea on what the true numbers are and the proposed harvest numbers are a absolute joke. I pay taxes, Wi hunting licenses that is supposed to help support the natural resources that I love, but the DNR continues to support the woke tree huggers and other special interest groups that want to take away our natural resources. Remember who pays your salary!!! Wi outdoorsmen and women. please pay your respects and manage the wolf population at true levels and numbers and stop letting these woke groups manipulate proper management!
chris n	All of it	No	less anti-wolf propaganda, no longer focused on a goal of 350 wolves.	it doesn't prohibit lethal intervention nor recreational hunting of wolves. we must do better to protect and preserve all wolf species to prevent extinction	3	
Steve Kall	All of it	Yes	Of the 350 minimum. Also buffer zones around reservations and the reduction of reporting time to 24 hours you're an idiot man you talk to me like I'm a piece of s***	Still allowing wolves to be hunted by dogs and trapping.	3	My wife and I live in northern Wisconsin in close proximity to many wolves. We feel they're part of the ecosystem and should not be hunted at all. The only time it becomes a problem is when we the people make it a problem by bearing irresponsible with their pets and livestock. There's really no need for a wolf management plan as nature will let them manage themselves.
Craig Thompson	Most of it	Yes	Very little, the WI DNR has become politicized and liberalized under Democrat leadership.	Dominant predators like wolves MUST have a population objective.	1	Wake up and use science, not politics and emotion.
Greg Dekalb	All of it	Yes	Controlling wolf numbers in zones that need it.	Not being able to reliably count the number of wolfs is disturbing, and to not be able to decide on a viable number.	2	I've been hunting in Ashland County for over 30 years and progressively every year is worse for deer hunting, it's a shame that the wolfs come before the Deer and Elk!!!!
melvin r yeakle	Just the parts I am interested in	Yes			0	less than 350

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
John McNellis	Most of it	Yes	Controlling the population by area	1. Does not address specific population goals, stick to the previous approved plan of 450. 2. Does not include s specific hunt tag percent to zone population: Example: Z1 has 500 wolves x 50% harvest goal = 250 tags for 2023 3. If I live NEAR a tribal land, why should my land be treated different? every square inch beside tribal should be treated the same. 4. If the intent is for the state to manage the herd and not harvest what is needed, plan needs to address over population by capturing and dispersing to all other areas in state where they do not currently exist. Let's be fair about this is we are going to have a management plan. Deer, turkey, coyotes all exist in every county. If the public really wants wolves, then it is a civil duty to place them in their back yard. Let's see this topic addressed in the plan!	3	If we are changing the plan, make it FULLY comprehensive and address all the issues needed. Not just the interest groups of Tribal, wolf advocates, and livestock. Appears to limit the hunter, nd only appease the public interest. Also state where the monies come from to adopt and implement this plan - be transparent. I am guessing directly or indirectly from hunting and fishing licenses. Please educate us all, thank you
Mark Laustrup	Just the parts I am interested in	Yes	Science based	No maximum or minimum number of wolves	8	It sure would be nice to see the J.Q. Public more involved. Now, it seems a vocal minority is getting all the press.
	Most of it	Yes		No numbers!	2	300! Quit playing wolf advocate and manage the animals.
John S	All of it	Yes	-ensure a healthy & sustainable wolf pack -address/reduce wolf conflicts -provide benefits provided by wolves	-any proposal to kill 2/3 of the wolf pack to meet an outdated & arbitrary management cap of 350 animals isn't just controversial, it is a political creation bordering on insanity. The last wolf hunt was a stinker!	9	We have to learn to live with wolves. And as a rural, deer hunting Badger I can live with that. It's been a long time since I heard a wolf howl at night. I'm looking forward to maybe hearing it again sometime in the future.
Steve Kall	All of it	Yes	The elimination of a minimum number of wolves on the landscape. Also a buffer zone around reservations.	Use of dogs and trapping.	4	
	All of it	Yes	Graphs	Too much fluff	3	It is disturbing to see the evidence and contacts I have had with wolf packs in Douglas County. I encountered 5 contacts with wolves during bear hunt and 7 during Whitetail hunting last year. I hear them almost nightly and witness deer kills in my yard. This depredation is harming our deer and bear cub populations. The deer here has suffered this winter due to the snowfall amounts and they are sitting ducks for the wolf packs in my area. I have several pictures on my trail cameras Year round. We need less numbers of wolves.
Nina Coleman	Just the parts I am interested in	No			10	
		Yes				Wolves are destroying the northern Wisconsin deer herd. Between the wolves and you guys not shutting down the deer farms that spread CWD, northern Wisconsin hunting and land values have decreased dramatically.
Shirley LaMarche	Just the parts I am interested in	Yes	Promoting an understanding toward wolf packs.	Harvesting. The public, unless in danger should not be involved.	1	I was born and raise rural with personal contact with one Mountain Lion who was about to attract me, escaped with my life. I was in the wrong place at the wrong time. Yet I would never form adverse attitudes towards these beautiful animals. I met few people in the U.P. who would not shot and kill, any time of the year a wolf or cat. I joined a forest camera group in the U.P. There were beautiful photos of wolf packs and their pups. I mistakingly made a comment about how cute the pups were and the enormous harassment from the group actually scared me. Forestry is quite naive of peoples true attitudes toward animals of prey. I wish more individuals would read of the benefits wolfs have created at Yellowstone. The wolves help balance the eco-system, as I'm sure you know.
	All of it	Yes	The elimination of a numerical target population ● The importance of the ecological benefits of wolves and inclusion of tribal values and knowledge. ● The attempt to minimize the impacts of a recreational hunt by adopting buffer zones around tribal lands, shortening reporting requirements and making hunting licenses zone specific. ● Emphasizes the use of non-lethal methods to reduce conflicts.	Absent is a commitment by DR to work with the legislature to overturn PA 169 and remove payments for hunting hounds, killed by wolves. • Hound training must be stopped. • The plan should establish a zero hunting quota to protect wolves in our national forests and other areas prime habitat. • The recreational hunting/trapping to reduce conflicts has no scientific basis. • At a minimum, DR should ban the use of dogs to hunt wolves in our national forests. • There is considerable uncertainty in estimating wolf populations based on the occupancy model and should not be used solely to determine population. The plan should include an oversight committee which is comprised of biologists and professionals.	7	Overall, the plan is good; however, the Committee was overrepresented by hunting organizations even though they represent the minority opinion of Wisconsinites. Too much emphasis was placed on the killing of wolves rather than co-existence.
Mitch Krug	Most of it	Yes	That there is a need for state management	The calculation of the number of wolves present in state.	5	There are many actors involved in this drama, however a balanced plan needs to be worked out that can rely on science and common sense.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
	All of it	Yes	The elimination of a numerical target population ● The importance of the ecological benefits of wolves and inclusion of tribal values and knowledge. ● The attempt to minimize the impacts of a recreational hunt by adopting buffer zones around tribal lands, shortening reporting requirements and making hunting licenses zone specific. ● Emphasizes the use of non-lethal methods to reduce conflicts.	Absent is a commitment by DNR to work with the legislature to overturn PA 169 and remove payments for hunting hounds, killed by wolves. ● Hound training must be stopped. ● The plan should establish a zero hunting quota to protect wolves in our national forests and other areas prime habitat. ● The recreational hunting/trapping to reduce conflicts has no scientific basis. ● At a minimum, DNR should ban the use of dogs to hunt wolves in our national forests. ● There is considerable uncertainty in estimating wolf populations based on the occupancy model and should not be used solely to determine population. ● The plan should include an oversight committee which is comprised of biologists and professionals.	6	I am a canine behavior specialist. I vehemently disagree with using dogs to hunt wolves. Please become familiar with the cruelty of this sport and use compassion to judge it.
Joan Glasser	All of it	No	Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. ● There is much greater recognition of the ecological role of wolves ● The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves ● The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed)	Absent is a commitment by DNR to work with the legislature to overturn PA 169 and remove payments for hunting hounds, killed by wolves. ● Hound training must be stopped. ● The plan should establish a zero hunting quota to protect wolves in our national forests and other areas prime habitat. ● The recreational hunting/trapping to reduce conflicts has no scientific basis. ● At a minimum, DNR should ban the use of dogs to hunt wolves in our national forests. ● There is considerable uncertainty in estimating wolf populations based on the occupancy model and should not be used solely to determine population. ● The plan should include an oversight committee which is comprised of biologists and professionals.	7	Overall, the plan is good; however, the Committee was overrepresented by hunting organizations even though they represent the minority opinion of Wisconsinites. Too much emphasis was placed on the killing of wolves rather than co-existence.
	All of it	Yes	Nothing	All of it	1	Without a population limit, and mgt practices, plan is a waste of time. Poor job
	All of it	Yes	none	Going beyond the 350 we were told.	0	There is no ceiling for the population. The WDNR has LIED all along to the public. Remember 350 was the goal. LIAERS !!!
Dianne	Most of it	Yes	Very small population maybe, large population absolutely not.		1	Increasing wolf population will put farmers, deer population and rural communities in danger. Bad enough we have so many coyotes. With less and less farmland it put stress on all these animals. For what purpose.
Roger Jolly	Most of it	Yes		Unnecessarily wordy!!	4	Manage wolves the same way you manage every other big game species. Give little if any weight to anti hunting input. Stick firmly to the original population goal of 350.
Scott Buss	Just the parts I am interested in	Yes	None - We don't need any wolves. Bad idea from the start. Get rid of them.	Same as 4	1	Again - we don't need them. Nothing will change until someone is killed by these things. They have no place in Wisconsin.
	Most of it	Yes	That the plan doesn't go with the 350 population and goes with not numbers but how the wolves are interacting naturally with other animals n people but the health of all is included and by and are looking at the whole picture of in regards to all living being together	I hate to see anything being out right killed but see necessary if causing I'll health to any species	7	Hoping that all are regarding the wolves as a part of the environment necessary to live amongst all other life n they have a belong here
Dirk Bengston	Just the parts I am interested in	Yes	Respecting the Native Americans. Specific zones for Wolf hunting.	None	10	Good job.
	All of it	Yes	I like the change to the zone specific harvest as long as the predicted DNR wolf population is similar to the true wolf population. I also like that the management zone boundaries are being revised.	I am worried that reducing registration times would negatively impact successful positive wolf harvest.	4	I am worried that the DNR is unable to get a true wolf population from the current monitoring process thus producing a low estimated population. Better monitoring must be established to get a more accurate wolf population to allow a more precise number of harvest authorizations per zone. Using the current estimated numbers produced from the current monitoring system, the population number is much lower than the true population which would then result in far fewer authorizations to be allowed, which again would lead to a unsuccessful harvest to control population.
Nicolas Cravillion	Most of it	Yes	Increasing systems and tools for measuring an accurate wolf population in Wisconsin.	Lack of true population understanding.	5	The draft plan is a great start, but in my opinion a sustainable wolf management plan should allow for hunting of the Wisconsin grey wolf. The population is a lot higher than what is being presented which is why the past hunt met the quota so fast. Many other animals need their populations looked at more closely as well. We have a large overpopulation issue across the board for many of Wisconsin's wild animals.
Jake A Anderson	All of it	Yes	Charts and insite information.	Its total lack of a detailed management plan!	1	I am very disappointed in this plan and its total lack of considering a reasonable target population goal. This seems like a expansion plan rather than a management plan. I also dislike the lack of understanding the need for management of the dangerous animals in this draft of a plan. It reads and seems to me that the author of this is not interested in the needs of the people who live and deal with these animals.
	All of it	Yes	That the DNR will allow some population control.	The fact that there is no set number for the number of wolf population that the land can support .	2	The wolf program is nothing like is was originally sold to the public. It ashame that the DNR is more interested in politics than the welfare of pray animals of wolves.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Doug Hansmann	All of it	Yes	Historical and ecological context — e.g., carrying capacity, pack dynamics, and breeding season.	Lack of target population size discussion other than the shockingly low action limits for re-listing. Also, while the bear population may not directly impact the carrying capacity for wolves, the unsurprising conflict between, and outsized influence of bear hunters on wolf acceptance begs for incorporation of bear goals and hunting practices in any best-practice wolf management plan.	8	While I strongly believe government-based population management practices for all wildlife species should be primarily driven by ecological considerations, I think the survey results — indicating most state residents prefer to keep roughly the current wolf population — are remarkably supportive of a near-carrying-capacity number of wolves. While it is perhaps difficult to state a population goal for Wisconsin, I sincerely hope that this confluence of actual and healthy numbers dictates the future of wolf management in Wisconsin.
Orren Fredrick	All of it	Yes	You are asking for input, the science is being updated.	You are proposing no wolf population goals in opposition to previous science and conservation goals. The sources that fund the WI DNR are the hunters, land owners and fee payers. You are ignoring their clear out cries in favor of "non contributing voices unaffected by policy.	1	I think specific areas do need specific number goals. The reservations are allowed to manage their own areas , but not areas other people pay taxes on. It is foolish to allow them part of a reduction number when they won't apply it. In my survey of Northern Minnesota wolf tourism, the hotels in St Louis Co. say it is non existent. That goal is imaginary. The locals see a deer population so low it may never recover. Loss for all who benefit from this past source of income, and nothing to harvest for people in a depressed economy. This is the future for Wisconsin if this plan goes ahead. The loss to Wisconsin hunters and property is a real one. Why should we continue to pay taxes when there are no deer to hunt. The anger at government is real and justified.
	All of it	Yes		see below	1	To start....to have a plan you have to work with Real World numbers to start with...with that said, your plan is not worth a penny that the 100+ pages that were submitted. You have no clue or maybe you do? but your numbers aren't even close. Are you afraid? or just don't want to report "real" numbers? The plan submitted present a lot of "fluff"....GET to The POINT of what the citizens of Wisconsin want and a direction they want for Wolf Management. This so called plan does absolutely nothing in solving a problem we have had with "lack" of Wolf management in our state. Doing more surveys and appointing more committees, etc...does nothing! I'm a hunter and steward of the land as a land owner in our great state and consider myself very knowledgeable of the wildlife concerns affecting our state, hunting seasons and herd management, the anti hunting community and how they have tried and successfully halted our hunting heritage at certain points throughout history. With that said too much politics have been injected into the states wildlife management programs....deer herd management, CWD and lack of deer in the north. Bear management is very poor. We have more bear and they are moving into areas never seeing bears before, yet it takes 10 years to get a tag in some units, etc., etc., and the wolf management (lack of) is an absolute joke! IMO. Stop trying to satisfy everybody....not everybody gets a "trophy"....even though that's what people think in our politically correct world. Do what's right for Wisconsin and our wildlife and have a simple plan that everyone understands, gets on board with and proceed to go through with it. Also, the tribal nations will not manage the wolf and say so in your "plan". Stop giving them permits or putting them into the equation, we know what they are (not) going to do. The DNR at one time was pro hunting, doesn't seem to be that way anymore. Too many non qualified folks in our DNR or management committees...again, my opinion. My personal thoughts falling on deaf ears as usual. Another survey!
Brian Bielema	Just the parts I am interested in	No	Basing all management on clear scientific data	Lethal control should not be done except when absolutely necessary in individual cases. Under no circumstances should hunting and trapping be allowed by the public.	1	As in other states controlled by Republicans wildlife management by biologists is overruled by politics and sound principles are set aside to provide hunters and wolf haters the right to kill them regardless of their status. Only with federal protection will wolves recover in states so controlled by politics.
Denise Thornton	All of it	Yes	The Department's 2022 scientific survey of statewide public attitudes towards wolves which shows the majority of residents wish the wolf population to remain the same.	I dislike vagueness about how many wolf harvesting licenses will be approved. Please include the carrying capacity of bears and bear hunters into the equation for our state's environmental health. I suspect the majority of those in the 2022 survey who wish wolf population to remain where it is would not mind the tiny increase in their taxes that eliminating the funds from bear hunter fees would require. This is about the future of our state's natural resources -- not currently popular recreational bear hunting.	8	Bear hunters (a very small percentage of our state population) interests seem to be over represented and are clearly indifferent to wolf population health and general ecological balance. Please let ecological experts and public will direct your choices here.
Brian Johnson	All of it	Yes	Zone specific permits not much else.Stick with what you told us to begin with, 350 Damon wolves.	Changing boundaries around reservations.	1	350 is enough. It's to bad you can't round em up and fence them in on the reservations, I think our native American neighbors would change their BS.
Gary Pelkola	Most of it	Yes		No base quota for wolves in northern Wisconsin	3	Wolves and other predators have decimated the deer population in Northern Iron County and must be controlled
robert devine	All of it	Yes	none	there should be a set number for population and he harvest set to keep it there.	1	our settler forefathers realized out of necessity there was no tolerance for large predators in populized areas. They hunted them and that kept the predators away from the humans. When you don't do that you get cougar and bear predation on humans like you see out west and alaska. The proponents of increasing wolf populations don't generally live in areas where the wolves exist, and don't invest in their conservation financially like hunters and fishermen do; through license purchase and PR funds.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
David Lefebvre	Most of it	Yes	The fact that the population of wolves will be managed.	A specific management number is not in the plan. 350 wolves in Wis along with the management of that number will ensure wolves remain in Wisconsin. I also disagree with a buffer zone between tribe lands and private land. The report is essentially taking control of private land away from the owners.	7	I have no problem with wolves but I do have a problem with them not being managed. There is a reason they were killed off many years ago. If you fail to manage them, I'm afraid citizens will manage them for you. That would be a waste of a valuable resource.
	Most of it	No	I appreciate the efforts of all WDNR staff involved in updating the state's wolf management plan. Although I believe the current plan needs significant updating (see next section), i recognize the efforts and improvements made to the previous plan, including: ● Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. ● There is much greater recognition of the ecological role of wolves ● The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves ● The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed	● The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on (see reference list below): ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution ● The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. ● The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ○ A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings. ○ Hounding or hound training, which are akin to allowing legalized dogfighting, should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public. ● The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. ○ Despite Act 169, which mandates a wolf hunting season, the department can still restrict the implementation of lethal methods by setting minimal quotas, including a quota of '0' wolves, restricting timing and methods. ○ Several studies have proven a proactive non-lethal approach leads to better conflict mitigation. ○ Lethal management often fails to provide a long-term solution to wolf predation and has the least consistent success rates when compared to non-lethal practices. In addition, there is significant evidence showing that lethal wolf management may be less functionally effective at mitigating subsequent livestock losses than non-lethal deterrents. ● The plan should require the implementation of abatement measures as well as the use of non-lethal conflict minimization techniques by domestic animal owners for the latter to receive compensation for confirmed predation. ● The plan also runs contrary to public values towards wolves (and omits mention of such majority values from the plan), despite department surveys evidencing that the broad public cares about wolves as individuals (and not just for the viability of the population). Given the recent liberalization of killing wolves by the state, it would be incredibly informative to note majority support of the following reasons for opposing a regulated wolf hunting/trapping season (which are all omitted from the plan): opposition to specific methods of harvest like hounds (64%) or traps (70%), feelings that hunting wolves is unnecessary (62%) or culturally offensive to Native American tribes (57%). ○ All such reasons convey majority disagreement with practices currently promoted and endorsed by the legislature and the WDNR, and such a conflict between managers and the public should not only be acknowledged, but foregrounded and carefully considered in policy (instead of dismissed). ○ Such decisions to omit literature or downplay evidence (e.g., such as majority opposition to killing wolves and their reasons) are contrary to principles of scientific integrity (e.g., present all relevant scientific evidence to the public) as well as ethics (e.g., disguising ethical decisions, such as recreational wolf killing, as robustly supported by science). ● Conflicting agency objectives (e.g., optimizing public hunting and conflict mitigation) are not only not acknowledged, but even misunderstood as harmonious, against the body of scientific evidence. That culminates in the prioritization of consumptive values and policies; e.g., according to the body of scientific literature, use of lethal methods, and especially public hunts, are contrary to most objectives relevant to: harm mitigation, the wellbeing of wolves, their ecological roles, and their non-exploitative enjoyment (i.e., Objectives A, B, D and F). ● There is a stark lack of consideration for individual wolves, wolf population health (including wellbeing), and measurable indicators for assessing any harms barring disease prevalence (e.g., accounting for cortisol levels or other stress hormones, measures of pair/pack persistence) ● There is an inappropriate understanding and consideration of tribal worldviews about wolves. Tribal worldviews of wolves are misconstrued as 'cultural benefits' tribes receive from the existence of a wolf population, when in fact tribal worldviews consider each individual wolf as a person and relative. Cultural respect and sensitivity towards such views, shared by many non-tribal	4	current draft wolf plan) Adams, L. G., Stephenson, R. O., Dale, B. W., Ahgook, R. T., & Demma, D. J. (2008). 				members, demand the strict mitigation of lethal measures, especially recreational killing, as opposed to their current promotion in the plan. ● In general, all omissions of scientific literature, the arbitrary prioritization of policy objectives, the rhetoric of the plan and the dismissal of public values and concerns for wolves point towards a biased, unscientific and instrumental view of wolves that promotes values contrary to broad public perspectives on wolves. ● 'SOM' wolf estimation methodology – From a recent critique: "The new methods sacrifice precision, but are believed to retain adequate accuracy and sensitivity to changing conditions for reliable decision-making. We review evidence for the accuracy, precision, and sensitivity of the new 'scaled occupancy model' (SOM) applied in Wisconsin. We conclude that the Wisconsin method would systematically overestimate wolf abundance by large (but currently incalculable) margins. Because Wisconsin, similar to other states, not only changed to unverified methods but also implemented widespread wolf killing, shortcomings in their estimates of wolf abundance may have far-reaching consequences for population viability and confidence in state wildlife managers. We discuss findings from Wisconsin alongside similar findings for other states' occupancy models being insensitive to human causes of mortality that have recently increased. Overall, Wisconsin's proposed method for estimating wolf abundance shows significant departures from best practices in scientific measurement. Verification will require independent replication and unbiased tests at multiple scales in multiple habitats under different human-induced mortality rates, and peer review before the new methods are considered reliable." LARRY BEIRL	I have not read any of the draft plan	Yes	NONE OF IT	POPULATION GOAL OF 350	1	I SAT IN ON THE MEETINGS WHEN THE DNR TOLD US THAT ALL WOLFS OVER THE POPULATION GOAL OF 350 WE THE SPORTSMEN AND TRAPPERS WOULD BE ABLE TO TRAP AND SHOOT THEM TO MAINTAIN THE POPULATION OF 350 WOLFS IN THE STATE OF WISC .
Joyce M Arndt	Just the parts I am interested in	Yes	it seems like a good plan,just hope its taken seriously	whenever people start 'controlling'nature..bad things happen	5	
Nathanael Secor	Just the parts I am interested in	Yes	I appreciate that Zone 1, 2, and 5 have low density numbers proposed for hunting quota. I appreciate that you are listening to stakeholders from many different perspectives.	I respectfully do not believe that wolves should be considered a game species. The growth of chronic wasting disease as an issue in our state's deer herd is of huge concern for me. We do not know if this has the possibility of jumping to other organisms in the wild, but we do know that it has made the leap to mice in lab conditions. This should give us great pause as it regards wolves considering the historic and current role of wolves in culling sick deer we should be promoting not targeting wild carnivores who preferentially kill sick deer. Additionally, I believe that the use of dogs to hunt wolves is irresponsible and cruel. It is irresponsible because of the known issue with bear dogs and pet dogs being targeted by wolves. Hunting with dogs presumes that surviving wolves are so stupid as to not understand the trend in dogs contributing to their brethren's exhaustion and death. Dogs will only be targeted further as this is the rule with carnivore conflict. It is cruel because the wolves do not have a chance to get away from multiple hounds trained on their scent.	3	

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Steven Johnson	Most of it	Yes	I like the fact that after procrastinating for several years, the DNR is finally attempting to address the need for an updated plan. Wolves in Wisconsin need to be managed to ensure they continue their exist in Wisconsin but not at the expense of other species, and agriculture and recreational activities.	1. The plan needs to include a specific population goal. 2. Expanding protected areas around native lands is a take away from non native rights. 3. The plan does not adequately address the impact of wolf populations on key recreational and economic species such as deer.	3	The summary for the plan lists an objective of providing benefits for hunting, trapping and sightseeing. As a resident in the center of wolf country in NW Wisconsin, how can I take this plan seriously if a listed objective is sightseeing? Does someone really believe there will be significant sightseeing activity and revenue in the territory of wolves by people coming to see wolves? I live here and consider myself very fortunate to see a wolf once a year and I spend 100s of hours a year in the woods. The plan does not adequately address the concerns and preferences of those who live in wolf territory. I have the strong impression it has too much influence from those who think they can go sightsee wolves. While I am glad to have wolves be a part of the Wisconsin wildlife species, I also believe their existence in Wisconsin has little benefit to the success of the recreational industry that is key to much of the state. As a past volunteer tracker in the wolf census program, I know the population numbers are VERY conservative and are likely impacting other key wildlife species that are clearly more important to the recreational industry. A plan to allow current populations to continue or even expand panders to those who give wolves mythical standing in the scheme of wildlife management. Wisconsin needs and deserves a management plan with clear objectives and goals to insure a viable wolf population exists at a level that is addresses ALL social/economic/recreational factors.
Vaughn spaulding	All of it	Yes	Scientific Research	Numbers are to high!!!!! Too little to late! Deer populations have suffered severely. Let's try harder to eliminate the high numbers.	3	The Northern half of the State needs serious updating….follow through on what was initially setup……A cap of 350 Wolves for the State!!!!!!
Wayne Nelsen	Most of it	Yes	The fact that we need to reduce the wolf population in Wisconsin	I didn't find anything in there about a hunting season for the general public!!!!!

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Steven Amundson	Just the parts I am interested in	Yes	I'm very pleased to see that you have a taken a scientific and wholistic approach to wolf management and didn't put a specific number on the wolf population for the state. I believe it is important to continuously assess and discuss the subject.	There isn't a specific element in the plan that I dislike.	10	
Jeff Hermann	Most of it	Yes	Putting a more modern plan in writing.	No real talk on how to control the overabundance of wolves in the Northern part of the state.	3	Getting more accurate counts of wolves. We all know that they are dramatically undercounted. Whether that is by accident or on purpose is up for debate. The last wolf hunt tells you all you need to know about the actual population of wolves. In less than two days the hunters and trappers harvested a giant percentage of what the official population count is in the state. That tells you that the population is undercounted. People that spend time in the woods can tell you there is a lot more than what it is stated.
	Just the parts I am interested in	Yes	That we continue to work towards a sustainable wolf population.	That, nowhere, did I see a specific population goal. A "sustainable" population should be quantitatively defined. Minimum and maximum.	1	As written- the wolf plan will allow the wolf population to go unchecked. Not good for the deer herd of the north, livestock and pets. Unacceptable.
	All of it	Yes	None	Population goals	0	I sold my cabin and land. Wife won't let me take our hunting dogs up north anymore. She won't go up there anymore either. Don't need wolfs.
Chad Trudell	Most of it	Yes	integration of adaptive management		7	
Richard Polodna	Most of it	Yes		No numerical population goal	1	Need more input from citizens that actually encounter wolves in their daily lives
Patrick Quaintance	All of it	Yes	That it has taken 13 years to finally get the plan worked on is a good thing.	I really do not like anything about the plan. Who ever came up with this plan has no experience on wolf management or the people that have to live with theses wolfs. They need to be managed at 350 or less or the people that live with him will.	1	You take the rights of private property owners to be able to hunt or trap a wolf in these sub zone. I wonder how the tribes would like it if I would be able to hunt and trap wolfs on tribal lands. So is the state going to do the same with bear since some of the tribal members are bear clan members. This is just not right. And the wolfs have been doing just find without these sub zone since the state has had four wolf hunts already.
John Kohler	Just the parts I am interested in	Yes	That it addresses that wolves should be managed and not left unchecked.		7	Understanding that given this predator is in protective status by the federal government limits in scope what the plan can do. As a sportsman I don't hate or want to see them eradicated however I don't think they should be given a complete pass while other predators are allowed to be hunted. Any plan that doesn't provide for complete balance is going to fail. And my next comment is more political in nature, but when politicians get involved in the decision making process the best interests of the animals are lost. That's one reason the DNR gets a bad reputation. Do I have the answer, no, I'm just some old guy voicing my opinion.
Weston Schmidt	Most of it	No			9	When planning wolf season, Trapping and dog hunting should be separate. Or a longer season starting before dog hunting as normal animal behavior travel or patterned routes can be disrupted during dog seasons.
	Most of it	Yes		There is no management goal for population. There should be a number of wolves stated in the plan to determine how the population should be managed and controlled. It should be kept at the 350 wolves as stated in the previous plan.	3	
Me	All of it	Yes	none. It is not true management when you favor one side over the other. No Sensible plan in the draft.	all of the draft!!	1	Wolves do not fulfill any ecological role in the environment! And the past history of Wisconsin supports my statement. Don't believe it?, ITS STILL TRUE!
Greg Sacia	Most of it	Yes		I don't think it shows enough info on how the dept will deal with farmers from wolf kills to livestock etc.	5	I believe there should be a minimum of 350 wolf tags available to hunters with dept control if the wolf population gets above dept target more tags would be issued.
Chris Svachula	All of it	No	I like that you are taking public comments however I'm not sure how much input is actually used.	There should be more tags and longer season. I believe as well as everyone I know that there are way more wolves than estimated.	2	There needs to be more wolves harvested. My family doesn't even hunt northern WI anymore. The deer popular is decimated. As an out of state land owner we are considering selling our northern property as it has no hunting value for deer and bear tags take close to 10 years of points. It's ridiculous that I can see we used to see dozens of deer on a hunter but see 2 or 3 over a long weekend. I would like to see archery only tags that are open longer and have their own quota. I am a bow hunter and don't gun hunt. I would relish the opportunity to take a wolf with my bow should one pass while I am on stand.
Jean Psyhos	Most of it	Yes	At least considering it's well-being	Harvesting	5	Let the wolves be and reimburse farmers for their livestock
	Most of it	Yes	The basis of the entire plan to me is to reduce the Wolf numbers just enough to appear to be doing something about it. There are too many wolves. I can't buy into the plan in any capacity because it's not aimed at significantly reducing the number of wolves.	Wolves are great in areas with limited human populations. I have traveled to far northern Wisconsin for over 35 yrs to hunt whitetail deer. For many years now it has been a joke. Days without seeing a deer. Most of our crew had abandoned coming up anymore. And got those of us who do still go have a hard time finding places to eat since so many have closed. I feel bad for what this has done for small businesses up there.	2	I said it in the previous section. Wolves have ruined the "up north" hunting experience for our family and friends.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
	All of it	Yes	I like the part that your trying to make a plan	The plan is based off of thoughts not actual listening to hunters	1	If you want to keep hopes up for the wolf hunt you did your job. You've made another plan to get shot done by a non hunting group or wildlife lovers that have no idea how big of a impact the wolf herd has on our deer herd. If you want the hunt do it. Stop letting other groups tell you how to manage your herd.
David Roth	Just the parts I am interested in	Yes	There is no population goal. How can you manage a population without a number to achieve that goal?	It's political and not science based. You know it and I do too.	1	There is no population goal in the plan. This plan is a farce. There should be a wolf population at around 350 wolves in Wisconsin like the original science based plan. The WI DNR has become political and catering to the special interest groups and the money and not the interest of managing the wildlife. It's disappointing to say the least.
	All of it	Yes	Overall it is a well thought out plan, but without a numeric population goal I don't feel it addresses "management" of wolf populations.	Without a numeric population goal I don't know how this can be considered a management plan. The plan ignores public input from those living in the northwoods as to why residents here feel numbers should be restricted to 350 wolves. Wolves are commonplace here, and restrictions must be put in place to reduce human/wolf conflicts and ensure wolf survival. Without a numeric goal this cannot happen nor is it management. It is simply monitoring.	1	
deanna horton	Most of it	No	We appreciate the efforts of all WDNR staff involved in updating the state's wolf management plan. Although we believe the current plan needs significant updating (see next section), we recognize the efforts and improvements made to the previous plan, including: ● Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. ● There is much greater recognition of the ecological role of wolves ● The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves ● The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed)	The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on (see reference list below): ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution ● The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. ● The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ○ A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings. ○ Hounding or hound training, which are akin to allowing legalized dogfighting, should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public. ● The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. ○ Despite Act 169, which mandates a wolf hunting season, the department can still restrict the implementation of lethal methods by setting minimal quotas, including a quota of '0' wolves, restricting timing and methods. ○ Several studies have proven a proactive non-lethal approach leads to better conflict mitigation. ○ Lethal management often fails to provide a long-term solution to wolf predation and has the least consistent success rates when compared to non-lethal practices. In addition, there is significant evidence showing that lethal wolf management may be less functionally effective at mitigating subsequent livestock losses than non-lethal deterrents. ● The plan should require the implementation of abatement measures as well as the use of non-lethal conflict minimization techniques by domestic animal owners for the latter to receive compensation for confirmed predation. ● The plan also runs contrary to public values towards wolves (and omits mention of such majority values from the plan), despite department surveys evidencing that the broad public cares about wolves as individuals (and not just for the viability of the population). Given the recent liberalization of killing wolves by the state, it would be incredibly informative to note majority support of the following reasons for opposing a regulated wolf hunting/trapping season (which are all omitted from the plan): opposition to specific methods of harvest like hounds (64%) or traps (70%), feelings that hunting wolves is unnecessary (62%) or culturally offensive to Native American tribes (57%). ○ All such reasons convey majority disagreement with practices currently promoted and endorsed by the legislature and the WDNR, and such a conflict between managers and the public should not only be acknowledged, but foregrounded and carefully considered in policy (instead of dismissed). ○ Such decisions to omit literature or downplay evidence (e.g., such as majority opposition to killing wolves and their reasons) are contrary to principles of scientific integrity (e.g., present all relevant scientific evidence to the public) as well as ethics (e.g., disguising ethical decisions, such as recreational wolf killing, as robustly supported by science). ● Conflicting agency objectives (e.g., optimizing public hunting and conflict mitigation) are not only not acknowledged, but even misunderstood as harmonious, against the body of scientific evidence. That culminates in the	2	we need more protection for our wolves.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
				prioritization of consumptive values and policies; e.g., according to the body of scientific literature, use of lethal methods, and 2 especially public hunts, are contrary to most objectives relevant to: harm mitigation, the wellbeing of wolves, their ecological roles, and their non-exploitative enjoyment (i.e., Objectives A, B, D and F). ● There is a stark lack of consideration for individual wolves, wolf population health (including wellbeing), and measurable indicators for assessing any harms barring disease prevalence (e.g., accounting for cortisol levels or other stress hormones, measures of pair/pack persistence) ● There is an inappropriate understanding and consideration of tribal worldviews about wolves. Tribal worldviews of wolves are misconstrued as 'cultural benefits' tribes receive from the existence of a wolf population, when in fact tribal worldviews consider each individual wolf as a person and relative. Cultural respect and sensitivity towards such views, shared by many non-tribal members, demand the strict mitigation of lethal measures, especially recreational killing, as opposed to their current promotion in the plan. ● In general, all omissions of scientific literature, the arbitrary prioritization of policy objectives, the rhetoric of the plan and the dismissal of public values and concerns for wolves point towards a biased, unscientific and instrumental view of wolves that promotes values contrary to broad public perspectives on wolves. ● 'SOM' wolf estimation methodology – From a recent critique: "The new methods sacrifice precision, but are believed to retain adequate accuracy and sensitivity to changing conditions for reliable decision-making. We review evidence for the accuracy, precision, and sensitivity of the new 'scaled occupancy model' (SOM) applied in Wisconsin. We conclude that the Wisconsin method would systematically overestimate wolf abundance by large (but currently incalculable) margins. Because Wisconsin, similar to other states, not only changed to unverified methods but also implemented widespread wolf killing, shortcomings in their estimates of wolf abundance may have far-reaching consequences for population viability and confidence in state wildlife managers. We discuss findings from Wisconsin alongside similar findings for other states' occupancy models being insensitive to human causes of mortality that have recently increased. Overall, Wisconsin's proposed method for estimating wolf abundance shows significant departures from best practices in scientific measurement. Verification will require independent replication and unbiased tests at multiple scales in multiple habitats under different human-induced mortality rates, and peer review before the new methods are considered reliable." (Treves & Santiago-Ávila, 2023)		
kris konopacky	Most of it	Yes	not much I feel wolfs should be treated as the predator they are I feel there numbers should be held in check at no more than the 350 number originally agreed to, I don't feel wolfs should be in the southern two thirds of the state at all	not holding to a number goal like you do with all other game animals that I feel have much more value deer bear turkeys	2	please manage them in a way that the wolf lovers don't constantly look for a judge to overturn delisting, Probably NOT possible
Jon Kuerschner	All of it	Yes	Zone-specific quotas and collaboration with multiple agencies to develop a plan that everyone can support.	Concerned about the management oversight needed to maintain and police the plan. Have considerations been made to improve the registration, monitoring and policing processes and technologies to support this plan?	8	Please work hard to put this plan in motion. We have to manage the wolves like all animals in our Wisconsin ecosystem. Thanks
scott dahlk	All of it	Yes	The ability to control the population in specific zones although I doubt the DNR has any intention of doing so.	No population goal is insane, we were sold this wolf recovery with the understanding that if the population hit 350 it would be managed to keep it there. We were flat out lied too	1	I hunt and hike the national forest in Bayfield county, there are wolf tracks everywhere. The population numbers being told to us are lies, it's at least double thier yearly counts. We ran a minimum of 14 wolves out of 1 section near Brinks Camp 2 years ago. Tell me again about the pack sizes, this plan is ridiculous, appears to have been written to go against science. Disgusted
Curtis	I have not read any of the draft plan	Yes	It didn't show up. BLANK PAGE !!	Let the Wolves be..... they are part of the life cycle. Sure I like to hunt them... I applied for a tag 2yrs ago. didn't know I could hunt them.... that day... only to find out 2 days later , wolf hunter fill the Quota... and went over.... some people don't get a chance. There should be a LOTTERY.... hello... you all screwed that up...Good Going !! Goofball bear hunters with Dogs are a problem. they over run my bait station and didn't give F..k about me being there baiting.. so I left the area...	0	LOTTERY..... Apply to get a TAG !! No over the Counter crap... you got $10.00 from me... and didn't get a notice about when to hunt...
	Most of it	Yes	not much, as is too one sided	a lot, as is one sided	2	I agree with a lot of other people on this plan that a sustainable number of the population of wolves needs to be added
Jeff Erickson	All of it	Yes	None	As an avid hunter in Wisconsin I see no use for the wolf I have hunted black river falls for the last 20 years the last two years I didn't even go for the lack of the year. It is ruined our deer camp in our annual hunt.	1	Then you try and re-introduce out and you see how they are decimating the elk

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Douglas Jensen	Just the parts I am interested in	No	Its thoroughness.	The executive summary needs to tell the bottom line (headline descriptions) for actions supporting each of the management goals. As a non-DNR ecologist and policy decision maker, I need to be able to see clear actions quickly to know which areas to focus on since I do not have time to read the full plan.	5	Put more meat and less fluff in the executive summary.
	Most of it	Yes	Being able to kill them	Limits	0	Kill them all hunting has never been the same after they were here
Greg	Just the parts I am interested in	Yes				When I was a kid hunting in Northern WI was fun. Saw a lot of deer. Deer numbers are to low and trophy quality is poor. We lease land out of state for hunting now
Dan Ruck	Most of it	Yes	The only thing i like is that you are formulating a plan.	1.No limits on population is absolutely a disgrace to the department. 2. Buffer zones are an absolute discrimination against neighboring landowners. I understand tribal lands but boundaries are boundaries. Unbelievable.	1	I am not anti-wolf. They need to be managed to a measurable level as originally established. I am a US citizen and i have landowner rights as well. Please stop the discrimination.
Jason Hilger	Most of it	Yes	Its a plan . . .	The plan needs to further reduce the population and there needs to be more investment into determining the correct number of wolves because estimates are way low. Wolves should be captured and distributed from the North to the South - the plan would change quickly when a dog in Madison is eaten.	0	
Marge	Most of it	Yes	Well documented science based management says it all.	I always get ticked when special interest groups especially those from out of state use money as their motivation to kill wolves.	7	
Cody Akey	Most of it	Yes	Potential to have a wolf harvest season again	I feel there is too much pressure from tribal and radical groups that represent the minority of the population.	7	PLEASE move forward with a productive Wolf harvest season!
	Most of it	Yes	Na	No numeric goal, no guarantee harvest season if above numeric goal of 350.	1	72 counties in state of wi. Allow 5 wolves per county. Would be a state goal of 350. Move wolves to Dane, Buffalo, LA Crosse, Milwaukee counties. The whole state should enjoy the creatures .
	All of it	Yes				Get rid of them and bring our deer herd back upnorth
Jon Buchler	Just the parts I am interested in	Yes			9	If this plan supports a vibrant, healthy wolf population, then I fully support it. You know more than I do, so I will trust your judgment. But the primary goal needs to be the health and welfare of the wolves. Bait trapping needs to be outlawed. Any trapping needs to be illegal. Thanks for the chance to provide my thoughts.
Ronald Henry	All of it	Yes	Totally rewritten and shows updated data. Seems like this is where we need to be: a good balance.		10	
Jarret Yoshida	Just the parts I am interested in	Yes		Why are we culling wolves? This is insane. The deer population is out of control.	1	
	Most of it	No	More recognition of the ecological role of wolves. Not having a quota of 350 wolves.	Stop solving everything by killing. Wolves are an essential part of the ecosystem and have the right to live. The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. ○ Despite Act 169, which mandates a wolf hunting season, the department can still restrict the implementation of lethal methods by setting minimal quotas, including a quota of '0' wolves, restricting timing and methods. ○ Several studies have proven a proactive non-lethal approach leads to better conflict mitigation. ○ Lethal management often fails to provide a long-term solution to wolf predation and has the least consistent success rates when compared to non-lethal practices. In addition, there is significant evidence showing that lethal wolf management may be less functionally effective at mitigating subsequent livestock losses than non-lethal deterrents.	4	
James Angresano	Most of it	Yes	Virtually everything - except the issue of compensating those who suffer depredation and stress related damages.	Only the absence of a proposal to increase compensation for depredation. Given the huge budget surplus we enjoy in Wisconsin some funds from this surplus could be allocated to compensate losses rather than relying only on revenue from hunting tags and the like. In addition, it could be pointed out what percentage of deer fatalities are due to wolves versus vehicles, disease and other predators.	9	The comprehensiveness and readability of the plan is superb.

Sandra Materi	Most of it		We appreciate the efforts of all WDNR staff involved in updating the state's wolf management plan. Although we believe the current plan needs significant updating (see next section), we recognize the efforts and improvements made to the previous plan, including: ● Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. ● There is much greater recognition of the ecological role of wolves ● The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves ● The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed)	The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on (see reference list below): ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution ● The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. ● The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ○ A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings. ○ Hounding or hound training, which are akin to allowing legalized dogfighting, should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public. ● The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. ○ Despite Act 169, which mandates a wolf hunting season, the department can still restrict the implementation of lethal methods by setting minimal quotas, including a quota of '0' wolves, restricting timing and methods. ○ Several studies have proven a proactive non-lethal approach leads to better conflict mitigation. ○ Lethal management often fails to provide a long-term solution to wolf predation and has the least consistent success rates when compared to non-lethal practices. In addition, there is significant evidence showing that lethal wolf management may be less functionally effective at mitigating subsequent livestock losses than non-lethal deterrents. ● The plan should require the implementation of abatement measures as well as the use of non-lethal conflict minimization techniques by domestic animal owners for the latter to receive compensation for confirmed predation. ● The plan also runs contrary to public values towards wolves (and omits mention of such majority values from the plan), despite department surveys evidencing that the broad public cares about wolves as individuals (and not just for the viability of the population). Given the recent liberalization of killing wolves by the state, it would be incredibly informative to note majority support of the following reasons for opposing a regulated wolf hunting/trapping season (which are all omitted from the plan): opposition to specific methods of harvest like hounds (64%) or traps (70%), feelings that hunting wolves is unnecessary (62%) or culturally offensive to Native American tribes (57%). ○ All such reasons convey majority disagreement with practices currently promoted and endorsed by the legislature and the WDNR, and such a conflict between managers and the public should not only be acknowledged, but foregrounded and carefully considered in policy (instead of dismissed). ○ Such decisions to omit literature or downplay evidence (e.g., such as majority opposition to killing wolves and their reasons) are contrary to principles of scientific integrity (e.g., present all relevant scientific evidence to the public) as well as ethics (e.g., disguising ethical decisions, such as recreational wolf killing, as robustly supported by science). ● Conflicting agency objectives (e.g., optimizing public hunting and conflict mitigation) are not only not acknowledged, but even misunderstood as harmonious, against the body of scientific evidence. That culminates in the prioritization of consumptive values and policies; e.g., according to the body of scientific literature, use of lethal methods, and 2 especially public hunts, are contrary to most objectives relevant to: harm mitigation, the wellbeing of wolves, their ecological roles, and their non-exploitative enjoyment (i.e., Objectives A, B, D and F). ● There is a stark lack of consideration for individual wolves, wolf population health (including wellbeing), and measurable indicators for assessing any harms barring disease prevalence (e.g., accounting for cortisol levels or other stress hormones, measures of pair/pack persistence) ● There is an inappropriate understanding and consideration of tribal worldviews about wolves. Tribal worldviews of wolves are misconstrued as 'cultural benefits' tribes receive from the existence of a wolf population, when in fact tribal worldviews consider each individual wolf as a person and relative. Cultural respect and sensitivity towards such views, shared by many non-tribal members, demand the strict mitigation of lethal measures, especially recreational killing, as opposed to their current promotion in the plan. ● In general, all omissions of scientific literature, the arbitrary prioritization of policy objectives, the rhetoric of the plan and the dismissal of public	1

				values and concerns for wolves point towards a biased, unscientific and instrumental view of wolves that promotes values contrary to broad public perspectives on wolves. ● 'SOM' wolf estimation methodology – From a recent critique: "The new methods sacrifice precision, but are believed to retain adequate accuracy and sensitivity to changing conditions for reliable decision-making. We review evidence for the accuracy, precision, and sensitivity of the new 'scaled occupancy model' (SOM) applied in Wisconsin. We conclude that the Wisconsin method would systematically overestimate wolf abundance by large (but currently incalculable) margins. Because Wisconsin, similar to other states, not only changed to unverified methods but also implemented widespread wolf killing, shortcomings in their estimates of wolf abundance may have far-reaching consequences for population viability and confidence in state wildlife managers. We discuss findings from Wisconsin alongside similar findings for other states' occupancy models being insensitive to human causes of mortality that have recently increased. Overall, Wisconsin's proposed method for estimating wolf abundance shows significant departures from best practices in scientific measurement. Verification will require independent replication and unbiased tests at multiple scales in multiple habitats under different human-induced mortality rates, and peer review before the new methods are considered reliable." (Treves & Santiago-Ávila, 2023)		
Roger Richter	Most of it	Yes	None	Everything	1	Leaves Wolfes alone!
Bill Ruder	Most of it	Yes	After all these years, at least the DNR submitted a plan.	Refusing to adhere to a set population goal number. It was used in the reintroduction program.WCC recommendation ignored.	1	
Charles Johnson	Just the parts I am interested in	No	Having no DNR quota.	This still contains a possible hunt.	2	Eliminate dogs used in any wolf hunt and better yet end all wolf hunting!
Todd Rongstad	All of it	Yes	You seem to address all of the conflict groups in a defensive crouch.	First, a hunt is a shortsighted effort to placate the fear and ignorance crowd over wolves in northern Wisconsin. Our wildlife populations are not just meant to serve or feed this human-centric idea if the forest. We are in their space and not vice versa. Let them fully return and fulfill their role, whether angry, misinformed northern white guy likes it or not. Second, it's long past time for more aggressive public education campaigns to help people understand the need for wolf reintroduction and return to our landscape. Not in a pleading way, but in a forceful, authoritative way. I know it's tough to deal with the ignorance, but only a forceful response has any chance of success.	4	I live full-time in the Chequamegon National Forest and have a wolf or wolves consistently nearby. They belong here, and we all need to adjust to that reality. We must reverse the human tradition of fear and hatred of the wolf. Please stand against the ignorance and fear, and reverse this tragedy. Thx for your efforts.
Paula Napychank	Most of it	No	Comprehensive with Clarity	N/A	9	None
Jane Alexander	Most of it	No	It seeks to be fair in regulation s.	There should not be lethal use in wolf management. Especially of Alpha females. The taking of wolves should be "o". Wolves as umbrella species are valuable in the ecosystems they inhabit.	2	It needs more work in the science.
Dean	Just the parts I am interested in	No				Please protect the Wolves, Please NO KILL
Maurice Plummer	Most of it	Yes	The control numbers, the surveillance and the possible hunt controls.		8	If it comes down to a public wolf hunt the kill permit fees should be high and the registration should be immediate.
DeWu	Just the parts I am interested in	No			7

LJ Orszlak	Just the parts I am interested in	No	I like the fact that there is a plan to help wolves.	I do not like all the "red tape" as far as implementing the plan.	3	
Jay Yoon	All of it	No			10	I always want support wolves as possible
Timothy Daley	Most of it	Yes	Science-based approach. The wolf population must be fluid letting nature determine the actual population that can be sustained subject to the interactions and conflicts with humans and livestock.	Lack of regulation on the training and use of dogs. I would like to see a complete review as to the use of dogs for bear and wolf hunting with the goal being a more humane protection of the dogs.	8	Set a review date in five years to assess the impact and results of the plan.
	Most of it	No	Removing an arbitrary wolf population goal is important to make sure the best-available science is centered in wolf management. The low quota zones are an important and welcome addition to the plan. The plan is rightly focused on the ecological benefits of wolves.		7	
	Most of it	No	Saving wolves	Wolves are a not harmful	10	Wolves need to be protected they are very important to the eco system
Cindy Kreiman	Most of it	No	I don't know I do know that all life matters not just ours	We are always looking at things from our own perspective and looking at the whole picture of the rights that belong to the wolves Have you asked the wolves how they feel?	3	There are too many that are killed illegally Killed and maimed in horrific ways Can you not see that they are living beings that have to survive in an unnatural man made world Can you not see that life is hard enough without us causing more problems because we want and need to be in control dominate and have power In essence all I see are cowards who cannot share the home that is meant for all not just us.,…
Cathy Stoba	All of it	No			10	
Arlene Steinberg	All of it	No	Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. There is much greater recognition of the ecological role of wolves. The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves. The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed).	The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on (see reference list below): ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution ● The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. ● The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ○ A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings. ○ Hounding or hound training, which are akin to allowing legalized dogfighting,should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public. ● The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. ○ Despite Act 169, which mandates a wolf hunting season, the department can still restrict the implementation of lethal methods by setting minimal quotas, including a quota of '0' wolves, restricting timing and methods. ○ Several studies have proven a proactive non-lethal approach leads to better conflict mitigation. ○ Lethal management often fails to provide a long-term solution to wolf predation and has the least consistent success rates when compared to non-lethal practices. In addition, there is significant evidence showing that lethal wolf management may be less functionally effective at mitigating subsequent livestock losses than non-lethal deterrents. ● The plan should require the implementation of abatement measures as well as the use of non-lethal conflict minimization techniques by domestic animal owners for the latter to receive compensation for confirmed predation. ● The plan also runs contrary to public values towards wolves (and omits mention of such majority values from the plan), despite department surveys evidencing that the broad public cares about wolves as individuals (and not just for the viability of the population). Given the recent liberalization of killing wolves by the state, it would be incredibly informative to note majority support of the following reasons for opposing a regulated wolf hunting/trapping season (which are all omitted from the plan): opposition to specific methods of harvest like hounds (64%) or traps (70%), feelings that hunting wolves is unnecessary (62%) or culturally offensive to Native American tribes (57%). ○ All such reasons convey majority disagreement with practices currently promoted and endorsed by the legislature and the WDNR, and such a conflict between managers and the public should not only be acknowledged, but foregrounded and carefully considered in	3	This plan shows some improvement over past iterations but overall relies on bad science and questionable ethics. There still needs to be substantial improvement.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
				policy (instead of dismissed). ○ Such decisions to omit literature or downplay evidence (e.g., such as majority opposition to killing wolves and their reasons) are contrary to principles of scientific integrity (e.g., present all relevant scientific evidence to the public) as well as ethics (e.g., disguising ethical decisions, such as recreational wolf killing, as robustly supported by science). ● Conflicting agency objectives (e.g., optimizing public hunting and conflict mitigation) are not only not acknowledged, but even misunderstood as harmonious, against the body of scientific evidence. That culminates in the prioritization of consumptive values and policies; e.g., according to the body of scientific literature, use of lethal methods, and 2 especially public hunts, are contrary to most objectives relevant to: harm mitigation, the wellbeing of wolves, their ecological roles, and their non-exploitative enjoyment (i.e., Objectives A, B, D and F). ● There is a stark lack of consideration for individual wolves, wolf population health (including wellbeing), and measurable indicators for assessing any harms barring disease prevalence (e.g., accounting for cortisol levels or other stress hormones, measures of pair/pack persistence) ● There is an inappropriate understanding and consideration of tribal worldviews about wolves. Tribal worldviews of wolves are misconstrued as 'cultural benefits' tribes receive from the existence of a wolf population, when in fact tribal worldviews consider each individual wolf as a person and relative. Cultural respect and sensitivity towards such views, shared by many non-tribal members, demand the strict mitigation of lethal measures, especially recreational killing, as opposed to their current promotion in the plan. ● In general, all omissions of scientific literature, the arbitrary prioritization of policy objectives, the rhetoric of the plan and the dismissal of public values and concerns for wolves point towards a biased, unscientific and instrumental view of wolves that promotes values contrary to broad public perspectives on wolves. ● 'SOM' wolf estimation methodology – From a recent critique: "The new methods sacrifice precision, but are believed to retain adequate accuracy and sensitivity to changing conditions for reliable decision-making. We review evidence for the accuracy, precision, and sensitivity of the new 'scaled occupancy model' (SOM) applied in Wisconsin. We conclude that the Wisconsin method would systematically overestimate wolf abundance by large (but currently incalculable) margins. Because Wisconsin, similar to other states, not only changed to unverified methods but also implemented widespread wolf killing, shortcomings in their estimates of wolf abundance may have far-reaching consequences for population viability and confidence in state wildlife managers. We discuss findings from Wisconsin alongside similar findings for other states' occupancy models being insensitive to human causes of mortality that have recently increased. Overall, Wisconsin's proposed method for estimating wolf abundance shows significant departures from best practices in scientific measurement. Verification will require independent replication and unbiased tests at multiple scales in multiple habitats under different human-induced mortality rates, and peer review before the new methods are considered reliable." (Treves & Santiago-Ávila, 2023)		
	All of it	Yes	appreciate the efforts of all WDNR staff involved in updating the state's wolf management plan. Although we believe the current plan needs significant updating (see next section), we recognize the efforts and improvements made to the previous plan, including: ● Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. ● There is much greater recognition of the ecological role of wolves ● The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves ● The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed) What not liked ● The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on (see reference list below): ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution ● The above scientific omissions, combined with	● The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on (see reference list below): ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution ● The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. ● The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ○ A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings. ○ Hounding or hound training, which are akin to allowing legalized dogfighting, should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public. ● The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. ○ Despite Act 169, which mandates a wolf hunting season, the department can still restrict the implementation of lethal methods by setting minimal quotas, including a quota of '0' wolves, restricting timing and methods. ○ Several studies have proven a proactive non-lethal approach leads to better conflict mitigation. ○ Lethal management often fails to	1	appreciate the efforts of all WDNR staff involved in updating the state's wolf management plan. 			the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. ● The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ○ A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings. ○ Hounding or hound training, which are akin to allowing legalized dogfighting, should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public. ● The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. ○ Despite Act 169, which mandates a wolf hunting season, the department can still restrict the implementation of lethal methods by setting minimal quotas, including a quota of '0' wolves, restricting timing and methods. ○ Several studies have proven a proactive non-lethal approach leads to better conflict mitigation. ○ Lethal management often fails to provide a long-term solution to wolf predation and has the least consistent success rates when compared to non-lethal practices. In addition, there is significant evidence showing that lethal wolf management may be less functionally effective at mitigating subsequent livestock losses than non-lethal deterrents. ● The plan should require the implementation of abatement measures as well as the use of non-lethal conflict minimization techniques by domestic animal owners for the latter to receive compensation for confirmed predation. ● The plan also runs contrary to public values towards wolves (and omits mention of such majority values from the plan), despite department surveys evidencing that the broad public cares about wolves as individuals (and not just for the viability of the population). Given the recent liberalization of killing wolves by the state, it would be incredibly informative to note majority support of the following reasons for opposing a regulated wolf hunting/trapping season (which are all omitted from the plan): opposition to specific methods of harvest like hounds (64%) or traps (70%), feelings that hunting wolves is unnecessary (62%) or culturally offensive to Native American tribes (57%). ○ All such reasons convey majority disagreement with practices currently promoted and endorsed by the legislature and the WDNR, and such a conflict between managers and the public should not only be acknowledged, but foregrounded and carefully considered in policy (instead of dismissed). ○ Such decisions to omit literature or downplay evidence (e.g., such as majority opposition to killing wolves and their reasons) are contrary to principles of scientific integrity (e.g., present all relevant scientific evidence to the public) as well as ethics (e.g., disguising ethical decisions, such as recreational wolf killing, as robustly supported by science). ● Conflicting agency objectives (e.g., optimizing public	provide a long-term solution to wolf predation and has the least consistent success rates when compared to non-lethal practices. In addition, there is significant evidence showing that lethal wolf management may be less functionally effective at mitigating subsequent livestock losses than non-lethal deterrents. ● The plan should require the implementation of abatement measures as well as the use of non-lethal conflict minimization techniques by domestic animal owners for the latter to receive compensation for confirmed predation. ● The plan also runs contrary to public values towards wolves (and omits mention of such majority values from the plan), despite department surveys evidencing that the broad public cares about wolves as individuals (and not just for the viability of the population). Given the recent liberalization of killing wolves by the state, it would be incredibly informative to note majority support of the following reasons for opposing a regulated wolf hunting/trapping season (which are all omitted from the plan): opposition to specific methods of harvest like hounds (64%) or traps (70%), feelings that hunting wolves is unnecessary (62%) or culturally offensive to Native American tribes (57%). ○ All such reasons convey majority disagreement with practices currently promoted and endorsed by the legislature and the WDNR, and such a conflict between managers and the public should not only be acknowledged, but foregrounded and carefully considered in policy (instead of dismissed). ○ Such decisions to omit literature or downplay evidence (e.g., such as majority opposition to killing wolves and their reasons) are contrary to principles of scientific integrity (e.g., present all relevant scientific evidence to the public) as well as ethics (e.g., disguising ethical decisions, such as recreational wolf killing, as robustly supported by science). ● Conflicting agency objectives (e.g., optimizing public hunting and conflict mitigation) are not only not acknowledged, but even misunderstood as harmonious, against the body of scientific evidence. That culminates in the prioritization of consumptive values and policies; e.g., according to the body of scientific literature, use of lethal methods, and especially public hunts, are contrary to most objectives relevant to: harm mitigation, the wellbeing of wolves, their ecological roles, and their non-exploitative enjoyment (i.e., Objectives A, B, D and F). ● There is a stark lack of consideration for individual wolves, wolf population health (including wellbeing), and measurable indicators for assessing any harms barring disease prevalence (e.g., accounting for cortisol levels or other stress hormones, measures of pair/pack persistence) ● There is an inappropriate understanding and consideration of tribal worldviews about wolves. Tribal worldviews of wolves are misconstrued as 'cultural benefits' tribes receive from the existence of a wolf population, when in fact tribal worldviews consider each individual wolf as a person and relative. Cultural respect and sensitivity towards such views, shared by many non-tribal members, demand the strict mitigation of lethal measures, especially recreational killing, as opposed to their current promotion in the plan. ● In general, all omissions of scientific literature, the arbitrary prioritization of policy objectives, the rhetoric of the plan and the dismissal of public values and concerns for wolves point towards a biased, unscientific and instrumental view of wolves that promotes values contrary to broad public perspectives on wolves. ● 'SOM' wolf estimation methodology – From a recent critique: "The new methods sacrifice precision, but are believed to retain adequate accuracy and sensitivity to changing conditions for reliable decision-making. We review evidence for the accuracy, precision, and sensitivity of the new 'scaled occupancy model' (SOM) applied in Wisconsin. We conclude that the Wisconsin method would systematically overestimate wolf abundance by large (but currently incalculable) margins. Because Wisconsin, similar to other states, not only changed to unverified methods but also implemented widespread wolf killing, shortcomings in their estimates of wolf abundance may have far-reaching consequences for population viability and confidence in state wildlife managers. We discuss findings from Wisconsin alongside similar findings for other states' occupancy models being insensitive to human causes of mortality that have recently increased. Overall, Wisconsin's proposed method for estimating wolf abundance shows significant departures from best practices in scientific measurement. Verification will require independent replication and unbiased tests at multiple scales in multiple habitats under different human-induced mortality rates, and peer review before the new methods are considered reliable." (Treves & Santiago-Ávila, 2023)		legalized dogfighting, should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public. ● The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. ○ Despite Act 169, which mandates a wolf hunting season, the department can still restrict the implementation of lethal methods by setting minimal quotas, including a quota of '0' wolves, restricting timing and methods. ○ Several studies have proven a proactive non-lethal approach leads to better conflict mitigation. ○ Lethal management often fails to provide a long-term solution to wolf predation and has the least consistent success rates when compared to non-lethal practices. Vicki J	All of it	No	I like the buffer zones around Tribal reservations. Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. The plan has greater recognition of the ecological role of wolves and the inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves.	The plan does not curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. The plan does not restrict nor outlaw "hounding" The plan does not recognize the LARGE body of best available scientific evidence on wolf ethology, sentience, sapience, sociability, agency and wellbeing, the effectiveness of non-lethal interventions, especially relative to lethal ones, the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution The plan is counter to public opinion that Wisconsin wolves, individually, have value ALIVE. A majority of people oppose a regulated wolf hunting/trapping season : the public opposition to specific methods of harvest like hounds (64% against it) or traps (70% against traps), feelings that hunting wolves is unnecessary (62%) or culturally offensive to Native American tribes (57%) are committed from the plan. All such reasons convey majority disagreement with practices currently promoted and endorsed by the legislature and the WDNR, and such a conflict between managers and the public should not only be acknowledged, but foregrounded and carefully considered in policy (instead of dismissed). The plan does not acknowledge that different Native Tribes of people have very personal views of wolves, many referring to a wolf as a relative or family. The plan dismisses those vital connections and values of the Native Peoples and general public, disregards scientific evidence and pretty much only caters to the small group of WHITE HUNTERS.	1	Try again.
Nancy Freyer	Most of it	No	Immediately Start Protecting Wolves.	Immediately Stop the Killing of Wolves.	1	More Protection of Innocent and Helpless Wolves.
Juan Hernandez Garibay	All of it	No	NONE OF THEM	I DISLIKE EVERYTHING ABOUT DRAFT PLAN(SORRY IF I AM SINCERE)	0	THE ONES THAT NEED OVERPOPULATION MANAGEMENT ARE HUNTERS, RANCHERS(THE ONES THAT KILL WOLVES) , AND CORRUPT FROM FISH AND WILDLIFE THAT ALLOWS KILLINGS, "WOLVES AND WILD ANIMALS RESTORE ECOSYSTEMS , KILING WOLVES DISRUPTS ECOSYSTEMS " HEY SORRY IF TRUTH IS AN OFFENSE!! NO MORE KILLINGS AT ALL!!!
nancy siebert	All of it	No			8	
Judy E. Embry	All of it	No	Buffer zones around tribal reservations. Recognition of the social value wolves have in the state, showing positive attitudes and increased opposition to wolf killing.	I do not believe there should ever be recreational killing of wolves. Any lethal management of wolves should be curtailed and used only in extreme circumstances. Hounding or hound training should never occur. It is cruel to the wolves and to the hounds. There should be no hunting season on wolves. Conflict with livestock should be addressed with non-lethal methods.	5	
Bridget Palecek	Most of it	Yes	Since wolves were reintroduced in Wisconsin it has been a waiting game for them to reach a total of 250. We all know wolves are a pack animal much like elephants who are family oriented. To kill the head of the pack is disorienting to the whole pack and inhumane. Why did we introduce wolves to begin with? To satisfy hunters and trappers? The wolves are here now at our bequest and all this game playing with their lives is disgusting.	I absolutely hate trapping any animal, especially claw traps. There is no need for trapping wolves today. It is cruel beyond belief - would you like to be caught in an excruciating painful trap for hours or days? Trapping for fur is obsolete so we need to come to grips with that and stop it and see it for what it is - cruelty for no good reason.	4	We reintroduced the wolves in Wisconsin and now you want to hunt them (for the fee money) and to make hunters happy. The majority of Wisconsin citizens couldn't care less about hunting, so you are appeasing a minority of folks who enjoy killing. I vote for the wolf - let them roam free. They are more loyal and family oriented than most humans.
	All of it	Yes	None	All of them	0	We as so called Humans can't even take or control ourselves so were do the DNR or any one else have any say about any Animals in the wild
Michael Gannon	All of it	No	I like the move away from the 350 wolf limits and the references to tribal lands which were previously ignored.	Under no conditions should 'recreational killing' be permitted given the massive damage hunting has caused wolf populations. Also there should be more factual, science based information included in the overall plan and it's conclusions.	6	Wolves are vital to any environment to help maintain natural balances that mankind overlooks or over manages. The idea of 'recreational killing' is a green light for the hunting community which has already proven its inability to respect wildlife and act within established limits. Wolves need a solid chance to prosper and grow and any interference beyond science based proven limits and measures should be avoided.
Joseph Marsala	Just the parts I am interested in	No	I appreciate the greater recognition of the ecological role of wolves, and the adoption of proposed buffer zones around tribal reservations.	Unless in extreme situations, any lethal management of wolves should be off the table. Hounding should be illegal. In general, all omissions of scientific literature, the arbitrary prioritization of policy objectives, the rhetoric of the plan and the dismissal of public values and concerns for wolves point towards a biased, unscientific and instrumental view of wolves that promotes values contrary to broad public perspectives on wolves. And finally, the plan should require the implementation of abatement measures as well as the use of non-lethal conflict minimization techniques by domestic animal owners for the latter to receive compensation for confirmed predation.	4	Wolves are essential to the ecosystem, and need to be allowed to live so they may accomplish their role in nature.
Natalie Powers	I have not read any of the draft plan	No	I don't like killing wolves	I don't like killing wolves	0	Wolves are very important to a healthy ecosystem

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
	Just the parts I am interested in	No	Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. ● There is much greater recognition of the ecological role of wolves ● The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves ● The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed)	The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on (see reference list below): ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution ● The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. ● The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ○ A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings Hounding or hound training, which are akin to allowing legalized dogfighting, should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public. ● The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. ○ Despite Act 169, which mandates a wolf hunting season, the department can still restrict the implementation of lethal methods by setting minimal quotas, including a quota of '0' wolves, restricting timing and methods. ○ Several studies have proven a proactive non-lethal approach leads to better conflict mitigation. ○ Lethal management often fails to provide a long-term solution to wolf predation and has the least consistent success rates when compared to non-lethal practices. In addition, there is significant evidence showing that lethal wolf management may be less functionally effective at mitigating subsequent livestock losses than non-lethal deterrents. ● The plan should require the implementation of abatement measures as well as the use of non-lethal conflict minimization techniques by domestic animal owners for the latter to receive compensation for confirmed predation. ● The plan also runs contrary to public values towards wolves (and omits mention of such majority values from the plan), despite department surveys evidencing that the broad public cares about wolves as individuals (and not just for the viability of the population). Given the recent liberalization of killing wolves by the state, it would be incredibly informative to note majority support of the following reasons for opposing a regulated wolf hunting/trapping season (which are all omitted from the plan): opposition to specific methods of harvest like hounds (64%) or traps (70%), feelings that hunting wolves is unnecessary (62%) or culturally offensive to Native American tribes (57%). ○ All such reasons convey majority disagreement with practices currently promoted and endorsed by the legislature and the WDNR, and such a conflict between managers and the public should not only be acknowledged, but foregrounded and carefully considered in policy (instead of dismissed). ○ Such decisions to omit literature or downplay evidence (e.g., such as majority opposition to killing wolves and their reasons) are contrary to principles of scientific integrity (e.g., present all relevant scientific evidence to the public) as well as ethics (e.g., disguising ethical decisions, such as recreational wolf killing, as robustly supported by science). ● Conflicting agency objectives (e.g., optimizing public hunting and conflict mitigation) are not only not acknowledged, but even misunderstood as harmonious, against the body of scientific evidence. That culminates in the prioritization of consumptive values and policies; e.g., according to the body of scientific literature, use of lethal methods, and especially public hunts, are contrary to most objectives relevant to: harm mitigation, the wellbeing of wolves, their ecological roles, and their non-exploitative enjoyment (i.e., Objectives A, B, D and F). ● There is a stark lack of consideration for individual wolves, wolf population health (including wellbeing), and measurable indicators for assessing any harms barring disease prevalence (e.g., accounting for cortisol levels or other stress hormones, measures of pair/pack persistence) ● There is an inappropriate understanding and consideration of tribal worldviews about wolves. Tribal worldviews of wolves are misconstrued as 'cultural benefits' tribes receive from the existence of a wolf population, when in fact tribal worldviews consider each individual wolf as a person and relative. Cultural respect and sensitivity towards such views, shared by many non-tribal members, demand the strict mitigation of lethal measures, especially recreational killing, as opposed to their current promotion in the plan. ● In general, all omissions of scientific literature, the arbitrary prioritization of policy objectives, the rhetoric of the plan and the dismissal of public values and concerns for wolves point towards a biased, unscientific and	4

				instrumental view of wolves that promotes values contrary to broad public perspectives on wolves. ● 'SOM' wolf estimation methodology – From a recent critique: "The new methods sacrifice precision, but are believed to retain adequate accuracy and sensitivity to changing conditions for reliable decision-making. We review evidence for the accuracy, precision, and sensitivity of the new 'scaled occupancy model' (SOM) applied in Wisconsin. We conclude that the Wisconsin method would systematically overestimate wolf abundance by large (but currently incalculable) margins. Because Wisconsin, similar to other states, not only changed to unverified methods but also implemented widespread wolf killing, shortcomings in their estimates of wolf abundance may have far-reaching consequences for population viability and confidence in state wildlife managers. We discuss findings from Wisconsin alongside similar findings for other states' occupancy models being insensitive to human causes of mortality that have recently increased. Overall, Wisconsin's proposed method for estimating wolf abundance shows significant departures from best practices in scientific measurement. Verification will require independent replication and unbiased tests at multiple scales in multiple habitats under different human-induced mortality rates, and peer review before the new methods are considered reliable." (Treves & Santiago-Ávila, 2023)		
	Most of it	No	Proposed buffer zones. Limiting the hunting of wolves to zero.	No seasonal hunting should be allowed. This is not based on the best science available.	4	Please protect the wolves. They are necessary and useful to our ecosystem.
Kim Sterrett	All of it	No	Education of all citizens including city folk and farmers...everyone ! Stop the demonization of wolves. I also liked that Tribes were allowed to individually comment rather than as mentioned, a "group response" And finally I liked the Examples of non-lethal wolf depredation abatement tools, such as 6-layer electric fences and special lighting. I appreciated the survey results and I agree with most of them as to learning to coexist with wolves is a good idea. I agree with the Tribal responses too that wolves are sacred. In my city we just had a seminar last month on coyotes from wildlife experts and it was great, super informative, and it was a full house of at least 350-400 people.	General allowances to hunt and kill wolves especially with the use of cruel crossbows. That is from another century not modern times. Would also like to see a reduction of cattle farming in the USA, then there are less calves for wolf prey and no compensation needed.	6	I did read through the entire draft and made notes...overall it seems to try to appease everyone, not an easy feat. Good luck. Thanks for allowing comments.
	All of it	No	We appreciate the efforts of all WDNR staff involved in updating the state's wolf management plan. Although we believe the current plan needs significant updating (see next section), we recognize the efforts and improvements made to the previous plan, including: ● Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. ● There is much greater recognition of the ecological role of wolves ● The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves ● The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed)	The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on (see reference list below): ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution ● The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. ● The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ○ A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings	1	
Christina Larkins	All of it	No	● More value is being placed on the ecological role of wolves. ● The old goal of 350 wolves in Wisconsin will no longer be a reference point for managing wolves. ● Using a social survey to note a rise in positive views of wolves, acknowledgement of their ecological roles and an upturn in opposition to the means and ways for killing wolves	A large amount of scientific literature on points such as the effectiveness in non-lethal controls, impacts of widespread killing on wolves well-being and social dynamics, and their sentience and sociability are missing from this draft, and it does not reflect the best available science.	4	
	Just the parts I am interested in	No	Addressing tribal concerns and the ecological importance of wolves	Please—recreational hunting is unacceptable, as is hunting as a management tool. Please prioritize non-lethal methods of management.	4	

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Jean Hoffman	Just the parts I am interested in	Yes	Like that the plan removes the numeric population goal; Like the buffer zones around tribal lands; The plan recognizes and emphasizes that wolves are a keystone species and that most Wisconsinites value wolves; The plan mentions and illustrates non lethal abatement measures as a way to avoid wolf conflicts; Like that the time hunters have to report kills is reduced from 24 to 8 hours.	The plan should prioritize non lethal ways to avoid wolf conflicts. It should call for a strategy to prioritize ways to acquire more funding for non lethal practices and to educate people on how to coexist with wolves; The plan should state that it should be reviewed more than once a year and that is will be updated as needed; Night hunting should not be allowed; I think the plan should put more restrictions on hound training and hound hunting. Dislike that the plan proposes hounding during the wolf breeding season. Hound hunting and training should not be allowed where wolf den and rendezvous sites are known to exist; Hound training and hunting should not be allowed where wolf families are not bothering anyone in the deep forests of our public lands.	8	The plan does not reflect everything I would like to see, but it is good to see some changes that hopefully will prevent out of control hunts Ike the one in February 2021. Thank you.
	Most of it	Yes	Buffer zone for tribal lands	Still resorting to lethal 'management' over non lethal and still allowing hounds (sickness!)	2	Hounding needs to stop. Only the few noisy members of the WBHA practice this barbarism. They run roughshod over all wildlife and trespass on private property with immunity. Wolves are integral to our ecology in WI, we need them to keep our deer healthy and our ecosystem in balance.
Jennifer Valentine	All of it	No	I appreciate the efforts of all WDNR staff involved in updating the state's wolf management plan. Although i believe the current plan needs significant updating (see next section), i recognize the efforts and improvements made to the previous plan, including: ● Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. ● There is much greater recognition of the ecological role of wolves ● The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves ● The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed)	What i don't like: ● The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on: ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution ● The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. ● The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ○ A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings. ○ Hounding or hound training, which are akin to allowing legalized dogfighting, should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public. ● The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. ○ Despite Act 169, which mandates a wolf hunting season, the department can still restrict the implementation of lethal methods by setting minimal quotas, including a quota of '0' wolves, restricting timing and methods. ○ Several studies have proven a proactive non-lethal approach leads to better conflict mitigation. ○ Lethal management often fails to provide a long-term solution to wolf predation and has the least consistent success rates when compared to non-lethal practices. In addition, there is significant evidence showing that lethal wolf management may be less functionally effective at mitigating subsequent livestock losses than non-lethal deterrents. ● The plan should require the implementation of abatement measures as well as the use of non-lethal conflict minimization techniques by domestic animal owners for the latter to receive compensation for confirmed predation. ● The plan also runs contrary to public values towards wolves (and omits mention of such majority values from the plan), despite department surveys evidencing that the broad public cares about wolves as individuals (and not just for the viability of the population). Given the recent liberalization of killing wolves by the state, it would be incredibly informative to note majority support of the following reasons for opposing a regulated wolf hunting/trapping season (which are all omitted from the plan): opposition to specific methods of harvest like hounds (64%) or traps (70%), feelings that hunting wolves is unnecessary (62%) or culturally offensive to Native American tribes (57%). ○ All such reasons convey majority disagreement with practices currently promoted and endorsed by the legislature and the WDNR, and such a conflict between managers and the public should not only be acknowledged, but foregrounded and carefully considered in policy (instead of dismissed). ○ Such decisions to omit literature or downplay evidence (e.g., such as majority opposition to killing wolves and their reasons) are contrary to principles of scientific integrity (e.g., present all relevant scientific evidence to the public) as well as ethics (e.g., disguising ethical decisions, such as recreational wolf killing, as robustly supported by science). ● Conflicting agency objectives (e.g., optimizing public hunting and conflict mitigation) are not only not acknowledged, but even misunderstood as harmonious, against the body of scientific evidence. That culminates in the prioritization of consumptive values and policies; e.g., according to the body of scientific literature, use of lethal methods, and 2 especially public hunts, are contrary to most objectives relevant	1	please leave the wolves alone

				to: harm mitigation, the wellbeing of wolves, their ecological roles, and their non-exploitative enjoyment (i.e., Objectives A, B, D and F). ● There is a stark lack of consideration for individual wolves, wolf population health (including wellbeing), and measurable indicators for assessing any harms barring disease prevalence (e.g., accounting for cortisol levels or other stress hormones, measures of pair/pack persistence) ● There is an inappropriate understanding and consideration of tribal worldviews about wolves. Tribal worldviews of wolves are misconstrued as 'cultural benefits' tribes receive from the existence of a wolf population, when in fact tribal worldviews consider each individual wolf as a person and relative. Cultural respect and sensitivity towards such views, shared by many non-tribal members, demand the strict mitigation of lethal measures, especially recreational killing, as opposed to their current promotion in the plan. ● In general, all omissions of scientific literature, the arbitrary prioritization of policy objectives, the rhetoric of the plan and the dismissal of public values and concerns for wolves point towards a biased, unscientific and instrumental view of wolves that promotes values contrary to broad public perspectives on wolves. ● 'SOM' wolf estimation methodology – From a recent critique: "The new methods sacrifice precision, but are believed to retain adequate accuracy and sensitivity to changing conditions for reliable decision-making. We review evidence for the accuracy, precision, and sensitivity of the new 'scaled occupancy model' (SOM) applied in Wisconsin. I conclude that the Wisconsin method would systematically overestimate wolf abundance by large (but currently incalculable) margins. Because Wisconsin, similar to other states, not only changed to unverified methods but also implemented widespread wolf killing, shortcomings in their estimates of wolf abundance may have far-reaching consequences for population viability and confidence in state wildlife managers. I discuss findings from Wisconsin alongside similar findings for other states' occupancy models being insensitive to human causes of mortality that have recently increased. Overall, Wisconsin's proposed method for estimating wolf abundance shows significant departures from best practices in scientific measurement. Verification will require independent replication and unbiased tests at multiple scales in multiple habitats under different human-induced mortality rates, and peer review before the new methods are considered reliable." (Treves & Santiago-Ávila, 2023)		
Laura	Just the parts I am interested in	No	We appreciate the efforts of all WDNR staff involved in updating the state's wolf management plan. Although we believe the current plan needs significant updating (see next section), we recognize the efforts and improvements made to the previous plan, including: ● Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. ● There is much greater recognition of the ecological role of wolves ● The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves ● The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed)	The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on (see reference list below): ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution ● The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. ● The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ○ A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings. ○ Hounding or hound training, which are akin to allowing legalized dogfighting, should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public. (Treves & Santiago-Ávila, 2023)		
	Just the parts I am interested in	No	Like The sound of Holistic, but doubt the Dept. Of Agriculture would even bother to to enforce this.	I couldn't find what type of trapping devices are being used. The traps that torture the animals for long times before they are killed should not be allowed. Traps that strangle them and make their brains turn to jelly or explode and this can also happen to our pets, should not ever be allowed. No torturing of any animal. Must be killed quickly and humanely.	5

Dr. S. Huber	All of it	No	These efforts are appreciate: That wolves in Wisconsin will no longer be managed by reference to the old numerical goal of 350 wolves. There is much greater recognition of the ecological role of wolves. The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves. The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed)	-The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. Lethal management often fails to provide a long-term solution to wolf predation when compared to non-lethal practices. -The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on (see reference list below): ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution-Hounding or hound training, which are akin to allowing legalized dogfighting, should be illegal. -The plan should require the implementation of abatement measures as well as the use of non-lethal conflict minimization techniques by domestic animal owners for the latter to receive compensation for confirmed predation. -The plan also runs contrary to public values towards wolves (and omits mention of such majority values from the plan), despite department surveys evidencing that the broad public cares about wolves as individuals (and not just for the viability of the population). -There is a lack of consideration for individual wolves, wolf population health (including wellbeing), and measurable indicators for assessing any harms barring disease prevalence. -All omissions of scientific literature, the arbitrary prioritization of policy objectives, the rhetoric of the plan and the dismissal of public values and concerns for wolves point towards a biased, unscientific and instrumental view of wolves that promotes values contrary to broad public perspectives on wolves.	4	
Britt Lind	Just the parts I am interested in	No	This plan is heavily written to favor hunters and farmers who make up most of the committee drafting the plan.	To use the term "management" is an insult to anyone who cares about wildlife. What you are talking about is allowing hunters to slaughter wolves for fun and pretend they're doing it for their own good. Leave the animals alone as they were before humans took over their land for profit.	1	As long as moneyed interests are in charge of the welfare of wolves they will continue to be slaughtered by idiotic cowards and the government agencies who should be protecting wildlife will continue to support their suffering and their eradication.
Mary Lou Ramirez	All of it	No	a holistic approach to ensuring the state's wolf population remains healthy and secure while balancing the public's diverse interests.	Revising wolf management zone boundaries to better reflect current wolf distribution and habitat.	1	
Richard Taylor	Most of it	No	Not much	The persecution of wolves	1	Poor
	Most of it	No	Non-lethal means to handle the wolf population	All the zones to kill wolf adults and pups. Going into dens to kill the pups.	2	People should be able to live in harmony with wolves with the right tools and information.
	Most of it	No	Some scientific data collected	Scientific data seems to be hand-picked to what the group wants versus what is best.	5	I'd like to see more scientific information included, such as: wolf ethology, sentience, sapience, sociability, agency and wellbeing effectiveness of non-lethal interventions, especially relative to lethal ones the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution
	Most of it	No	Safety of the wolves	I'm concerned about the well-being of the animals. I'm worried the public will get scared or threatened by their presence and want to kill them. Which is WRONG!	6	The wolf population has declined everywhere. They have been on the board line of extinction. We need to protect them at all cost
Edele Heath	All of it	Yes	Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. Greater recognition of the ecological role of wolves. Adoption of proposed buffer zones around tribal reservations.	The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature. Scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy,results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. The plan should require the implementation of abatement measures as well as the use of non-lethal conflict minimization techniques by domestic animal owners for the latter to receive compensation for confirmed predation. The plan also runs contrary to public values towards wolves (and omits mention of such majority values from the plan) despite department surveys evidencing that the broad public cares about wolves as individuals, not just for the viability of the population. Conflicting agency objectives (e.g., optimizing public hunting and conflict mitigation) are not only not acknowledged, but even misunderstood as harmonious, against the body of scientific evidence. In general, all omissions of scientific literature, the arbitrary prioritization of policy objectives, the rhetoric of the plan and the dismissal of public values and concerns for wolves point towards a broad biased, unscientific and instrumental view of wolves that promotes values contrary to broad public perspectives on wolves.	1	
Michael Reynolds	All of it	No	Saving the animals	Not savingthem	10

Sharon Porter	Most of it	No	Wolf protections			
Teresa	Most of it	No	The part of the draft plan is there is recognition of wolves in WI that is very important to our ecology. They help balance the population of deer and other wildlife. They are an apex predator (if you don't include humans) and we need them to keep everything in check.	I wish the plan had a more of a focus on wolf protections. The evidence needs to be clear on how populations are counted and if these populations are a risk to ranches in the area. I haven't seen any evidence of this. I also want to understand why there is a need to kill wolves by trappings and other lethal ways especially by the public. This doesn't seem safe to the public nor necessary to kill wolves indiscriminately. The wolves keep the environment healthy and in balance. The local populations views seem to be in favor of not killing wolves why is it necessary to kill them? I want to understand this argument more, I'm not convinced we need to kill wolves to keep "ranches safe". Please include more scientific evidence in the reason why less wolves are optimum to the area.	5	I'm providing neutral support. I think it's great this plan is recognizing wolves are an important part of our ecosystem and there's a lot of support behind saving these wolf populations. They are more important than not having them. There needs to be way more evidence to prove why there is a need to kill any even 1 in the first place. I just don't see it stated anywhere. Please include evidence of many scientific studies to avoid bias as well. I want to see more scientists, teachers, hunters, everyone to get a more clear picture of what's happening out in the wild. Thank you for listening.
Susan McFadden	All of it	No	None. There is zero reason to annihilate the wolf population except for man's incessant blood thirst in killing innocent animals, from deer to wolves. Complete disregard for other living beings. Man is the most destructive animal to inhabit this planet.	All of it. What is the real purpose of this slaughter? Let's get real for a change. Wolves, deer, rabbit, birds, squirrel etc. have just as much of a right to live peacefully on this planet. They have families, offspring and elders..just as humans. They provide for one another. They have geniune love for one another. It sickens me to know that you feel the only answer is a murderous rampage and the complete annihilation of a species.	0	After reading this plan, how can anyone assume humans are superior to any species. It is always the same playbook, kill kill kill.
P.A. Woodburn	I have not read any of the draft plan	No	I haven't read it but I don't in any way whatsoever approve of killing any wolf whatsoever. The wolves have as much right to live on this planet as anyone else. The wolves don't belong to Wisconsin. The wolves are an apex species and critical for the environment. I won't set foot in Wisconsin until I know you are going to leave the wolves alone.	I'm sure you have read all of the negative things that happened to Yellowstone when wolves were removed. Haven't you read about climate change? The wolves don't need to be managed by humans.	0	My answer to above is one. It is not clear how the thing works. Every thing I have ever read concerning wolves and Wisconsin is negative. That is why I haven't bothered to read it. I know it is going to be about killing more wolves. The wolves will be here when we have managed to kill and destroy the planet by climate change or some other stupidity. Don't run another species into extinction no matter what your latest method is it is wrong.
Tammi Priggins	Just the parts I am interested in	No	I love trying to save the wolves, they are God's creatures. I am their voice!!!	N//A	7	
Heidi	Most of it	No	I just like to protect all wildlife		10	Save and protect wolves and all wildlife
Angela B.	Most of it	No	1. Pursue options to minimize human/wolf conflicts. 2.Include the overall ecosystem health and sustainability of the wolf population as a stated goal. 3. Allow wolf populations to fluctuate naturally. 4.Collaborate with government agencies and Tribes in monitoring wolf populations. 5. Use science-based input and methodology to monitor/estimate wolf populations. 6. Create zones of no/low wolf harvest based on Tribal boundaries, conflict levels, and research.	1. Wolf depredation compensation program.	9	
Karen Bartell	Just the parts I am interested in	No	● Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. ● There is much greater recognition of the ecological role of wolves ● The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves ● The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed)	● The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on (see reference list below): ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution ● The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. ● The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ○ A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings. ○ Hounding or hound training, which are akin to allowing legalized dogfighting, should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public. ● The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. ○ Despite Act 169, which mandates a wolf hunting season, the department can still restrict the implementation of lethal methods by setting minimal quotas, including a quota of '0' wolves, restricting timing and methods. ○ Several studies have proven a proactive non-lethal approach leads to better conflict mitigation. ○ Lethal management often fails to provide a long-term solution to wolf predation and has the least consistent success rates	3

Jonathan	Just the parts I am interested in	No	The improvements over previous iterations	shoddy science and ethics behind some of the policies	0	
Therese Laitinen	All of it	Yes	I am overall pleased with the entire draft.		9	
David	Just the parts I am interested in	No	Nothing	Plan to exterminate the wolf	1	Human white colonizers have driven countless plant & animal species extinct due to human expansion. The state kills everything in it's path. How do you live with yourselves causing so much damage to the environment? Your wolf murder plan is shameful and I'm embarrassed for you killers
J	All of it	No	I like and appreciate the greater acknowledgement of the ecological role of wolves in the draft plan.	I wish the plan would prioritize the protection of wolves with regards to livestock disputes. Act 169, which allows a wolf hunting season, could be changed to set a quota of 0 wolves. Hunting wolves statistically does not provide a long term solution to live stock issues, where as a non lethal approach would benefit not only the farmers, live stock, and wolves; but the eco system as well.	6	
	Just the parts I am interested in	No				Wolves need protection, period.
p nunez	Most of it	No	not too much	The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on (see reference list below): ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution ● The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. ● The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ○ A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings.	2	
Richard Kite	Just the parts I am interested in	No	Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. ● There is much greater recognition of the ecological role of wolves ● The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves ● The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed)	The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on (see reference list below): ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution ● The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. ● The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ○ A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings. ○ Hounding or hound training, which are akin to allowing legalized dogfighting, should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public. ● The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. ○ Despite Act 169, which mandates a wolf hunting season, the department can still restrict the implementation of lethal methods by setting minimal quotas, including a quota of '0' wolves, restricting timing and methods. ○ Several studies have proven a proactive non-lethal approach leads to better conflict mitigation. ○ Lethal management often fails to provide a long-term solution to wolf predation and has the least consistent success rates when compared to non-lethal practices. 				livestock losses than non-lethal deterrents. ● The plan should require the implementation of abatement measures as well as the use of non-lethal conflict minimization techniques by domestic animal owners for the latter to receive compensation for confirmed predation. ● The plan also runs contrary to public values towards wolves (and omits mention of such majority values from the plan), despite department surveys evidencing that the broad public cares about wolves as individuals (and not just for the viability of the population). Given the recent liberalization of killing wolves by the state, it would be incredibly informative to note majority support of the following reasons for opposing a regulated wolf hunting/trapping season (which are all omitted from the plan): opposition to specific methods of harvest like hounds (64%) or traps (70%), feelings that hunting wolves is unnecessary (62%) or culturally offensive to Native American tribes (57%). ○ All such reasons convey majority disagreement with practices currently promoted and endorsed by the legislature and the WDNR, and such a conflict between managers and the public should not only be acknowledged, but foregrounded and carefully considered in policy (instead of dismissed). ○ Such decisions to omit literature or downplay evidence (e.g., such as majority opposition to killing wolves and their reasons) are contrary to principles of scientific integrity (e.g., present all relevant scientific evidence to the public) as well as ethics (e.g., disguising ethical decisions, such as recreational wolf killing, as robustly supported by science). ● Conflicting agency objectives (e.g., optimizing public hunting and conflict mitigation) are not only not acknowledged, but even misunderstood as harmonious, against the body of scientific evidence. That culminates in the prioritization of consumptive values and policies; e.g., according to the body of scientific literature, use of lethal methods, and 2 especially public hunts, are contrary to most objectives relevant to: harm mitigation, the wellbeing of wolves, their ecological roles, and their non-exploitative enjoyment (i.e., Objectives A, B, D and F). ● There is a stark lack of consideration for individual wolves, wolf population health (including wellbeing), and measurable indicators for assessing any harms barring disease prevalence (e.g., accounting for cortisol levels or other stress hormones, measures of pair/pack persistence) ● There is an inappropriate understanding and consideration of tribal worldviews about wolves. Tribal worldviews of wolves are misconstrued as 'cultural benefits' tribes receive from the existence of a wolf population, when in fact tribal worldviews consider each individual wolf as a person and relative. Cultural respect and sensitivity towards such views, shared by many non-tribal members, demand the strict mitigation of lethal measures, especially recreational killing, as opposed to their current promotion in the plan. ● In general, all omissions of scientific literature, the arbitrary prioritization of policy objectives, the rhetoric of the plan and the dismissal of public values and concerns for wolves point towards a biased, unscientific and instrumental view of wolves that promotes values contrary to broad public perspectives on wolves. ● 'SOM' wolf estimation methodology – From a recent critique: "The new methods sacrifice precision, but are believed to retain adequate accuracy and sensitivity to changing conditions for reliable decision-making. We review evidence for the accuracy, precision, and sensitivity of the new 'scaled occupancy model' (SOM) applied in Wisconsin. We conclude that the Wisconsin method would systematically overestimate wolf abundance by large (but currently incalculable) margins. Because Wisconsin, similar to other states, not only changed to unverified methods but also implemented widespread wolf killing, shortcomings in their estimates of wolf abundance may have far-reaching consequences for population viability and confidence in state wildlife managers. We discuss findings from Wisconsin alongside similar findings for other states' occupancy models being insensitive to human causes of mortality that have recently increased. Overall, Wisconsin's proposed method for estimating wolf abundance shows significant departures from best practices in scientific measurement. Verification will require independent replication and unbiased tests at multiple scales in multiple habitats under different human-induced mortality rates, and peer review before the new methods are considered reliable." (Treves & Santiago-Ávila, 2023		
Sarah Kittrell	All of it	No	I only like, that saving them is important	Any killing	4	Wolves are essential
mark baker	Most of it	No	im already sponsering helene, let me know when the renewal will be plz

	All of it	No	The current plan needs significant updates, but so far I like: + Wolves in WI will no longer be managed by reference to the old and weird numerical goal of 350 wolves. + The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves. + Seems to be a much greater recognition of the vital ecological role of wolves. + The adoption of proposed buffer zones around tribal reservations that previously did not exist.	There are too many reasons that this plan is a big, fat FAIL. - The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on:- x Wolf ethology, sentience, sapience, sociability, agency and wellbeing; x Impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution; x The effectiveness of non-lethal interventions, especially relative to lethal ones - The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. - The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. x A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings. x Hounding or hound training, which are akin to allowing legalized dogfighting, should be illegal as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public. - The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. x Several studies have proven a proactive non-lethal approach leads to better conflict mitigation. x Lethal management often fails to provide a long-term solution to wolf predation and has the least consistent success rates when compared to non-lethal practices. Additionally, there is significant evidence showing that lethal wolf management may be less functionally effective at mitigating subsequent livestock losses than non-lethal deterrents. x Despite Act 169, which mandates a wolf hunting season, the department can still restrict the implementation of lethal methods by setting minimal quotas, including a quota of '0' wolves, restricting timing and methods - The plan should REQUIRE the implementation of abatement measures as well as the use of non-lethal conflict minimization techniques by domestic animal owners for the latter to receive compensation for confirmed predation. - The plan also runs contrary to public values towards wolves (and omits mention of such majority values from the plan), despite department surveys evidencing that the broad public cares about wolves as individuals (and not just for the viability of the population). Given the recent liberalization of killing wolves by the state, it would be incredibly informative to note majority support of the following reasons for opposing a regulated wolf hunting/trapping season (which are all omitted from the plan): opposition to specific methods of harvest like hounds (64%) or traps (70%), feelings that hunting wolves is unnecessary (62%) or culturally offensive to Native American tribes (57%). x Such decisions to omit literature or downplay evidence (e.g., such as majority opposition to killing wolves and their reasons) are contrary to principles of scientific integrity (e.g., present all relevant scientific evidence to the public) as well as ethics (e.g., disguising ethical decisions, such as recreational wolf killing, as robustly supported by science). x All such reasons convey majority disagreement with practices currently promoted and endorsed by the legislature and the WDNR, and such a conflict between managers and the public should not only be acknowledged, but foregrounded and carefully considered in policy (instead of dismissed). - Conflicting agency objectives (e.g., optimizing public hunting and conflict mitigation) are not only not acknowledged, but even misunderstood as harmonious, against the body of scientific evidence. That culminates in the prioritization of consumptive values and policies; e.g., according to the body of scientific literature, use of lethal methods, and 2 especially public hunts, are contrary to most objectives relevant to: harm mitigation, the wellbeing of wolves, their ecological roles, and their non-exploitative enjoyment (i.e., Objectives A, B, D and F). - There is a stark lack of consideration for individual wolves, wolf population health (including wellbeing), and measurable indicators for assessing any harms barring disease prevalence (e.g., accounting for cortisol levels or other stress hormones, measures of pair/pack persistence). - There is an inappropriate understanding and consideration of tribal worldviews about wolves. Tribal worldviews of wolves are misconstrued as 'cultural benefits' tribes receive from the existence of a wolf population, when in fact tribal worldviews consider each individual wolf as a person and relative. Cultural respect and sensitivity towards such views, shared by many non-tribal members, demand the strict mitigation of lethal measures, especially recreational killing, as opposed to their current promotion in the plan. - In general, all omissions of scientific literature,	4	Do better.

				the arbitrary prioritization of policy objectives, the rhetoric of the plan and the dismissal of public values and concerns for wolves point towards a biased, unscientific and instrumental view of wolves that promotes values contrary to broad public perspectives on wolves. - 'SOM' wolf estimation methodology – From a recent critique: "The new methods sacrifice precision, but are believed to retain adequate accuracy and sensitivity to changing conditions for reliable decision-making. We review evidence for the accuracy, precision, and sensitivity of the new 'scaled occupancy model' (SOM) applied in Wisconsin. We conclude that the Wisconsin method would systematically overestimate wolf abundance by large (but currently incalculable) margins. Because Wisconsin, similar to other states, not only changed to unverified methods but also implemented widespread wolf killing, shortcomings in their estimates of wolf abundance may have far-reaching consequences for population viability and confidence in state wildlife managers. We discuss findings from Wisconsin alongside similar findings for other states' occupancy models being insensitive to human causes of mortality that have recently increased. Overall, Wisconsin's proposed method for estimating wolf abundance shows significant departures from best practices in scientific measurement. Verification will require independent replication and unbiased tests at multiple scales in multiple habitats under different human-induced mortality rates, and peer review before the new methods are considered reliable." (Treves & Santiago-Ávila, 2023)		
	Most of it	No	Scientific approach to wolf management, consideration for the impact on the cultural and natural environment of wolf management and elimination of inhumane trapping and hunting techniques	Any allowances for inhumane hunting, mass killing or trapping activities	8	Thank you for your work on this plan
Patricia Browne	All of it	No	I appreciate the efforts of all WDNR staff involved in updating the state's wolf management plan. Although we believe the current plan needs significant updating (see next section), we recognize the efforts and improvements made to the previous plan, including: ● Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. ● There is much greater recognition of the ecological role of wolves ● The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves ● The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed)	The current draft does not reflect the best available science and is missing a substantial amount of scientific literature on (see reference list below): ○ wolf ethology, sentience, sapience, sociability, agency, and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, well-being, social dynamics, ecological relationships, and evolution ● The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a primary management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous, and of stronger inference. ● The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ○ A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, have found that policies allowing the liberalized killing of wolves results in a direct increase in the hazard and incidence of illegal killings. The plan should prioritize wolf protection and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. ○ Despite Act 169, which mandates a wolf hunting season, the department can still restrict the implementation of lethal methods by setting minimal quotas, including a quota of '0' wolves, restricting timing and methods. ○ Several studies have proven a proactive non-lethal approach leads to better conflict mitigation. ○ Lethal management often fails to provide a long-term solution to wolf predation and has the least consistent success rates when compared to non-lethal practices. In addition, significant evidence shows that lethal wolf management may be less functionally effective at mitigating subsequent livestock losses than non-lethal deterrents. ● The plan should require the implementation of abatement measures as well as the use of non-lethal conflict minimization techniques by domestic animal owners for the latter to receive compensation for confirmed predation. ● The plan also runs contrary to public values towards wolves (and omits mention of such majority values from the plan) despite department surveys evidencing that the broad public cares about wolves as individuals.	4	Overall, Wisconsin's proposed method for estimating wolf abundance shows significant departures from best practices in scientific measurement. Verification will require independent replication and unbiased tests at multiple scales in multiple habitats under different human-induced mortality rates, and peer review before the new methods are considered reliable." (Treves & Santiago-Ávila, 2023)
	Most of it	Yes	Not much	350 wolfs no more,surey,boundies,people working on the plan	1	We need low numbers for wolfs too ,help our deer and elk herd.These two hunting seasons bring alot of money ,to WI.
	All of it	No	The summary of animal reintroduced and their control of the elk population. Also the way Wisconsinites trust the DNR	Bounties on wolves and quota system and how they affect wolves population If some major illness occurs you can potentially affect the whole population and severely deplete tje Wolf population and then the killing of more wolves	3	The elk population will regulate the wolf population. Culling can be too drastic

Overall, Wisconsin's proposed method for estimating wolf abundance shows significant departures from best practices in scientific measurement. Verification will require independent replication and unbiased tests at multiple scales in multiple habitats under different human-induced mortality rates, and peer review before the new methods are considered reliable."		
	All of it	No	Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. There is much greater recognition of the ecological role of wolves The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed)	The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on (see reference list below): ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution ● The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. ● The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ○ A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings. ○ Hounding or hound training, which are akin to allowing legalized dogfighting, should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public. ● The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. ○ Despite Act 169, which mandates a wolf hunting season, the department can still restrict the implementation of lethal methods by setting minimal quotas, including a quota of '0' wolves, restricting timing and methods. ○ Several studies have proven a proactive non-lethal approach leads to better conflict mitigation. ○ Lethal management often fails to provide a long-term solution to wolf predation and has the least consistent success rates when compared to non-lethal practices. In addition, there is significant evidence showing that lethal wolf management may be less functionally effective at mitigating subsequent livestock losses than non-lethal deterrents. ● The plan should require the implementation of abatement measures as well as the use of non-lethal conflict minimization techniques by domestic animal owners for the latter to receive compensation for confirmed predation. ● The plan also runs contrary to public values towards wolves (and omits mention of such majority values from the plan), despite department surveys evidencing that the broad public cares about wolves as individuals (and not just for the viability of the population). Given the recent liberalization of killing wolves by the state, it would be incredibly informative to note majority support of the following reasons for opposing a regulated wolf hunting/trapping season (which are all omitted from the plan): opposition to specific methods of harvest like hounds (64%) or traps (70%), feelings that hunting wolves is unnecessary (62%) or culturally offensive to Native American tribes (57%). ○ All such reasons convey majority disagreement with practices currently promoted and endorsed by the legislature and the WDNR, and such a conflict between managers and the public should not only be acknowledged, but foregrounded and carefully considered in	4

				policy (instead of dismissed). ○ Such decisions to omit literature or downplay evidence (e.g., such as majority opposition to killing wolves and their reasons) are contrary to principles of scientific integrity (e.g., present all relevant scientific evidence to the public) as well as ethics (e.g., disguising ethical decisions, such as recreational wolf killing, as robustly supported by science). ● Conflicting agency objectives (e.g., optimizing public hunting and conflict mitigation) are not only not acknowledged, but even misunderstood as harmonious, against the body of scientific evidence. That culminates in the prioritization of consumptive values and policies; e.g., according to the body of scientific literature, use of lethal methods, and especially public hunts, are contrary to most objectives relevant to: harm mitigation, the wellbeing of wolves, their ecological roles, and their non-exploitative enjoyment (i.e., Objectives A, B, D and F). ● There is a stark lack of consideration for individual wolves, wolf population health (including wellbeing), and measurable indicators for assessing any harms barring disease prevalence (e.g., accounting for cortisol levels or other stress hormones, measures of pair/pack persistence) ● There is an inappropriate understanding and consideration of tribal worldviews about wolves. Tribal worldviews of wolves are misconstrued as 'cultural benefits' tribes receive from the existence of a wolf population, when in fact tribal worldviews consider each individual wolf as a person and relative. Cultural respect and sensitivity towards such views, shared by many non-tribal members, demand the strict mitigation of lethal measures, especially recreational killing, as opposed to their current promotion in the plan. ● In general, all omissions of scientific literature, the arbitrary prioritization of policy objectives, the rhetoric of the plan and the dismissal of public values and concerns for wolves point towards a biased, unscientific and instrumental view of wolves that promotes values contrary to broad public perspectives on wolves. ● 'SOM' wolf estimation methodology – From a recent critique: "The new methods sacrifice precision, but are believed to retain adequate accuracy and sensitivity to changing conditions for reliable decision-making. We review evidence for the accuracy, precision, and sensitivity of the new 'scaled occupancy model' (SOM) applied in Wisconsin. We conclude that the Wisconsin method would systematically overestimate wolf abundance by large (but currently incalculable) margins. Because Wisconsin, similar to other states, not only changed to unverified methods but also implemented widespread wolf killing, shortcomings in their estimates of wolf abundance may have far-reaching consequences for population viability and confidence in state wildlife managers. We discuss findings from Wisconsin alongside similar findings for other states' occupancy models being insensitive to human causes of mortality that have recently increased. Overall, Wisconsin's proposed method for estimating wolf abundance shows significant departures from best practices in scientific measurement. Verification will require independent replication and unbiased tests at multiple scales in multiple habitats under different human-induced mortality rates, and peer review before the new methods are considered reliable." (Treves & Santiago-Ávila, 2023)		
Kimberly Vernon	Most of it	No	Save the wolves	N/A	7	Please save the wolves. They need to be added to the endangered species list again. The Wolf plays a important part in our environment as seen in the yellow stone documentary.
GidaNaser	All of it	No	Saving Wisconsin wolves	NA	10	
Emmanuel James Muyuela	I have not read any of the draft plan	No	The elements that seem good to me are the plans to promote public education and encourage acts that benefit wolf conservation.	What I see about that this that's so wrong is the fact that after a certain number of wolves in the state (350), people are basically allowed to do what they want to them. I know this could prevent overpopulation, but can't the ecosystem balance these populations naturally?	5	
Amanda Hedgpeth	All of it	No	I appreciate the efforts of all WDNR staff involved in updating the state's wolf management plan. Although we believe the current plan needs significant updating (see next section), we recognize the efforts and improvements made to the previous plan, including: ● Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. ● There is much greater recognition of the ecological role of wolves ● The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves ● The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed)	The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on (see reference list below): ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution ● The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. ● The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ○ A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings. ○ Hounding or hound training, which are akin to allowing legalized	5	Killing should not be allowed unless a human is in under direct attack and protecting themselves

				will require independent replication and unbiased tests at multiple scales in multiple habitats under different human-induced mortality rates, and peer review before the new methods are considered reliable." (Treves & Santiago-Ávila, 2023)		
Nina Berry	Most of it	No	I like that the plan recognizes wolves are an important part of the ecosystem, the inclusion of a social survey, and that buffer zones around reservations are proposed. I appreciate all the thought and effort going into this update!	This update doesn't include the latest science on things like how killing wolves affects their social dynamics and evolution, the incredible effectiveness of non-lethal deterrents (much better than lethal ones!). I dislike the promotion of "sustainable recreational killing" of wolves, which is an oxymoron and isn't supported by the most recent, vigorously researched science. Killing should be an absolute last resort. The science shows that when you have liberal killing of wolves, it actually leads to GREATER predation by the remaining wolves. So you're shooting yourself in the foot as well as shooting the wolves.	2	Thank you for reading my comment!
Cecelia Samp	Most of it	No	I like the idea of using non-lethal methods for wolf "management " as studies like those in Idaho show this method is much more effective than killing wolves.	The plan seems to give those living in higher wolf populated areas more weight in allowed wolf numbers. Science shows that wolf-human contact is very low.	5	I really appreciate the input from Native American tribes. Their ancestors lived alongside wolves and showed that humans and wolves can co-exist rather well. They link the prosperity between humans and wolves. Humans need to take more responsibility for wolf conflict. Pet conflict can, in most cases, be better controlled. If you live in an area with wildlife you must adjust and be adaptable. Wildlife was there long before humans. Hunting dogs are more vulnerable because they are in wolf habitat hunting wildlife which exposes them to more conflict. Farmers should take advantage of non-lethal methods to deter wolves. Wolves inspire strong feelings from people, both in support and in the hatred of wolves. Plans should be based on science and what is best for the wolf, not fear of what ifs.
Armond Matevosian	Just the parts I am interested in	No	The wolf population is increasing as it should		3	
	Just the parts I am interested in	No	The current draft has some improvements over previous plans and I appreciate the work done to update this plan. I support the recognition of the ecological role of wolves, the change in the goal/number of wolves and the adoption of proposed buffer zones around tribal reservations.	However, the current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on the following: wolf ethology, sentience, sapience, sociability, agency and wellbeing; effectiveness of non-lethal interventions, particularly relative to lethal ones; and the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution. The above omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted evidence being more recent, numerous and of stronger inference. I believe the plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. Period. In addition, the plan should prioritize wolf protection and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. The plan should require the implementation of abatement measures as well as the use of non-lethal conflict minimization techniques by domestic animal owners for the latter to receive compensation for confirmed predation. Hounding or hound training, which is similar to allowing legalized dogfighting, should be illegal or severely restricted as this practice is archaic and extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the general public. The plan also runs contrary to public values towards wolves and omits mention of such majority values from the plan, despite department surveys evidencing that the broad public cares about wolves as individuals and not just for the viability of the population. I oppose a regulated wolf hunting/trapping season. There is an inappropriate understanding and consideration of tribal views about wolves. Cultural respect and sensitivity towards such views, shared by many non-tribal members, demand the strict mitigation of lethal measures, especially recreational killing, as opposed to their current promotion in the draft plan. In general, all omissions of scientific literature, the arbitrary prioritization of policy objectives, the rhetoric of the plan and the dismissal of public values and concerns for wolves point towards a biased, unscientific and instrumental view of wolves that promotes values contrary to broad public perspectives on wolves. Thank you for your consideration.	4

The plan also runs contrary to public values towards wolves (and omits mention of such majority values from the plan), despite department surveys evidencing that the broad public cares about wolves as individuals (and not just for the viability of the population). Given the recent liberalization of killing wolves by the state, it would be incredibly informative to note majority support of the following reasons for opposing a regulated wolf hunting/trapping season (which are all omitted from the plan): opposition to specific methods of harvest like hounds (64%) or traps (70%), feelings that hunting wolves is unnecessary (62%) or culturally offensive to Native American tribes (57%).	3	
Barbara Liszeo	All of it	No	● Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. ● There is much greater recognition of the ecological role of wolves ● The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves ● The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed)	● The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on (see reference list below): ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution ● The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. ● The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ○ A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings.	4	The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. ○ Despite Act 169, which mandates a wolf hunting season, the department can still restrict the implementation of lethal methods by setting minimal quotas, including a quota of '0' wolves, restricting timing and methods. ○ Several studies have proven a proactive non-lethal approach leads to better conflict mitigation. ○ Lethal management often fails to provide a long-term solution to wolf predation and has the least consistent success rates when compared to non-lethal practices. In addition, there is significant evidence showing that lethal wolf management may be less functionally effective at mitigating subsequent livestock losses than non-lethal deterrents.
	Most of it	No	We appreciate the efforts of all WDNR staff involved in updating the state's wolf management plan. Although we believe the current plan needs significant updating (see next section), we recognize the efforts and improvements made to the previous plan, including: ● Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. ● There is much greater recognition of the ecological role of wolves ● The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves ● The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed)	don't like: ● The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on (see reference list below): ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution ● The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. ● The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ○ A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings. ○ Hounding or hound training, which are akin to allowing legalized dogfighting, should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public. ● The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. ○ Despite Act 169, which mandates a wolf hunting season, the department can still restrict the implementation of lethal methods by setting minimal quotas, including a quota of '0' wolves, restricting timing and methods. ○ Several studies have proven a proactive non-lethal approach leads to better conflict mitigation. ○ Lethal management often fails to provide a long-term solution to wolf predation and has the least consistent success rates when compared to non-lethal practices. In addition, there is significant evidence showing that lethal wolf management	4

				may be less functionally effective at mitigating subsequent livestock losses than non-lethal deterrents. ● The plan should require the implementation of abatement measures as well as the use of non-lethal conflict minimization techniques by domestic animal owners for the latter to receive compensation for confirmed predation. ● The plan also runs contrary to public values towards wolves (and omits mention of such majority values from the plan), despite department surveys evidencing that the broad public cares about wolves as individuals (and not just for the viability of the population). Given the recent liberalization of killing wolves by the state, it would be incredibly informative to note majority support of the following reasons for opposing a regulated wolf hunting/trapping season (which are all omitted from the plan): opposition to specific methods of harvest like hounds (64%) or traps (70%), feelings that hunting wolves is unnecessary (62%) or culturally offensive to Native American tribes (57%). ○ All such reasons convey majority disagreement with practices currently promoted and endorsed by the legislature and the WDNR, and such a conflict between managers and the public should not only be acknowledged, but foregrounded and carefully considered in policy (instead of dismissed). ○ Such decisions to omit literature or downplay evidence (e.g., such as majority opposition to killing wolves and their reasons) are contrary to principles of scientific integrity (e.g., present all relevant scientific evidence to the public) as well as ethics (e.g., disguising ethical decisions, such as recreational wolf killing, as robustly supported by science). ● Conflicting agency objectives (e.g., optimizing public hunting and conflict mitigation) are not only not acknowledged, but even misunderstood as harmonious, against the body of scientific evidence. That culminates in the prioritization of consumptive values and policies; e.g., according to the body of scientific literature, use of lethal methods, and 2 especially public hunts, are contrary to most objectives relevant to: harm mitigation, the wellbeing of wolves, their ecological roles, and their non-exploitative enjoyment (i.e., Objectives A, B, D and F). ● There is a stark lack of consideration for individual wolves, wolf population health (including wellbeing), and measurable indicators for assessing any harms barring disease prevalence (e.g., accounting for cortisol levels or other stress hormones, measures of pair/pack persistence) ● There is an inappropriate understanding and consideration of tribal worldviews about wolves. Tribal worldviews of wolves are misconstrued as 'cultural benefits' tribes receive from the existence of a wolf population, when in fact tribal worldviews consider each individual wolf as a person and relative. Cultural respect and sensitivity towards such views, shared by many non-tribal members, demand the strict mitigation of lethal measures, especially recreational killing, as opposed to their current promotion in the plan. ● In general, all omissions of scientific literature, the arbitrary prioritization of policy objectives, the rhetoric of the plan and the dismissal of public values and concerns for wolves point towards a biased, unscientific and instrumental view of wolves that promotes values contrary to broad public perspectives on wolves. ● 'SOM' wolf estimation methodology – From a recent critique: "The new methods sacrifice precision, but are believed to retain adequate accuracy and sensitivity to changing conditions for reliable decision-making. We review evidence for the accuracy, precision, and sensitivity of the new 'scaled occupancy model' (SOM) applied in Wisconsin. We conclude that the Wisconsin method would systematically overestimate wolf abundance by large (but currently incalculable) margins. Because Wisconsin, similar to other states, not only changed to unverified methods but also implemented widespread wolf killing, shortcomings in their estimates of wolf abundance may have far-reaching consequences for population viability and confidence in state wildlife managers. We discuss findings from Wisconsin alongside similar findings for other states' occupancy models being insensitive to human causes of mortality that have recently increased. Overall, Wisconsin's proposed method for estimating wolf abundance shows significant departures from best practices in scientific measurement. Verification will require independent replication and unbiased tests at multiple scales in multiple habitats under different human-induced mortality rates, and peer review before the new methods are considered reliable." (Treves & Santiago-Ávila, 2023)

Barty Thompson	Just the parts I am interested in	No	I applauded the apparent change of attitude from perceiving wolves as vermin to acknowledging their ecological value and moving away from the goal of keep maintaining as low as population as possible in Wisconsin.	They still have not included the recognition of the moral worth of wolves that are reflected by the attitudes of the majority of the people in Wisconsin and the US. THey should not be depicted as items that can be destroyed to meet desires of individuals who are so biased by their anthropocentric views that only humans matter. Wolves and wolf individuals matter a great deal. This report should be trying to achieve the goal of developing a plan that minimizes the killing or harming of wolves. As such it needs to be transparent about the need to value wolves as sentient beings. Non-lethal methods of remediation should should be the main methods with lethal methods coming only as a last resort. Recreational hunting for wolves has no place in this report. Nor does hunting with hounds/dogs or any other methods which induce more pain and harm than necessary.	2	There are some improvements, but the plan has to reflect a changed understanding of our relationship with non-humans. It is past time to recognize that wolves and other animals are intrinsically valuable and need to be treated with respect and care. This report needs to adjust its provisions to reflect this viewpoint.
Ashley Stagnari	All of it	No	We appreciate the efforts of all WDNR staff involved in updating the state's wolf management plan. Although we believe the current plan needs significant updating (see next section), we recognize the efforts and improvements made to the previous plan, including: ● Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. ● There is much greater recognition of the ecological role of wolves ● The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves ● The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed)	The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on (see reference list below): ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution ● The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. ● The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ○ A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings. ○ Hounding or hound training, which are akin to allowing legalized dogfighting, should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public. ● The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. ○ Despite Act 169, which mandates a wolf hunting season, the department can still restrict the implementation of lethal methods by setting minimal quotas, including a quota of '0' wolves, restricting timing and methods. ○ Several studies have proven a proactive non-lethal approach leads to better conflict mitigation. ○ Lethal management often fails to provide a long-term solution to wolf predation and has the least consistent success rates when compared to non-lethal practices. Beverly Foster	Just the parts I am interested in	No	The plan also runs contrary to public values towards wolves (and omits mention of such majority values from the plan), despite department surveys evidencing that the broad public cares about wolves as individuals (and not just for the viability of the population). Given the recent liberalization of killing wolves by the state, it would be incredibly informative to note majority support of the following reasons for opposing a regulated wolf hunting/trapping season (which are all omitted from the plan): opposition to specific methods of harvest like hounds (64%) or traps (70%), feelings that hunting wolves is unnecessary (62%) or culturally offensive to Native American tribes (57%). ○ All such reasons convey majority disagreement with practices currently promoted and endorsed by the legislature and the WDNR, and such a conflict between managers and the public should not only be acknowledged, but foregrounded and carefully considered in policy (instead of dismissed). ○ Such decisions to omit literature or downplay evidence (e.g., such as majority opposition to killing wolves and their reasons) are contrary to principles of scientific integrity (e.g., present all relevant scientific evidence to the public) as well as ethics (e.g., disguising ethical decisions, such as recreational wolf killing, as robustly supported by science).	Personally, I think that we should stop hunting wolves. This is 2023, not 1623 when people didn't know any better. Wolves are essential to their ecosystems. They are wise, beautiful, emotional, family-oriented, ancient creatures who deserve all the support and protection we can give them. Ranchers need to be tightly restricted in their grazing areas and if people can't keep their pets safe, they shouldn't have them. If we don't learn to live with nature, we're all animals, pretty soon, it will be too late.	3	
Joel J. Piehl	All of it	No	1. The adoption of proposed buffer zones around tribal reservations 2. There is much greater recognition of the ecological role of wolves	Overall, Wisconsin's proposed method for estimating wolf abundance shows significant departures from best practices in scientific measurement. Wisconsin, similar to other states, not only changed to unverified methods but also implemented widespread wolf killing, shortcomings in their estimates of wolf abundance may have far-reaching consequences for population viability and confidence in state wildlife managers. 1. The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. 2. A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings. 3. The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature. The scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence. 3. There is still a great deal of the ecological role of wolves that should be added. 4. The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. 5. It should include that there's a majority of public support for opposing a regulated wolf hunting/trapping season (which are all omitted from the plan): opposition to specific methods of harvest like hounds (64%) or traps (70%), feelings that hunting wolves is unnecessary (62%) or culturally offensive to Native American tribes (57%).	1	I dream for the day that the term sustainable applies to all the wild life that is NECESSARY for earth's sustainability. The wolves play a key role the balance.
Larisa Garski	All of it	No	I appreciate that the plan included a social survey and I do appreciate that the old numerical management goal has been	The draft plan misunderstands the nuanced relationship between wolves indigenous tribes. The plans lack of focus on non-lethal management tools is of profound concern.	4	
Kirsty	All of it	No	That time has been given to look at the wolf population	Any form of killing the wolves. Why not use meat baited with contraceptives if you don't want them to breed. Americans just seem to want to kill things	0	
Kathi Michalek	I have not read any of the draft plan	No				Let them be!
Kelly ODell	Just the parts I am interested in	No	I don't like anything from your so called plan	Wolf Harvesting why do u people keep killing the wolf, u invade their homes and take over their land, just as the white man took over the Indian's land. When they according to u so called government find the wolf a pain, now all of a sudden u want to lower their numbers by killing them. How cruel can u people be?		U really don't want to hear what I am thinking right about now.

Vicki Napper	Most of it	No	Your study of wolf habits and interaction with species	Specifically on page 35 "mong wolf range residents in Oregon and wolf stakeholders (i.e. issue public) in Michigan, researchers found political party affiliation to be the best predictor of attitudes toward wolves, an effect that was intensified when one's social community (e.g., friends, family) belonged to the same political party (Hamilton et al., 2020; Lute et al., 2016). In both studies, politically conservative identities were more likely to hold negative attitudes toward wolves" Seriously, if political party is the driving factor of deciding how to educate people about wolves, then it will be highly skewed. A focus on social groups seems to be more of a significant factor.	8	I did not see a strong connection between what the various Tribes held to be important and the overall management plan for wolves. Statistical data doesn't seem to be the best factor for determining overall kill rate (aka "harvesting"..these are not plants). Management of wolves by area of influence is difficult but needs to be a highly considered factor. Also timing of hunts to minimize distruption to pack heirarchy. There are many factors that contribute toward wolf mortality beyond human presence/harvesting that need to be more highly considered.
Steve Hughes	I have not read any of the draft plan	No	None of it.	All of it.	0	What right have you got to kill intelligent, sociable, and family orientated animals? Wolves are being persecuted due to the lies of ranchers and farmers. Mother Nature dictates wolf populations. Conservation does NOT start with a high powered rifle or other nefarious methods!!
james massmann	Just the parts I am interested in	Yes	zero	most	1	I want the wolf numbers down to 3-400 in the entire state of wi.
D. Corsiglia	Most of it	No	● Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. ● There is much greater recognition of the ecological role of wolves ● The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves ● The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed)	It does not reflect best available science and is missing a substantial amount of scientific literature; it is biased and runs contrary to scientific evidence; The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life; The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence; The plan should require the implementation of abatement measures as well as the use of non-lethal conflict minimization techniques by domestic animal owners for the latter to receive compensation for confirmed predation; The plan also runs contrary to public values towards wolves;	4	
	I have not read any of the draft plan	No				We need to protect these wolves and not have humans gun them down with helicopters and hunting. There should be preservation land where they can establish their habitat and live free without fear of being killed. Only legislation can provide this protection because these laws passed by congress would ultimately be the voice of these harmless species to protect these wolves
Ayce Knutson	All of it	Yes	What we like: We appreciate the efforts of all WDNR staff involved in updating the state's wolf management plan. Although we believe the current plan needs significant updating (see next section), we recognize the efforts and improvements made to the previous plan, including: ● Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. ● There is much greater recognition of the ecological role of wolves ● The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves ● The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed)	What we don't like: ● The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on (see reference list below): ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution ● The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. ● The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ○ A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings. ○ Hounding or hound training, which are akin to allowing legalized dogfighting, should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public. ● The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. ○ Despite Act 169, which mandates a wolf hunting season, the department can still restrict the implementation of lethal methods by setting minimal quotas, including a quota of '0' wolves, restricting timing and methods. ○ Several studies have proven a proactive non-lethal approach leads to better conflict mitigation. ○ Lethal management often fails to provide a long-term solution to wolf predation and has the least consistent success rates when compared to non-lethal practices. In addition, there is significant evidence showing that lethal wolf management may be less functionally effective at mitigating subsequent livestock losses than non-lethal deterrents. ● The plan should require the implementation of abatement measures as well as the use of non-lethal conflict minimization techniques by domestic animal owners for	2	PROTECT our precious, iconic and ESSENTIAL WOLVES at all costs. It is time to ban hunting and only use non-lethal methods.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
				the latter to receive compensation for confirmed predation. ● The plan also runs contrary to public values towards wolves (and omits mention of such majority values from the plan), despite department surveys evidencing that the broad public cares about wolves as individuals (and not just for the viability of the population). Given the recent liberalization of killing wolves by the state, it would be incredibly informative to note majority support of the following reasons for opposing a regulated wolf hunting/trapping season (which are all omitted from the plan): opposition to specific methods of harvest like hounds (64%) or traps (70%), feelings that hunting wolves is unnecessary (62%) or culturally offensive to Native American tribes (57%). ○ All such reasons convey majority disagreement with practices currently promoted and endorsed by the legislature and the WDNR, and such a conflict between managers and the public should not only be acknowledged, but foregrounded and carefully considered in policy (instead of dismissed). ○ Such decisions to omit literature or downplay evidence (e.g., such as majority opposition to killing wolves and their reasons) are contrary to principles of scientific integrity (e.g., present all relevant scientific evidence to the public) as well as ethics (e.g., disguising ethical decisions, such as recreational wolf killing, as robustly supported by science). ● Conflicting agency objectives (e.g., optimizing public hunting and conflict mitigation) are not only not acknowledged, but even misunderstood as harmonious, against the body of scientific evidence. That culminates in the prioritization of consumptive values and policies; e.g., according to the body of scientific literature, use of lethal methods, and 2 especially public hunts, are contrary to most objectives relevant to: harm mitigation, the wellbeing of wolves, their ecological roles, and their non-exploitative enjoyment (i.e., Objectives A, B, D and F). ● There is a stark lack of consideration for individual wolves, wolf population health (including wellbeing), and measurable indicators for assessing any harms barring disease prevalence (e.g., accounting for cortisol levels or other stress hormones, measures of pair/pack persistence) ● There is an inappropriate understanding and consideration of tribal worldviews about wolves. Tribal worldviews of wolves are misconstrued as 'cultural benefits' tribes receive from the existence of a wolf population, when in fact tribal worldviews consider each individual wolf as a person and relative. Cultural respect and sensitivity towards such views, shared by many non-tribal members, demand the strict mitigation of lethal measures, especially recreational killing, as opposed to their current promotion in the plan. ● In general, all omissions of scientific literature, the arbitrary prioritization of policy objectives, the rhetoric of the plan and the dismissal of public values and concerns for wolves point towards a biased, unscientific and instrumental view of wolves that promotes values contrary to broad public perspectives on wolves. ● 'SOM' wolf estimation methodology – From a recent critique: "The new methods sacrifice precision, but are believed to retain adequate accuracy and sensitivity to changing conditions for reliable decision-making. We review evidence for the accuracy, precision, and sensitivity of the new 'scaled occupancy model' (SOM) applied in Wisconsin. We conclude that the Wisconsin method would systematically overestimate wolf abundance by large (but currently incalculable) margins. Because Wisconsin, similar to other states, not only changed to unverified methods but also implemented widespread wolf killing, shortcomings in their estimates of wolf abundance may have far-reaching consequences for population viability and confidence in state wildlife managers. We discuss findings from Wisconsin alongside similar findings for other states' occupancy models being insensitive to human causes of mortality that have recently increased. Overall, Wisconsin's proposed method for estimating wolf abundance shows significant departures from best practices in scientific measurement. Verification will require independent replication and unbiased tests at multiple scales in multiple habitats under different human-induced mortality rates, and peer review before the new methods are considered reliable." (Treves & Santiago-Ávila, 2023)		
Val	Most of it	No	The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. ○ Despite Act 169, which mandates a wolf hunting season, the department can still restrict the implementation of lethal methods by setting minimal quotas, including a quota of '0' wolves, restricting timing and methods. ○ Several studies have proven a proactive non-lethal approach leads to better conflict mitigation. ○ Lethal management often fails to provide a long-term solution to wolf predation and	I think there are far more ethical, researched, and effective practices when it comes to the treatment and or/containment of wolves. Many of the 'hunting' practices and or wolf management practices due to so-called 'predation' are inhumane, illogical, and unwarranted. Wolves are sentient creatures and do what wolves do...just as any other creature living a natural life in the wild.	5	As a NYS resident, one.of the states becoming ridiculously more and.more.lax with criminal laws...it's really a joke. Commit a crime and get released two hours later because, You didn't mean to do it..jails.overvrowded, and just simply because of the bleeding heart liberals running things...suffice it to say....WOLVES should just be let alone to live. They don't commit half of the atrocities that humans do. Wolves are living as intended as wild animals. Just let them be.

				wolf predation and has the least consistent success rates when compared to non-lethal practices. In addition, there is significant evidence showing that lethal wolf management may be less functionally effective at mitigating subsequent livestock losses than non-lethal deterrents. ● The plan should require the implementation of abatement measures as well as the use of non-lethal conflict minimization techniques by domestic animal owners for the latter to receive compensation for confirmed predation. ● The plan also runs contrary to public values towards wolves (and omits mention of such majority values from the plan), despite department surveys evidencing that the broad public cares about wolves as individuals (and not just for the viability of the population). Given the recent liberalization of killing wolves by the state, it would be incredibly informative to note majority support of the following reasons for opposing a regulated wolf hunting/trapping season (which are all omitted from the plan): opposition to specific methods of harvest like hounds (64%) or traps (70%), feelings that hunting wolves is unnecessary (62%) or culturally offensive to Native American tribes (57%). ○ All such reasons convey majority disagreement with practices currently promoted and endorsed by the legislature and the WDNR, and such a conflict between managers and the public should not only be acknowledged, but foregrounded and carefully considered in policy (instead of dismissed). ○ Such decisions to omit literature or downplay evidence (e.g., such as majority opposition to killing wolves and their reasons) are contrary to principles of scientific integrity (e.g., present all relevant scientific evidence to the public) as well as ethics (e.g., disguising ethical decisions, such as recreational wolf killing, as robustly supported by science). ● Conflicting agency objectives (e.g., optimizing public hunting and conflict mitigation) are not only not acknowledged, but even misunderstood as harmonious, against the body of scientific evidence. That culminates in the prioritization of consumptive values and policies; e.g., according to the body of scientific literature, use of lethal methods, and 2 especially public hunts, are contrary to most objectives relevant to: harm mitigation, the wellbeing of wolves, their ecological roles, and their non-exploitative enjoyment (i.e., Objectives A, B, D and F). ● There is a stark lack of consideration for individual wolves, wolf population health (including wellbeing), and measurable indicators for assessing any harms barring disease prevalence (e.g., accounting for cortisol levels or other stress hormones, measures of pair/pack persistence) ● There is an inappropriate understanding and consideration of tribal worldviews about wolves. Tribal worldviews of wolves are misconstrued as 'cultural benefits' tribes receive from the existence of a wolf population, when in fact tribal worldviews consider each individual wolf as a person and relative. Cultural respect and sensitivity towards such views, shared by many non-tribal members, demand the strict mitigation of lethal measures, especially recreational killing, as opposed to their current promotion in the plan. ● In general, all omissions of scientific literature, the arbitrary prioritization of policy objectives, the rhetoric of the plan and the dismissal of public values and concerns for wolves point towards a biased, unscientific and instrumental view of wolves that promotes values contrary to broad public perspectives on wolves. ● 'SOM' wolf estimation methodology – From a recent critique: "The new methods sacrifice precision, but are believed to retain adequate accuracy and sensitivity to changing conditions for reliable decision-making. We review evidence for the accuracy, precision, and sensitivity of the new 'scaled occupancy model' (SOM) applied in Wisconsin. We conclude that the Wisconsin method would systematically overestimate wolf abundance by large (but currently incalculable) margins. Because Wisconsin, similar to other states, not only changed to unverified methods but also implemented widespread wolf killing, shortcomings in their estimates of wolf abundance may have far-reaching consequences for population viability and confidence in state wildlife managers. We discuss findings from Wisconsin alongside similar findings for other states' occupancy models being insensitive to human causes of mortality that have recently increased. Overall, Wisconsin's proposed method for estimating wolf abundance shows significant departures from best practices in scientific measurement. Verification will require independent replication and unbiased tests at multiple scales in multiple habitats under different human-induced mortality rates, and peer review before the new methods are considered reliable." (Treves & Santiago-Ávila, 2023)		
Dawn Mello	I have not read any of the draft plan	No	I tried to upload it and nothing happened. There was no draft plan to read. But if it's killing wolves and cubs then I disagree.	You people selling wolves lives. God created them.	0	All you have to do to stop wolves from killing livestock is: 1. Playing a recording of wolves howling. It's been proven to work. I don't think you people want to make it work. 2. Protect livestock by fencing them in electrical fences. But no they go near the wolf's den and taunt them. They're animal's that survive by killing other animals. Not for greed or profit like you people. 3. Just leave them alone.

	Just the parts I am interested in	Yes	I feel the DNR is trying to be fair to all the diverse opinions and needs of the State regarding wolves	I oppose a mandated wolf hunt in Wisconsin.This option should be eliminated from the wolf management plan.. The public has indicated they want a larger Wolf population..When the wolves were reintroduced into the Yellowstone area in 1995 they improved and stabilized the entire habitat for a diverse range of wildlife by reducing the elk populations which were eating the trees.Coyote populations were also reduced by as much as 50%inI some areas which in turn increased the populations of of pronghorn and red fox. When the trees restored,the entire ecosystem improved. The wolves reintroduction was a success! We have an abundance of deer in our state. I know many people that have had their vehicles destroyed by run-ins with deer in our area. It is almost impossible to get loaner cars or get a damaged car fixed in reasonable time because of the proliferation of the deer encounter tees. Wolves help to reduce th We need them to increase their range and balance our deer overpopulation. !!.That s counter productive and not solving any problems. If predating livestock isa an issue, that cane managed with compensation .I ask you to DELETE the option for a mandated hunt. It is counterproductive and unnecessary, and will result in overkill,which was the unfortunate result of the last mandated hunt.	5	A well advertised program of compensation, along with education of the crucial role the wolf plays in our ecosystem would be the best solution to educate the public (in schools, and other public venues)and gain publicr support for a healthy wolf population in our state.
Ragnar Sigurdsson	All of it	Yes	What we like: We appreciate the efforts of all WDNR staff involved in updating the state's wolf management plan. Although we believe the current plan needs significant updating (see next section), we recognize the efforts and improvements made to the previous plan, including: ● Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. ● There is much greater recognition of the ecological role of wolves ● The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves ● The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed)	What we don't like: ● The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on (see reference list below): ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution ● The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. ● The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ○ A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings. ○ Hounding or hound training, which are akin to allowing legalized dogfighting, should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public. ● The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. ○ Despite Act 169, which mandates a wolf hunting season, the department can still restrict the implementation of lethal methods by setting minimal quotas, including a quota of '0' wolves, restricting timing and methods. ○ Several studies have proven a proactive non-lethal approach leads to better conflict mitigation. ○ Lethal management often fails to provide a long-term solution to wolf predation and has the least consistent success rates when compared to non-lethal practices. In addition, there is significant evidence showing that lethal wolf management may be less functionally effective at mitigating subsequent livestock losses than non-lethal deterrents. ● The plan should require the implementation of abatement measures as well as the use of non-lethal conflict minimization techniques by domestic animal owners for the latter to receive compensation for confirmed predation. ● The plan also runs contrary to public values towards wolves (and omits mention of such majority values from the plan), despite department surveys evidencing that the broad public cares about wolves as individuals (and not just for the viability of the population). Given the recent liberalization of killing wolves by the state, it would be incredibly informative to note majority support of the following reasons for opposing a regulated wolf hunting/trapping season (which are all omitted from the plan): opposition to specific methods of harvest like hounds (64%) or traps (70%), feelings that hunting wolves is unnecessary (62%) or culturally offensive to Native American tribes (57%). ○ All such reasons convey majority disagreement with practices currently promoted and endorsed by the legislature and the WDNR, and such a conflict between managers and the public should not only be acknowledged, but foregrounded and carefully considered in policy (instead of dismissed). ○ Such decisions to omit literature or downplay evidence (e.g., such as majority opposition to killing wolves and their reasons) are contrary to principles of scientific integrity (e.g., present all relevant scientific evidence to the public) as well as ethics (e.g., disguising ethical decisions, such as recreational wolf killing, as robustly supported by science). ● Conflicting agency objectives (e.g., optimizing public hunting and conflict mitigation) are not only not	2	PROTECT our precious iconic ESSENTIAL WOLVES at all costs!

Polly Schneck	Most of it	No	1) Wolves in WI will no longer be managed by reference to the old numerical goal of 350wolves. 2) There is much greater recognition of the ecological role of wolves 3) The adoption of proposed buffer zones around tribal reservations 3) The inclusion of a social survey, which notes increased positive views of wolves,knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves	1) Scientific omissions (see more below), combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence. Much of the omitted scientific evidence is more recent, thorough (there's more of it) and of stronger inference. 2) The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life.oA substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings. 3) Hounding or hound training, which are akin to allowing legalized dog fighting, should be illegal, as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public. 4) The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence.oDespiteAct 169, which mandates a wolf hunting season, the department can still restrict the implementation of lethal methods by setting minimal quotas, includinga quota of '0' wolves, restricting timing and methods.oSeveral studies have proven a proactive non-lethal approach leads to betterconflict mitigation.oLethal management often fails to provide a long-term solution to wolf predation and has the least consistent success rates when compared to non-lethal practices.In addition, there is significant evidence showing that lethal wolf management may be less functionally effective at mitigating subsequent livestock losses than non-lethal deterrents. 5) The plan should require the implementation o abatement measures as well as the use ofnon-lethal conflict minimization techniques by domestic animal owners for the latter to receive compensation for confirmed predation. 6) The plan also runs contrary to public values towards wolves(and omits mention of suchmajority values from the plan), despite department surveys evidencing that the broad public cares about wolves as individuals (and not just for the viability of the population). Given the recent liberalization of killing wolves by the state, it would be incredibly informative to note majority support of the following reasons for opposing a regulated wolf hunting/trapping season (which are all omitted from the plan): opposition to specific methods of harvest like hounds (64%) or traps (70%), feelings that hunting wolves is unnecessary (62%) or culturally offensive to Native American tribes (57%). All such reasons convey majority disagreement with practices currently promoted and endorsed by the legislature and the WDNR, and such a conflict between managers and the public should not only be acknowledged, but foregrounded and carefully considered in policy (instead of dismissed).Such decisions to omit literature or downplay evidence (e.g., such as majority opposition to killing wolves and their reasons) are contrary to principles of scientific integrity (e.g., present all relevant scientific evidence to the public) as well as ethics (e.g., disguising ethical decisions, such as recreational wolf killing,as robustly supported by science). 7) Conflicting agency objectives (e.g., optimizing public hunting and conflict mitigation) are not only not acknowledged, but also misunderstood as harmonious, against the body of scientific evidence. That culminates in the prioritization of consumptive values and policies; e.g., according to the body of scientific literature,use of lethal methods, and especially public hunts, are contrary to most objectives relevant to: harm mitigation, the wellbeing of wolves, their ecological roles, and their non-exploitative enjoyment (i.e.,Objectives A, B, D and F). 8) There is a stark lack of consideration for individual wolves, wolf population health (including wellbeing), and measurable indicators for assessing any harms barring diseaseprevalence (e.g.,accounting for cortisol levels or other stress hormones,measures ofpair/pack persistence). 9) In general, all omissions of scientific literature, the arbitrary prioritization of policy objectives, the rhetoric of the plan and the dismissal of public values and concerns for wolves point towards a biased, unscientific and instrumental view of wolves that promotes values contrary to broad public perspectives on wolves. 10) 'SOM' wolf estimation methodology – From a recent critique: "The new methods sacrifice precision, but are believed to retain adequate accuracy and sensitivity to changing conditions for reliable decision-making. We review evidence for the accuracy,precision, and sensitivity of the new 'scaled occupancy model' (SOM) applied in Wisconsin. We conclude that the Wisconsin method would systematically overestimate wolf abundance by large (but currently incalculable) margins. Because Wisconsin, similar to other states, not only changed to unverified methods but also implemented widespread wolf killing, shortcomings in their estimates of wolf abundance may have far-reaching consequences for population viability and confidence in state wildlife managers. Findings from Wisconsin,	1	

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
				alongside similar findings for other states' occupancy models, are insensitive to human causes of mortality that have recently increased.Overall, Wisconsin's proposed method for estimating wolf abundance shows significant departures from best practices in scientific measurement. Verification will require independent replication and unbiased tests at multiple scales in multiple habitats under different human-induced mortality rates, and peer review before the new methods arec onsidered reliable." (Treves & Santiago-Ávila, 2023) 10) The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on (see reference list below):ɔwolf ethology, sentience, sapience, sociability, agency and well beingɔeffectiveness of non-lethal interventions, especially relative to lethal onesɔthe impact of widespread killing on wolves' physiology, behavior, well being,social dynamics,ecological relationships and evolution. Donna Logsdon	Just the parts I am interested in	No	That it recognizes that the wolves have an integral part to play in maintaining a healthy ecosystem.	I am a chemist and I found the scientific credibility to it sketchy. It doesn't reflect a sound professional treatment. Instead things are left out and not presented in a scientifically credible way. Also hounding should not even be an issue. We are far beyond allowing that cruelty. Also disappointed it did not even mention how the public values wolves and all wildlife on THEIR public lands.	2	Please consider a non lethal approach as studies have proven that produces optimal conflict mitigation.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Sindy Schalon	All of it	No	There has been improvement over previous plans, but not enough.	The science does NOT support the killing of wolves.	2	In general, all omissions of scientific literature, the arbitrary prioritization of policy objectives, the rhetoric of the plan and the dismissal of public values and concerns for wolves point towards a biased, unscientific and instrumental view of wolves that promotes values contrary to broad public perspectives on wolves.
Lisa Lashawayt	Just the parts I am interested in	No	What we like: We appreciate the efforts of all WDNR staff involved in updating the state's wolf management plan. Although we believe the current plan needs significant updating (see next section), we recognize the efforts and improvements made to the previous plan, including: ● Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. ● There is much greater recognition of the ecological role of wolves ● The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves ● The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed)	What we don't like: ● The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on (see reference list below): ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution ● The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. ● The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ○ A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings.	4	Please consider all options that come from compassion, kindness to all animals.
	I have not read any of the draft plan	No	Only to Stop killing, SLAUGHTERING, murdering wolf's.	That wolf's are not killed.	10	Why can't you just get a way to Stop SLAUGHTERING animals and wolf's. They were here first.
Nancy Dean	Most of it	No	Non lethal methods to prevent predation of livestock	Do not like traps because many of today's people don't check frequently enough ex daily.	7	Would like relocation to areas where populations are diminished. Do not want hunts from helicopters like have happened other places. Do not want explosives used like has occurred other places, rescues and protected areas could be utilized. These are a keystone species. Wildlife should not be chased away from areas with wolves because this increases likelihood of livestock predication.
Olga Kim	All of it	No	● Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. ● There is much greater recognition of the ecological role of wolves ● The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves ● The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed)	● The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on (see reference list below): ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution ● The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. ● The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ○ A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings. ○ Hounding or hound training, which are akin to allowing legalized dogfighting, should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public. ● The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. ○ Despite Act 169, which mandates a wolf hunting season, the department can still restrict the implementation of lethal methods by setting minimal quotas, including a quota of '0' wolves, restricting timing and methods. ○ Several studies have proven a proactive non-lethal approach leads to better conflict mitigation. ○ Lethal management often fails to provide a long-term solution to wolf predation and has the least consistent success rates when compared to non-lethal practices. In addition, there is significant evidence showing that lethal wolf management may be less functionally effective at mitigating subsequent livestock losses than non-lethal deterrents. ● The plan should require the implementation of abatement measures as well as the use of non-lethal conflict minimization techniques by domestic animal owners for the latter to receive compensation for confirmed predation. ● The plan also runs contrary to public values towards wolves (and omits mention of such majority values from the plan), despite department surveys evidencing that the broad public cares about wolves as individuals (and not just for the viability of the population). Given the recent liberalization of killing wolves by the state, it would be incredibly informative to note majority support of the following reasons for opposing a	3	

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
				regulated wolf hunting/trapping season (which are all omitted from the plan): opposition to specific methods of harvest like hounds (64%) or traps (70%), feelings that hunting wolves is unnecessary (62%) or culturally offensive to Native American tribes (57%). ○ All such reasons convey majority disagreement with practices currently promoted and endorsed by the legislature and the WDNR, and such a conflict between managers and the public should not only be acknowledged, but foregrounded and carefully considered in policy (instead of dismissed). ○ Such decisions to omit literature or downplay evidence (e.g., such as majority opposition to killing wolves and their reasons) are contrary to principles of scientific integrity (e.g., present all relevant scientific evidence to the public) as well as ethics (e.g., disguising ethical decisions, such as recreational wolf killing, as robustly supported by science). ● Conflicting agency objectives (e.g., optimizing public hunting and conflict mitigation) are not only not acknowledged, but even misunderstood as harmonious, against the body of scientific evidence. That culminates in the prioritization of consumptive values and policies; e.g., according to the body of scientific literature, use of lethal methods, and 2 especially public hunts, are contrary to most objectives relevant to: harm mitigation, the wellbeing of wolves, their ecological roles, and their non-exploitative enjoyment (i.e., Objectives A, B, D and F). ● There is a stark lack of consideration for individual wolves, wolf population health (including wellbeing), and measurable indicators for assessing any harms barring disease prevalence (e.g., accounting for cortisol levels or other stress hormones, measures of pair/pack persistence) ● There is an inappropriate understanding and consideration of tribal worldviews about wolves. Tribal worldviews of wolves are misconstrued as 'cultural benefits' tribes receive from the existence of a wolf population, when in fact tribal worldviews consider each individual wolf as a person and relative. Cultural respect and sensitivity towards such views, shared by many non-tribal members, demand the strict mitigation of lethal measures, especially recreational killing, as opposed to their current promotion in the plan. ● In general, all omissions of scientific literature, the arbitrary prioritization of policy objectives, the rhetoric of the plan and the dismissal of public values and concerns for wolves point towards a biased, unscientific and instrumental view of wolves that promotes values contrary to broad public perspectives on wolves. ● 'SOM' wolf estimation methodology – From a recent critique: "The new methods sacrifice precision, but are believed to retain adequate accuracy and sensitivity to changing conditions for reliable decision-making. We review evidence for the accuracy, precision, and sensitivity of the new 'scaled occupancy model' (SOM) applied in Wisconsin. We conclude that the Wisconsin method would systematically overestimate wolf abundance by large (but currently incalculable) margins. Because Wisconsin, similar to other states, not only changed to unverified methods but also implemented widespread wolf killing, shortcomings in their estimates of wolf abundance may have far-reaching consequences for population viability and confidence in state wildlife managers. We discuss findings from Wisconsin alongside similar findings for other states' occupancy models being insensitive to human causes of mortality that have recently increased. Overall, Wisconsin's proposed method for estimating wolf abundance shows significant departures from best practices in scientific measurement. Verification will require independent replication and unbiased tests at multiple scales in multiple habitats under different human-induced mortality rates, and peer review before the new methods are considered reliable." (Treves & Santiago-Ávila, 2023)		
Johanna	I have not read any of the draft plan	No				Wolves have to be able to exist and live from Canada down to Mexico. There should be an American effort to support a wolf corridor through our states. We need to protect and support this incredible intelligent animal to manage the land that humans dont live on.
Mary Margaret OConnell	Most of it	No	Limits on killing wolves	Authorizes killing wolves		Protect wolves
ENRICO PETER BARTOCETTI	All of it	No	Realization of the importance of the species	The management of hunting or killing of wolves.	7	
Maryanne deGoede	I have not read any of the draft plan	No	Not sure because I have not read it but if it involves killing wolves, I don't like it. How about electric fences for protection of animals?	Not sure but if you get creative you can achieve more than by just repeating past solutions. I don't think killing should always be the solution. It is counterproductive. It leads to more killing.	1	I am praying for the earth and its creatures. Animals are the life of the land. We will be lonely without them.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Allyson	Most of it	No	I like the facts about the Wisconsin wolves.	Mainly the length. Would be a bit easier to navigate if the page of where each section starts	5	I just hope wolf hunting, killing, trapping slows down significantly. We could easily relocate wolves into areas that need the population and yet they're killed
Amber Crose	All of it	No	I like that Wisconsin is trying to find a way to coexist with wolves and disrupt their natural habitat as much as possible.	I dislike and firmly disagree with any legal wolf hunting, culling or loss of wolf life.	3	Solutions should include better livestock management, fewer factory farms and humane deterrence. Hunting, killing or culling wolf populations in the United States is unacceptable. These animals deserve to live in their natural habitat. We are the invasive species.
gary d	Just the parts I am interested in	No	improvements over previous iterations	The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life	7	
	Most of it	No	We appreciate the efforts of all WDNR staff involved in updating the state's wolf management plan. Although we believe the current plan needs significant updating (see next section), we recognize the efforts and improvements made to the previous plan, including: ● Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. ● There is much greater recognition of the ecological role of wolves ● The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves ● The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed)	What we don't like: ● The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on (see reference list below): ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution ● The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. ● The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ○ A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings. ○ Hounding or hound training, which are akin to allowing legalized dogfighting, should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public. ● The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. ○ Despite Act 169, which mandates a wolf hunting season, the department can still restrict the implementation of lethal methods by setting minimal quotas, including a quota of '0' wolves, restricting timing and methods. ○ Several studies have proven a proactive non-lethal approach leads to better conflict mitigation. ○ Lethal management often fails to provide a long-term solution to wolf predation and has the least consistent success rates when compared to non-lethal practices. In addition, there is significant evidence showing that lethal wolf management may be less functionally effective at mitigating subsequent livestock losses than non-lethal deterrents. ● The plan should require the implementation of abatement measures as well as the use of non-lethal conflict minimization techniques by domestic animal owners for the latter to receive compensation for confirmed predation. ● The plan also runs contrary to public values towards wolves (and omits mention of such majority values from the plan), despite department surveys evidencing that the broad public cares about wolves as individuals (and not just for the viability of the population). Given the recent liberalization of killing wolves by the state, it would be incredibly informative to note majority support of the following reasons for opposing a regulated wolf hunting/trapping season (which are all omitted from the plan): opposition to specific methods of harvest like hounds (64%) or traps (70%), feelings that hunting wolves is unnecessary (62%) or culturally offensive to Native American tribes (57%). ○ All such reasons convey majority disagreement with practices currently promoted and endorsed by the legislature and the WDNR, and such a conflict between managers and the public should not only be acknowledged, but foregrounded and carefully considered in policy (instead of dismissed). ○ Such decisions to omit literature or downplay evidence (e.g., such as majority opposition to killing wolves and their reasons) are contrary to principles of scientific integrity (e.g., present all relevant scientific evidence to the public) as well as ethics (e.g., disguising ethical decisions, such as recreational wolf killing, as robustly supported by science). ● Conflicting agency objectives (e.g., optimizing public hunting and conflict mitigation) are not only not acknowledged, but even misunderstood as harmonious, against the body of scientific evidence. Thomas Artin	Just the parts I am interested in	No				I strongly support protections for wolves.
						LEAVE OUR WOLVES ALONE!! GOD DID NOT PUT THEM HERE ON THIS EARTH TO BE SLAUGHTERED BY A MERE HANDFUL OF STUPID REDNECK INFIDELS, AS THE VAST MAJORITY REVERES OUR FOUR-LEGGED RELATIVES VERY SACRED!!!

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Frederick A Mathwig	Most of it	Yes	that wolves can be managed through multiple methods, ie. in areas of conflict, with deprivation of livestock, dogs etc.	no set minimal number that is acceptable lack of hunters needs and desires being met as it relates to deer populations and hunter satisfaction not giving a weighted consideration for those of us living in wolf country vs non wolf country residents no major consideration for the negative economic impact it has on northern communities as relates to major reduction in deer densities word salad obviously developed by a bunch of attorneys more consideration given to pro wolf groups and tribes than those with different views	3	need to have specific number of wolves not open ended a number that was originally proposed of 350 animals! acknowledge the findings of others who have extensively studied wolves in Minnesota where the northern deer herd has been decimated by wolves to 2 or less deer per square mile Dr.Ken Nordberg no mention of thrill killing by wolves in number of deer killed killed annually by a single wolf they do take down healthy animals as our group has witness by observing wolves chasing perfectly healthy animals maybe if we had ads showing wolf deprivation i.e. a mangled dog or deer the general public would have a different view of wolves instead of this playful non threatening animal on tv ads if numbers of wolves left unchecked disease could have very debilitating effects i.e. sarcoptic mange etc
Becky Scholze	All of it	Yes	The plan removes a numeric population goal: Removing an arbitrary wolf population goal is important to make sure the numbers of wolves are adaptable, so they can be based on best-available science and ecological changes.	The plan currently allows hound training during the wolf hunting season across the state until the last zone is closed. The DNR needs to better regulate hound training on wolves. Training season should close in each zone as it is closed for hunting, and not remain open everywhere until the last zone closes.	9	
Cynthia Samels	Most of it	Yes	The non-numeric population goal The greater recognition of the ecological benefits of wolves as a vital keystone species The proposed buffer zones around tribal reservations The use of zone-specific harvest permits Low quota zones are an important and welcome addition to the plan Emphasis on public education that is desperately needed The plan is reflective of the overall positive public opinions survey about wolves in Wisconsin * Overall this plan centers on science, public input, and Tribal engagement- the core tenets of the best way to protect, conserve, and sustain our shared natural resources.	The plan fails to prioritize opportunities for non lethal alternatives to reduce wolf-livestock conflicts No mention of the need to revisit and update the plan on a regular basis with incoming and new scientific data Two permanent and separate committees (one stakeholder AND one science based) should be appointed. The scientific oversight is critical. The plan currently allows hound training during the wolf hunting season across the state until the very last zone is closed. The DNR should better regulate hound training on wolves. Training seasons should close in each zone as it is closed for hunting, and not remain open everywhere until the last zone closes. There is need for separate private and public land harvest permits to ensure that harvest does not come predominantly from core areas of public land. This was a very big issue in the Feb season. The plan should allow the DNR to create temporary (very low quota) CWD zones when the disease appears in new areas to maximize the opportunity to keep it from spreading. CWD will have easier encroachment to the north if the government wolf population is reduced. Western Lincoln County is now in zone 3 and should be in zones 1 or 2 due to high quality habitat. Lone wolves should be clarified and not considered to be their own pack as this is most often a temporary, not a life-long, condition.	9	Thank you FROM ZONE 1A for focusing on the science and emphasizing education! We love our wolves and would prefer they not be hunter at all, especially since a carrying capacity has never had a chance to be determined. And certainly not with the use of dogs. We understand that is, as of now, not under your purview.
Cynthia Samels	Most of it	Yes	The non-numeric population goal The greater recognition of the ecological benefits of wolves as a vital keystone species The proposed buffer zones around tribal reservations The use of zone-specific harvest permits Low quota zones are an important and welcome addition to the plan Emphasis on public education that is desperately needed The plan is reflective of the overall positive public opinions survey about wolves in Wisconsin * Overall this plan centers on science, public input, and Tribal engagement- the core tenets of the best way to protect, conserve, and sustain our shared natural resources. We understand that is, as of now, not under your purview.
	All of it	Yes			1	The wolf quota needs to be lowered.
	Most of it	No	Tribal consult, attempt for non-lethal mitigation, public education, appreciation for wolves role as critical apex predator in complex ecosystem	1) Indiscriminate killing. Wolves have highly complex social dynamics. Packs are 73% more likely to dissolve if the pack leader dies of human-related causes. Destabilized packs lead to increased livestock depredation. 2) unclear plan for dealing with poaching and cruel trapping/snaring 3) no clear addressing of wolves historically being chased down by vehicles, dogs, and helicopters or pups being killed in dens	7	
Robert Koepcke	Just the parts I am interested in	Yes	Removing an arbitrary population goal; involvement of various interest groups; low quota zones; quantifies wolf attacks on humans and pet animals; mitigation of wolf livestock damage including non-lethal methods.		9	I may have missed it, but is there any mention of restricting the hound hunting of wolves? Or is such for future consideration?

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Dan Laskowski	Most of it	Yes	The fact that the DNR finally came through and came up with a wolf plan in order to satisfy the federal level so we can finally get the wolf de-listed again and legally manage them.	I do not support the new wolf plan as there are many flaws in it. What we need to do is start working together as a team instead of ignoring the issues of the ever increasing wolf population in order for our wolf management plan to be successful. All elected officials, who include our legislators, need to be involved and should be pushing for a sound wolf management plan. Wisconsin should seize the opportunity to be the example for all the wolf inhabited states by having a plan that has a wolf population, but that is grounded in reality and not at the expense of its citizens. Wisconsin has well surpassed the federal requirements to have them delisted as an endangered species, so the state should be focusing their effort on getting them delisted so they can manage them appropriately. If you were to ask me what I think the number of wolves should be in the state I would tell you "0", because I have been an avid deer hunter in the northern most part of Wisconsin, and have been a landowner in Bayfield County for the past 29 years. My opinion is one extreme and is a very selfish and an irresponsible one at that. And if you were to talk to the anti-hunters, which were the majority speaking during the public input session, you would get that no wolves should be harmed, which is the other extreme and also a very selfish and irresponsible opinion. The difference is I get and understand that there is a need for the wolf, but it needs to be managed like all other natural resources, which the anti's will never agree with. They have their own personal agenda and do not really care about the natural resource in itself; if they did they would realize the wolf needs to be managed and should only inhabit areas that are conducive to their life style. It would not be healthy for the public nor the wolf to inhabit urban areas in southern Wisconsin, even though I would love to send them all to Madison and release them like DeSantis did the illegal immigrants to New York to help prove a point. There also should not be buffer zones around the Indian reservations, correct me if I'm wrong but I thought that is what the reservation was for, so that anything contained on the reservation would be protected and managed just as the Native Americans would like and what was agreed upon way back when the treaties were first signed. That makes no sense, especially for those of us who own land that fall into these area's, now you are going to try and tell us we can't legally hunt our own land if given the opportunity for a permit, that is ridiculous! Then we should not have to pay property taxes if we can't exercise the right to legally harvest game because we are located in this presumed buffer zone. The wolf has all but eliminated the whitetail deer where my property is located in the sand river bottoms. I have been hunting this area since 1993 and never have I seen such an abuse of a natural resource. In 2018 I met the wolf biologist (at least I think he was, he was hired by Red Cliff to track the wolves in Bayfield county for 1 year) and he told me that at the time the Echo Valley pack was the largest in Bayfield county (18), the second largest was the Lost Creek pack around Cornucopia which is only 10 miles from me. So if that amount of wolves cleared out this area in the last 5 years or so and now we can't harvest them, what good is my place as a deer camp?? Who would ever want to buy it???? Will I get reimbursed for what the state has allowed the wolf to do to my property value because there are no deer left? Out of the 29 years of hunting deer in Bayfield county, in the past 20 years I averaged at least 4 weeks a year hunting here, this year for 5 weeks straight and sadly only saw 4 bucks and a doe and fawn, I am so embarrassed to report that but it's the truth and there were only 2 days (one for rain and one for snow) that I did not hunt out of all that time. The last 4 years I have hunted out of state (Iowa, Kansas, Canada, & Minnesota) and still spent at least 4 weeks at my cabin, I never thought the day would come where I would have to hunt anywhere else just to see some deer, but it has happened. Of all of the places and states that I have ever hunted, Bayfield County is by far the most beautiful and majestic land to have had the opportunity to hunt. With all of the rolling hills and awesome oak ridges and thousands of acres of public lands a hunter could not ask for a better place. But now with hardly any deer it is sadly a disappointment. It continues to get harder and harder to for me to waste my time and money hunting in Wisconsin in the foreseeable future, especially at my age. This year my son and I will be heading to Kansas again and this time we will not be buying a Wisconsin bow license. In fact I have a realtor looking for a farm down in Iowa for me to buy for retirement. I only say that because if the state cares at all for its residents/hunters, they should be interested in why they are leaving. Now, maybe not everyone loves to hunt as much as me and my family and are willing to move on and hunt regularly in other states but some will. The wolf and the deer are both a natural resource and the DNR cannot continue to sacrifice one natural resource for another. For the DNR to say they do not need or want to have a wolf population goal is very irresponsible and goes against every natural resource they currently manage. The	1	

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
				DNR uses population goals and amounts to manage fish, deer, bear, pcb's in water, air pollution, etc., how can you now then throw that out the window for wolf management, that is ridiculous. I hope that with the new DNR secretary we will see a change in how the wolf management program progresses so that the public does not get fed biased data from their agency or other special interest groups trying to sway the public, especially for those that do not hunt and are not aware of truly how many wolves are really out there. It was not surprising that the majority of the wolf lovers commenting during the public input live in the southern part of the state where there are no wolves, kind of ridiculous I think. The saddest part was that there were more out of state opinions for not managing wolves than there were in state supporters for managing wolves. Also, the amount of surveys sent to each area should be proportional to where the wolves reside, not just random or equally throughout the state when the wolf is not equally distributed throughout the state. I sure hope we get this right going forward because there are a lot of natural resources that will be affected by this decision. Thanks for taking the time to read my thoughts and feel free to get a hold of me if there is anything you would like to discuss! Dan Laskowski		
katy Head	All of it	Yes	I support all of Objective A I support Objective B with the exception of product B6d on page 132 which refers to the use of dogs to hunt wolves. I support all of Objectives D, E and F	I do not support Objective C at all and I strongly object to the terms "wolf related recreation" I do not support the idea that the wolf is a game animal like a deer or an elk. No part of the wolf is useful to the hunter. Hunting wolves with snowmobiles and dogs is inhumane to the dogs, destructive to the environment and a slaughter of an animal that can be dealt with in so many other humane ways. I live in Zone 2. the wolf population is high. I have seen wolves, heard wolves and have never had a conflict with a wolf. Please use lethal means only in the case of clear wolf depredation by a particular wolf or wolves. Especially if a wolf is attacking a domestic animal. We dont need a harvest to control only a small number of problem wolves. Please eliminate the wolf harvest season. Hunters can hunt other game	8	I think the plan is surprisingly positive toward maintaining a healthy wolf population. I was glad to hear about the programs in place for citizen scientists to assist in tracking which will help the authorities to keep abreast of the wolf populations in specific areas. I was very happy to hear that there are many sub zone 2 areas. I live in one such zone. I mainly object the the idea of a "wolf harvest" I think it is unnecessary. Thank you very much for giving me the opportunity to give you my feedback.
	All of it	Yes	No population limit	The allowing any wolf killing by " hunters" this encourages the idea of sport killing for enjoyment	5	I would like to see state funded guard dogs and possibly fencing for livestock protection
Dan Ferrari	Most of it	Yes	I like the plan of not setting a goal number ,and letting wolves reach a natural level that reflect the pray numbers. Only problem animals should be removed..	Any hunting season that does not use a lottery system to keep the number of animals to a minimum.	7	A plan that makes an effort to maintain a sustainable wolf population is good for the long term management of a completely healthy forest ecosystem.
George Evans	Most of it	Yes	The thoroughness of the studies was appreciated. I would have liked to see input of the Native Americans separated from the survey. Utilizing their reservations as a refuge would be a great opportunity for study of wolf ecologies. The Objective C specifically outlining how you would utilize hunting and trapping was appreciated. And it was nicely detailed. Being a student of Prof Em JJ Hickey I was disappointed in the first Wolf Plan in ' 99 where it was barely mentioned. These people are our main management tool. Its like a carpenter using a saw or hammer. Very necessary. Plus the funding provides necessary revenue for further research. My friends were not happy when dove hunting was legalized. I told them more than likely you would see more doves and a consistent population over time. The most hunted and fished creatures in Wisconsin are the most abundant. And many more flora and fauna get to enjoy the ride !	In your Executive Summary I question one statement in "Characterizing Respondents" where you add that "to ensure results were representative of the sampled population weights were applied to adjust for gender, age and percapita hunting participation". Does this mean you adjusted their responses to reflect there actual percentage makeup of the Wisconsin population? And did this/you change or "adjust" the published results to weigh their responses accordingly ? Some of your wording of the results I felt you were leading the reader and not entirely reflecting the results especially when it came to Table 25 and figure 27.	8	Nobody knew how our last Wolf hunt was to end up. The pent up demand. The advances in tools for hunting such as night vision optics, thermal imaging, suppresors, Onyx maps and similar apps. Electronic calls and the many scent reducing applications. Not to mention cell phones, gps, powerful walkie talkies etc . All offered a huge advancement from the previous hunts. Quite the learning experience. Next time approach the harvest goals similar to bear, bobcat, fisher where you do not have one specific number. Explain that the range is within our goal of recovery and and will further the health of wolves. I have seen wolves in January and February and March with mange ! You explain how and what contributes to this. A well managed harvest and also a well managed deer herd will help prevent this from happening . Good luck ! the harvest goals
	Most of it	Yes		178 Pages???????	2	Need to lower the # of wolves.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
James Kerler	All of it	Yes	I am very pleased with the overall structure of the plan. It is wise to incorporate geographical differences in public opinion, differentiating and giving weight to the values of people who live in wolf territory. The plan's six objectives and the way they are prioritized are logical and the products pursued under each objective seem reasonable and broad. The plan provides a good platform for disseminating knowledge to all stakeholders and drawing input from a diverse advisory committee. Compromises will be necessary based on the needs of wolves and people will be needed and this plan allows for that. As a forest land owner who has encountered wolves more than once on my property, and as a nature lover and long time deer hunter, I believe the plan will respect my interests, though I recognize the process of doing this is complex. I am pleased that the plan seems to seek "constant improvement" through ongoing scientific research on wolf ecological impacts & benefits, wolf monitoring techniques and public opinion and culture. This allows for changes to incorporate new knowledge. Importantly this plan does not tie itself to static wolf population goals that were established over 20 years ago. Instead it incorporates the latest science to establish a dynamic and geographically focused process for managing wolf populations. It also responds to the needs of landowners who experience depredation. I am pleased that the plan respects tribal rights, culture and preferences. It also enables the DNR to consider Wisconsin's hunting culture and it's economic impacts as well as the diverse interests of people across the state.	My likes are much stronger than my dislikes, but I would like to see non-lethal conflict interventions for wildlife depredations given some priority, perhaps via landowner incentives. There would also be some benefit to including a periodic plan review and update.	9	It is unfortunate that wolf management is as contentious as it is and that Wisconsin's legislature has played a heavy handed role. The new plan though needs to respect federal and state law, science and Wisconsin's diverse cultural preferences. This may not be easy to do but the draft plan seems to encourage this to happen. I think Aldo Leopold would look favorably on this draft plan. Thank you for all the work done in preparing this plan and for the opportunity to comment on it.
	All of it	No		Oppose the expansion of the buffer zone around the reservation. You are opposed to unlimited population.	3	
Raquel	Most of it	Yes	I think the historical information and attitudes sections were interesting and reflect that most Wisconsinites are in favor of wolves and maintaining a healthy wolf population. I like the idea of trying non lethal means first to avoid conflicts with wolves (fencing, harassing, notices to avoid hunting dog issues, etc). I think continuing wolf education is very important, I hear a lot of misinformation about wolves, their biology and impacts.	I didn't see a section about the type of hunting that is allowed and the reason for the hunting seasons. For example, I am concerned about pregnant wolves being harvested and wolves that have dependent pups. While I am not a fan of trapping, I think hunting wolves with dogs is inhumane. The recent fall hunt was a travesty that significantly reduced the public trust in the DNR's ability and desire to maintain Wisconsin's resources for anyone other than those who hunt. I also do not think the state should issue licenses to hunt wolves from people out of state.	6	I think a really great effort was made to accommodate differing views on wolf management; although I'm guessing most hunters won't be supportive of it. Unfortunately many still seem to have the aversion to all things carnivore that we saw 100+ years ago.
Gregory Klatkiewicz	All of it	Yes	I am pleased that there is an attempt to develop a wolf management plan.	There is no numerical population goal.	1	Not having a numerical population goal may have been a nice attempt to eliminate a hotbed focal point in this very controversial issue, but it is not practical or workable. Historically that number has always been around 350 and should remain as such. Wolf encounters in state have increased significantly with the current population level. Bow hunting this past season, in Vilas County, I had a wolf on my deer carcass (at 8am) before I could even get out of my stand.
Julie Turner	Most of it	No	The parts about protecting wolves.	The parts about wolf hunting.	7	I support the plan for the most part. I encourage any organizations to protect wolves.
Gina Mason	All of it	Yes	The adaptive approach to our wolf population.	I support complete removal of our state law which requires a wolf hunt. I believe the plan should address this law directly and work to have it removed.	8	

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Sara Grace	All of it	Yes	I support the plan having no population goal number. I like that the plan moves away from getting hung up on a fixed number goal, and instead focuses on ecological function and the use of adaptive targeted management. I support the redrawing and planned use of the wolf zones, including the buffer zones around reservations. I think the buffer zones are very important, and should be closed to wolf harvest if/when possible. I like the plan's use of science-based management. The best available science should always guide Wisconsin's conservation efforts and treatment of wolves. The plan is extremely well-written, researched, and fascinating to read. While I am no expert, it appears to be very comprehensive, objective, balanced, and respectful of a wide range of views, and rooted in actual scientific research.	State management efforts should prioritize the traditional ecological knowledge Wisconsin's native tribes on how to live with wolves and value wolves' role in maintaining the long-term health of prey populations and the health and diversity of plant communities. I know Wisconsin is a hunting state, but I don't like hunting with hounds - for either wolf or bear. That said, since I know hound-hunting is probably not going away, the training of hunting dogs should be limited ONLY to when wolf hunting/trapping season is open in that zone. Hunting should issue zone-specific permits, only allowing harvest in a single zone until the zone is closed. Enough permits should be issued that zones can be closed by early December, to avoid a long harvest season that can negatively impact wolf breeding season etc. I support mandatory harvest registration and in-person certification, which should also require biological samples for monitoring and research. I would like to see research on wolf impact on CWD in deer. I think prevention and non-lethal responses to livestock depredation should be pursued before use of lethal techniques, and would like to see a plan for increased research on non-lethal wolf control methods. I'm concerned about illegal killing, and would like to see the plan prioritize a range of efforts to reduce illegal kill rates. Please make sure the Wolf Advisory Committee is fully representative of all viewpoints. I would like to see greater representation for Wisconsin native tribes, science-based research, and wildlife/conservation science organizations. ACT 169 needs to be changed to allow the DNR to fully use scientific-based adaptive management for Wisconsin's wolf population. Outreach and education is critical to increase public understanding of wolves and should be prioritized and fully funded.	7	I strongly support maintaining a fully healthy and ecologically functional wolf population in Wisconsin.
	Just the parts I am interested in	Yes	Allowing different groups to comment and provide information.	No specific wolf numbers for the entire state and not just based on an area.The need for managed hunt and trapping season by the public not mentioned.	1	There need to be a statewide wolf season for hunting and trapping as is done for other predators. I wouldn't care to hunt or trap wolves myself, but season should be implemented asap. The we have wild areas and true wilderness areas the wolf needs to managed in such areas for its own good and will more public acceptance of the wolf instead of "all love or all hate' attitudes that is now the attitude. Wisconsin needs to support 350 wolves that would be tolerated as Wisconsin is a heavily developed and populated state for the most part. Would reduce hunter ,dog owner and farmers conflicts to a tolerable level.
Ryan LHeureux	Most of it	Yes		Doesn’t seem like a management plan with no population goal…	1	
	All of it	Yes		No Population goal / target population	4	All species have a management population - the wolf should also have a management population qty. that is managed too.
Deb Muraro	Just the parts I am interested in	Yes	It strives to: • be stewardship-focused and science-based driven—not numeric-population-goal oriented. • be zone-based when determining if populations should grow, maintain, or reduce and also be respectful of Tribal zone quota requests. • offer workshops to help educate livestock owners on how to proactively reduce risks. • increase public understanding of the vital importance of wolves.	I did not notice if it will it be regularly updated. It took almost 25 years for this new plan. That’s too long to wait to react if the dynamics of climate change and biodiversity suddenly cause wolf populations to dramatically change.	10	Two things: 1. In the future, if wolves no longer are protected under the ESA, are there guard rails in place to ensure that outside hunting groups (e.g. Hunter Nation) will never again be able to file lawsuits to force a hunt that might result in a slaughter like the one that occurred in 2021? 2. When reading the plan, I was disappointed to learn that Wis. Admin. Code NR 19.80(1)(8) disallows the rehabilitation of wolves in Wisconsin. If an animal is endangered, why are we not attempting to save as many as we can for a robust gene pool?
Susie Stevenson	Just the parts I am interested in	Yes	Focus on education and continuing education, the fact your tagging wolves and you started doing this early on. recognizing tribal relationships, and the importance of it, research on new techniques for addressing conflicts with livestock etc. Continued use of non lethal techniques for wolf conflicts,	Allowing the use of hunting dogs, and inhumane trapping, complaints of dogs being killed by wolves is a chance an individual takes, my dog got run over by a car, does that mean all cars should be banned ? I would've liked to have seen more language about PRESERVING their habitats, I believe preserving Wisconsin forests is key... Wolves are native to Wisconsin, they belong here Thank you!!	6	My main focus is to preserve wolf habitat , Wisconsin forests, and protect the wolves , we need more education on healthy boundaries for wildlife in WI You cannot put a pricetag on a pack of wolves in the wild, healthy forests and clean water will follow. Lets preserve our beautiful state, protect the wildlife and the forests they live in. Thank you

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
GUY SCHULTZ	Most of it	Yes		The plan must be based on a population goal for a designated area.	2	Thanks for the opportunity to comment on the proposed wolf management plan. I'd like to begin with the Land O' Lakes herd study on page 14 of the draft plan where it states "overall deer density was reduced by 62%". Again 62%, and this area was not over-run with deer beforehand! I have deer hunted this area for at least 25 years, frankly the quality of the current deer hunting experience is absolutely terrible. It's no surprise that I see fewer hunters, not sure our group will hunt there much longer either. The only deer left in the area stay close to populated areas to avoid the wolves. The casual person may think there are too many deer, heck they are in town and all around the cabins by the lakes. But step in the woods, nothing. The "landscape of fear" is reality. The DNR wonders why people are leaving hunting? lack of deer, equals a poor hunting experience. You are playing right into the animal rights groups plan. All the Land O' Lake's report seems to care about is the tree growth with the deer removed. Nothing at all is said about the impact of each wolf eating approximately 20 deer a year has. Wolves wiped out 62% of the deer, then what happened next? The DNR did and does continue to promote liberal seasons for a new superior hunting weapon the cross bow, Crossbow use in Vilas County yielded roughly 295% better success rates with a reduced herd than vertical bows. In essence the DNR double dipped the deer herd, which like anything else it's a fragile ecosystem. Strategy 5A starting on page 114 does little to address whitetail deer balance. Reduce the wolves and the crossbow season length for the able bodied and maybe, maybe, the deer can recover to provide for all. At a meeting I asked "What's The DNR plan when the whitetail population is 20% under goal?" The DNR rep had no real answer other than reduce doe tags. If we have a severe winter at this point the northern deer herd could collapse completely. What will the wolves have to eat once the deer are gone due to mismanagement of the wolf population? ELK? The new plan to allow the wolf population to go unchecked does neither the wolves or deer justice. So, what are some other ramifications of this new Wolf management plan placing higher value on Wolves' health/population over whitetail deer? 1. Without the tourism dollars from deer hunting Land O'Lakes/Vilas County is now promoting the use of dirt bikes, UTVs, ATVs, etc. to rip up all the woods. Nice! 2. How is the DNR to recover lost deer license revenue and Pittman Robertson funds? 3. A friend owned 100's of acres specifically for whitetail deer hunting outside Westfield, Wi. which is in the central part of the state. Wolves moved in and inside of 2 years wiped out the deer herd. What happened next? They sold the property and bought in Illinois. Once again, Nice! White-tailed deer are not varmints, they; 1. Provide Food for HUMANS, not just wolves. 2. Create recreation and recreation dollars which should be equal for all user groups, 3. Generate a heck of a lot money for tourism and support the DNR. Promote a wolf population goal of 350! Lastly, thoroughly read your mission statement on page #1 You see noble words that include "protect, enhance, sustainable, ecosystems that sustain all life." The DNR's mission comes down to maintaining balance in all the user groups of nature. Again, Thanks for the opportunity to comment. I hope you do the right thing.
Anne Steinberg	Just the parts I am interested in	Yes	The plan is based on science and there are no longer arbitrary wolf quotas. Maintaining a viable wolf population and recognizing their vital role in the ecology of our state, Plans to educate the public and find ways to address wolf-related conflict besides hunters The tribes were consulted and their own words are included in the draft.	I don't agree with allowing hunting of wolves unless it is the DNR managing conflicts with farmers or others. My understanding of the tribal opinions in the draft is that they oppose hunting wolves and instead support taking care of these brothers. And I believe that respect for all living beings means that we only hunt or harvest what we will eat. Killing should not be a sport.	8	I sincerely hope we can all work to make sure decisions are based on science and the opinions of the majority of Wisconsinites.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Christine B.	Just the parts I am interested in	No	I appreciate the efforts of all WDNR staff involved in updating the state's wolf management plan. Although I believe the current plan needs significant updating (see next section), I recognize the efforts and improvements made to the previous plan, including: ● Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. ● There is much greater recognition of the ecological role of wolves ● The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves ● The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed)	The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on (see reference list below): ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution ● The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. ● The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ○ A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings. ○ Hounding or hound training, which are akin to allowing legalized dogfighting, should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public. ● The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. ○ Despite Act 169, which mandates a wolf hunting season, the department can still restrict the implementation of lethal methods by setting minimal quotas, including a quota of '0' wolves, restricting timing and methods. ○ Several studies have proven a proactive non-lethal approach leads to better conflict mitigation. ○ Lethal management often fails to provide a long-term solution to wolf predation and has the least consistent success rates when compared to non-lethal practices. In addition, there is significant evidence showing that lethal wolf management may be less functionally effective at mitigating subsequent livestock losses than non-lethal deterrents. ● The plan should require the implementation of abatement measures as well as the use of non-lethal conflict minimization techniques by domestic animal owners for the latter to receive compensation for confirmed predation. ● The plan also runs contrary to public values towards wolves (and omits mention of such majority values from the plan), despite department surveys evidencing that the broad public cares about wolves as individuals (and not just for the viability of the population). Given the recent liberalization of killing wolves by the state, it would be incredibly informative to note majority support of the following reasons for opposing a regulated wolf hunting/trapping season (which are all omitted from the plan): opposition to specific methods of harvest like hounds (64%) or traps (70%), feelings that hunting wolves is unnecessary (62%) or culturally offensive to Native American tribes (57%). ○ All such reasons convey majority disagreement with practices currently promoted and endorsed by the legislature and the WDNR, and such a conflict between managers and the public should not only be acknowledged, but foregrounded and carefully considered in policy (instead of dismissed). ○ Such decisions to omit literature or downplay evidence (e.g., such as majority opposition to killing wolves and their reasons) are contrary to principles of scientific integrity (e.g., present all relevant scientific evidence to the public) as well as ethics (e.g., disguising ethical decisions, such as recreational wolf killing, as robustly supported by science). ● Conflicting agency objectives (e.g., optimizing public hunting and conflict mitigation) are not only not acknowledged, but even misunderstood as harmonious, against the body of scientific evidence. That culminates in the prioritization of consumptive values and policies; e.g., according to the body of scientific literature, use of lethal methods, and 2 especially public hunts, are contrary to most objectives relevant to: harm mitigation, the wellbeing of wolves, their ecological roles, and their non-exploitative enjoyment (i.e., Objectives A, B, D and F). ● There is a stark lack of consideration for individual wolves, wolf population health (including wellbeing), and measurable indicators for assessing any harms barring disease prevalence (e.g., accounting for cortisol levels or other stress hormones, measures of pair/pack persistence) ● There is an inappropriate understanding and consideration of tribal worldviews about wolves. Tribal worldviews of wolves are misconstrued as 'cultural benefits' tribes receive from the existence of a wolf population, when in fact tribal worldviews consider each individual wolf as a person and relative. Cultural respect and sensitivity towards such views, shared by many non-tribal members, demand the strict mitigation of lethal measures, especially recreational killing, as opposed to their current promotion in the plan. ● In general, all omissions of scientific literature, the arbitrary prioritization of policy objectives, the rhetoric of the plan and the dismissal of public values and concerns for wolves point	4	Please read the following studies (not currently integrated into your draft wolf plan) to come up with a better solution: Adams, L. G., Stephenson, R. O., Dale, B. W., Ahgook, R. T., & Demma, D. J. (2008). Population Dynamics and Harvest Characteristics of Wolves in the Central Brooks Range, Alaska. 				towards a biased, unscientific and instrumental view of wolves that promotes values contrary to broad public perspectives on wolves. ● 'SOM' wolf estimation methodology – From a recent critique: "The new methods sacrifice precision, but are believed to retain adequate accuracy and sensitivity to changing conditions for reliable decision-making. We review evidence for the accuracy, precision, and sensitivity of the new 'scaled occupancy model' (SOM) applied in Wisconsin. We conclude that the Wisconsin method would systematically overestimate wolf abundance by large (but currently incalculable) margins. Because Wisconsin, similar to other states, not only changed to unverified methods but also implemented widespread wolf killing, shortcomings in their estimates of wolf abundance may have far-reaching consequences for population viability and confidence in state wildlife managers. We discuss findings from Wisconsin alongside similar findings for other states' occupancy models being insensitive to human causes of mortality that have recently increased. Overall, Wisconsin's proposed method for estimating wolf abundance shows significant departures from best practices in scientific measurement. Verification will require independent replication and unbiased tests at multiple scales in multiple habitats under different human-induced mortality rates, and peer review before the new methods are considered reliable." marian celesnikj	All of it	Yes	---removal of numeric wolf population goal, ---redrawing of wolf management zone, ---buffer zones around tribal reservations,	---need specific descriptions of how each zone will be managed to acheive the plan's goals need process to ensure enough licenses are issued in any wolf hunt so thta quotas can be met before wolf breeding season, need to limit dog training to only times when wolf hunting or trapping is open in the particular zone. need a specific time;ling for implementation and outlin eof how each zone will be manged to achieve plan's goals. ---include a plan to solve problem of disposal of livestock carcasses ---to prevent wolf /farm conflict. need harvest registration within 8 hours. ----Recreational hunting as a way to reduce conflict has no scientific basis.	7	---Ideally there would be no hunting of wolves in the buffer zones. ----Need significant number of scientists and tribal representativeson wolf advisory board ----Need a timeline for implementation of plan ----build in review of plan by wolf biologists at five year intervals ----The plan is a big improvement over the existing plan, but will all of it's goals actually be acheived. Keep listening to the wolf biologists.
Zach Brahan	All of it	Yes	That they realize there is a problem with the numbers and management is needed	Didn't like that there is mostly pro wolf studies used. The word depredation is used often. These pets and animals are killed by the wolf don't have to class it up.	3	If a wolf management plan would be put into place I feel most people wouldn't hate them anymore but would get excited for the chance to hunt them. The whole attitude would change if people knew there was a hunting season for them instead of being told they are on your landscape and there is nothing you can do to control it. Also the coyote fox and hare studies with wolves present is also trying to paint a nice picture of the wolf just being around to help those animals. While they are kill two to three times as many pounds of animals daily. Thanks

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
	Most of it	Yes	Not much. This supposed to be a draft plan on how to manage wolves. 250 pages ??? You talk about what wolves eat and how they mate ect ect it's more like a biology course on wolves.	You don't have a grasp on the devastation wolves cause. Northern Idaho was wiped out of game and currently has four bounty areas for wolves $2000 , $1500,$1,000 and $500. The wolf estimate for Montana , Idaho, Wyoming was I believe 1,600 at delisting but now after years of hunting and trapping is 2,600. Minnesota, Wisconsin and Michigan have a very low super conservative estimate of 4,500 wolves while having 59,000 square miles less land mass and 21 million more people than the 3 western states yet our wolves which number almost double are on the endangered spices list. This is not acceptable. Our deer in Douglas county are disappearing. Mature bucks are becoming rare and I can't remember the last good rub I've seen. A wildlife biologist on tv talking about Idaho said wolves are sanitizers and that is the true history of wolves as well documented in Alaska and Idaho and if not managed Northern Wisconsin will be a disaster. Originally 80 was the states number to manage then it was raised to 350 snd now in reality it's probably 3,000 they are literally everywhere. I'm done buying a license in Wisconsin as are many of my friends We sit all season and rarely see a deer. I've hunted here for 50 years we're we enjoyed world class deer hunting, now it's all but gone and for what? What I dislike about your draft is there is no aggressive management plan for wolves and it looks more like an endorsement for ever increasing wolves because that's what will happen without a far more liberal quota and season than you will ever propose.	1	I wish you would come up North and see what wolves have done to ruin what we love
	All of it	Yes	none	there must be a population goal of 250-350 wolves that is a healthy and sustainable population. wolf counting is not properly conducted. No lone wolfs counted?	1	Deer season in hayward was the best week of the year for me and my friends at my dads deer shack he built in 1970 till wolfs changed that by 2005 sold shack now
Lirael Armstrong	Most of it	No	I like that the wolf management plan is trying to increase protections for wolves.	I do not think the plan goes far enough to protect our precious wolves!	5	I am in favor of increasing wolf protections, requiring non-lethal conflict interventions, and banning recreational killing!
Danny Bourassa	All of it	Yes	To keep the Wolf's in a balanced number		9	All good
Danny Bourassa	All of it	Yes	Keeping a good count of the amount of wolf so we can control there numbers.	I think it's pretty good.	9	
Michelle Seaman	Most of it	Yes	I appreciate how the WMP strives to be inclusive, bringing together public input, wildlife science, tribal consultations and wolf management committee input. I recognize that this is a complex issue involving and affecting many people – Native Americans, farmers, homeowners, hunters, scientists, wildlife advocates – often with differing or conflicting ideas. I commend the DNR for working hard and with a spirit of cooperation and fairness.	I think that because Native Americans have the longest historical relationship with wolves, tribal ecological knowledge should be even more respected and applied. This plan already "recognizes the valuable contributions over the years to wolf recovery and management by the tribes including data collection, information sharing and financial contributions." Why not learn even more from tribal experts? To move "from wolf recovery to long-term stewardship," I believe we should prioritize indigenous knowledge. Regarding wolves, tribal members are our best teachers.	7	I am the daughter of a hunter, and while my family only had a modest acre, our neighbors were farmers. My brothers and I roamed hundreds of acres, thanks to their trust and generosity. It is for this reason that after years away from Wisconsin (for job opportunities mostly), I came home. I know we can respect one another. I humbly ask that we do what's right for indigenous people and wolves.
Joe Rising	Just the parts I am interested in	Yes	The detail understanding the ecology of wolves.	So many problems involve hunting dogs going after black bears. I am 100% against the present practice of using dogs to hunt bears, wolves and other species. M sure you are aware of the reasons for this. It is inhuman to the dogs and their prey. It is not hunting in my book. It is a sad sport, that has no place on public lands. Given the technical advances with gps, four wheelers and "goats." The advancement of rifles and scopes… I suggest not licensing the use of dogs for hunting bears, wolves and other animals. This whole area of sport hunting needs to be revisioned. Bloodlust is what we saw in the last wolf hunt. The Overkill, by out of state oriole/groups abusing Wisconsins natural abundance and taking advantage of Wisconsin's public lands. Please remove this opportunity from the licensing. No dogs, no off-road vehicles, no hunting parties, no out of State licensing for killing wolves. Thanks.	2	I see nature from a kinship point of view. We are all relatives. These species are not "resources". They don't need to be "managed". Wolves need to be respected and human community needs to be integrated with them. Thanks
	All of it	Yes	Removing an arbitrary wolf population goal is important to make sure the best-available science is centered in wolf management The low quota zones are an important and welcome addition to the plan The plan is rightly focused on the ecological benefits of wolves		9	
	All of it	No	I am glad wolves living in the state of Wisconsin will no longer be limited to 350 individuals as that is not a genetically healthy population. I appreciate your recognition of the critical role this keystone native carnivore has in healthy ecosystems, noting increasingly positive views of wolves by the population as a whole, whose knowledge of wolf ecology has finally outpaced irrational fear. This has brought out more and more opposition to the cruel, hideous and unnecessary methods of wolf removal. I am especially glad there will be buffer	I don't like that the current draft seems to be missing close to eighty studies on wolf behavior and social dynamics, conscious intelligence, and ecological evolution. You have also forgotten to mention that lethal intervention fails to provide a long-term solution to wolf-livestock conflict and has the least consistent success rates when compared to non-lethal management practices. This results in biased plan that runs contrary to more recent scientific evidence. Furthermore, wolf hunting by hounds should be illegal as it is a disgusting practice, extremely cruel to wolves and dogs alike and is not supported by the majority of hunters or the public. It remains an anachronism from past centuries that should have been long abolished, like cockfighting, dog fighting, and fur trapping. We should be protecting, not harming, one of the most magnificent and useful animal species that has shared a long and mutually beneficial history with humankind.	4	Although significant improvements have been made, this plan needs to be more transparent regarding what we know of wolf behavior and agency, current public opinion, and not continue to promogulate centuries of abusive human transgressions against this most noble species.

			zones around tribal reservations, where the understanding is that wolves are family.			
	Most of it	Yes	None of it	Bring numbers down to 350 like we were told. Hunters, farmers and landowners have not been represented!	1	Not accurate wolf population numbers and no plan to reduce numbers for northern Wisconsin! The animal rights people that don't even live here are listened to more than the people that live here. You work for us that reside here not those that don't. Please remember that!
Charles Ajer Sr	Most of it	Yes	None of it	It looks one sided for the wolf lovers and not enough consideration take for farmers, hunters and land owners in the north. No goal numbers. We were scammed when this first came out that 80 would be good. Then 350 to be regulated. We were lied to and the animal rights people got there way instead of Wisconsin DNR regulating them. It's a disaster in Douglas Cty and the deer herd is shambles because the DNR bowed to these crazy people. Now our deer herd is suffering andproperty is worth less because of people that won't stand up and do the right thing. Shamefull!! The team should focus on caring capacity like all the other animals and set a goal of 350 like we were told in the beginning. DO YOUR JOB we pay you for. You work for Wisconsin not people that don't even live here.	1	Please do this right Wolves have a place just regulate them like any other resource. Bring numbers down to 350 like we were promised! It's sad to say but it looks like common sense is even gone from DNR!
Eric Rempala	All of it	Yes	Using a more scientific based quota as opposed to an arbitrary number. Better focus on Wolf ecological benefits. Taking in tribal input and lowering quota near tribal lands.	Lack of oversight of hound hound training and hunting. Lack of plan for future review.	8	
Wendy Dreskin	Most of it	No	Pursue options to minimize human/wolf conflicts Include the overall ecosystem health and sustainability of the wolf population as a stated goal of the Wolf Management Plan	I do not support any hunting or trapping	3	Compensation for pets should not be given if pet owners allowed pets to roam freely. I do not support any sport killing of wolves.
	Most of it	Yes	I support regulated hunting, trapping, and lethal control of wolves.	I support a wolf population closer to 350, not 1000.	5	
Matt	Most of it	No	Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. ● There is much greater recognition of the ecological role of wolves ● The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves ● The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed)	The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on (see reference list below): ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution ● The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. ● The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ○ A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings. ○ Hounding or hound training, which are akin to allowing legalized dogfighting, should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public. ● The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. ○ Despite Act 169, which mandates a wolf hunting season, the department can still restrict the implementation of lethal methods by setting minimal quotas, including a quota of '0' wolves, restricting timing and methods. ○ Several studies have proven a proactive non-lethal approach leads to better conflict mitigation. ○ Lethal management often fails to provide a long-term solution to wolf predation and has the least consistent success rates when compared to non-lethal practices. In addition, there is significant evidence showing that lethal wolf management may be less functionally effective at mitigating subsequent livestock losses than non-lethal deterrents. ● The plan should require the implementation of abatement measures as well as the use of non-lethal conflict minimization techniques by domestic animal owners for the latter to receive compensation for confirmed	4	

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
				predation. ● The plan also runs contrary to public values towards wolves (and omits mention of such majority values from the plan), despite department surveys evidencing that the broad public cares about wolves as individuals (and not just for the viability of the population). Given the recent liberalization of killing wolves by the state, it would be incredibly informative to note majority support of the following reasons for opposing a regulated wolf hunting/trapping season (which are all omitted from the plan): opposition to specific methods of harvest like hounds (64%) or traps (70%), feelings that hunting wolves is unnecessary (62%) or culturally offensive to Native American tribes (57%). ○ All such reasons convey majority disagreement with practices currently promoted and endorsed by the legislature and the WDNR, and such a conflict between managers and the public should not only be acknowledged, but foregrounded and carefully considered in policy (instead of dismissed). ○ Such decisions to omit literature or downplay evidence (e.g., such as majority opposition to killing wolves and their reasons) are contrary to principles of scientific integrity (e.g., present all relevant scientific evidence to the public) as well as ethics (e.g., disguising ethical decisions, such as recreational wolf killing, as robustly supported by science). ● Conflicting agency objectives (e.g., optimizing public hunting and conflict mitigation) are not only not acknowledged, but even misunderstood as harmonious, against the body of scientific evidence. That culminates in the prioritization of consumptive values and policies; e.g., according to the body of scientific literature, use of lethal methods, and 2 especially public hunts, are contrary to most objectives relevant to: harm mitigation, the wellbeing of wolves, their ecological roles, and their non-exploitative enjoyment (i.e., Objectives A, B, D and F). ● There is a stark lack of consideration for individual wolves, wolf population health (including wellbeing), and measurable indicators for assessing any harms barring disease prevalence (e.g., accounting for cortisol levels or other stress hormones, measures of pair/pack persistence) ● There is an inappropriate understanding and consideration of tribal worldviews about wolves. Tribal worldviews of wolves are misconstrued as 'cultural benefits' tribes receive from the existence of a wolf population, when in fact tribal worldviews consider each individual wolf as a person and relative. Cultural respect and sensitivity towards such views, shared by many non-tribal members, demand the strict mitigation of lethal measures, especially recreational killing, as opposed to their current promotion in the plan. ● In general, all omissions of scientific literature, the arbitrary prioritization of policy objectives, the rhetoric of the plan and the dismissal of public values and concerns for wolves point towards a biased, unscientific and instrumental view of wolves that promotes values contrary to broad public perspectives on wolves. ● 'SOM' wolf estimation methodology – From a recent critique: "The new methods sacrifice precision, but are believed to retain adequate accuracy and sensitivity to changing conditions for reliable decision-making. We review evidence for the accuracy, precision, and sensitivity of the new 'scaled occupancy model' (SOM) applied in Wisconsin. We conclude that the Wisconsin method would systematically overestimate wolf abundance by large (but currently incalculable) margins. Because Wisconsin, similar to other states, not only changed to unverified methods but also implemented widespread wolf killing, shortcomings in their estimates of wolf abundance may have far-reaching consequences for population viability and confidence in state wildlife managers. We discuss findings from Wisconsin alongside similar findings for other states' occupancy models being insensitive to human causes of mortality that have recently increased. Overall, Wisconsin's proposed method for estimating wolf abundance shows significant departures from best practices in scientific measurement. Verification will require independent replication and unbiased tests at multiple scales in multiple habitats under different human-induced mortality rates, and peer review before the new methods are considered reliable." (Treves & Santiago-Ávila, 2023)		
Shawn	Most of it	Yes	None. Our ancestors eliminated wolves for a reason. Wisconsin is better off without them.	The whole draft	0	I work to hard raising beef on pasture to have an unnecessary threat like wolves added to the equation. The coyotes are bad enough harassing my cattle.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Michael A Morack	All of it	Yes	Objective B: Address and Reduce Wolf-Related Conflict	1. Failure to hold to the 1999 plan of 350 +-10% 2. Taking of a 6 mile area around Indian Reservations 3. Failure to actually look at the wolf impact following 2000 was the 1999 plan threshold was met and exceeded 4. Couching the impacts in what can best be referred to as romantic notions regarding wolves 5. Looking at the potential of wolf habitat without regard to the impact 6. Lack of understanding the impact on the people of Wisconsin and having more empathy for the wolf than the people	0	Wolf Management Plan Comments Why 350 made sense Between 2002 an 2003 the estimated over winter wolf population exceeded the 1999 plan of 350. The number was developed through careful deliberation considering the wolf's impact on environment, social interactions, and sustaining a wolf population within the state. Sustaining a wolf population according to the USFWS Endangered Species Act requires the wolf population reach and hold a population of 100 animals for five years. There is sufficient evidence that the population of 350 is spot on and that the number exceeding that is creating intolerable conditions within the state. By looking at the impact the wolf has had on the state once 350 was approached and then exceeded it is clear that the state has been forced into a downward spiral that no longer has an upside. Ignoring the impact the wolf has had or attempting to minimize the impact through distractions such as there are plenty of deer in the state; or livestock depredation is isolated to a few farms; or forest improvements are simply painting over the problems with rose colored glasses. As stated in the WOLF ADVISORY COMMITTEE MEETING 9/10/2014 "There was an agreement between the DNR and sportsman in the 1980s to help fund the restoration of wolves in the state; sportsman provided $1 million and were promised that 80 wolves would be sustainable." Between 1980 and 1995 the number of wolves was revised to 100, and in 1995 after careful consideration of scientific, environmental and social impacts, Federal and State regulations and goals, along with carrying capacities was set at 350. This was revised in 1999 to a plus or minus 10% of 350 as the overwinter goal as more reasonable to maintain. That 1999 plan remains in place as the 2022 Plan is under consideration. Since the wolf population eclipsed the 1999 plan we have considerable data to consider if a revision from that plan is warranted. We have personal experiences, testimonies, depredation claims, deer harvest records, and elk reintroduction population tallies before and after up to the current estimated overwinter population of 1,034-1,057 in 2022. There has been extensive work and analysis to determine the wolf's tendencies, needs, and abilities to survive by L. David Mech, Dr. David Mladenoff, Sarah Pratt, Dr. James C. Kroll, Adrian P. Weydeven, Teb B.Lyon & Will N Graves, and Paul Swanland who I rely upon considerably to understand wolf dispersal, colonizing, and optimal survival conditions. Initial studies led to the conclusion that wolves need prime territory, avoidance of roads, and people. More recent studies support a wider area of Wisconsin suitable for wolf distribution based substantially upon prey availability – deer, elk, and beaver (one study included turkeys) as well as avoidance to people and roads. It is these revised studies that support the 2022 plan without a prescribed population. My personal theory is the availability of prey is the only limiting factor to wolf distribution. Being an apex predator puts them in the highest category to adapt to a complex mix of environments as we are seeing their dispersal support that conclusion. "Wolves present such challenges because they adapt to many human land uses (Blanco et al. 1992, Fuller et al. 1992, Thiel et al. 1998)." My first consideration why the 1995 & 1999 plans are well thought out population goals regards the impact of wolves on deer and elk. Elk were introduced in 1995, areas already habituated by wolves. As the wolf population grew to and eclipsed the 350 one of the first casualties was elk recruitment. Recruitment of elk was zero for many years. When I addressed this with WDNR personnel I was informed it was primarily bear and coyotes. I rejected this opinion as they existed prior to wolves and recruitment was never zero. Not until a bull elk was killed by wolves along with Kentucky concerned about providing more elk did the WDNR consider lethal action required to support the elk introduction. When I look at the deer harvest in wolf territories, we see a similar correlation. Beginning in 2003 as wolf numbers climbed, deer harvest declined and has steadily diminished. Hunters who hunted the north have reported seeing wolves and no deer. In Vilas County I hunted there since I was 16 years of age. My father and I would count shots in the fist hour. Our count was usually around 35. This last season I counted 3 shots for the four days I hunted. In the presence of wolves all CDAC's voted for growth in deer herds. When I bring this subject up to WDNR personnel I was told I am not considering bad winters and winter kill. I consider it however scouting in April in the area we hunt found a deer yard where the evidence of over 40 deer could be counted killed and completely consumed. We simply no longer see deer tracks, but plenty of wolf tracks. Yes this is anecdotal evidence. Many see wolves as a method to reduce deer costs. This argument reminds me of the same argument why we should allow recreational pot because alcohol is worse. So we compound the problem by having two expenses on the books rather than one and even if marginally successful and the deer herd is drastically reduced the 600,000 hunters no longer participate. As compiled by Welcome To Hunting Works For Wisconsin Economic Data HUNTING IS PART OF WISCONSIN'S CULTURE •

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
						895,000 people hunt in Wisconsin each year. • 12 million days are spent hunting in Wisconsin. HUNTING SUPPORTS WISCONSIN'S ECONOMY • Hunters support over 34,000 jobs in Wisconsin. • Hunting generates $1 billion in salaries and wages. • Yearly spending by hunters in Wisconsin is $2.6 billion. • The average Wisconsin hunter spends $2,800 each year. HUNTING IS A KEY SOURCE OF TAX REVENUE • Hunters generate $228 million in taxes for the state of Wisconsin. • Wisconsin hunters pay $263 million in federal taxes. WISCONSIN HUNTING: THE BOTTOM LINE • The total ripple effect from hunting in Wisconsin is $4 BILLION. The next area of consideration looks at depredation. This chart can be located at https://p.widencdn.net/7o52me/WolfDamagePayments Depredation reimbursement started in 1982. Not until 2001 do we see an uptick in depredation, especially in livestock, but we also see this in regard to dogs. As reported in Wolf depredation on domestic animals in Wisconsin, 1916-2000, Adrian 'lkeues, Rarldle X..Jurcwicz. Lisa .\Talrglzton -Treues,Robert A. Rose, Robert C. CFTllging, and Adrian P. Weydeven "In Wisconsin, USA, over the past 2 5 years, wolves have recolonized mixed forest-agriculture habitats range beyond public lands and recolonize agriculture and now number approximately 250 animals. Human-wolf conflict has resurfaced as a result." Population size, pack size, normalization to people, and greater opportunity provide the axis for greater and greater depredation. These costs can be minimized if insufficient revenues from harvest sales occur however intolerance to wolves will accelerate and could provide impetus for lawsuits that in turn would be more costly to the state. In the last few years we had a wolf visit our farm in Waukesha for approximately 18 months. She had three pups, reared them and I watched how she weaned them. She brought them to the edge of our hayfield and proceeded to cross over the middle. The pups would not follow. Within 30 days of that act one pup was hit and killed by a car and was confirmed 100% wolf. I reported this to the WDNR who scoffed, claimed they were coyotes until I described the size, then coydogs, and then wanted to know where I was trained in wolf identification at which point I suggested they come and observe from our dining room window as she was a frequent visitor. I heard laughter as they hung up. Recently 2022-2023 we heard a wolf howl. Wolves follow the deer not the boundaries we place upon them and if unchecked or managed will adapt to every condition of the state. As more and more packs develop, individuals move to avoid conflict and will establish new ranges and to adapt to them. (Adrian P. Weydeven) The desire by some is to repopulate the entire historical range of the wolf. Why is depredation and dispersal important? Wisconsin's primary business is agriculture and livestock, both beef and dairy. Farms Operations† Farm Operations - Area Operated, Measured in Acres / Operation 222 Farm Operations - Number of Operations 64,100 Farm Operations - Acres Operated 14,200,000 A study conduct by UW Madison: "Wisconsin's farms and agricultural businesses generate $104.8 billion in economic activity and 437,700 jobs, based on data for 2017, according to a new study from the University of Wisconsin–Madison. This is an increase from a 2012 study that found agriculture generated $88.3 billion in economic activity and 413,500 jobs in the state." Our dairy industry Wisconsin's namesake: "What percentage of Wisconsin's Agricultural receipts are dairy products? Dairy products account for over 1/2 (54%) of Wisconsin's total agricultural receipts earning the state the #2 position among the states behind California for the production of dairy products." Milk Production † Milk - Production, Measured in Lb / Head 24,884 Milk - Production, Measured in $ 5,959,976,000 Milk - Production, Measured in Lb 31,702,000,000 Stress in dairy herds will stop milk production and create conditions where cows will not impregnate. Loss of milk production will impact our cheese industry as well. "The stress of predation by wolves can cause cows to lose pregnancies, lower milk production and lead to smaller weight gains, said Mattias Gugel, Tiffany's Livestock Inventory † Cattle, Cows, Beef - Inventory (First of Jan. 2022) 295,000 Cattle, Cows, Milk - Inventory (First of Jan. 2022) 1,275,000 Cattle, Incl Calves - Inventory (First of Jan. 2022) 3,500,000 Cattle, On Feed - Inventory (First of Jan. 2022) 270,000 Goats, Milk - Inventory (First of Jan. 2022) 74,000 Sheep, Incl Lambs - Inventory (First of Jan. 2022) 82,000 Hogs - Inventory (First of Dec. 2021) 365,000 Chickens, Broilers - Production, Measured in Head 55,900,000 Wolf population increase by nature increases complaints, depredation, and intolerance. Final Environmental Assessment For The Management of Wolf Conflicts and Depredating Wolves in Wisconsin, April 2006 Considering that the wolves inhabit approximately 25% of the state in 2022 and we see the cost in depredation accelerating as they expand is not a smart plan for Wisconsin or the wolf as they move deeper into more intensive agricultural areas. Other positives I have heard regarding the wolf regard tourism where people will flock to hear wolves howling or perhaps even see a wolf. These are a few

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
						testimonials I have captured from people living in wolf country. One 64 year old woman jogging in white shorts and a white tank top had a revolver strapped to her waist. Not usually what one sees in jogger attire. I stopped to talk with her to learn why. She has a regular run she does everyday of nice weather. This particular day he caught movement coming through the woods right toward her and thought at first a deer. When she saw it her next thought was a dog but then realized it was a wolf. A neighbor who just happened by right then saw what was happening and had her get in their car. The wolf stopped and watched them for 20 minutes before heading off. She does not know what would have happened but carries the sidearm ever since. Land o Lakes has invested in a bike path. A man was surveying it for a ride with his kids that afternoon when he saw three wolves heading right toward him. He accelerated and as he said fortunately he was faster on the bike. He did not return with his kids. A bow hunter was preparing for the afternoon hunt. His last act of preparation was strapping a holster and pistol on his waist. Thinking he was not aware I suggested he not take the gun as the DNR will ticket him for carrying it while bow hunting. His response, "I don't give a F#&* what the DNR think. I have had so many issues with wolves I plan on always carrying. This is the third spot I have hunted to get away from them and they are everywhere." In 1997 or 98 I saw my first wolf while deer hunting. It ran up and stopped 10 yards from me. We stood and assessed each other for a few minutes and then it left. A big beautiful grey. The next day my dad had it run up within 5 yards. He turned hearing it running thinking it was a deer upon which it pulled up short. My recent experiences 2018-2021 have not been as wonderful. Walking to a stand one morning I saw three wolves coming toward me. I got to a clearing and watched as they circled. I could only see shadows in the moonlight. They finally departed and when I could no longer hear them proceeded toward my stand. I could hear them returning. I climbed the ladder and had them with me until 10:30 that morning. I left the woods when they departed. The last encounter left me more rattled. As I still hunted to a location I knew about I saw 5 distinct wolf tracks in the sand. They were moving ahead of me. I got to where I wanted to sit and they were still moving along the road away to the west. I eased up along a ridge and was about to sit when a wolf west howled. This was answered to the east, north, and south in close proximity. I worked back to the road and headed to a knoll that provided good visibility. 20 minutes after taking up this position I watched a grey and a black walk through the marsh. I left the woods. We saw no deer for the fifth year in a row. These are not events that improve tourism. Many hunters I knew have gone south to hunt. My goal is not to eliminate wolves in the state but to place them in a manageable number minimizing conflict. I am concerned that what we will see are more wolf attacks as experienced by Ray Calaway, Wood County having lost three guard dogs and 13 sheep. As a livestock seed stock producer whose primary job is care, husbandry, and protection of our animals the idea of watching wolves tear into them and not allowed to do anything but watch is abhorrent as it would be to anyone. Reimbursement of loss of any one would be insufficient for the loss in genetic gain and uniqueness of 25 years of careful breeding. With the uncontrolled population of wolves on the Indian reservation, 350 wolves to plan would provide all the benefits but minimize the damages and conflict. The idea that the state is even considering a taking of 6 miles around the Indian Reservation is baffling. The wolves like Yellowstone would have the protection of the Reservation. Should they move out of the reservation for some reason they become wards of the state and subject to the states rules. I suppose Indians could claim ceded rights but that involves harvest not mandating protection of certain species. There are many reasons the state should abide by the 1999 plan of 350 plus or minus 10%. First, improve the opportunity of elk introduction. Second, restore conditions so that deer can recover and build the herds as CDAC's are working toward. Third, eliminate the threat to agriculture and livestock farmers and preserve the economic stability and ability to the state. Improve conditions for hunting not only for deer but all species such as Grouse that many who used to hunt in the state refuse to risk their dogs. It will allow tourism in the north as they work very hard to create economic opportunity to residents. And last it will reduce intolerance for wolves providing a successful path toward introduction. The WDNR posts areas of the state that should be avoided because of wolf issues. Various surveys show that although most Americans value wolves, they do not do so to the exclusion of important human needs (Kellert 1986, 1987, 1999; Tucker and Pletscher 1989, Thompson and Gasson 1991, Wolstenholme 1996). Wolves Behavior, Ecology, and Conservation, Page 296. Respectfully Submitted, Michael A Morack [redacted] Waukesha, WI 53189-7965 [redacted]

Megan D	All of it	Yes	Nothing!!	The total amount of desired wolves in Wisconsin is way too high	0	The total number of wolves in Wisconsin is wayyyy underestimated The total population goal in Wisconsin should be less than 200 The depredations of dogs/livestock etc Is far too high and too costly for the state Wolf hunting with dogs SHOULD always be allowed
	All of it	Yes	Having a wolf hunting season as a management tool and to provide a consumptive benefit to the citizens of Wisconsin.		8	
	Most of it	Yes	Management flexibility. Public education.	No particular dislike.	10	Comprehensive plan.
Duane Harpster	All of it	Yes	That you finally got one done, even if it is poorly done.	Zone sizes,are to large do not allow problem areas to be properly address. Volunteer track counts are ridiculous, the DNR has the personnel and equipment to do comprehesive accurate counts. Numbers are necessary to have public trust and to satisfy the feds.	1	There is no public confidence in the DNR here in wolf country.
Carol Eloranta	All of it	Yes	Excellent job in presenting wolf biology information. Education in key!	I understand wolf behavior, as a predator, is very different than deer, and that successful hunting is carried out differently. Yet, baiting, chasing with dogs and trapping wolves or other game, are ways to kill that give great advantage to the hunter. These are very effective methods to use for extermination. If less effective methods are used (like deer hunting archery and gun) maybe population dynamics would be more stable? Rather than exceeding targets so quickly. I dislike the trapping of animals with non-lethal restraints. the restraint creates extreme stress, before it is shot. Non-lethal wounding with gun happens too, but the animal is less stressed when free to flee, than when restrained.	9	Well written, readable and informative presentation of info. More education and familiarity of wolf behavior can improve acceptance of wolves on the landscape. Flood the media with info! There is high density of deer where I live in Clark Co. I would like to know how a few resident wolves affect the deer population and deer behavior. Research findings may inform farmers who fear livestock losses of possible positive effects overall...less loss from deer due to crop damage. especially along woodlot edges. Do they keep the deer moving? I agree with tribal comments that our future is connected to wolves and environment overall. Makes so much sense. Thank you for all the effort put into this plan!
Barbara Bernhardt	Most of it	Yes	I like that it is science-based and will be managed by wildlife biologists.I like that it prioritizes the health of the wolf population and not politics or the influence of out-of-state hunting groups. I like that there is not a numeric population goal.	I don't like that trapping is allowed, as personally think it is cruel and inhumane.	9	Thank you for this well-reasoned, science-based management plan. I like that there is also an education component to help people understand the role of wolves in the ecosystem. I agree that there should be some compensation for livestock depredation. However, I think that concerning wolves and training of hunting dogs, that more responsibility should be put on the dog owners to avoid those areas where wolves are known to live, breed, raise their pups, and hunt. I personally disagree with the practice of hunting with dogs, except to retrieve game birds and waterfowl

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Margaret Gompper	All of it	Yes	First and foremost, I appreciate the time and energy put forth in creating a new and revised Wisconsin Wolf Management Plan. It removes the arbitrary and dated wolf population goal and numeric population strategy used in the past. It allows for science-based adaptability based on environmental changes and low-quota sub zones that create a buffer around Tribal lands. Additionally, I appreciate the commitment to rely on science, continued research and educating the public that wolves are "keystone species" that play an essential role in maintaining a healthy ecosystem. I highly value the mission statement especially the assurance that all people will have the opportunity to use and enjoy our natural resources. Thank you for allowing public input which is vital in understanding future management practices. I live in zone 2 and have additional comments where requested.	I strongly recommend hounding on wolves be illegal in the state of WI. I have specifically described in the comment section below.	6	1) Noted on page 127 of the draft plan re: wolf hunting with hounds. I do not support training and hunting wolves with hounds. As you know WI is the only state that legalizes the hunting of wolves with dogs. This is exceedingly cruel and inhumane to both hounds and wolves. It is unsportsmanlike and has no ecological or scientific rationality. This practice is not supported by the majority of ethical hunters or the broader public (Bradshaw et al 2022). WI Act 169 of 2011 allows pursuit of hound hunting on wolves and should be either revised or removed. I realize the WDNR cannot regulate statutory legislation but this act is contrary to any definition of wolf stewardship. My pets and I have encountered many negative situations during bear training and hunting season with hounds on my property not to mention the depredations and cost incurred especially in wolf caution areas. Additionally, hunting wolves with hounds should not be allowed in sub zone areas. Unsupervised hounds do not know borders. 2) Also noted on page 27 of the draft plan is a proposal to create a designated hound training period on wolves to begin after the deer gun season ends and end in all zones only when the final wolf harvest zone closes. If any single wolf harvest zone remains open longer than any other, hound training can continue everywhere. Hound training should end in all zones at the same time. 3) The hound training period is proposed to take place during wolf breeding season (Mech 2002). This timing destroys pair bonding, breeding and territorial defense and is not ecologically sound. There is a lack of data collection from the February 2021 WI wolf hunt which took place during the wolf breeding season to substantiate the impact to specific local packs and much more. 4) The hound training period suggested will also disrupt winter wolf tracking surveys. 5) Noted on page 164 of the Proposed Wolf Management Plan is a map portraying subzone 2B. It designates Hwy 64 as the northern most boundary which in a sense, acts as a buffer for Tribal lands where wolves are protected. The subzones proposed will reflect a reduction in wolf harvest quotas. Large agricultural lands are located north of Hwy 64 and most importantly, 1000's of acres of Chequamegon-Nicolet National Forest lands have been heavily logged due to the catastrophic storms in 2019. Fuel breaks have been created and logging unrelated to the storms have been ongoing since 2019 leaving reducing the forest lands to 1-tree/acre especially north of Silver Birch Road and continuing to Lily and Pickerel. I recommend a reduction in quotas north of Hwy 64 since the habitat has been decimated and is no longer heavily forested with likely a major decline in wolf population. Since there are no primary highways heading west from Hwy 52 to Hwy 32, I recommend a reduction in quotas be considered north of Hwy 64 in the township of Wolf River for at least a period of 5-years or until the forest can recuperate. 6) The mission statement says, "To ensure the right of all people to use and enjoy these resources in their work and leisure. To work with people to understand each other's views and to carry out the public will." With the existing hunting seasons and a proposed training and wolf hunting season, there doesn't seem to be a safe place to hike, walk a dog, photograph wildlife or collect data for Cornell for ornithological collection as I do. I personally was shot at while hunters were chasing deer on my property. US Forest Service and the sheriff were notified. My land abuts national forest. I and many others feel we cannot safely enjoy the outdoors or even work outdoors during hunting seasons which continue to evolve. I would be more than happy to purchase a license to use and enjoy our natural resources. I have that right on paper but not in reality. I hope you will understand my view as many others feel the same. 7) I reiterate, I strongly recommend hounding on wolves be illegal in the state of WI for the reasons listed.
George Mason	All of it	Yes	Monitoring and public awareness goals.	The 2021 harvest numbers show a massive disconnect between quotas and permits. I do not see anything in this plan that would prevent that from happening again.	4	2021 was a disaster from a management perspective. Any plan must set stringent limits to prevent a repeat of that season.
Dewey Sebold	All of it	Yes	What is it to like?	How can you manage anything without a goal? 350 or less would gain much support for the plan.	1	The plan should be written by county officials not state DNR bureaucrats. Each county should decide the population. Decision should come from those most affected.
Jim Winkler	Most of it	Yes	The statements that the harvest of wolves in Wisconsin seems to have had no impact on wolf populations.	The millions of dollars spent on depredation over the years. Couldn't this money be spent on habitat for all critters.	1	As a 50 year resident of central Wisconsin I have watched the deer herd dwindle the point that deer hunting is a waste of time. As a trapper the wolves have figured out how to catch the beaver, again to the point that it is a labor of love to even find a beaver. Same with rabbits and hare. Lots of cut overs and regrowth but no game. where did it all go? Friend have found lots of wolf kills. You know that 3 R's you like to promote, forget it kids need to see lots to be interested. Not seeing any or few deer for a few days of deer season means that will not remain a hunter for long. Who pays the bills? Wolf watchers or deer hunters. Don't shoot yourself in the foot yet another time. Us old farts are getting fed up and are less and less willing to put up with more nonsense. I have a degree in Biology and understand the Science, but which animals have a higher priority? Your decision. Hope you go with common sense and not politics.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
	Most of it	Yes	None of it because your numbers don't add up properly	Again your numbers are so far off!!	0	Keep the wolves at 350 like the plan first called for! You people really need to learn how to count!! The only thing you are waiting for is a human to be killed and that's terrible and shame on you!! It's very close to happening. I no longer buy a deer tag in Wisconsin because of deer numbers being so low, haven't had a deer tag for 7 years now and how much more do you plan on losing?! I do enjoy hunting other states! Are the anti's paying you? It sure looks that way. White people are paying way too much for you idiots!! Start listening to the people, which you haven't from the beginning. You should get in the woods and do your job!!!
Dan De Vries	All of it	No	Although they are not part of the plan, I like the statements submitted by the tribal representatives. I like the fact that the plan expresses at least passing affirmation of tribal values. I like the fact that the plan acknowledges the ecological value of wolves.	The fact that it advocates recreational hunting and trapping of wolves. And the fact that it refers to killing wolves as "harvesting" them. Cringe worthy.	3	In many instances, in the survey of scientific findings, academic studies that indicate the environmental and social values that wolves provide for human beings and other animals are countered with less convincing studies that undermine those findings of value. Such attempted "balancing" undermines the overall justification of the plan itself.
Thomas Windau	Most of it	Yes	Wolf management by delineated zones. Wolf management to maintain and grow wolf populations in appropriate zones while addressing conflicts.		8	
	All of it	Yes	The surveys and graphs are helpful to gauge public opinion	The glaring problem is the plan has no stated population goal of 350 wolves. Not including lone wolves contributes to underestimating the population. Buffer zones around reservations are too large. More emphasis needs to be placed on recovering the deer population	2	How can a "plan" not set a management goal? This only ensures there will be more conflict than ever regarding wolf management. This could have been a great opportunity for the dnr to spotlight and validate the North American conservation model and support the people that finance and do all the heavy lifting for the dnr and conservation. Instead they gave equal consideration to the groups that oppose sound management. The answer is simple. Re-establish a goal of 350 wolves and set the harvest to achieve that goal. Conflicts will decrease substantially and more people will appreciate wolves for the amazing creatures that they are.
	Just the parts I am interested in	Yes	Thorough. Appears recommendations are science based.		8	
Jill Edwards	All of it	Yes	Zone system, scientific evaluation of wolf numbers, not setting a "number," respect for the tribes, 8 hour and in-person reporting system, using Wolf Advisory Committee (and proposed makeup of committee members), and educational goals.	While I have a background in science and science writing, some of the graphs/charts were confusing. Page 68 representing the percent of wolves killed in Table 11 as a decimal instead of whole number will be confusing to regular readers, e.g., Winter of 2013-2014 44% of wolf death was human caused. Showing it 0.44 makes it look like a very small number to those with no science background. Whole numbers would be better.	9	It is shame the DNR cannot control hunting methods. Hunting with dogs, traps, baits, and snares is a big reason why so many object to the wolf hunt. Not sportsman-like methods and not real hunting. Lazy people driving vehicles instead of walking and tracking and learning about their prey.
Doug Middleton	Most of it	Yes	1. The plan removes a numeric population goal. 2. The plan honors Tribal requests for low quota zones. 3. There is an expressed commitment to science and continued research. 4. The plan includes responses from the public opinion survey.	Make sure the wording of the plan can not be twisted to allow an egregious wolf hunt like the hunt of February 2021.	9	
	All of it	Yes		Expansion of Zone 4 into Marathon County as well as the elimination of the population goal in favor of a holistic approach.	2	
	All of it	Yes	I really can't think of one my mind is clouded by all I don't like	The boundaries around tribal lands. The way the count is tallied specifically not counting lone wolves, low estimation of wolves. Low harvesting when a season is possible	0	It seems like the people in charge have no idea what's really going on in the northern part of the state where I spend most of my time I couldn't begin to estimate anything in the southern part of the state because I'm not there it just makes sense that the people that should be in charge of this and have the most input should be from the northern part of the state
Kenneth HINZPETER	Most of it	Yes	There's is nothing I like	The buffer zone is a joke, how do you dictate, on private property, that you don't pay any taxes on, in my opinion the buffer zone is only there to please the native Americans,	1	Shame on this group, contacting the humane society, this group does not like the American hunter, in fact they actually hate the hunter
Corene Martin	Most of it	Yes	I am pleased to see that the DNR has eliminated a number-based population goal and is instead focusing on the benefits the wolves serve ecologically.	It is cruel to allow for a year round training period for wolf hunting dogs, this should be much more regulated. Also there should be much more focus and support for non-lethal methods of dealing with wolf depredations.	9	Wisconsin needs a better balance between what the hunting community wants and what the rest of the state's non hunting community wants. Right now, it feels very unbalanced, and it often feels like the Wisconsin DNR acts solely in the interest of the hunters, not in the animal's best interest or the interest of our nature loving population.
Brady Zuck	Most of it	Yes	We appreciate the opportunity as cattle producers who live in wolf territory to have our voices heard.	1) No numerical population goal - how do you manage a population without a target? How can you fail the test when there is no grading rubric? 2) As cattle producers, we need more effective management tools to deal with both direct depredation and the impact that the presence of wolves have on cattle. Currently, our WI cattle producers are extremely limited on the options they have to deal with problem wolves. We are carrying the burden of wolf damage with no real way to address the issue. 3) How do we fairly compensate producers for lost production due to wolf pressure? For example, cattle that are restless, do not graze normally, break loose from fences, or see a higher abortion rate?	1	As a cattle producer, I am not advocating that we have zero wolves in Wisconsin. However, we need to have realistic management tools to use when faced with wolf issues. We need to address both direct depredation and the negative consequences cattle face when wolf pressure is high.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
	Most of it	Yes	I like how both sides were generally represented. The damage the wolves cause, and the balance they help create.	Allowing people not affected at all either way to have so much input into the outcome of the Wolf Management Plan	5	I believe we should have a plan that allows the control of the wolf population to a number that is realistic, per scientific information, while still allowing them to exist on a landscape that is able to maintain a healthy number. Too much of a good thing is never good!
	Most of it	Yes	Strategy C3, very important, Same with D	Wolves should not be hunted/trapped, and that should not be accounted for in the plan. Objective B2C is avoidable and should not be compensated for Objective C1 needs to be minimized as much as possible. Traps and Dogs should never be allowed. Strategy C3 needs to be elevated, it is very important, and most residents would benefit. The number of people who would rather see a live wolf greatly outnumbers the residents that would hunt a wolf.	6	
	All of it	Yes	I like the emphasis on science based education and action. I am pleased that the DNR is asking for public input. Your report was very informative and thorough.	I do not believe in harvesting the wolf. I agree with the native tribes about our historical and current relationship to the wolves. Wolves help our ecosystem by hunting deer. Deer cause more damage to humans and property on our roads than the wolves cause by taking a very limited number of livestock. I am opposed to hunting wolves with dogs and read in your report that most of the dogs killed by wolves were hunting them or bears. This is inhumane and unnecessary.	5	I am hesitating to support the plan wholeheartedly because of past irresponsible actHumane. the state of Wisconsin. I hope future wolf management is more scientific and humane.
	All of it	Yes	Including tribal input. Recognizing that the harvest of wolves may have little effect of established packs. Acknowledging that 29% of population could be harvested with established packs like WI has. Acknowledging that it is "increasingly difficult for hunters to limit activities to areas that are not occupied by wolves" - although impossible would be more accurate.	Although wolves may be effective at identifying weaknesses among prey that doesn't mean they don't go after the strongest especially when referring to hound depredation. It's pretty unfair for the residents who live in wolf ranges to be forced to deal with them when residents in non-wolf ranges don't really have to deal with them and if there is a "problem wolf" in their area, it gets transported to overpopulated wolf area to cause more problems. I believe regulated hunts do increase tolerance and decrease poaching. I have had a hound killed by wolves and basically blame the politicians more than the wolves. I don't want revenge - nothing will bring my hound back and that was a huge loss for myself and my family. I do want the wolf to fear me and that is not the case in northern Wisconsin. I want to be able to hunt with my hounds as I have for the past 35 years without the constant worry about wolves killing them. It was such a great experience before wolves were reintroduced now it is very stressful and getting to the point of us not letting our hounds loose. A wolf hunt makes wolves leery of us in a good way. As far as people "wanting at least as many as in 2014" is deceiving because I don't believe the state has honestly shared or even knows exactly how many wolves there are so people are "wanting as many based on a false number". Obviously, urban would be more supportive because again they don't have to deal with the threat to their pets. I disagree that most wolf attacks occur when hunters are not in close proximity to the dogs. We were 100 yards from our hound when he was killed. The same is true for many other hound hunters that I have talked with. Goal of turning now to "sustainable, long-term management" should include "with protection for residents and their pets who are now forced to share the forest". I dislike permits that are zone specific. I think it is better to shut down zones as they are filled as has been done in the past and is used out West. The problem was allowing too much time to report a harvest. I am concerned that by not listing a specific "target population" our state is not going to actually try to keep a manageable population and will let the wolf population get even higher than it already is. I am also disappointed that our state has not been able to have any say in delisting wolves as threatened. If the wolf numbers are too low in other states to delist, then Wisconsin should look at relocating wolves to those states.	5	This plan is useless without a wolf hunting season. More and more hunters are becoming discouraged - maybe that's the state's secret goal - how sad is that? Does the DNR even care about hunting traditions?
Matt Lybeck	All of it	Yes	That you are actually willing to talk about the wolf issue and not just sweep it under the rug.	Main problem is no management number. We have limits on fish, speed limits on roads, goal populations for deer, but when it comes to wolves, the sky is the limit. It makes many people lose all respect for the wolf and makes a political joke of the DNR. People take the problem into their own hands when officials refuse to be responsible. Now wolves are shot and left to go to waste. How is that helping? If there was a season, the state would make money and people would feel like something is being done to responsibly manage the wolves. This plan is ridiculous and childish as far as it ignores the wolf problem.	1	If the DNR doesn't want to put out a population goal, do an actual population count, or have a serious management plan, then why do they have all these numbers for every other animal that they attempt to manage? Your organization is a joke and I don't respect any of your political BS. Get out of the office and into the field to see what nature is really like!
Brad Kraege	All of it	Yes	I like the statistics on the wolf population history, along with data on the potential impact on the deer and elk populations.	While I fully appreciate that any specific population goal you publish will probably wind up in court, I recommend you consider a minimum, maximum and target populations. This could be percentages, such as a target of 50% of the carrying capacity. It would leave you the flexibility you want, but put some structure around it for the hunting population.	8	I think the subzones are a layer of complexity that is not necessary. I get that you are trying to create a buffer around tribal lands, but wolves within tribal areas will range well outside these boundaries, and despite your best efforts can't be protected. This is happening with the Yellowstone wolves and will happen here. Also, while your zone boundary maps copy the deer maps, I recommend you consider moving more of Adams, Wood and Portage County outside the Forest zone 5, and move them into 4. This is more farmland than forest and is an area of high wolf conflicts. I believe these conflicts stem from this being marginal wolf habitat, and they are preying on livestock because of this.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Madeline Barone	Just the parts I am interested in	No	1. Removing an arbitrary wolf population goal is important to make sure the best-available science is centered in wolf management 2. The low quota zones are an important and welcome addition to the plan 3. The plan is rightly focused on the ecological benefits of wolves 4. The plan removes a numeric population goal 5. The plan creates low quote zones around Tribal lands where the Tribes requested it 6. The plan is rightly focused on the ecological benefits of wolves 7. The plan is reflective of the public opinions survey 8. There is expressed commitment to science and continued research with partners and acknowledges that "keystone species such as wolves are an important component of a healthy ecosystem"	The DNR should better regulate hound training on wolves 2. There is currently no guidance in plan for the next review or update 3. The plan acknowledges that there are responsible farming practices and other non-lethal options to reduce wolf and livestock conflicts	9	Wolves are a keystone species and could potentially impact keeping things in ecological balance. I respect the tribes views on wolves and think that the tribes/local views are highly important.
Jacey	Just the parts I am interested in	Yes	I like that this plan focuses on the ecological benefits of wolves and recognizes that they are keystone species.	I wish that this plan focused more heavily on non-lethal ways to avoid wolf/livestock conflict.	7	Thank you for making forward progress. Wolves are intrinsically valuable and need to be protected.
Stephanie	Most of it	Yes	1. I was encouraged to see that the DNR has acknowledged the ecological benefits of wolves, and their vital importance in our ecosystem. 2. I am relieved that the DNR has taken away the numerical goal of wolves. The outdated plan had called for a population of 350 wolves. Wolves should not be managed based on a number. 3. I liked that all of the Tribes in Wisconsin were given the opportunity to share their perspectives on wolves and the cultural significance of them in the plan. 4. I oppose the lethal removal of wolves before non-lethal strategies are implemented. I liked how the plan emphasized the use of non-lethal methods to reduce conflict. 5. the adaptation of buffer zones around tribal lands and making hunting licenses zone specific. Way too many wolves were killed in Feb 2021 without any of these guidelines, and this cannot happen ever again.	1. The plan should establish a zero-hunting quota. There is no need for a recreational wolf hunt. Scientific studies have shown that killing wolves results in pack members to split up and cause more damage and depredation. Intact packs overwhelmingly stay out of trouble. 2. Hound training must be stopped! Hounds harass wolves and other wildlife in the forest and stress them out. These hounds are knowingly put in harm's way, and when a wolf does kill a hound, the owners are reimbursed. This does not benefit anybody. PA 169 should be overturned. 3. Wolves should NEVER be hunted using hounds. It is legal dog fighting. 4. The plan should include a committee of biologists and professionals to act as oversight. There are too many pro-wolf hunting groups involved. This does not reflect the values of Wisconsin citizens. The majority of the people in this state do not support wolf hunting.	7	Overall, I think the DNR did a good job with this plan. I want to reinforce that recreational wolf hunting should never be a first option. Hounds should never be used to hunt wolves. The ecological importance of wolves should be shared with the public and the DNR should speak about wolves in a positive light. Coexistence and non-lethal methods should take first priority.
Pat K	Most of it	Yes	Liked: the inclusion of the Tribes' input and presence on the committee. Also links to their management plans which show how differently their cultures approach "managing" the Wolf and offer ideas for that.	Base licenses always on science, not quotas. Do similar as is done for other large game, not a quota with the goal of how much of the population can be taken before the species gets into the red zone. Quotas seem made for failure for another reason. This, because the number of licenses issued (over 1,000) vs the quotas (a couple hundred) don't seem to be realistically enforceable in the field. How do all these licensees know when the quota has been reached and they have to stop hunting/trapping/running their dogs? And how do you know they do? I may have missed it but there should be robust enforcement and penalties for people who run their dogs repeatedly in Wolf Caution map areas and repeatedly submit compensation claims for loss. This is a 'thing.' Especially when they go into known den territory. I have seen dogs that look like quilts having been stitched up so often from what seems to be deliberate running where they should not. It would be helpful to have a feed specialist on the committee when suggesting supplemental nutrition and other measures to support stressed livestock that end up being crowded or moved toward structures for protection.	9	It's a lot to digest and I had to ultimately skim some areas, but it is overall good. An improved approach with appropriate balance of areas and inclusion of Tribal stakeholders.
	All of it	Yes	I like we are talking about it	I do not agree with population goals	2	
Melanie Weberg	All of it	Yes	1. Attempts to be more balanced (consumptive vs. non-consumptive 2. Creation of tribal buffer zones 3. Removal of maximum population numbers 4. Non-lethal methods emphasized 5. Suggestions for an Increase in positive wolf social media presence to counter false propaganda Wisconsin websites such as "Wisconsin Wolf Facts".	1. Hound dog training on wolves should not be allowed. 2. Lacks emphasis on poaching in Wisconsin and ways to resolve. 3. Lacks discussion of current pack size (2.6) and importance of robust wolf packs. Both MN and MI have pack sizes between 3.6 and 5 with minimal baiting and no training - is Wisconsin a sink and what can be done? 4. Absent any mention of commitment to working with legislature to: a) remove dog depredation payments and until then no payments in previously announced caution areas; b) removal of mandatory wolf hunt 5. Too large of an emphasis on recreational wolf killing as only approximately 12% of Wisconsin residents hunt and also there is no science that supports it as a management tool. 6. Wolf Advisory Committee should have scientists and biologists from outside the state agency as well or there should be a separate committee for strictly science with outside scientists and biologists represented. 7. The Wisconsin public is	7	According to the draft, 2,041 known wolves have died from human-caused incidents. That is unacceptable - we can do better than that.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
				against trapping of wolves as was given a very small mention in the draft. Trapping should not be allowed.		
Jill Giencke	All of it	Yes	I am encouraged to see all the science-based explanations and points. There is no arbitrary numerical goal regarding wolf population. Low quota zones around Tribal lands. Recognizing the ecological--and tourist-driven economical--benefits of wolves. Acknowledgement of public support for wolves, even in counties where wolves live. Commitment to research and updating.	Does not eliminate the use of hounds when hunting wolves, an abomination. No specific date for when the plan will next be updated. While non-lethal methodologies are recognized and encouraged, they are not pushed as a priority for the DNR, when that seems a no-brainer. Overemphasis on vague "hunter satisfaction levels" without addressing hiker/photographer/recreator/etc "satisfaction levels".	9	We cannot have our wolf population managed and manipulated to suit hunters the way we currently manage and manipulate the white-tail deer population to suit this minority of Wisconsin citizens. Our wildlife does not exist for us, even if they must live at the mercy of our whims.
	Most of it	Yes	Seeking out improved methods to accurately count the population.	No specific population goal. Current law is 350 it should remain there.	2	We had a great plan, with little to no issues. The past hunts have gone off without a hitch and the populations remain stable. It's a renewable resource just manage the numbers appropriately.
	Just the parts I am interested in	Yes	History of the wolf pack spread and overall study of predation and habits of wolves	NA	4	I believe the wolf count is understated and that the amount of deer killed is understated. A hunting season is vital to keep the numbers in check
John Herbst	Most of it	Yes	Removing an arbitrary wolf population goal is important to make sure the best-available science is centered in wolf management The low quota zones are an important and welcome addition to the plan The plan is rightly focused on the ecological benefits of wolves Very beneficial to historical underrepresentation of native First Nations peoples thoughts and cultural perspectives on gray wolves in WI. As the original settlers of the areas covered in this draft proposal, their input should be pivotal to all decision-making bodies involved in this draft proposal process. The plan removes a numeric population goal: Removing an arbitrary wolf population goal is important to make sure the numbers of wolves are adaptable, so they can be based on best-available science and ecological changes. The plan creates low quota zones around Tribal lands where the Tribes requested it: These lands are treaty-protected with documented wolf packs. Making this update is an important and welcome addition to the plan. Ideally, the plan would expand these zones beyond just the few that are listed. The plan is rightly focused on the ecological benefits of wolves The plan is reflective of the public opinions survey that was released along with the plan and finds that opinions toward wolves have grown significantly more favorable towards wolves There is expressed commitment to science and continued research with partners and acknowledges that “keystone species such as wolves are an important component of a healthy ecosystem”	The DNR should better regulate hound training on wolves. The DNR should close wolf-focused hound training activities as each wolf hunting zone closes.The plan currently would allow hounds to chase wolves for training purposes during the wolf hunting season, across the entire state, until the very last wolf zone is closed. This could go on for months and would interfere with the wolf breeding season in late winter. There is currently no guidance in plan for next review or update – there should be a plan for regularly updating the plan (so we don’t have another plan that is used for decades) and there should be permanent, ongoing stakeholder AND science committees to oversee wolf management in Wisconsin – The scientific oversight is critical. The plan acknowledges that there are responsible farming practices and other non-lethal options to reduce wolf and livestock conflicts, but stops short of recommending that the DNR prioritizes these opportunities.	9	It needs CONSTANT, regular intervals of scientifically and stakeholder centered review and approval both in order to be acceptable to all parties concerned, and to therefore be practicable and in agreement with best management practices of natural ecological practices in WI.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Bryan Bruss	Most of it	Yes	I like that the health of the white-tail deer herd is part of Strategy A (specifically, Strategy A-5a).	I do not like that there is no longer a strategy that includes a number that indicates the ideal size of the wolf population. I also do not think that strategy 3C belongs in the document. There are quite a few statements/conclusions drawn in the entire document that in my opinion are biased toward a pro-wolf attitude, but I am ok with them. However, Strategy 3C is extremely exaggerated and I think it should be removed.	7	You are probably not surprised that I am (more accurately was) a deer hunter. My decision to stop deer hunting is directly related to the quality of my deer hunting experience in the area where I grew up and hunted all my life, until about 10 yrs. ago (Nicolet-Chequamegon Nat'l Forest east and northeast of Three Lakes, WI). To put it briefly, and empirically, the amount of decent sized bucks, or sign of them, had dropped to a point where hunting in the Northwoods was no longer worth it to me. I am also a big fan of the wolf population recovery. I know I am not alone as part of the deer hunting population that complains the hunting quality isn't what it used to be. The biggest problem I see is why the DNR evaluation of the deer herd does not match the general consensus of the hunters. And, unfortunately for the wolf, their growth has been inversely proportional to the deer hunters' perceived hunt quality. Specifically to the Wolf Management Plan: I would like to see Strategy A-5a be a much more prominent part of the plan. Develop a model for the deer herd that correlates to experiences in the field and make it a much more influential factor in the wolf population equation. The wolf population recovery is a great thing, but it should not come at the expense, or perceived expense, of the deer hunt. I think we can all agree that the value the deer hunt brings to this state (especially Up North where they badly need it), should take priority over any value the wolf population may bring, especially of the bequest variety.
Michelle Hayward	Most of it	No	I appreciate that the updated management plan is a vast improvement on the last one. It is clear that a lot of effort has gone into it. It is great to see the following within the plan: The scrapping of the short-sighted goal of a tiny population of 350 individual wolves. Their essential role within ecology is recognized. The presence of a social survey citing favorable opinions on wolves, recognition of their keystone species status, and opposition to the questionable motives behind the justification and methods used to kill wolves. Acknowledging the role of wolves in tribal culture and adopting the proposed buffer zones around reservations.	Q5. Overall, what elements from the draft plan do you DISLIKE? Again, being specific is most useful to our team 1. As someone who would like to see an increase in the protection of wolves via non-lethal interventions, and a complete ban on recreational killing, I deeply dislike the following assumptions and omissions: The lack of current best available science and literature on the following: Their behavior, sentience (particularly their ability to feel pain), sociability (essential when trying to expand their population and genetic diversity) and general well-being. The success rates of non-lethal interventions & how we can address any failures without immediately turning to lethal ones. The mental, physical, and social impact of widespread killing on wolves, and the downstream impacts of subsequent behavioral adaptations on the wider ecology and evolution. 2. The omission of this essential information, and the assumption that recreational killing (likely based on the historical 350 population target of previous plans) is a sustainable management strategy in its own right (where are the figures backing this up?). This means that the newer and more widespread sources of data, and its potentially huge impact on wolf management, is not even being gathered. 3. Lethal forms of wolf management should be the exception, not the rule. It should only be used in the exceptional circumstance of defending human life. There are 61 mentions of trapping in the plan. Research shows that allowing the widespread trapping and killing of wolves not only puts non-target species at risk (surely wolves should be non-target!), it also creates social confusion over what is a legal and illegal killing. It also creates an atmosphere of indifference, ultimately increasing the killing of wolves everywhere. Authorizing the use of hounding on wolves means the state is promoting and approving of dog fighting, and all the social ills that go alongside this hideous crime. Wolves and hounds suffer immensely. It is not a quick death. The majority of the public, and hunters, do not support this barbaric form of hunting. 4. The plan is still heavily weighted in favor of lethal wolf management. This is wrong. The lives of every wolf should be prioritized throughout the plan. In cases where livestock is involved, all non-lethal management of wolves should be utilized. For example, secure fencing protects and excludes if installed efficiently. Studies have shown that acting proactively with non-lethal methods, rather than reactively, is the best way to change predator behavior. If a wolf is 'just' killed, with no non-lethal deterrents used, there is no knowledge passed onto their fellow pack members of where to stay away from. The void is then filled by another wolf, who is likely to kill livestock again. If it is made difficult to obtain potential prey, they will look for more natural sources, of which there are many. There is no reason why Act 169 can't be set at a minimal quota, with restrictions on methods used, or even set at zero. 5. Any compensation plan must require evidence that every effort has been made by the claimant to non-lethally deter and minimize predation of livestock. 6. The plan largely ignores the social survey results indicating that the majority of the public cares deeply for not just the overall wolf population, but what individual wolves have to endure in the current climate of widespread killing. This goes far beyond whether the population is simply viable. The following views regarding the opposition of a regulated wolf hunting/trapping season were omitted from the plan: The widespread disgust of the public regarding hounding (64% object), trapping (70% object). Questioning whether the hunt was even needed (62%) and	4	

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
				whether the hunt is culturally offensive to Native American tribes (57%). This should be the basis of the plan, not business as usual via policy and practices that are inhumane and unscientific. Departments should attempt to meet the expectations of the overwhelming majority - not dismiss them. The omission of scientific and social evidence results in a blinkered view of the wider wolf situation, a lack of public accountability and a lack of governmental and scientific integrity. This creates a skewed picture of the true beliefs held by the majority of survey participants, ultimately fudging the results and controlling the narrative to justify, for example, the continuation of recreational wolf killing. 7. Conflicting agency objectives is not addressed. Hunting means more pack dispersal, lost wolf knowledge when the pack patriarchy and matriarchy is destroyed, and more opportunistic behavior. Wolf predation does not drop with an increase in hunting. They are interconnected. Favoring hunting is a bias that cannot be justified. Hunting completely disregards harm mitigation, the wellbeing of wolves, their ecological roles, and their non-exploitative enjoyment, breaching Objectives A, B, D and F. 8. The harm done to individual wolves; which you are aware that the public are deeply attuned to; is not considered. Imagine being set on by a pack of dogs or caught in a trap for hours or days! 9. The simplification of tribal beliefs regarding wolves. The mere presence of wolves in Wisconsin does not fulfill 'cultural benefits'. Each individual wolf is considered a person and relative. The reduction of pain in what should be the rare use of lethal measures, is key to sensitively respecting tribal culture. Killing for fun, rather than out of absolute life-threatening necessity, is therefore a breach of these beliefs. The plan fails to understand or acknowledge this. 10. Overall, the report is biased. Essential scientific data and detailed public opinion is intentionally missing. The report is a foregone conclusion. 11. The new 'scaled occupancy model' (SOM) is a reliable method of population estimation that should form the backbone of any population management plan. The unverified methods that Wisconsin has chosen to use to establish population size has resulted in a huge over-estimate of wolf abundance; completely ignoring the impact of its own widespread wolf killing (216 wolves in 2001 alone - 97 above the agreed quota!). Thus, a fictional situation is created whereby the state is overrun by wolves and their populations are healthy. The consequences of this for the remaining wolves is dire, who are already in a dire situation. This is in no way best practice. The report should be scrapped alongside all recreational hunting. Only after an independent, unbiased data gathering on true population size can a plan be put in place. The true population figure is likely to be a shock, and a sense of shame, to the majority of residents that wish to protect these beautiful, essential animals.		
Maureen McCoy	Most of it	Yes	That the plan is based on science, wolf areas, and public/tribal input	Wolf-hunting hounds in all areas for the entire season No plan for updating the plan based on data	8	Thank you for updating the antiquated plan.
Mary Wegner	Just the parts I am interested in	Yes	1. Removing an arbitrary wolf population goal is important to make sure the best-available science is centered in wolf management 2. The low quota zones are an important and welcome addition to the plan 3. The plan is rightly focused on the ecological benefits of wolves	1. The DNR should better regulate hound training on wolves. 2. There is currently no guidance in plan for next review or update 3. The plan acknowledges that there are responsible farming practices and other non-lethal options to reduce wolf and livestock conflicts, but stops short of recommending that the DNR prioritizes these opportunities.	9	
Scott Lowery	Most of it	Yes	I really like moving away from a (necessarily arbitrary) numerical goal for wolf population and instead focusing on research related to how a healthy gray wolf population supports and benefits almost all aspects of the natural environment where they live. The plan highlights current research on the trophic cascade effect, and takes a balanced view based on science rather than pandering to popular mythology, which can run the gamut from romanticizing to demonizing this native apex predator. I also really support how reflective the plan seems to be of Tribal input, specifically creating low quota zones around Tribal lands where requested.	No complaints or reservations. Very exhaustive, great work!!	10	
Cheryl leonard	Most of it	Yes	I like limiting around tribal land as the nation's want. I like using scientific research on the wolves populations as they change. I detest hounds being used as they are victims as well.	I personally think they should declare the wolves protected.	9	Wolves population varies from year to year. If we allow them to be hunted use scientific research on it. Ask the experts who study the wolves.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
	All of it	Yes	Very well laid out. Easy to get to areas fast of specific question/concern. Like that there is no set population goal--just like the bear, deer, and other plans.	I do not like that there is any hound hunting to be allowed for wolves. State law has that there shall be no canine against canine fights and that is what happens when hounds are chasing wolves or coyotes--hound hunters instigate that behavior and allow it. Also trespass and coyotes/wolves can not get up trees or fly away like other animals chased by hounds/dogs.	9	Don't listen to the fear mongering assocations such as WWF and they were part of this whole plan making already. There is not a wolf behind every tree as most people of this uneducated people say. We live in wolf country in Bayfield county and surrounded by woods of mostly public, but some private. The ecosystem gets along by itself and we need to manage wildlife the right way, not the wrong way. Use science as well as being considerate of the tribal nations on wolf management.
Sharon	Just the parts I am interested in	Yes	Develop materials to assist local department and customer services staff in providing accurate and consistent information to wolf-related inquiries.	Anything that uses the term "wolf harvest". This is digusting to think of mammals that are conscious beings with thoughts and emotions as some "thing" to "Harvest" --- like a grain of wheat. All animals deserve to be left alone and deserve the innate right to live WILD AND FREE as they are BORN to be.		All wolves and animals deserve to be left alone and deserve the innate right to live WILD AND FREE as they are BORN to be. Humans shouldn't have to "Manage" wildlife. The term wild -- should mean wild. Meaning leave them alone. No harm to them. Let them be. Let them live safe and free! There are 4.9 million domestic dog bites each year.. where is the P.R. for that. Where is the education on how much harm domestic dogs do each year! Wolves do their best to stay away from humans. Tolerance, acceptance of wolves. Wolves are not a "trophy". That is SICK. I love wolves.
	Most of it	Yes	hunting will be allowed as a management tool	hunting will be very limited. It should be open all year long with unlimited tags.	1	open wolf hunting like coyote hunting. the hunters/trappers would never be able to kill enough wolves to endanger the population. there are way more wolves in WI than are counted inthe 'surveys'.
Gary Dunsmoor	All of it	Yes	Not having numeric population goals. Common sense wolf zones. Good population monitoring plans with science based management. Plan includes increased wolf education. Harvest permits going to zone specific, with timely registration and certification. The plan shows respect for Native American beliefs, and concerns regarding wolf management.	Seasons could run well into wolf breeding season. Dog training should occur only during wolf open season.	9	Overall the plan is thorough and comprehensive. The focus, as it should be, concentrates on maintaining a viable, healthy wolf population while providing various recreation. Hopefully after delisting, harvest seasons, analysis and future research, it can be shown the wolf population can be maintained at over the the 350 level that so many deer and hound hunters are obsessed over, without high conflict levels. Also, hopefully revision of this draft plan will not cater to the wishes of the segment of hunters/hound people that insist on a 350 goal.
	Most of it	Yes	That wolves have a place in Wisconsin	We should have a population goal. Previously it was set at 350. I think that would be too low. 700 would be a good goal. When I worked (retired now), it was said if you can not measure it, you can not manage it. We could have the population goal be reviewed every 5 years as part of the plan. While it recognizes that people living in wolf have less of a tolerance for wolves, I don't see where the plan gives those people any more of a voice.	5	Obviously, while the comment deadline was extended, it must not be important to DNR to update the web page.
	Most of it	Yes	This plan seems to reflect the best science and educated attitudes toward wolves and their complex relationship with land and people, including tribal preferences. Ecology and cooperation are superior to sport hunting & fear.	not qualified to say, but cooperative efforts to find alternatives to killing as a way to reducing herds might come in the next revision?	9	thank you for working so hard on this
James Juedes	I have not read any of the draft plan	Yes				You smart people should know, that if you don't come up with a hunting season that addresses and adequately controls the wolf population in this state and stop bowing to those stupid environmentalist and the "sacred" crap that the native Americans are constantly whining about, that we hunters and land owners will take matters into our own hands and control the population ourselves.
Carol S. Enseki	Most of it	Yes	1)The plan removes a numeric population goal: Removing an arbitrary wolf population goal is important to make sure the numbers of wolves are adaptable, so they can be based on best-available science and ecological changes. 2) The plan creates low quota zones around Tribal lands where the Tribes requested it: These lands are treaty-protected with documented wolf packs. Making this update is an important and welcome addition to the plan. Ideally, the plan would expand these zones beyond just the few that are listed. 3) The plan is rightly focused on the ecological benefits of wolves. 4) The plan is reflective of the public opinions survey that was released along with the plan and finds that opinions toward wolves have grown significantly more favorable. 5)There is expressed commitment to science and continued research with partners and acknowledges that “keystone species such as wolves are an important component of a healthy ecosystem.”	1) The DNR should better regulate hound training on wolves. The DNR should limit wolf-focused hound training activities to only when wolf hunting is allowed in each zone. 2) There is currently no guidance in plan for next review or update – there should be a plan for regularly updating the plan (so we don’t have another plan that is used for decades) and there should be permanent, ongoing stakeholder AND science committees to oversee wolf management in Wisconsin – this oversight is critical. 3) The plan acknowledges that there are responsible farming practices and other non-lethal options to reduce wolf and livestock conflicts, but doesn’t recommend that these opportunities are prioritized.	9	Thank you for your efforts in creating this draft of Wolf Management Plan for Wisconsin. Over the last 12 years I have read up on the gray wolf and what I have learned about them has engendered much respect for their species, and brought them close to my heart, e.g. 1) packs practice population control within their pack respective packs through the behavior of the alpha couple, 2) each member of the pack works awfully hard physically to hunt and provide food for the pups, and to rear the pups, and 3) they are curious, with a keen sense of playfulness, experience, grief and compassion, and an abiding love for their offspring. The books I have read include "Never Cry Wolf" by Farley Mowat, "The Wisdom of Wolves" by Jim and Jamie Dutcher about their six years of experience living with and observing wolf society in the Sawtooth Pack in the Idaho wilderness. It is unfortunate that many children, including myself, grew up with the prevalent though incorrect stereotypes of the Big Bad Wolf, and The Lone Wolf, both of which are not born out by actual historical experience. This stereotype, interestingly, is present in Russian as well as American fairy tales. Perhaps this Wolf Plan will be the beginning of dispelling these misperceptions.
Adarl Datride	All of it	Yes	I like that there is a plan to allow hunting and trapping of wolves.	I dislike that the plan is hesitant to treat wolves as a managed resource, like other wildlife. I dislike that a clear population goal is lacking.	7	I would like the Wisconsin DNR to be put in charge of Wolf Management and manage them as a resource to be hunted and trapped just like any other game species with population goals and

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Merri Ann Gonzalez RN	All of it	Yes	No 350 cap. At least mention of NON-lethal measures. Zone specific quotas and closures. No zone-hopping. Change to 8 hours to report a kill. NOT all year long training of dogs on wolves.	AFTER the listening session on Tues Feb. 8th…I have some thoughts. I live in zone 3, but I can spit into zone 1. I raise what I call "wolf tidbits" little fat French Bulldogs. At one point I had 19 of them. I live in the middle of 3 known packs of wolves, and never have I had a problem with wolves. Hounders cause me to keep my windows closed at night due to the inordinate amount of baying/howling/screaming almost every night year round. These noises come from their incessant night time hunting/training for anything that moves. What is actually going on out there is anybody's guess, because after Gov. Walker gutted the DNR there are almost no way any game warden could patrol the vast area I live in. Since I live in Burnett County…don't even suggest I call the sheriff office….that cluster is well documented. They absolutely refuse to ticket, fine, chastise these trespassing marauders. I have read the entire WOLF MANAGEMENT PLAN DRAFT now, and while this is eons better than the over 20 year old plan, I have some suggestions. 1. If your hound is killed in a KNOWN WOLF CONCENTRATED AREA…..only 50% of the 2,500 should be awarded. You need to take at least half of the responsibility for putting that dog in harms way. 2. The first time a farmer loses livestock he is reimbursed the full amount, but is given a document to sign stating that if happens again he must SHOW proof of implementation of at least 2 NON lethal deterrents before he is paid in full for the second depredation. 3. DNR needs to send a letter to congress requesting the MANDATORY wolf hunt after delisting be removed from act 169. Let Science and winter counts dictate when too many are too much. 4. No use of bait containing either animal products (already part of the plan) or chocolate (due to toxic chemicals in chocolate) to bait wolves. 5. Hound training on wolves in my area is 365 days a year, so restricting them to after the deer season is an improvement, but should be restricted to a 2 week period. The hounders in my area run their dogs day and night 365 days a year on "SOMETHING"…I can't sleep with my windows open, because the noise or baying hounds, screaming in the woods, and loud vehicles doing donuts on the private road wakes me up. If there is hound training on wolves it should be when other hunters are already disrupting wildlife with the deer gun season. Maybe then they will speak up about this fringe group. But especially not in February when breeding season is in full swing. This is not part of act 169 and doesn't need to be in this management plan. But I recognize that if you restrict wolf training they will just say they are training for Coyote which is incessant. 6. Any wolf removed from the landscape due to predation should count toward any future wolf hunt quota for the following legal wolf hunt. Also any dead wolf from vehicle encounter, or other wolf kill like SSS wolves found from poaching. All should be counted toward the next legal mandatory wolf hunt quota. 7. Zone specific licenses only. When your zone is closed you are done wolf hunting. This is in the plan, but we have been promised this before and it never materialized, so I am just reiterating it here. 8. 8 hours to report your wolf kill. In the new draft, just substantiating it. 9. No night time hunting at all. Already in effect in regard to hounding….expand this. 10. No use of both snowmobiles/atv's AND HOUNDS at the same time. These 2 components are mostly to blame for the severely shortened February Fiasco overkill Wolf hunt. 11. If Sheriff's office (Burnett county) refuses to fine or ticket hounders deliberately trespassing DNR should fine those involved. 12. Wolf education in schools particularly in the zones 1, 2, and 3. Can we teach something besides training serial killers? Appreciation of wildlife gets little or no attention. (serial killers all start out killing and dissecting small animals) 13. Product C2H has so many flaws it should be eliminated. There is a leash law in this state for any dog owner off their own property has to abide by…why not hounders? {get them out of their pick up trucks staring at those screens and into those woods following their hounds…..that's hunting with dogs} Right after the deer gun season wolves begin to breed. This will be disrupted. You are in fact NOT "Considering the biological impact upon wolves". The training should stop when the legal wolf hunt for that zone stops. To further harass the packs after losing various pack members may stress packs to dissolve completely. I suggest that there not be more than one tag's worth of hounds allowed to train together. i.e. 3 hunters = 18 hounds should never be allowed for any reason, both during a legal hunting season or during a legal training period. 14. Have we learned nothing from that February Fiasco Slaughter? Packs of hunters, on packs of snowmobiles, with packs of illegally loaded (on a moving machine) long guns driving packs of hounds on packs of wolves…..Dog fight in the woods. Every possible restriction on this hounding(WANTON WASTE) since it is legislatively mandated must be employed. International Notoriety for barbarism was not a good look on the face of WI. WI's legal traditionalist hunters who fill their freezers with venison every year to feed their families were disgusted by this clown-show. The enclosed survey of how	8	Please take the time to read what I have written in question 5. My research, hours and hours of being on zooms and even in person with the Spring surveys, wcc meetings, DNR meetings on zoom, NRB meetings, and reading minutes of those I didn't attend, and my heart and soul on this issues are reflected on number 5.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
				Wisconsinites use the outdoors and all that apply to them were checked. Hunting in general is down in the 20 something percent…how many are using packs of hounds? This should NOT be confused with bird dogs, who retrieve or point out prey. That is a thing of beauty. Ripping a bear cub to pieces, or a wolf by a pack of trained blood thirsty hounds isn't even in the same ballpark. THEN Kazmierski NRB suggests a quota of 500 for the 2nd hunt in the same calendar year????? Thankfully that did not take place, and cooler heads prevailed. 15. TALKING about only hunting wolves where they are a predation problem and actually doing just that seems difficult. NO HUNTING WOLVES EVER IN FEDERAL FORESTS…no training dogs there either. Non-consumptive-tax paying-goods and services user-landowners need their space too. We may not pay for hunting licenses, but WE LIVE HERE (many hounders come from out of state) WE PAY HIGH REAL ESTATE TAXES, we pay sales taxes, use local goods and services, and there are TENS OF THOUSANDS of dollars donated to the DNR each year by us non=consumptive users. Merri Ann Gonzalez RN/AKC breeder of Merit [redacted] Shell Lake WI 54871 (not California) (1 mile from Hertle Turtle Rez in Hertle) [redacted]		

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
	Just the parts I am interested in	No	Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. There is much greater recognition of the ecological role of wolves The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed	The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on (see reference list below): wolf ethology, sentience, sapience, sociability, agency and wellbeing effectiveness of non-lethal interventions, especially relative to lethal ones the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings. Hounding or hound training, which are akin to allowing legalized dogfighting, should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public. The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. Despite Act 169, which mandates a wolf hunting season, the department can still restrict the implementation of lethal methods by setting minimal quotas, including a quota of '0' wolves, restricting timing and methods. Several studies have proven a proactive non-lethal approach leads to better conflict mitigation. Lethal management often fails to provide a long-term solution to wolf predation and has the least consistent success rates when compared to non-lethal practices. In addition, there is significant evidence showing that lethal wolf management may be less functionally effective at mitigating subsequent livestock losses than non-lethal deterrents. The plan should require the implementation of abatement measures as well as the use of non-lethal conflict minimization techniques by domestic animal owners for the latter to receive compensation for confirmed predation. The plan also runs contrary to public values towards wolves (and omits mention of such majority values from the plan), despite department surveys evidencing that the broad public cares about wolves as individuals (and not just for the viability of the population). Given the recent liberalization of killing wolves by the state, it would be incredibly informative to note majority support of the following reasons for opposing a regulated wolf hunting/trapping season (which are all omitted from the plan): opposition to specific methods of harvest like hounds (64%) or traps (70%), feelings that hunting wolves is unnecessary (62%) or culturally offensive to Native American tribes (57%). All such reasons convey majority disagreement with practices currently promoted and endorsed by the legislature and the WDNR, and such a conflict between managers and the public should not only be acknowledged, but foregrounded and carefully considered in policy (instead of dismissed). Such decisions to omit literature or downplay evidence (e.g., such as majority opposition to killing wolves and their reasons) are contrary to principles of scientific integrity (e.g., present all relevant scientific evidence to the public) as well as ethics (e.g., disguising ethical decisions, such as recreational wolf killing, as robustly supported by science). Conflicting agency objectives (e.g., optimizing public hunting and conflict mitigation) are not only not acknowledged, but even misunderstood as harmonious, against the body of scientific evidence. That culminates in the prioritization of consumptive values and policies; e.g., according to the body of scientific literature, use of lethal methods, and especially public hunts, are contrary to most objectives relevant to: harm mitigation, the wellbeing of wolves, their ecological roles, and their non-exploitative enjoyment (i.e.,Objectives A, B, D and F). There is a stark lack of consideration for individual wolves, wolf population health (including wellbeing), and measurable indicators for assessing any harms barring disease prevalence (e.g., accounting for cortisol levels or other stress hormones, measures of pair/pack persistence) There is an inappropriate understanding and consideration of tribal worldviews about wolves. Tribal worldviews of wolves are misconstrued as 'cultural benefits' tribes receive from the existence of a wolf population, when in fact tribal worldviews consider each individual wolf as a person and relative. Cultural respect and sensitivity towards such views, shared by many non-tribal members, demand the strict mitigation of lethal measures, especially recreational killing, as opposed to their current promotion in the plan. In general, all omissions of scientific literature, the arbitrary prioritization of policy objectives, the rhetoric of the plan and the dismissal of public values and concerns for wolves point towards a biased, unscientific and	4	

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
				instrumental view of wolves that promotes values contrary to broad public perspectives on wolves. 'SOM' wolf estimation methodology – From a recent critique: "The new methods sacrifice precision, but are believed to retain adequate accuracy and sensitivity to changing conditions for reliable decision-making. We review evidence for the accuracy, precision, and sensitivity of the new 'scaled occupancy model' (SOM) applied in Wisconsin. We conclude that the Wisconsin method would systematically overestimate wolf abundance by large (but currently incalculable) margins. Because Wisconsin, similar to other states, not only changed to unverified methods but also implemented widespread wolf killing, shortcomings in their estimates of wolf abundance may have far-reaching consequences for population viability and confidence in state wildlife managers. We discuss findings from Wisconsin alongside similar findings for other states' occupancy models being insensitive to human causes of mortality that have recently increased. Overall, Wisconsin's proposed method for estimating wolf abundance shows significant departures from best practices in scientific measurement. Verification will require independent replication and unbiased tests at multiple scales in multiple habitats under different human-induced mortality rates, and peer review before the new methods are considered reliable." Michael Munyon	Most of it	Yes	Keeping the wolf in Wisconsin. State management of the wolf population.	No set limit of the wolf population. I think the wolf population limit should be in the 500 to 700 range. I think the Tribal input is valued more than the citizens of Wisconsin input. The 6 mile no hunting buffer zone around the Tribal Lands is just plane wrong to the individual land owners. Out of state input should be not allowed unless it is from an expert with scientific facts. Animal Rights Activists should have ZERO input. Science needs to be followed in management. WDNR needs to push for State Control.	2	The Wolf Plan was WAY past due. The WDNR dragging their feet on rolling this out puts another black eye on the Department.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Mark Zich	Most of it	Yes	The plan is outstanding in providing historical and scientifically accurate data on Wisconsin wolves. The updated wolf management plan gives those Wisconsin residents who are uneducated or are arbitrarily biased against wolves the opportunity to become better informed. The plan also adequately addresses the human-wolf interaction dynamics and dispels numerous myths regarding wolves. I've heard from so many hunters who claim to be afraid of being physically harmed by wolves while recreating in the wolves territories and your management plan specifically addresses and makes clear how wolves rarely engage or harm humans. The plan removes a numeric population goal: Removing an arbitrary wolf population goal is important to make sure the numbers of wolves are adaptable, so they can be based on best-available science and ecological changes. The plan creates low quota zones around Tribal lands where the Tribes requested it: These lands are treaty-protected with documented wolf packs. Making this update is an important and welcome addition to the plan. Ideally, the plan would expand these zones beyond just the few that are listed. The plan is rightly focused on the ecological benefits of wolves. The plan is reflective of the public opinions survey that was released along with the plan and finds that opinions toward wolves have grown significantly more favorable towards wolves. There is expressed commitment to science and continued research with partners and acknowledges that "keystone species such as wolves are an important component of a healthy ecosystem".	There is currently no guidance in plan for next review or update – there should be a plan for regularly updating the plan (so we don't have another plan that is used for decades) and there should be permanent, ongoing stakeholder AND science committees to oversee wolf management in Wisconsin – The scientific oversight is critical. The plan acknowledges that there are responsible farming practices and other non-lethal options to reduce wolf and livestock conflicts, but stops short of recommending that the DNR prioritizes these opportunities.	9	Outstanding document and extremely necessary so that we do not repeat our country's past mismanagement and slaughter of animals that are vital to a balance, healthy ecosystem. Trophy game hunting by humans is vastly more damaging to the health of deer due to the elimination of the strongest of the herd; whereas, wolves eliminate the least strongest in the herd.
Steve Matthias	Most of it	Yes	I'm glad to see the plan doesn't see the need to set any limits to the wolf population so that nature is able to run its course. There are enough threats to their existence and they don't need an artificial numerical limit. Keep wildlife wild. It's great to see that the plan works with the Native American tribes by respecting the treaties. I especially like the increased effort to educate the public about wolves. It wasn't until I read "Of Wolves and Men" by Barry Lopez that I found out what impact the wolf has on the ecology and the benefits of having them in our fragile ecosystem. I'd like to imagine being in a classroom that was benefiting from such a lesson plan. I respect your sensitivity to public opinion and appreciate this opportunity to make comments.	I don't agree with the hunting of wolves and especially using dogs that are trained to focus on wolves. Too bad the DNR even needs to have hunting dog control added to their concern but more regulation is needed like including a greater limit on the training period for wolf-hunting dogs. There are non-lethal ways to manage the wolf if the need arises. If the concern is damage to livestock, maybe the focus should shift to preventative measures and resources to help educate the livestock grower too.	9	I'd like to see where this plan leads. If changes occur, do we get to review it again and offer our opinions? So nice to see this action being taken, it would be sad to see it created, dated and shelved without any future oversight. Hopefully your organization will continue to make the plan ongoing by continuing and regularly reevaluating it based on the latest environmental science and input from us Wisconsin residents. The plan is well done, thanks for the opportunity to comment.
	Most of it	Yes	Nothing.	Today, Wisconsin State Representative Rob Swearingen and I, along with 28 of our colleagues, submitted an official comment regarding the Department of Natural Resource's proposed Wolf Management Plan. A species management plan with no prescribed population goal is no management plan at all. All this does is open the door for lawsuit after lawsuit regarding future harvest quotas set by the Natural Resources Board. We see right through this – the whole state can see right through this. Wolves have negatively impacted families, farmers, deer hunting, tourism, property values, and communities throughout our state. We stand with the 36 counties from all across Wisconsin who have passed resolutions in favor of setting a wolf population goal of 350 or less, and request that the department take this under serious consideration prior to moving forward with this process.	1	We need to control the population of wolves. It will get worse as years go on. The time is NOW to control the situation before it's too late.

Garrett Laskowski	All of it	Yes	There is nothing I like about this plan.	There is no numeric goal or target to hold the DNR/State accountable to managing the wolf population. This plan cites narrow studies and a survey that feels slanted in its phrasing. The plan essentially gives decision making power to a wolf committee, which strips decision making from our legislative bodies and by extension, the residents of Wisconsin. One committee should not hold this much power over such a large decision. This should be made by voters and legislative representatives. This plan seems to be weighing the opinions of everyone equally, whether they are from out of state, out of wolf territory, or in wolf territory. Ultimately, the vast majority of the weight should be given to people living in those areas as it affects their day to day life. Someone from south Wisconsin, much less out of state, should not be able to have a say like the residents and landowners in wolf territory. On the topic of buffer zones, this affects residents those areas even more. That land should not be treated as an extension of the reservations, it is private property and those landowners bought that land for recreation, farming or whatever it may be. Not to be infested with wolves. At that rate, the state should have to buyout the landowner at fair market value for their property if they wish to sell, because they have diminished its value.	0	This plan is very one sided and is just sad on all fronts. The data and "science" supporting this is not good. The survey phrasing was slanted, and then when referenced in all other areas of the plan, was grossly mischaracterized to fit the narrative. And it is just very depressing to see that northern citizens are not given more weight and are not being considered while someone that does not live there is making decisions because wolves "make them feel good"
[redacted]	Most of it	Yes	I'm not sure I like any of the plan because most times it's just put out there to make everyone happy. The dnr has told us the plan for years but didn't stick to it .	My opinion I want an accurate count of the wolf population not just what it is it is . I would like to see the wolves managed to keep a population but not so many that they wipe out the prey species in the area.	1	Wolves are devastating the deer herds in the north woods . This cause a lack of revenue for the north economy and drives down property values as well as lack of opportunities for outdoorsmen. They should be managed to 350 in the state not 3500 , we have to many in my area. I've see the deer numbers drop considerably in the last 20 years .
John S Bronikowski	All of it	Yes	I like the detailed history. When charting a course for the future, it is important to remember where we have been.	I cannot believe a Management Plan would not have population goals!! I also believe it is ridiculous to continue to give 1/2 the harvest quota to the tribes when they refuse to participate in the harvest!!! That would be like sending turkey tags or antlerless deer tags to non-hunters. Quit playing political games for show. If they won't participate in the harvest, they should not share in the quota of harvest tags.	3	This is a good start, what used to be called a boilerplate document. But it is missing measurable goals - probably to avoid controversy! Without population goals and realistic harvest methods, it is an incomplete plan.
Joi Kamper	All of it	No	i like the idea of people having zone specific tags. Although I adamantly oppose the constant weight given to hunters that just want to go out and kill an animal we basically had to import from Canada after we already killed it off.	I would like to see more metrics for measuring the survival rate of wolves and that vehicle collisions be included in the count for wolves that killed. I would also like to see more efforts to avoid vehicle collisions. I also want to see more public education on the benefit that wolves provide to ecosystem and more research on this.	6	
	Just the parts I am interested in	Yes	Lots of good historical data on wolf attacks and reasons for attacks.	all good		More wolves needed now that there is less of a deer hunting tradition/culture in wisconsin
	Most of it	Yes		you need a specific population goal, just saying more ,less, or stay the same means nothing depending on who you ask. 350 is good number	1	The old plans, 350 wolf population goal is reasonable both biologically and socially
Jim Greenfield	Most of it	Yes	We need to stick to the original agreement of 300 wolves and not try to welch on it.	I have gone from an advocate of wolf reintroduction to an opponent because of large number of wolves and lack of concern for deer hunters, dog owners and norther residents.	0	The most important thing is to not break the agreement for a 300 wolves. Since wolf fanciers and advocate are endorsing the DNR wolf "biologists" I have zero confidence that the DNR will look out for my interests as a property owner, lifelong deer hunter (although I did not go to lack of deer) and bird dog owner. Stick to the original agreement._
	Most of it	No			1	
Tom Chapman	All of it	Yes	I support protections and sustainability goals of wolf populations in zones 1,2 and 5	I prefer protections and sustainability goals of zone 3 and 4 be the same as described in zones 1,2 and 5 - at the very least for connectivity.	6	A thriving wolf population in as much of the state as possible is our moral responsibility
Rick Lukes	Just the parts I am interested in	Yes				Issue live trapping permits to all interested trappers to stock wolves in every county in the state. Sportsmen should relocate as many wolves as possible in the Madision -Milwaukee area since people there want to see more wolves in natural habitat. Since most environmentalist believe wolves only harvest the old and sick animals this would help control the spread of CWD. Wolves have decimated the deer population in my area of Price County. Hunting isn't worth the effort particularly if you are horn hunting. The lack of game for hunting has depressed hunting land values to virtually nothing. For farmers the land was our 401K for retirement.

	All of it	No	We appreciate the efforts of all WDNR staff involved in updating the state's wolf management plan. Although we believe the current plan needs significant updating (see next section), we recognize the efforts and improvements made to the previous plan, including: ● Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. ● There is much greater recognition of the ecological role of wolves ● The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves ● The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed)	The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on (see reference list below): ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution ● The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. ● The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ○ A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings. ○ Hounding or hound training, which are akin to allowing legalized dogfighting, should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public. ● The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. ○ Despite Act 169, which mandates a wolf hunting season, the department can still restrict the implementation of lethal methods by setting minimal quotas, including a quota of '0' wolves, restricting timing and methods. ○ Several studies have proven a proactive non-lethal approach leads to better conflict mitigation. ○ Lethal management often fails to provide a long-term solution to wolf predation and has the least consistent success rates when compared to non-lethal practices. In addition, there is significant evidence showing that lethal wolf management may be less functionally effective at mitigating subsequent livestock losses than non-lethal deterrents. ● The plan should require the implementation of abatement measures as well as the use of non-lethal conflict minimization techniques by domestic animal owners for the latter to receive compensation for confirmed predation. The plan also runs contrary to public values towards wolves (and omits mention of such majority values from the plan), despite department surveys evidencing that the broad public cares about wolves as individuals (and not just for the viability of the population). Given the recent liberalization of killing wolves by the state, it would be incredibly informative to note majority support of the following reasons for opposing a regulated wolf hunting/trapping season (which are all omitted from the plan): opposition to specific methods of harvest like hounds (64%) or traps (70%), feelings that hunting wolves is unnecessary (62%) or culturally offensive to Native American tribes (57%). ○ All such reasons convey majority disagreement with practices currently promoted and endorsed by the legislature and the WDNR, and such a conflict between managers and the public should not only be acknowledged, but foregrounded and carefully considered in policy (instead of dismissed). ○ Such decisions to omit literature or downplay evidence (e.g., such as majority opposition to killing wolves and their reasons) are contrary to principles of scientific integrity (e.g., present all relevant scientific evidence to the public) as well as ethics (e.g., disguising ethical decisions, such as recreational wolf killing, as robustly supported by science). ● Conflicting agency objectives (e.g., optimizing public hunting and conflict mitigation) are not only not acknowledged, but even misunderstood as harmonious, against the body of scientific evidence. That culminates in the prioritization of consumptive values and policies; e.g., according to the body of scientific literature, use of lethal methods, and especially public hunts, are contrary to most objectives relevant to: harm mitigation, the wellbeing of wolves, their ecological roles, and their non-exploitative enjoyment (i.e., Objectives A, B, D and F). ● There is a stark lack of consideration for individual wolves, wolf population health (including wellbeing), and measurable indicators for assessing any harms barring disease prevalence (e.g., accounting for cortisol levels or other stress hormones, measures of pair/pack persistence) ● There is an inappropriate understanding and consideration of tribal worldviews about wolves. Tribal worldviews of wolves are misconstrued as 'cultural benefits' tribes receive from the existence of a wolf population, when in fact tribal worldviews consider each individual wolf as a person and relative. Cultural respect and sensitivity towards such views, shared by many non-tribal members, demand the strict mitigation of lethal measures, especially recreational killing, as opposed to their current promotion in the plan. ● In general, all omissions of scientific literature, the arbitrary prioritization of policy objectives, the rhetoric of the plan and the dismissal of public values and concerns for wolves point towards a biased, unscientific and	3	

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
				instrumental view of wolves that promotes values contrary to broad public perspectives on wolves. 'SOM' wolf estimation methodology – From a recent critique: "The new methods sacrifice precision, but are believed to retain adequate accuracy and sensitivity to changing conditions for reliable decision-making. We review evidence for the accuracy, precision, and sensitivity of the new 'scaled occupancy model' (SOM) applied in Wisconsin. We conclude that the Wisconsin method would systematically overestimate wolf abundance by large (but currently incalculable) margins. Because Wisconsin, similar to other states, not only changed to unverified methods but also implemented widespread wolf killing, shortcomings in their estimates of wolf abundance may have far-reaching consequences for population viability and confidence in state wildlife managers. We discuss findings from Wisconsin alongside similar findings for other states' occupancy models being insensitive to human causes of mortality that have recently increased. Overall, Wisconsin's proposed method for estimating wolf abundance shows significant departures from best practices in scientific measurement. Verification will require independent replication and unbiased tests at multiple scales in multiple habitats under different human-induced mortality rates, and peer review before the new methods are considered reliable." (Treves & Santiago-Ávila, 2023)		
	All of it	Yes	The fact that studies on wolves is taking place, that the reality that wolves are beneficial to the environment and an integral part of the environment	'Harvesting' is an extremely offensive term. No one eats the individuals that are murdered. The eradication of animals because they are a problem to humans. Bounty hunters. The use of canines to kill canines. Reimbursement of dog hunters for invading wolves' spaces. Using dogs for eradication of any mammal	5	Very detailed in many aspects. I actually read through many of the extensive footnotes. I totally am in agreement with the tribes, wolves are as important as we humans. Ceded territory should be much more inclusive of tribes rights. I am totally in opposition to the hunting of wolves. I sat in on most of the ZOOM meeting and callers were overwhelmingly opposed to the eradication of wolves. I have been asking people in my community if they would please respond to your survey. Orally out of 39 people, one believes wolves should be eliminated, two were neutral and 36 felt wolves should be allowed to exist and thrive. The study has shown the positives of wolves and we should build upon that

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Ed Metcalf	Most of it	Yes	It appears that it initial survey and input portion is very comprehensive, to the point of being redundant.	There seems to be a lean towards not having an actual population goal number. There also seems to be a push towards more research. There also seems to be concern about maintaining genetic diversity. The idea of hunts that have zone restricttions. The fact that (unless I missed it) there isn't a clear plan for dealing with wolves that have established livestock predation tendancies. The compensation for livestock predation needs to be clearly addressed and not dependant on a moving amount of available funds. Really, we are concerned about wildlife viewing and recreational opportunities for wolves?	2	My concern with having no population goal is, then the main force for population densities will be carrying capacities. That will increrase human/wolf conflict and people living in and around prime wolf habitat will always have wolf issues because wolves will always be at the brink of carry capacity. Researach is expensive and the wolves have been in the area for well over 20 years, if you don't know what they eat and where they live by now you have issues wth the study designs. Maintaining geneitic diversity is only going to open the whole plan up to more lawsuits from groups that want no controll over the population. They are simply going to tell you every time the wolf comes off the endangered list that you are not able to prove there is enough genetic diversity, hence you have to leave the wolves alone. I understand the arguments that genetic diversity supposedly helps prevent extinction, but i feel it is a good idea in theory but in reality it has been disproven time and time again. For example take the current wolf population, they started from a very few wolves, they seem to have managed quite well with a very small amount of genetic diversity. Another local example is the Butternut area elk herd. From my understanding, one cow went over there and had a bull calf , and the herd grew from those 2? The condors in California and the list goes on, we put more emphasis on genetic diversity that it warrants. The problem with hunt zones is simply that the wolves move depending upon available food. The pack maybe in an area when a person applies but may have exhausted available food supplies and be gone by the time the hunt actually occurs. Even if the zones are large there will be packs that live along the zone boundaries and raom between zones. In reality what is the problem with an area being over hunted? The wolves will re-establish a pack in that area as their population grows in other areas where wolves were not harvested. As we have seen the wolf population in the state is very robust and adabtable. I think that it is clear that the problem wolves can be removed and it will not affect the population as a whole. The problem wolves are a very small percentage of the whole population and removing a pack from an area will simply eliminate issues in a timely manner and decrease conflicts. I feel it is pretty clearly established that once a pack learns that livestock are much easier to kill they prefer to harvest them than natural prey. The current policy for predation compensation is flawed. First of all it is dependant upon an unkown amount. I know it is difficult to budget for an amount when there is no idea how many claims there may be but the budget has to be set high enough to accomodate that unknown. The fact that peple feel they are not correctly compensated for their losses spurs dislike for the wolves. It is much easier to live with wolves and predation problems if you are being compensated, no different that compensation for crop damage from bear and deer. Also the compensation has to take into consideration the animals potential end value, for example; most calves are killed when they are young and the compensation is based on the value at the time of death. This year I sold my 550 pound calves for $2.14 per pound. That's over $1100 per calf. Had they been killed with-in the first month of life I would have been compensated for about $300 IF there was enough money in the pot! and if I could prove that wolves actually killed it. So each wolf predation would have cost me a minimum of $800. I know the arguement that the calf may not have made it to market and all of that but the DNR has the responsibility for compensating livestock owner's like crop damage. Nobody uses the arguement that the corn may not have made it to harvest because there may have been a hail storm or wind damage etc. There are several areas that discuss managing wolves for recreational opportunities. I'm not telling you anything that you do not already know, but they are one of the most elusive animals that we live with. I have been in the area since the wolves came back and had 2 predation claims. I seriously doubt I have more than 20 actual sightings. If you are trying to manage this species for recreational opportunities you're wasting your time. The people who want to have opportunities have to do what every other person who wants recreational opportunities does, wether it is hunting or viewing. Do the leg work, find out where the animals are living and make plans accordingly. If they think they should be able to jump in their car and go for a drive and see wolves along the road and roll down their windows and hear them howling that is an unrealistic expectation. Managing wolves for their recreational value should not be a concern nor part of the plan.

	All of it	Yes	informative, a look at all opinions	no goal, open ended	4	In response to the draft wolf plan: It's too bad we can't go back and here the complaints of the people that lived in the 30s, 40s and 50s. I reminder a story of how the wolfs went into the barn and pulled out a calve when I was in grade school. The technology was not there to bring the stories for us to hear in the future. I don't believe your survey that people want more than 350 wolfs. This was the number to start with and should be kept as close as possible. I don't think anyone wants to omit them from Wisconsin, but numbers should be in kept in check with hunting (with dogs and night predator hunting and trapping used). People don't feal safe giving answers that can be logged to track them for one. Asking people that can't be traced in some way may give you their real feelings and correct answer. Education, knowledge or experience of wolfs can make judgment about wolfs. If you control the education and write the questions you control the outcome. History and experience should weigh heavily on the decisions. How is it that some one living in a city can tell someone how to live in the county that don't have the knowledge of someone living or interacting with the wolf. When a wolf season takes place, it should not be in the deer season or I should say the month of November. There is enough movement in the woods with all the other hunting season going on. I suggest a January or February hunting, trapping season for the wolf population controlled hunting season. I think more information of all animal populations could be learned from a season with out deer hunters. January would be better before any winter stress on animals. Hunting seasons could be every other year, not every year, has anyone thought about that, this was done when Minnesota had a moose season. How about dogs one year and no dogs every other year. This would help to monitor and not over harvesting. The more I read the report the more I see to keep the wolfs at 350 or as close as possible. All the data used for this report and now you don't want to use numbers? Numbers is used on every other animal. This is a tactic to change what the public was told. Wolfs must be kept in control, they are a killing machine. Objectives did not include or considered populations of people, why not? Wolfs will cleanout a territory and move to the next territory much like the natives did before the white man. This goal should be left as we were told at 350 wolfs. This number was picked to insure we had wolfs but not over run with wolfs. As a hunter of the northern part of Wisconsin I have seen number of kills, possible wolf that on those years never saw any deer. Did see eagles and scavengers around the deer kills but no deer. Could be coyotes too but your report references wolf eat and kill more deer for the eating abbots. Wolfs are on the move following there prey and the more wolfs the less deer as your charts express. (and elk) There are less and less hunters because hunters are not hunting because seeing fewer and fewer deer. Is this the goal? It looks like it could be the end game. Management plan objectives goal should be 350 wolfs. What few moose we have they will kill, is it worth having what the land can carry? They will wipe out everything and move on to anther area like the natives did. How much money spent on elk and we can't hunt any elk. Looks at time we are feeding the elk to the wolf. It's complicated but hunting is conservation. Keep the wolf numbers at 350 as a greed too. Thanks Mike
Cassidy	I have not read any of the draft plan	No	We appreciate the efforts of all WDNR staff involved in updating the state's wolf management plan. Although we believe the current plan needs significant updating (see next section), we recognize the efforts and improvements made to the previous plan, including: Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. There is much greater recognition of the ecological role of wolves The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed.)	However, there are some objections: The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on (see reference list below): Wolf ethology, sentience, sapience, sociability, agency and wellbeing. Effectiveness of non-lethal interventions, especially relative to lethal ones. The impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings. Hounding or hound training, which are akin to allowing legalized dogfighting, should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public. The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. Despite Act 169, which mandates a wolf hunting season, the department can still restrict the implementation of lethal methods by setting minimal quotas, including a quota of '0' wolves, restricting	5	References: https://www.sciencedirect.com/science/article/pii/S0006320713003418?via%3Dihub https://www.nature.com/articles/s41598-020-70837-x https://docs.legis.wisconsin.gov/2011/related/acts/169 https://journals.plos.org/plosbiology/article?id=10.1371/journal.pbio.2005577 https://www.sciencedirect.com/science/article/pii/S2351989419306225?via%3Dihub https://journals.plos.org/plosone/article?id=10.1371/journal.pone.0209716 https://widnr.widen.net/s/tsvfkqkh9w/pub_ea_017 https://www.nature.com/articles/s41598-022-09711-x https://www.frontiersin.org/articles/10.3389/fevo.2022.782840/full

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
				timing and methods. Several studies have proven a proactive non-lethal approach leads to better conflict mitigation. Lethal management often fails to provide a long-term solution to wolf predation and has the least consistent success rates when compared to non-lethal practices. In addition, there is significant evidence showing that lethal wolf management may be less functionally effective at mitigating subsequent livestock losses than non-lethal deterrents. The plan should require the implementation of abatement measures as well as the use of non-lethal conflict minimization techniques by domestic animal owners for the latter to receive compensation for confirmed predation. The plan also runs contrary to public values towards wolves (and omits mention of such majority values from the plan), despite department surveys evidencing that the broad public cares about wolves as individuals (and not just for the viability of the population). Given the recent liberalization of killing wolves by the state, it would be incredibly informative to note majority support of the following reasons for opposing a regulated wolf hunting/trapping season (which are all omitted from the plan): opposition to specific methods of harvest like hounds (64%) or traps (70%), feelings that hunting wolves is unnecessary (62%) or culturally offensive to Native American tribes (57%). All such reasons convey majority disagreement with practices currently promoted and endorsed by the legislature and the WDNR, and such a conflict between managers and the public should not only be acknowledged, but foregrounded and carefully considered in policy (instead of dismissed). Such decisions to omit literature or downplay evidence (e.g., such as majority opposition to killing wolves and their reasons) are contrary to principles of scientific integrity (e.g., present all relevant scientific evidence to the public) as well as ethics (e.g., disguising ethical decisions, such as recreational wolf killing, as robustly supported by science). Conflicting agency objectives (e.g., optimizing public hunting and conflict mitigation) are not only not acknowledged, but even misunderstood as harmonious, against the body of scientific evidence. That culminates in the prioritization of consumptive values and policies; e.g., according to the body of scientific literature, use of lethal methods, andespecially public hunts, are contrary to most objectives relevant to: harm mitigation, the wellbeing of wolves, their ecological roles, and their non-exploitative enjoyment (i.e., Objectives A, B, D and F). There is a stark lack of consideration for individual wolves, wolf population health (including wellbeing), and measurable indicators for assessing any harms barring disease prevalence (e.g., accounting for cortisol levels or other stress hormones, measures of pair/pack persistence) There is an inappropriate understanding and consideration of tribal worldviews about wolves. Tribal worldviews of wolves are misconstrued as 'cultural benefits' tribes receive from the existence of a wolf population, when in fact tribal worldviews consider each individual wolf as a person and relative. Cultural respect and sensitivity towards such views, shared by many non-tribal members, demand the strict mitigation of lethal measures, especially recreational killing, as opposed to their current promotion in the plan. In general, all omissions of scientific literature, the arbitrary prioritization of policy objectives, the rhetoric of the plan and the dismissal of public values and concerns for wolves point towards a biased, unscientific and instrumental view of wolves thatpromotes values contrary to broad public perspectives on wolves. 'SOM' wolf estimation methodology – From a recent critique: "The new methods sacrifice precision, but are believed to retain adequate accuracy and sensitivity to changing conditions for reliable decision-making. We review evidence for the accuracy, precision, and sensitivity of the new 'scaled occupancy model' (SOM) applied in Wisconsin. We conclude that the Wisconsin method would systematically overestimate wolf abundance by large (but currently incalculable) margins. Because Wisconsin, similar to other states, not only changed to unverified methods but also implemented widespread wolf killing, shortcomings in their estimates of wolf abundance may have far-reaching consequences for population viability and confidence in state wildlife managers. We discuss findings from Wisconsin alongside similar findings for other states' occupancy models being insensitive to human causes of mortality that have recently increased. Overall, Wisconsin's proposed method for estimating wolf abundance shows significant departures from best practices in scientific measurement. Verification will require independent replication and unbiased tests at multiple scales in multiple habitats under different human-induced mortality rates, and peer review before the new methods are considered reliable." (Treves & Santiago-Ávila, 2023)

elliot isaac stokes	Just the parts I am interested in	Yes	1)I am siding with greater protection of our wolf population with limited culling and hunting. 2)Research and science based decision making. 3)I support the plans movement away from single numeric population goals and would prefer using the adaptive management 3 point process elucidated in the plan proposal 4)Reduction of harvest registration times and support the issuing of zone-specific wolf harvest permits to meet quota. 5)Revising wolf management zone boundaries to better reflect current and improved wolf distribution and habitat health with some consideration given for wolf predation on cattle and farm animals and its concerns and resulting issues.	Being careful with wolf culling on the side of error with more consideration for transplanting problem animals or using other control mechanisms	9	A healthy wolf predator population allows for the return to a healthy ecosystem, wildlife and plant habitat for nature and human kind alike. During a time of pandemics and disease in animals we must all be aware of the importance of controlling diseased and weak animals and wildlife to decrease exposure to us all. Healthy wildlife and ecosystem helps to advance a healthy society of man and animal, anything less is not desirable. The current Wolf Management Plan should be implemented and allow the wolf population to develop
Sara Wild	All of it	Yes	Removal of a numeric population goal: Removing an arbitrary wolf population goal is absolutely essential to ensure the numbers of wolves are adaptable, so they can be based on best-available science and ecological changes. The plan creates low quota zones around Tribal lands where the Tribes requested it: These lands are treaty-protected with documented wolf packs. Making this update is an important and welcome addition to the plan. Ideally, the plan would expand these zones beyond just the few that are listed. The plan is rightly focused on the ecological benefits of wolves The plan is reflective of the public opinions survey that was released along with the plan and finds that opinions toward wolves have grown significantly more favorable towards wolves There is expressed commitment to science and continued research with partners and acknowledges that “keystone species such as wolves are an important component of a healthy ecosystem“.		10	
Joanne	All of it	No	all for the compensation of farm animals if and when ... if wolves are going to be radio collard than they should not should not be SHOT DOWN !! easy lazy kill right ?	Biological Carrying Capacity.. WHAT ARE YOUR BOUNDARIES THAT YOU WANT THESE WOLVES TO ABIDE BY: KNOWING WOLVES AND WILDLIFE HAVE NO BOUNDARIES ??? due to human element population and taking land and GRAZING (ranchers) FARM ANIMALS ON PUBLIC LANDS !!! where wolves roam mostly to hunt . I must say wow there is lots of you making these rules for wolves THE COMMITTEES is more than live wolves out there.. !! thank goodness they don't read about there and death row or life what ever comes first.. take a look at your WOLF PACK STATISTICS IN BLUE, DOWN DOWN DOWN --you kill off to many wolf packs and leave lone wolves ... (this is some draft!!! its like the US government infrastructure bill of what 4,000 pages =	2	if you have a pack of wolves say 6-8.. and you start killing them off one by one. and then leave one lone wolf .. that lone wolf will need an easy kill which would be a "farm /ranch animals due to the wiping out of the WOLF PACK. Wolves hunt in a PACK AND HAVE A SYSTEM ON HOW TO .. AND THEY DO A RUNNING PLANNING HUNT IN A PACK AND ITS WILDLIFE ...(NOT FARM /RANCH ANIMALS) SO THE MORE YOU KILL OFF WOLF PACKS AND MAKE THEN LONE WOLVES THE MORE THEY WILL DO AN EASY KILL OF FARM /RANCH ANIMALS AND NOT A PACK RUN HUNT OF WILDLIFE . so again you kill off WOLVES when there are to many (whats to many ??? is always questionable in your view) and upset the packs and YOU ALL ARE THE CULPRITS participate in the lone wolf kill .. plus KEEP FARM RANCH ANIMALS OFF PUBLIC LANDS TO GRAZE ... (this is made into a zig zag draft, its all over the place, still a RED FLAG against wolf packs and pups.)
Anne-Marie Hewitt	All of it	No	The removal of a numerical target population. The inclusion of the importance of the ecological benefits of wolves and of tribal values and knowledge. The attempt to minimise the impacts of a recreational hunt by adopting buffer zones around tribal lands, shortening reporting requirements and making hunting licenses zone specific. The Emphasis on the use of non-lethal methods to reduce conflicts.	No commitment by the DNR to work with the legislature to overturn PA 169 and remove payments for hunting hounds, killed by wolves. Hound training must be stopped. The plan should have a zero hunting quota to protect wolves in our national forests and other areas of prime habitat. The recreational hunting/trapping to reduce conflicts has no scientific basis. At the very least, DNR should ban the use of dogs to hunt wolves in our national forests. There is considerable uncertainty in estimating wolf populations based on the occupancy model and this should not be used alone to determine population sizes. The plan should include an oversight committee, made up of biologists and professionals.	7	The Committee was over-represented by hunting organisations, despite the fact that they represent the minority opinion of Wisconsinites. Too much emphasis was placed on the killing of wolves rather than co-existence.
	Most of it	Yes	The word Manegment, its time to manage	Reniging on the original goal of 350 animals	1	Let the Counties set the goal for their county,not outsiders that don't have to deal with the ramifications. This would be similar to the CDAC for deer management.
Elaine Becker	Just the parts I am interested in	No			2	Healthy ecosystems NEED large predators to keep prey species from overpopulating, overgrazing, causing soil erosion, widespread disease and starvation. In addition, the presence of wolves helps deter deer and other wildlife from being on roads as it is in the open. If deer avoid roads, that reduces injuries from car accidents!
	All of it	Yes	informing the public	no limit of wolves, boundaries around tribal land, sharing quotas with the tribes, listening to the large group of people that don't live in wolf territories that have no idea what the farmers and other residents have to deal with daily. Not acknowledging all the town boards of the counties if wolf country that have had resolutions. etc. etc.	2	have your listing sessions in wolf country, and get boots on the ground to talk to the farmers and sportsmen that don't have the time to go to the meetings. the squeaky wheel gets the grease, and that is the pro-wolf people.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
	Just the parts I am interested in	Yes	Very little; it's too long too read all of it	There are no measurable goals - how will you know when the population is enough?	3	I don't consider myself anti-wolf, but in Oneida and Langlade counties I believe that wolves are negatively affecting deer populations. It's good to have wolves, but now there are too many. I am not a member of the WWF, but agree with most of their concerns.
Jim Johannes	All of it	Yes	see below	see below	1	Allow me to make three comments. First, I urge you to throw out the radical tails of the feedback you are receiving on this plan and focus on the comments of the more rational and balanced viewpoints you are receiving. Specifically, I urge you to reject any public comments that say we should have no wolves and to reject any comments that argue we should not hunt wolves. The latter typically come from the hypocritical fringe who view the killing of a single wolf as cruel but could care less about the cruelty of a wolf killing 20 deer a year or someone's cattle by eating them alive as they struggle for survival. Second, without putting numerical values on the number of wolves we should have in each area of the State you really do not have a plan because 1) the absence of weights on your primary objectives (• Ensuring a healthy and sustainable wolf population to fulfill its ecological role • Addressing and reducing wolf-related conflict • Providing multiple benefits associated with the wolf population) and 2) measurable criteria used to evaluate each really allows you to do whatever you want to do whenever you want to do it. When I was a kid the Mickey Mouse Club TV show had a name for that kind of uncertainty. It was called anything can happen day. That is what you have here. I must note parenthetically that I am puzzled by the plan focusing on the ecological role of wolves today because for 50 years when we had no wolves nobody worried about this role as other predators on the landscape fulfilled that role. It is, therefore, quite puzzling that we now need lots of wolves for ecological purposes. Maybe in Iowa and Dane County where there are few apex predators to control CWD and control the deer that really do cause ag and property damage. Not everywhere for sure. In other words, for the Northern part of the State there is no needed ecological role and for the South, where wolves would not be tolerated, it is a moot point. In other words, this ecological role is grossly overplayed. If my second point is not clear let me state it another way. What dooms a plan? What causes plans to fail? Based on my 50 years of sitting on public and private boards and committees it is • a lack of focus • Insufficient or inaccurate data • Lack of quantifiable objectives (nobody would accept this vagueness in a compensation plan for employees for example) Your plan is plagued by all three problems. Without ex ante weights on objectives and quantifiable outcomes for objectives this plan is doomed to fail politically and operationally! Third, in the absence of quantifiable weights on your objectives and reliable data, you seem to be saying "trust us, we will get it right" But how can we trust you when you keep coming up with estimates that defy common sense and logic and with harvest goals that serve only to confuse people and provide rallying cries for the lunatics on opposite side of this debate. For example 1. If you really only want to kill 125 wolves don't issue tags to kill 250 and give half those to the tribes who you know will kill zero. How dumb is that. Issue tags for 125 and do not give the tribes any if they are not going to be used. Say what you mean, don't intentionally deceive or create political situations that only divide. The fact that you set up the last harvest in this confusing way lost you a lot of credibility with the public. Even wolf lovers were confused! 2. Why do you pretend (defend by your silence) that we killed 25% of all the wolves in Wisconsin in two days of really only hunting certain parts of the state where dogs could assist in the hunt. There is no way you will wipe out 25% of anything in two days without using nuclear weapons. 3. Don't tell us that there are only 4 wolves per pack in Wisconsin when you only survey part of the State, don't count single wolves patrolling the perimeter of the pack, when we send you pictures of 9, 10, 11, 12, 13 wolves in packs in late Fall, and when the whole wolf LOVING world like The California Wolf Center, National Wildlife Foundation and the International Wolf Center among others (see below) say the average pack is 8. That's a big C'mon Man, get real. We have 2x the wolves you say we have. Stop pretending otherwise. You only incite rage in the half you need on your side. To try to sell "only 4" in the face of all the evidence to the contrary makes you look very foolish and, worse yet, disingenuous. I am reminded of the cross examination of the witness in the movie "My Cousin Vinny" who tries to tell people that grits cook faster in his kitchen than anywhere else. Mr. Gambini: "So, Mr. Tipton, how could it take you five minutes to cook your grits when it takes the entire grit-eating world 20 minutes to cook grits?" Mr. Tipton: "I don't know. I guess I am a fast cook." Mr. Gambini: "I'm sorry, I was all the way over here. I couldn't hear you. Did you say you're a fast cook? That's it? Are we to believe that boiling water soaks into a grit faster in your kitchen than in any other place on the face of the

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
						earth? Do the laws of physics not apply in your kitchen? You seem to be acting like Mr. Tipton. So please restore some confidence in the public. Do not listen to the fringes on either side, do not support an "anything can happen plan without real focus or measurables", and please stop pulling our leg to cater to those who do not want a balanced approach to wolf management. We can live with wolves but we do not need the thousands that this plan can justify because it refuses to put weights on the different objectives that can be challenged and refuses to establish definitive, numerical population targets in different regions of the State. How big are the packs? 1. WISCONSIN GRAY WOLF MONITORING REPORT 15 APRIL 2019 THROUGH 14 APRIL 2020 "The count included 1018-1041 wolves living in 256 packs, or an average of 4.0 - 4.1 wolves per pack." 2. The studies below, mostly from very wolf friendly sources, say that the average gray wolf pack is 8.1! In other words, the DNR is underestimating the minimum number of wolves in Wisconsin by 50% . International Wolf Center Red wolf packs are generally smaller than gray wolf packs and usually have 2 to 8 members, but a pack of 12 has been observed in the wild. Wolf Haven International Average pack size 6-8 animals National Wildlife Federation Wolves live in packs. Most packs have four to nine members, but the size can range from as few as two wolves to as many as 15. Animal Start Wolves are social animals living in groups from 8 to 15 members. California Wolf Center Wolf pack size can range from 2 to 10 wolves, with the average pack size consisting of 6 wolves. PBS Nature The average size is 6 but packs exceeding 30 members have been observed. Live Science Usually, a pack will have only one male and female and their young. This usually means about 10 wolves per pack, though packs as large as 30 have been recorded. National Geographic Wolves live and hunt in packs of around six to ten animals. Journal of MammologyEstimating gray wolf pack size and family relationships using noninvasive genetic sampling at rendezvous sites We detected 65 wolves (5-20 wolves per pack) with NGS, and the pack counts from NGS were the same or higher for adults and the same or slightly lower for pups compared with the counts from observation and telemetry. (Average pack size 13) Understanding Wolf Behavior from GPS Tracking Data These packs usually consist of a group of 5–9 wolves.
Steven E. Dunphy	All of it	Yes	The thoroughness. Great maps.	No numeric cap on Wolfs. The whatever the landscape can support is an unexceptionable end.	4	Zones around the Reservations should be open to more harvest.
J. Ries	All of it	No	I like that we are talking about the wolf issue and that we have a place to share our views.	The plan is not using Scientific information, it is missing a large amount of key information, Copied and listed below... wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution	2	Thank you for having this platform open to the public
	Most of it	Yes	Science - based population estimates and appropriate harvest limits; Collaboration with tribes of Wi & universities Research on wolf predation on deer	Dog training for wolf hunting. Dogs should not be allowed to chase wolves.	9	Eliminate wolf-hunting near tribal reservations. Eliminate cruel trapping of wolves
William	Just the parts I am interested in	Yes	Increase in population of wolves	Having the original plan goal of 350 wolves	10	Too many deer in SE Vilas county where I live. Was a small wolf pack nearby but was eliminated a couple of years ago when over 200 were taken. I'd like to see and wolves in my area and help control the abundant deer numbers
David White	Most of it	Yes	0	The size of the so called buffer zones , doing away with numbers for harvest goals , total pop. The manner of how you are going to count the wolf pop. is totally unexcepable !!!!!! For a lack of a better word ,Stupid !! The D.N.R has lied from the beginning of this wolf story from the very start , and you still are ! question for you why in the world would you involve the humane society in this !!!	1	After going over this so called PLAN , no wonder the outdoorsmen of wisconsin and the D.N.R keep drifting farther apart year after year .
Todd Edinger Sr.	Just the parts I am interested in	Yes	None	All	0	The DNR SHOULD NOT!!! Be directed by anti-hunters And wolf lovers.. or The tribes on this subject… They need to decide if they want hunting dollars and all the hunting dollars generate in the state. Or if they want everyone to take there dollars to other states??? Or the people that come here and usually camp in all the free camping areas and bring granola bars and water bottles.. that they buy else where?? Your WOLF is killing businesses,clubs and life styles..We had numerous hound clubs up here in the Northwoods … there's none left the WOLF took care of that!!! You need to look at the big picture of what this animal is doing and MANAGE IT!!!! Call me [redacted] I have way more to say!!! 350 is to many because the way you guys operate it will be 35000. I think your in the 3000 now for numbers

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
	Just the parts I am interested in	Yes	The emphasis on research and the balance between the ecological benefits and conflict	none	10	very Impressive
Wisconsin Bowhunters Association	All of it	Yes		No numerical population goal	2	Resolution Whereas, gray wolves are a viable wildlife species in Wisconsin, deserving to be managed in their own best interest and in the interest of those directly affected by their presence. And whereas, the objective of the Wisconsin Wolf Reintroduction Plan was to establish a sustainable wolf population in Wisconsin and the U.P., as defined by the US Fish and Wildlife Service. And whereas, that objective was reached and exceeded over 20 years ago. But due to obstructionist lawsuits by anti-hunting and animal rights groups, citing the Endangered Species Act - for a species that has never been endangered in North America – wolves have been afforded absolute protection for most of that time. And whereas; due to that protection and almost no controls or management, wolves have expanded into areas of high human density and into areas not considered good wolf habitat. In fact, the density of wolves in Wisconsin, compared to human density, is already higher than anywhere else in the country. And whereas; this expansion has resulted in continual conflicts including depredation on livestock, pets, hunting dogs and threats to human safety. And whereas: these depredations and threats have increased significantly since the statewide wolf population exceeded 350 wolves; a number established by the DNR in 1999 and reaffirmed in 2007 as an adequate and reasonable population goal. And a number that is over 3 times greater than the number defined by the experts at US Fish and Wildlife Service as necessary to maintain the population here. And whereas; Wisconsin's wolves' primary source of food is whitetail deer, and their impact on the deer herd in many areas of Wisconsin has been devastating. The high wolf densities in Northern Wisconsin and now the Central Forest Region, threaten Wisconsin's deer hunting heritage, with significant negative impacts on tourism and commerce. It is estimated that wolves, hunting 24/7/365, take more deer in several northern Wisconsin counties than deer hunters do. As we have seen in western states, smaller populations of wolves have decimated whole elk herds to the point that deer and elk seasons and quotas had to be curtailed or eliminated. And now, even with very liberal wolf harvest regulations, those states struggle to keep wolf populations under control. Therefore, be it resolved, that the board of directors of Wisconsin Bowhunters Association, on behalf of our thousands of members and hundreds of thousands of deer hunters, respectfully request that the Department of Natural Resources modify the draft wolf management plan to retain the statewide wolf population goal of 350 wolves and manage wolves to that goal through annual harvest seasons as permitted by the US Fish and Wildlife Service. Respectfully Submitted on this 14th day of January, 2023 Board of Directors, Wisconsin Bowhunters Association
Chris Pedone	All of it	No		None	1	
Lon Mosbrucker	Most of it	Yes	science based management. Coming to conclusions based on studies, documentation, and education.	i am against any harvesting of wolves, especially dog hunts. All dog hunting should be banned, including bear. Verification of livestock depredation would be the only reason to remove a wolf.	7	I believe wolves will manage themselves if left alone and will have a positive environmental impact for everyone, including the deer hunter. i believe taking preventative measures by livestock owners will also decrease the conflict of wolves and there animals. There is way to much paranoia about the big bad wolf. If left alone they will be fine and of little conflict to anyone. The positives out-weigh any negative impact. Lastly i urge you to consider a ban on all dog hunting of any predator animal in Wisconsin. The use of dogs to hunt what is considered a predator animal is not a sport. Thank you and i would volunteer if needed to help on the research needed on wolf.
Sandra Materi	I have not read any of the draft plan	No	• The elimination of a numerical target population • The importance of the ecological benefits of wolves and inclusion of tribal values and knowledge. • The attempt to minimize the impacts of a recreational hunt by adopting buffer zones around tribal lands, shortening reporting requirements and making hunting licenses zone specific. • Emphasizes the use of non-lethal methods to reduce conflicts.	, what elements from the draft plan do you Dislike? • Absent is a commitment by DNR to work with the legislature to overturn PA 169 and remove payments for hunting hounds, killed by wolves. • Hound training must be stopped. • The plan should establish a zero hunting quota to protect wolves in our national forests and other areas prime habitat. • The recreational hunting/trapping to reduce conflicts has no scientific basis. • At a minimum, DNR should ban the use of dogs to hunt wolves in our national forests. • There is considerable uncertainty in estimating wolf populations based on the occupancy model and should not be used solely to determine population. • The plan should include an oversight committee which is comprised of biologists and professionals.	7	
Ben R	Most of it	No	There is much greater recognition of the ecological role of wolves.	The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life.	4	The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Francis White	Most of it	No	Leaving out a numerical target population of wolves. The importance of wolves for a healthy environment, with positive changes already proven many years ago. Positive consultancy of tribes and their understanding of the key role that wolves play. Giving true attention to minimize the impacts of a recreational hunt by adopting buffer zones around tribal lands. Emphasizing the use of non-lethal methods to reduce conflicts.	DNR should work with the legislature to overturn PA 169 and remove payments for hunting hounds, killed by wolves, while hound training must be banned. Missing is a zero hunting quota to protect wolves in our national forests and other areas prime habitat! Ban "recreational" hunting /trapping, the cruelest of all, this has no value at all to reduce "conflicts" neither! Determining wolf populations is very uncertain, other nature lovers and experts should be consulted. A committee of biologists and professionals should have a strong advisory role and influence in all of this.	6	This committee was overrepresented by hunting organizations even though they represent the minority opinion of Wisconsinites. Too much emphasis was placed on the killing of wolves rather than co-existence and respect!
	Most of it	No	The review in itself.	It would appear that stakeholders who are for the hunting of the wolf were / are over represented. What about Prohibiting dogs at all for hunting wolves considering you have a good guide for domestic dogs available	7	I think the use of the word 'harvesting' is offensive. It would also appear that the plan emphasises the 'hunting', 'killing' aspect of wolves to manage rather than no lethal methods
	Most of it	Yes	Human Dimensions of Wolf Management: A Literature Review. It was interesting at the wide range of aspects that were studied in the findings of the public/ business views of the wolf.	You had studies citied that were published and reviewed by other scientists that showed the benefits of Apex predators in areas ie. Yellowstone and potions of Colorado. But after writing of their findings you interjected of it possibly being anthropomorphic which contaminates their findings. It should be viewed as the other published findings are viewed and not weakened as we know this term does of their scholarly work.	4	I believe that the solutions are from old tactics that have been used and presented for decades with highly unsatisfactory results. Whilst the hunting, ranching, and trapping industry were given a place at the discussions. Other agencies which have tirelessly studied,accomplished field work studies with biologists and scientists have been mostly ignored ie. Poject Coyote. We cannot expect to solve problems with the same mindset/ information that has created these problems.
Brian	All of it	Yes		I do not lake the fact that the plan does not manage for a specific number of wolves.	1	I am very concerned about this plan not managing for a specific number of wolves on the landscape. I spend a great deal of time in Vilas County. In that time I have seen first hand what a wolf pack can do to a local deer population. Each year we see the wolves coming closer and closer to our home. Now even in our front yard. We never saw this kind of behavior in the past. It is clear to people that have lived in this area for many years that there are too many wolves. Very few deer, many close human encounters. This plan needs to determine the number of wolves that can coexist with human beings. And then manage the wolves to that number.
Gary G Ruhser	Just the parts I am interested in	Yes	I am impressed with the overall length and the vast amount of detail and effort applied, especially as it relates to science and precise definition.	Not enough emphasis on the reality human/wolf interaction problems are not caused so much by wolves moving into human territory but the fact we cause problems by being in their territory.	10	I am a busy Old Guy, 78 years old, living in the country on a farm, who quit his well-paid engineering profession at age 46 to work summers in the outdoors, BWCAW rehabilitation work, Sage Grouse surveys in Colorado, Grouse surveys in Wyoming, Hacking Peregrine Falcons in the Rocky Mountain West. I am a self-published author of 4 books on Amazon. When wolves were first colonizing in Wisconsin, I volunteered with the Timber Wolf Alliance to give wolf presentations to clubs and school age children, and have met wolf research leaders like Thiel and Mech. I just wanted to let you know I fully support this plan, all the effort that went into it, and I fully support Science, facts, and data. I wish you well in the political games that will ensue, and hope Science wins out. It occurred to me recently we could eliminate all these hard-fought Wildlife Management Plans and instead have one People Management Plan - it's people and politicians causing "problems", not wildlife. Wildlife is just trying to survive, and we humans keep occupying more and more of their territory every year, every day. Best wishes to you. Love your youthful enthusiasm and application of Science to your job.
John Korth	Just the parts I am interested in	Yes	That science and collaboration will be used for management.	More needs to be done for citizen education about wolves. This should include more detailed statistics about human and wolf interactions, how wolves affect the environment around them, more exact habitat range and needs, carrying capacity, etc.	9	Where did the 350 management number come from? This is out there a lot, but to my knowledge no one knows from where. At least among the hunters and non hunters I know. It seems like a number that was just pulled out of a hat and it stuck. Where is the science behind it? I like that there is no population goal listed in this plan as of now, but I imagine there will have to be one once the DNR can come up with a scientifically based one that includes the myriad of factors involved. Maybe this should be addressed in the plan.
Loren A. Brumberg	Most of it	Yes	- Removing numeric goals - Redrawing wolf zones & creation of buffer zones around tribal reservations - rigorous focus on wolf population monitoring - science-based monitoring - mandatory harvest registration & in-person certification requirements - education & outreach efforts	- allowing the use of dogs to pursue wolves. If required, limit training of dogs to only the periods when wolf harvest season is open in the zone	9	- identify funding allocation & funding sourced - follow-up public attitude survey - rescind regulations under 2011 Act 169 or pursue statutory changes - include conservation science organization representation on Wolf Advisory Committee
Dale Biertzer	All of it	Yes	Wolves do need to be managed	Goals of wolf population are to high and should not be more than 700	6	Population goal of no more than 700. Ban the use of use of dogs for big game hunting. These dogs are harassing all the wildlife including wolves.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Susan Szabo	Just the parts I am interested in	Yes	• The elimination of a numerical target population • The importance of the ecological benefits of wolves and inclusion of tribal values and knowledge. • The attempt to minimize the impacts of a recreational hunt by adopting buffer zones around tribal lands, shortening reporting requirements and making hunting licenses zone specific. •counting hounds, killed by wolves. • Hound training must be stopped. • The plan should establish a zero hunting quota to protect wolves in our national forests and other areas prime habitat. • The recreational hunting/trapping to reduce conflicts has no scientific basis. • At a minimum, DNR should ban the use of dogs to hunt wolves in our national forests. • There is considerable uncertainty in estimating wolf populations based on the occupancy model and should not be used solely to determine population. • The plan should include an oversight committee which is comprised of biologists and professionals.	Overall, the plan is good; however, the Committee was overrepresented by hunting organizations even though they represent the minority opinion of Wisconsinites. Too much emphasis was placed on the killing of wolves rather than co-existence. Emphasizes the use of non-lethal methods to reduce conflicts.	7	• Absent is a commitment by DNR to work with the legislature to overturn PA 169 and remove payments for hounds killed by wolves.
Diane Cain	All of it	Yes	I believe the 2022 Wolf Management Plan represented the sentiments of the 2022 Wolf Management Committee well and thoroughly by educating the public about the nature of wolves, their value in the ecosystem as a keystone species, wolf statistics, the generally favorable attitudes WI residents have toward wolves, livestock predation, carcass disposal issues, and the DNR goal of focussing on a holistic and pragmatic approach to wolf management, conservation and stewardship which includes no numeric population goal. The DNR recognized the necessity of educating the public regarding the role wolves play in probable CWD mitigation, in decreasing car/deer collisions and in separating disparaging fallacies regarding wolves from facts. 4. Elements I liked: a. No minimum wolf numeric population goal b. "dispersal is important for creation of new packs and for gene flow between them." c. sources of human caused mortality include being accidentally struck by vehicles, illegal poaching, legal harvest, illegal poaching, depredation removals and accidental take. d. "keystone species such as wolves are an important component of a healthy ecosystem". e. "another study attributed a 24 % average reduction in county deer-vehicle collisions due to changes in deer behavior associated with the area being occupied by wolves." f. "In areas of high wolf occupancy; abundance of mice and voles were reduced. Since small mammals are the dominant reservoir hosts for Lyme disease, sufficient wolf numbers could potentially reduce the incidence of Lyme disease in human populations". g. "Wolves are known to be attracted to bear baits placed for bear hunting purposes. This could potentially increase interactions between bears and wolves in the summer and fall months, when both species may have young" h. "Only 9% of packs will breed the next year if both breeders were eliminated. When both breeders were eliminated 85% of packs were dissolved" i. The average deer density in Wisconsin's Northern Forest was 20 deer per square mile in 2021. Average deer density in the Central Forest averaged 29 deer per square mile in 2021-very little difference since 2011. j. Across 9 statements about wolves, the majority of Wisconsinites responded in a way that reflected favorable attitudes toward wolves" k. "while modifications to question design between 2014 and 2022 limited statistical	5. Elements of the Wolf Management Plan I Dislike: a." However they noted that breeder pack mortality and pack dissolution had no effect on either immediate or longer term population dynamics" b. "The presence of wolves near cattle can invoke a fear response in cattle" c. "this plan recognizes the value and biologically recovered status of gray wolves in WI"	9	However the 2022 Wolf Management Plan will be the play book for wolf management for the next 10 years and these are ideas I have for embellishing upon the Plan. 1. The 2022 WI public wolf survey generally reflected a decreasing appetite for recreational wolf hunting. The term "recreational hunt" would be more aptly classified as a "zone specific selective cull" using the criteria of the DNR. The term "recreational hunt" sends a message which diminishes the value of the wolf as a keystone species. 2. Hopefully the Wolf Advisory Committee will include scientific and logical thinkers who might consider the following factors. a. In 2021 around 210 farmers were issued permits for deer agricultural damage-many in the locales where wolves live. Perhaps farmers could look to predators as a means of dealing with the overpopulation of deer. b. Wolf hunting in marginal territories targets dispersing animals and stifles the creation of new packs with genetic diversity. 10-15 % of wolves are lone wolves or dispersers. 3. Studies show a wolf in WI is 34-45 % more likely to die of poaching than any other cause, in particular when snow and hunting periods overlap from late fall to early winter. Perhaps coyote hunting should not be allowed during the 9-day deer hunt to help to mitigate the issue of killing wolves inadvertently. 4. WI DNR reports from 4/2019-4/2020 show 7 % of wolves were killed by vehicle collisions. As humans continue to encroach on wildlife habitat the problem will escalate. A bipartisan senate bill is being hammered out in Congress which includes $350 million dollars for wildlife crossings and corridors. Wildlife corridors would prevent accidents, decrease poaching and promote genetic diversity of wolves and all wildlife. 5. The issue of wolves feeding at bear bait is problematic for wolves and bear hounds. The problem could be mitigated through common sense measures. WI is the only state which allows bear hound training after bears and wolves have been acclimated to bait sites since April 15th of each year. Curtail bear baiting to 2 weeks before the hunt as in most of the other states. 6. Funding for non-lethal preventive measures to deter predators should be made readily available to all farmers to prevent predator habituation.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
			comparisons, informal comparisons suggest statewide support for a wolf hunting and trapping season has declined over the last 8 years.' 11 1. " research has shown wolves will utilize livestock carcass dumps, including altering their diet" m. "several preventative options exist which may reduce conflict potential. These include maintaining healthy, well-fed animals, conducting calving/lambing activity near a barnyard and proper livestock carcass disposal." n. no longer allowing training hounds on wolves year round. changes authorize the training of dogs the Monday following the closure of the regular gun deer season and concluding when the wolf harvest season closes. o. "recent scientific studies and experiences reveal the pervasiveness and impact of misinformation, sensationalism and rumors which may be generated among those across the full spectrum of stakeholders and the public" p. "Public outreach and educational activities are an integral part of wolf recovery success in the Upper Great Lakes region."			
Maria Novotny	All of it	Yes	I really appreciate the scientific research and longitudal data that informs much of this approach. It reassures me that the approach is based on best practices. I also greatly appreciate how tribal perspectives and history is incorporated. As someone who is not native but recognizes the colonial history of WI, I think it is really important to offer a plan that considers science and history.	I am concerned about the communication approach. I believe as outlined in this plan that the public debates over wolves relates to public misperceptions about wolves. For instance, I split my time between Milwaukee and Phillips Wi. And as the report indicates there are two varying perspectives for people who live in rural areas with wolves (like Phillips) versus more urban areas like Milwaukee. Changing public perception depends on communication about wolves. Yet there is such little engagement in the rural areas like Phillips with wolves. Plus there are literacy issues with how information gets shared. I'd like a more thought out plan with how communication and public engagement may be structured and supported in this.	7	I appreciate this being circulated to the public for feedback. That said, and this relates to my comment above, the only way that I knew about this plan is because I subscribe to a Lac Du Flambeau tribal newsletter. They encouraged participation. I say this because I worry that many other key stakeholders who live in wolf populated areas and are not tribal members may not be participating in this survey. I want to encourage communication approaches that may better engage all stakeholders. That only helps ensure the successfulness of this plan.
	Most of it	No	I appreciate that the plan has dropped the old numerical goal of 350 wolves and the inclusion of buffer zones around reservations.	I greatly object to the failure to prioritize or even consider the avoidance of cruelty in the plan. Allowing horrendously cruel activities such as hunting, trophy hunting, allowing dogs to hunt down and dismember individual wolves, trapping, and the reliance on lethal control measures over non-lethal methods means that the team ignored scientific findings regarding wolf ethology, sentience, and well-being - and ethics. There is tremendous suffering masked behind such euphemisms as "wolf harvest," "wolf over-harvest," "recreational", "dog training." and "outdoor opportunities." Dog hunting and trapping should be stopped immediately - I cannot believe that the team even considered allowing such cruel activities to continue. Hunting of all predators including wolves should be banned outright or at least phased out as quickly as possible while educating the public about the cruelty of hunting these wonderful animals. If phasing out is the decision, the season should be reduced to a very short time period and a limited number of permits awarded by lottery. Also, lethal control measures should be made the very last resort. The plan should explicitly emphasize the use of scientifically based, non-lethal interventions and population self-management. I beg the team to reconsider its proposals to allow such unnecessary and horrendous cruelty to continue to cause such unimaginable suffering and to revise the plan so that it is as much wolf-centered as people-centered.	0	Please ban hunting, trapping, and lethal wolf interventions. Base your decisions on avoiding suffering and unnecessary cruelty and not on what has been done in the past nor on the demands of a few who claim that inflicting suffering and killing is a recreation.
Christa Hoffman	Most of it	Yes		1) I Oppose the creation of Buffer Zones surrounding reservations that would take away the rights of private landowners. I also oppose giving away wildlife management authority. (Pg 106) b. The department excludes 'reservation wolves' from harvest consideration when developing wolf harvest quotas. Creation of subzones around tribal lands increases the wolves that can be exclude from population estimates. (C1d) • Lack of numerical population goal; and resources are needed to ensure that current plans can be managed. • Lack of long-term solutions for preventing wolf depredation beyond permanent fencing. (Objective B1d) • Expansion of DNR authority into animal husbandry practices. (Objective B1e) • Development of wolf-related tourism- as most wolf habitat is on private property.	7	My home is within the boundaries of wolf habitat. I respect these animals and appreciate cultural significance to my tribal neighbors. As a business and private property owner, ensuring that those who live closest to these animals have a voice in how this plan is executed and enforced before over population occurs in our zone is critical.
	Most of it	Yes	Very comprehensive study but should have been about 20 pages.	I did not anything that actually is a proposal as to how you are going to address the problem that wolves causing to our other species of wildlife, i.e deer, rabbits, grouse.	1	Do not let the public that doesn't actually live in the area affected have so much say in the actual quotas.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Thomas Lochner	Most of it	Yes			7	I live in northern Price Co. in the middle of wolf country. I supported the wolf re-introduction and believe wolves should remain a part of the ecosystem in WI. That being said I think the plan should have a numeric goal. Many hunters and farmers want a goal so the DNR can be held accountable. From the report, I found it interesting that taking an alpha male or female from a pack will lead to their replacement in the pack. Each pack normally only raises one litter of pups/season. Eventually when setting harvest goals, it should be taken into account that removing one wolf is only that, your not removing future pups from the pack. Bear dog hunters took a beating at the public listening session. As long as bear hunting remains legal, hunters should continue to compensated for wolf/dog encounters. I am a very active outdoor person (hunting, fishing, birding, hiking, xc skiing, snowshoeing, berry picking, etc). I've seen about a dozen wolves and have never had a negative encounter. It seems like the carrying capacity for wolves in my area has been reached as the population seems to be pretty stable for 10 or more years. Reducing the population in my area by 25% or so would be a good thing. Thanks and good luck. The DNR is in a tough position as both sides have opposing objectives and are extremely passionate. Hopefully the plan and it's implementation will at least partially satisfy all sides.
	Just the parts I am interested in	Yes	The continued focus on science based infomation and involvement of a wide ranging groups and stakeholders		9	
Mary Anne Ericson	All of it	No	1. The dropping of a numeric population goal, as these are arbitrary and scientifically unsupported. 2. The recognition that wolves are ecologically important and that they belong in Wisconsin. 3. The commitment to ongoing scientific research and education.	The excellent publication on Wolf Conservation Planning that was put out by the Endangered Species Coalition a few years ago identified three crucial values that should be the bedrock of any wolf management plan. Plans should be based on science, they should be inclusive of all citizens, and they should be grounded in ethical principles. In my view, Wisconsin's new plan falls short especially when it comes to incorporating ethical principles. Here are a few examples of how ethics gets short shrift. 1. Out of 297 entries in Literature Cited at the end of the plan, I believe only two of them specifically address the ethical dimensions of wildlife management. There are great resources out there that are highly relevant to wildlife management that should be included in any wildlife policy discussions, such as G. A. Bradshaw's Carnivore Minds, and especially Martha C. Nussbaum's book Justice for Animals: Our Collective Responsibility. 2. It is telling that in the identification of the four stakeholder groups who merit consideration in the wolf planning process -- hunters/trappers, farmers/ranchers, wolf advocates, and unaffiliated citizens -- only wolf advocates are said to have as their mission the humane ethical treatment of all wildlife. Should that not be the overriding concern of all stakeholders? 3. Missing from the plan is any discussion of the interests of wolves themselves. "Hunter satisfaction" is repeatedly recognized as an important value, but how can that possibly take precedence over the interests of wolves themselves -- in living, reproducing, maintaining intact families, being free to traverse their territory, and not being tortured? Ethically, there is simply no equivalence. As intelligent, sentient, highly social animals, wolves have compelling interests of their own which merit respect and protection. Wolves do not exist only as populations to be managed, or as animals either useful or problematic for humans, but as individual beings with standing in the moral universe. A wolf conservation plan grounded in ethics could not support any form of "recreational" hunting and would commit itself to its elimination by one means or another.	4	Some additional comments: 1. The disclaimer at the beginning of the plan regarding the language used in the plan does not justify or excuse the continued use of such language. Terms like "harvest," "take," "lethal control," and even "management" obscure the reality of the killing (and even assassination) of wolves. "Harvest" in particular evokes images of "bringing in the sheaves," and is entirely inappropriate and misleading to the lay reader, whether or not it accords with the "prevailing" terminology. One would have hoped that a brand new wolf plan would aim for greater honesty and transparency in the language it employs. 2. Allowing hunting and trapping as a tool of conflict mitigation is entirely wrong-headed and does not accord with what I understand to be the best available science. Hunting and trapping kill indiscriminately rather than focusing on specific wolves who may have engaged in chronic livestock predation. Hunting and trapping, especially where one or both of the breeding pair are killed, usually results in breaking up families and forcing younger, less experienced wolves, to turn to predation on vulnerable livestock rather than on wild ungulates. This perpetuates or even promotes conflicts rather than reducing them. 3. Although the plan doesn't dispute that wolves may have a role in controlling CWD in the deer population, and calls for more research in this area, it doesn't go far enough in recognizing and valuing wolves for their tremendous potential in increasing biosecurity. We face dire threats from climate change, loss of biodiversity, and zoonotic disease, which makes it even more imperative that our keystone species, including our apex predators, be protected and helped to flourish, so that they can do their work to keep our natural systems healthy and in balance.
Bruce	All of it	Yes	There are no elements from the draft plan for anyone living in the northern Wisconsin wolf management area to like.	I dislike all DNR wolf management plans in Wisconsins north woods. Our wild deer herd has been decimated. While there are deer in most of northern Wisconsin neighborhoods, deer numbers in the big woods are extremely low. While I understand wolves are not the only deer predators, they are the most efficient winter predators. There’s very few fawns in the National and State forests in northern Wisconsin. DNR wolf numbers are very flawed in northern Wisconsins big woodlands. Boots on the ground wolf counters can easily see how large the wolf numbers are in the big woods during a drive after fresh snow in the big woods. People living the so called wolf management area should not be subjected to these extreme wolf numbers. Not only is the deer herd being destroyed, our pets and animals are at high risk. As the wolf numbers increase, the wolves are encroaching our neighborhoods. Wolf numbers would be more accurately counted using a system like our sex,age, kills numbers used to manage the deer herd. Having a wolf plan without a wolf number plan is absolutely ridiculous. That number should be 350. Maybe the only way Wisconsin deer hunters can have a much input in getting a manageable wolf number is to not buy deer licenses.	1

	All of it	Yes			1	
Paola	Just the parts I am interested in	No	I appreciate the efforts of all WDNR staff involved in updating the state's wolf management plan. Although I believe the current plan needs significant updating (see next section), I recognize the efforts and improvements made to the previous plan, including: ● Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. ● There is much greater recognition of the ecological role of wolves ● The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves ● The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed)	● The current draft does not reflect the best available science and is missing a substantial amount of scientific literature on (see reference list below): ○ wolf ethology, sentience, sapience, sociability, agency, and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, well-being, social dynamics, ecological relationships, and evolution ● The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous, and of stronger inference. ● The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ○ A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, have found that policies allowing the liberalized killing of wolves results in a direct increase in the hazard and incidence of illegal killings. ○ Hounding or hound training, which is akin to allowing legalized dogfighting, should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public. ● The plan should prioritize wolf protection and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. ○ Despite Act 169, which mandates a wolf hunting season, the department can still restrict the implementation of lethal methods by setting minimal quotas, including a quota of '0' wolves, restricting timing and methods. ○ Several studies have proven a proactive non-lethal approach leads to better conflict mitigation. ○ Lethal management often fails to provide a long-term solution to wolf predation and has the least consistent success rates when compared to non-lethal practices. In addition, there is significant evidence showing that lethal wolf management might be less functionally effective at mitigating subsequent livestock losses than non-lethal deterrents. ● The plan should require the implementation of abatement measures as well as the use of non-lethal conflict minimization techniques by domestic animal owners for the latter to receive compensation for confirmed predation. ● The plan also runs contrary to public values towards wolves (and omits mention of such majority values from the plan), despite department surveys evidencing that the broad public cares about wolves as individuals (and not just for the viability of the population). Given the recent liberalization of killing wolves by the state, it would be incredibly informative to note majority support of the following reasons for opposing a regulated wolf hunting/trapping season (which are all omitted from the plan): opposition to specific methods of harvest like hounds (64%) or traps (70%), feelings that hunting wolves is unnecessary (62%) or culturally offensive to Native American tribes (57%). ○ All such reasons convey majority disagreement with practices currently promoted and endorsed by the legislature and the WDNR, and such a conflict between managers and the public should not only be acknowledged but foregrounded and carefully considered in policy (instead of dismissed). ○ Such decisions to omit literature or downplay evidence (e.g., such as the majority opposition to killing wolves and their reasons) are contrary to the principles of scientific integrity (e.g., present all relevant scientific evidence to the public) as well as ethics (e.g., disguising ethical decisions, such as recreational wolf killing, as robustly supported by science). ● Conflicting agency objectives (e.g., optimizing public hunting and conflict mitigation) are not only not acknowledged, but even misunderstood as harmonious, against the body of scientific evidence. That culminates in the prioritization of consumptive values and policies; e.g., according to the body of scientific literature, use of lethal methods, and 2 especially public hunts are contrary to most objectives relevant to harm mitigation, the the well-being of wolves, their ecological roles, and their non-exploitative enjoyment (i.e., Objectives A, B, D, and F). ● There is a stark lack of consideration for individual wolves, wolf population health (including wellbeing), and measurable indicators for assessing any harms barring disease prevalence (e.g., accounting for cortisol levels or other stress hormones, measures of pair/pack persistence) ● There is an inappropriate understanding and consideration of tribal worldviews about wolves. Tribal worldviews of wolves are misconstrued as 'cultural benefits' tribes receive from the existence of a wolf population, when in fact tribal worldviews consider each individual wolf as a person and relative. Cultural respect and sensitivity towards such views, shared by many non-tribal members, demand the strict mitigation of lethal measures, especially recreational killing, as opposed to their current promotion in the plan. ● In general, all omissions of scientific literature,	5	

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
				the arbitrary prioritization of policy objectives, the rhetoric of the plan, and the dismissal of public values and concerns for wolves point towards a biased, unscientific, and instrumental view of wolves that promotes values contrary to broad public perspectives on wolves. ● 'SOM' wolf estimation methodology – From a recent critique: "The new methods sacrifice precision, but are believed to retain adequate accuracy and sensitivity to changing conditions for reliable decision-making. We review evidence for the accuracy, precision, and sensitivity of the new 'scaled occupancy model' (SOM) applied in Wisconsin. We conclude that the Wisconsin method would systematically overestimate wolf abundance by large (but currently incalculable) margins. Because Wisconsin, similar to other states, not only changed to unverified methods but also implemented widespread wolf killing, shortcomings in their estimates of wolf abundance may have far-reaching consequences for population viability and confidence in state wildlife managers. We discuss findings from Wisconsin alongside similar findings for other states' occupancy models being insensitive to human causes of mortality that have recently increased. Overall, Wisconsin's proposed method for estimating wolf abundance shows significant departures from best practices in scientific measurement. Verification will require independent replication and unbiased tests at multiple scales in multiple habitats under different human-induced mortality rates, and peer review before the new methods are considered reliable." (Treves & Santiago-Ávila, 2023)		
	Most of it	Yes	Overall, the data was very detailed however the feeling of looking out for the wolves to ensure their future in Wisconsin was best takeaway from the draft.	Dislike trying to allow the wolves to be viewed as a nuisance that should be controlled. Disagree with hunting wolves.	5	The DNR needs to protect the wolves to ensure their future. The benefits to the environment that they provide is well documented.
	Most of it	Yes	The identifying the different management zones in the state is a good start.	It does not reduce the population in the northern part of the state to a reasonable level. The sub zones need to be eliminated. Having these sub zones is forcing unfair problems with the wolf onto the landowners outside of the tribal lands.	2	Until a real meaningful hunting/trapping season can be had to help reduce the gross over population of the wolf in the northern part of the state, the state should relocate large numbers of them to the southern part of the state. The landowners in the northern part of the state should not be unfairly forced to bare the blunt of the wolf problems.
	Just the parts I am interested in	Yes	none of it	one of the most important parts of this wolf plan should have been setting a realistic population goal. clearly that was not addressed We need to set the population goal at 350 as was written in the previous plan.	1	I live and hunt in the central forest region we are over run with wolves instead of sitting behind your desks go out and look and talk to the people in that region they will tell you we desperately need to reduce the population there and the northern counties
Janice Kimmet	Just the parts I am interested in	Yes	Respect for Tribal Reservation Traditions	No quota, Not enough input from those affected by Wolf depredation.	2	As a sheep farmer along with my son , we have seen first hand the devastation that wolves can bring. No one, who has seen the battle field, after 13 ewes have been torn apart, would think of the wolf as a warm, fuzzy, sweet animal. Wolves are smarter than most men and know when to attack. The pack came twice during thunderstorms when the dogs would be seeking shelter. Since the initial attack in 2019, my son has lost one at a time, instead of a dozen at a time. His farm is near Pittsville where the most notorious pack roams. He had two donkeys and beef cattle at the time of the attack but the wolves attacked during thunderstorms when the dogs were seeking shelter. I have been raising sheep since 1975. Sheep have a complicated family structure in a herd as well as wolves. Multi generation families are what create the healthiest flocks where the older matriarchs teach the younger sheep the right plants to eat, how to react to the sheep dogs and how to raise and nuture their lambs. No farmer replaces his ewe population every year, but when wolves attack those key matriarchs are lost. The trauma from the attacks prevent the survivors from ever thriving again. The trauma to my son's 8 children from seeing their pet sheep destroyed carcasses within feet of their playground will never be erased.
Irene Ellis	All of it	No	Buffer zones to protect Native reservations Recognition of ecological importance of wolves	Too much emphasis on hunting and lethal management.	6	Thank you for a better plan than previously existed. Still needs improvements
William Ulferts	All of it	No	Lifting the numerical cap Attempting to prevent the travesty that occurred in the last wolf hunt Buffer zones	Hound hunting is very barbaric. How is it different than dog fighting? No night hunting.	7	Too much emphasis on hunting and not enough on protection. No more national disgrace wolf hunts.
Jim Ellis	All of it	Yes	Removal of numerical number Recognition of importance of wolves	Dog hunting - very barbaric traps very unfair Too much emphasis on lethal management	6	Save this keystone species - we should recognize how much like us they are!
Ashley Ulferts	All of it	No	Lifting the wolf 350 cap Recognition of importance of wolves to the ecosystem	Dog hunting is sick Night hunting is unethical Trapping is inhumane Too much emphasis on hunting and lethal management	5	Please review the Minnesota plan which is much better than this one. But thank you for your work on this.
Nick Ulferts	All of it	No	Buffer zones - recognition that wolves have cultural significance to Native Americans	Hunting by hounds - very barbaric. How is this different than dog fighting?	6	We must never see the state overhunt as occurred last year. It was a travesty and an insult to all Native Americans
Christina Diane Ulferts	All of it	No	Lifting the population number Buffer zones	Allowing hound hunting, night hunting, and traps. We need to focus more on protection and non lethal management	7	Thank you for your work on this. The public overwhelmingly wants to protect wolves and recognizes that they are a keystone species. Protect brother wolf!

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Donald Furo	Just the parts I am interested in	Yes	none.	Not setting any quota.	1	need to set a 350 max. quota.
Phyllis	Just the parts I am interested in	No	The stated goals continuing with scientific research on wolves.	I have strong objections to the failure to outlaw hunting, lethal population control, hounding, and trapping of wolves. This implies a continued failure of agencies and the public to consider the cruelty of actions taken against fellow sentient creatures as a guiding principle for wildlife conservation and management plans. Such plans should make the avoidance of cruelty a top priority and should recognize that other species are sentient and can suffer just like humans. These plans should be wildlife-centered and seek to support other species' well-being and happiness.	1	The plan is not really an improvement at all - it continues horrendously cruel actions against wolves.
Christina K	Most of it	No	I like that wolf populations in WI will no longer be managed by reference to the old numerical goal of 350 wolves. I also like the inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves. Finally, I appreciate the addition of buffer zones around tribal reservations.	The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings. In addition: Hounding or hound training should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public. The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. The plan should require the implementation of abatement measures as well as the use of non-lethal conflict minimization techniques by domestic animal owners for the latter to receive compensation for confirmed predation.	3	Please consider adjusting your plan by considering more scientific research findings as listed below: ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing. ○ effectiveness of non-lethal interventions, especially relative to lethal ones. ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution. Thank you for your consideration.
	Just the parts I am interested in	Yes		I would like a desired wolf population number with a plan to manage to keep at that number.	1	
Dr. Tammy Cloutier	Most of it	No	I appreciate that attempts are being made to update wolf management, including not using the old goal of 350 wolves, the recognition that wolves have an important ecological role, the use of social survey that shows increased positive views of wolves, and adopting proposed buffer zones around tribal reservations.	Despite the efforts presented to "update" wolf management, there is still much work to be done. Elements that need improvement are: including the best available science (a substantial amount of information is missing), decreasing the bias of this plan (it stills leans in favor of recreational killing and consumptive users), curtailing lethal management wolves (with rare exceptions relating to immediate defense of life), prioritizing wolf protections and taking action for coexistence rather than offering the appearance of coexisting, requiring implementation of abatement measures and non-lethal techniques in order to receive CONFIRMED predation compensation, revising the plan to coincide with public values toward wolves rather than supporting the views of a few that oppose wolves, resolving conflicting agency objectives (all should work toward coexistence), increasing understanding of tribal views of wolves, and increasing consideration for individual wolves. Policy objectives, politics, and lack of scientific literature all have a negative impact on this current proposed plan. You can and must do better.	4	Wolves are not the enemy. The actions and voices of a few have vilified them and silenced the voices of those who wish to coexist with this important species. A responsible and responsive plan can and should address the items noted in the DISLIKE comments. Thank you for your time and consideration.
RICHARD BAUDHUIN	All of it	Yes	HAVING A HARVEST SEASON	NO NUMBER TO MANAGE FOR	4	
	All of it	Yes	I like the facet that you are going to make it a structured project and not a free for all everything have a time and a place	No comment	10	The only other issue I see with creating this plan is there's gonna be a lot of backlash from Antey hunting groups. There's a lot of backlash ready from groups such as wolf patrol harassing hound hunters running in the national forest land even if they are not doing anything wrong there's already been talk on social media by people, saying how hounds have no place in national forest land there is no reason to have hunting or any of that it disturbs ecosystem in the wolves but on the same time, the number of wolves is what is disturbing the ecosystem not just the hounds, running in the woods or anything like that I would like to see more people understanding that's aspect of it all an in hopes the hunter harassment will decrease
Ken Liebenstein	I have not read any of the draft plan	Yes			1	After Getting feedback from organizations like Wisconsin wildlife federation, Wisconsin Bowhunters Association and other outdoor organizations and listening to their comments I am unable to support the plan as written
Smoke	All of it	Yes	None of it…. You need a new team	I don't think you all realize the damage you're doing….	0	

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
	Most of it	Yes	Maintaining and managing a wolf population in Wisconsin while allowing hunters and trappers to aid in population and conflict management by taking some of the harvestable surplus.	Setting the population goal to a specific number when it is difficult to impossible to get an exact population count with the current estimation methods. Allowing everyone in Wisconsin an equal say in wolf management when everyone does not equally have to live with them.	5	I hope the DNR can lead us on the correct path of wolf population management using scientific data and not emotional decision making. I like having wolves in the state but having more opinions from places with a higher population of people like Dane county who don't have to live with wolves should not overshadow the opinions of the people who do have to live with them. If the native tribes don't want to participate in the states management plan then they should not have say in the rest of the state. I do not want to see wolves eradicated from the state, but if we are in this as a state then everyone in the state should have to deal with the pros and cons of living amongst wolves. If the wolf population is not controlled and managed the DNR will be missing out on revenue from license sales, and when they begin to negatively affect the deer population the DNR will miss out on the revenue generated from those license sales. Ultimately leaving the DNR unable to fund projects and improvements that they can do to help maintain the wildlife of Wisconsin. Such as the money spent to re-establish an elk population in the state, of which I also support. I stand behind the DNR but not the special interest groups that seem determined to steer the decisions they make.
	Most of it	Yes		How can the State of Wisconsin decide a wolf management plan without input from animal welfare organizations input, wolf advocate organizations and scientists and veterinary experts?? Why does the bear Hunters Association have a say and not these important contributors.	0	How can the State of Wisconsin decide a wolf management plan without input from animal welfare organizations input, wolf advocate organizations and scientists and veterinary experts?? Why does the bear Hunters Association have a say and not these important contributors.
Deb Wills	Most of it	No	Conceptually, I like the Wolf Management Plan Goal Statement as presented in the Executive Summary.	The current draft is missing a substantial amount of current scientific literature, including consideration of at least 9 scientific papers published within the last 5 years.	2	Neither science nor "management" of wolves justify trophy hunting of wolves, regardless of how many times you repeat the term "Ensure a Healthy and Sustainable Wolf Population to Fulfill its Ecological Role." Lethal "management" should be utilized only in the most dire of life-threatening circumstances. Regardless of the data provided in the plan, wolves have survived thousands of years without human management of their populations. Humans have co-existed. Presentation of data about the acceptable "take" level is simply rationalization for support of trophy hunting that offers no actual benefits to the wolf population or the ecological community as a whole. Recreational killing is clearly the main management strategy. Reports from state wildlife agencies indicate that herbivore populations are growing in wolf territory, so the claim that hunting is required to avoid decimation of prey species is in question. (Additionally, the USDA reports wolves are responsible for < 0.1% of livestock deaths.) I'm pleased that "In recognition of tribal sovereignty, to respect tribal values associated with wolves, and" (probably most importantly) "to avoid potential jurisdictional confusion regarding management and enforcement…" the "federally recognized tribes in Wisconsin" are allowed to disallow wolf hunts on their territory. Wolf hunts should be disallowed. This Draft plan is biased toward trophy hunting, runs contrary to *current* scientific evidence and is most definitely not about stewardship.
Stacy Gilson	All of it	Yes	I believe a property owner should be allowed to protect their livestock but they need to be educated in non lethal methods and money should be raised to help keep dead farm animals disposed of properly so not to draw predators in. I think better science for determining the population needs to be initiated by involving people to become engaged with the counts and observations. I would love our Great Lakes region to develop more wild life observation points.	Holding wolf hunts should not be the goal to take down wolves for no reason. The wolves number has stabilize and depredations are down when the packs are not killed. Research has shown packs mourn and disband when they lose the elders who teach them to avoid humans, hunt native prey and stay together. Zero is a number. Methods used to take wolves during a hunt should NOT BE DONE WITH THE USE OF DOGS. NO NIGHT HUNTING AND NO USE OF DISTRESS CALLS. NO BAITING NO TRAPS. Taking wolves with the use of dozens of dogs is not a hunt it's a slaughter. It's a dog fight it's not a sport and it's not done for a no other purpose but the thrill of killing.	3	Although parts of this plan start out in the positive side about our wolves and stating their importance to a healthy ecosytem it quickly turns into a frenzy for advocating a killing sport. I have nothing against hunters who take animals for food but killing out of hate for an animal, myths about a species and holding no respect for an animals existence is not conservation . Every single time Wisconsin holds a wolf hunt these people take more than what's allowed. EVERY SINGLE TIME. There is no mention on how you would stop VIOLATIONS or enforce punishment for violating rules, trespassing and cruelty of using dogs to maul and rip them apart. past hunts show there is no stopping the cruelty being done to our wolves and no regard for what happens to packs when broken apart. These wolves belong to all of us. I do not support a wolf hunt .
	Just the parts I am interested in	No	Thank you for your efforts in reviewing and updating the state's wolf management plan. I like the recognition of wolves important role in the ecosystem. I also think that it makes sense to propose buffer zones around tribal reservations.	I would like the plan to focus on protecting wolves and non-lethal wolf management. Lethal management practices should be ended, and lethal force should only be considered justified in the event of immediate life preservation. The plan should not promote recreational killing as a management strategy, and hounding should be banned. Scientific research does not support these practices. The current draft should include more review of pertinent, current scientific literature. Also, the plan should require that farmers/ranchers implement abatement measures and non-lethal conflict minimization techniques to qualify for compensation related to predation. The plan should support and reflect the public's strong valuation of wolves as a species rather than look at wolves as a problem that needs to be solved.	4	Thank you for considering my comments.
Michael Hinz	Most of it	Yes		The Wisc plan needs a wolf management goal or limit of the amount of wolves. The 350 limit originally proposed seems reasonable as the estimated number of wolves have exploded and are causing tremendous harm to farmer's animals, pets, and other wildlife	1	

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Dylan Hughes	All of it	Yes	Focusing on science and removing the population goal numbers. Factoring in ecological benefits and that there are benefits to having a healthy wolf population in the state.	Better regulations on hound training. Develop a more future proof plans for how new wolf plans will be developed and how to incorporate new science and research into decisions.	9	I really appreciate all the hard work people have put into this plan. It's a great draft and will benefit the state
Katarina Lang	Most of it	No	I appreciate the efforts of all WDNR staff involved in updating the state's wolf management plan. Although I believe the current plan needs significant updating, I recognize the efforts and improvements made to the previous plan, including: ● Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. ● There is much greater recognition of the ecological role of wolves ● The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves ● The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed)	● The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on: ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution ● The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. ● The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ○ A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings. ○ Hounding or hound training, which are akin to allowing legalized dogfighting, should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public. ● The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. ○ Despite Act 169, which mandates a wolf hunting season, the department can still restrict the implementation of lethal methods by setting minimal quotas, including a quota of '0' wolves, restricting timing and methods. ○ Several studies have proven a proactive non-lethal approach leads to better conflict mitigation. ○ Lethal management often fails to provide a long-term solution to wolf predation and has the least consistent success rates when compared to non-lethal practices. In addition, there is significant evidence showing that lethal wolf management may be less functionally effective at mitigating subsequent livestock losses than non-lethal deterrents. ● The plan should require the implementation of abatement measures as well as the use of non-lethal conflict minimization techniques by domestic animal owners for the latter to receive compensation for confirmed predation. ● The plan also runs contrary to public values towards wolves (and omits mention of such majority values from the plan), despite department surveys evidencing that the broad public cares about wolves as individuals (and not just for the viability of the population). Given the recent liberalization of killing wolves by the state, it would be incredibly informative to note majority support of the following reasons for opposing a regulated wolf hunting/trapping season (which are all omitted from the plan): opposition to specific methods of harvest like hounds (64%) or traps (70%), feelings that hunting wolves is unnecessary (62%) or culturally offensive to Native American tribes (57%). ○ All such reasons convey majority disagreement with practices currently promoted and endorsed by the legislature and the WDNR, and such a conflict between managers and the public should not only be acknowledged, but foregrounded and carefully considered in policy (instead of dismissed). ○ Such decisions to omit literature or downplay evidence (e.g., such as majority opposition to killing wolves and their reasons) are contrary to principles of scientific integrity (e.g., present all relevant scientific evidence to the public) as well as ethics (e.g., disguising ethical decisions, such as recreational wolf killing, as robustly supported by science). ● Conflicting agency objectives (e.g., optimizing public hunting and conflict mitigation) are not only not acknowledged, but even misunderstood as harmonious, against the body of scientific evidence. That culminates in the prioritization of consumptive values and policies; e.g., according to the body of scientific literature, use of lethal methods, and especially public hunts, are contrary to most objectives relevant to: harm mitigation, the wellbeing of wolves, their ecological roles, and their non-exploitative enjoyment (i.e., Objectives A, B, D and F). ● There is a stark lack of consideration for individual wolves, wolf population health (including wellbeing), and measurable indicators for assessing any harms barring disease prevalence (e.g., accounting for cortisol levels or other stress hormones, measures of pair/pack persistence) ● There is an inappropriate understanding and consideration of tribal worldviews about wolves. Tribal worldviews of wolves are misconstrued as 'cultural benefits' tribes receive from the existence of a wolf population, when in fact tribal worldviews consider each individual wolf as a person and relative. Cultural respect and sensitivity towards such views, shared by many non-tribal	4	

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
				members, demand the strict mitigation of lethal measures, especially recreational killing, as opposed to their current promotion in the plan. ● In general, all omissions of scientific literature, the arbitrary prioritization of policy objectives, the rhetoric of the plan and the dismissal of public values and concerns for wolves point towards a biased, unscientific and instrumental view of wolves that promotes values contrary to broad public perspectives on wolves. ● 'SOM' wolf estimation methodology – From a recent critique: "The new methods sacrifice precision, but are believed to retain adequate accuracy and sensitivity to changing conditions for reliable decision-making. We review evidence for the accuracy, precision, and sensitivity of the new 'scaled occupancy model' (SOM) applied in Wisconsin. We conclude that the Wisconsin method would systematically overestimate wolf abundance by large (but currently incalculable) margins. Because Wisconsin, similar to other states, not only changed to unverified methods but also implemented widespread wolf killing, shortcomings in their estimates of wolf abundance may have far-reaching consequences for population viability and confidence in state wildlife managers. We discuss findings from Wisconsin alongside similar findings for other states' occupancy models being insensitive to human causes of mortality that have recently increased. Overall, Wisconsin's proposed method for estimating wolf abundance shows significant departures from best practices in scientific measurement. Verification will require independent replication and unbiased tests at multiple scales in multiple habitats under different human-induced mortality rates, and peer review before the new methods are considered reliable."		
	All of it	Yes	Plan appears to be more science based than previous approach. Like some of the more protectionary measures in place to help protect wolves and monitor populations.	The data included in the report and on which the draft plan is based fails to include any updates from 2021. On Page 68, the wolf harvest management is based on 2011-2020 data, despite the serious and damaging issues that took place during the February 2021 cull. The plan doesn't properly address the significant overharvest above the quota counts, does not address the dangers posed by allowing the hunting of wolves with dogs, and does not address or identify additional research needed after a winter hunt during mating season and the drastic population impact and on-going issues that resulted. The previous plan had suggested a late winter management goal of 350 wolves. This number was weaponized during the wolf cull hunting arguments to suggest this was the ideal population and exterminating 70-80% of the wolves in Wisconsin was ok because it would still leave the population above this number. This draft plan on page 111 does not go far enough to dispute the way that number can be read, and in fact suggests 250 to be the minimum threshold. This number should be updated to more accurately reflect the updated carrying capacity numbers found elsewhere in the plan, since that number has increased from 500 previously to more than 1,300 in this plan.	6	20 of the "wolves" killed during the February harvest were just puppies, it is a poor reflection on our sporting heritage when 10% of the hunt is dedicated to unsustainable killing of baby animals. Had a second hunt been conducted in Wisconsin in the same manner as the first, it would have lead to a nearly 56% reduction in the state wolf population. This level of slaughter would have had significant knock-on effects for which we don't have good data and which could have permanently threatened the wolf population in the state. More work needs to be done within this plan to provide additional protections in the case of another delisting of federal protection for wolves.
Rob Hemenway	Most of it	Yes	I glad we have a population of wolves in the state and are working to keep them.	I completely disagree with a non numerical goal. How do you hit a target if you have no idea what you are aiming for. 350 is a good number, let's stick with that.	1	
Juliann Rule	Just the parts I am interested in	No	I like the following improvements to the plan: 1. Wolves in Wisconsin will no longer be managed by use of the old numerical goal of 350 wolves. 2. There is much greater recognition of the ecological role of wolves 3. The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves 4. The adoption of proposed buffer zones around tribal reservations where previously no buffer zones existed	I dislike the following parts of the plan: 1. The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on such as: Wolf ethology, sentience, sapience, sociability, agency and well being Effectiveness of non-lethal interventions, especially relative to lethal ones The impact of widespread killing on wolves' physiology, behavior, well being, social dynamics, ecological relationships and evolution 2. The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. I can see no reason why someone should be allowed to kill wolves for fun. 3. The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. There is a substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidenceof illegal killings. I believe hounding or hound training, which are akin to allowing legalized dogfighting, should be illegal or severely restricted as this practice is extremely cruel to wolves and the hounds alike and is not supported by the majority of hunters or the broad public. 4. The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. Even with Act 169, which mandates a wolf hunting season, the department can still restrict the implementation of lethal methods by setting minimal quotas, including a quota of '0' wolves, restricting timing and	4

				methods. Several studies have proven a proactive non-lethal approach leads to better conflict mitigation. Lethal management often fails to provide a long-term solution to wolf predation and has the least consistent success rates when compared to non-lethal practices. In addition, there is significant evidence showing that lethal wolf management may be less functionally effective at mitigating subsequent livestock losses than non-lethal deterrents. 5. The plan should require the implementation of abatement measures as well as the use of non-lethal conflict minimization techniques by domestic animal owners for the latter to receive compensation for confirmed predation. 6. The plan is contrary to public values towards wolves and omits mention of such majority values from the plan, despite department surveys evidencing that the broad public cares about wolves as individuals (and not just for the viability of the population). Given the recent liberalization of killing wolves by the state, it would be incredibly informative to note majority support of the following reasons for opposing a regulated wolf hunting/trapping season (which are all omitted from the plan): opposition to specific methods of harvest like hounds (64%) or traps (70%), feelings that hunting wolves is unnecessary (62%) or culturally offensive to Native American tribes (57%). All such reasons convey majority disagreement with practices currently promoted and endorsed by the legislature and the WDNR, and such a conflict between managers and the public should not only be acknowledged, but foregrounded and carefully considered in policy (instead of dismissed). Such decisions to omit literature or downplay evidence (e.g., such as majority opposition to killing wolves and their reasons) are contrary to principles of scientific integrity (e.g., present all relevant scientific evidence to the public) as well as ethics (e.g., disguising ethical decisions, such as recreational wolf killing, as robustly supported by science). 7. Conflicting agency objectives (e.g., optimizing public hunting and conflict mitigation) are not only not acknowledged, but even misunderstood as harmonious, against the body of scientific evidence. That culminates in the prioritization of consumptive values and policies; e.g., according to the body of scientific literature, use of lethal methods, and especially public hunts, are contrary to most objectives relevant to: harm mitigation, the wellbeing of wolves, their ecological roles, and their non-exploitative enjoyment (i.e., Objectives A, B, D and F). 8. There is a large lack of consideration for individual wolves, wolf population health (including wellbeing), and measurable indicators for assessing any harms barring disease prevalence (e.g., accounting for cortisol levels or other stress hormones, measures of pair/pack persistence) 9. There is an inappropriate understanding and consideration of tribal worldviews about wolves. Tribal worldviews of wolves are misconstrued as 'cultural benefits' tribes receive from the existence of a wolf population, when in fact tribal worldviews consider each individual wolf as a person and relative. Cultural respect and sensitivity towards such views, shared by many non-tribal members, demand the strict mitigation of lethal measures, especially recreational killing, as opposed to their current promotion in the plan. 10. In general, all omissions of scientific literature, the arbitrary prioritization of policy objectives, the rhetoric of the plan and the dismissal of public values and concerns for wolves point towards a biased, unscientific and instrumental view of wolves that promotes values contrary to broad public perspectives on wolves. 11. The Wisconsin method of estimating numbers of wolves would systematically overestimate wolf abundance by large (but currently incalculable) margins.		
Jack Johnson	Most of it	Yes	Addressing conflicts of livestock, including depredation of killing and harassment and long term damage.	Not having a numeric goal. Specifically 350 maximum.	3	Delete the buffer area around reservations.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Brett Bockhop	Most of it	Yes	Elimination of a numerical population goal; though it appears a comprehensive population viability analysis hasn't been completed for the state or region, such an analysis would give managers an idea of what the population needs to be for this important keystone species to persist as a contributor to a healthy intact ecosystem. I worked for WDNR when the 350 number was set, and know how it was arbitrarily established as a number "WDNR thought the citizens would accept" when the original number proposed was much higher. We can never again have population numbers be political footballs. We need solid scientifically established goals to maintain a healthy viable population. Better recognition of the importance of the ecological role of the wolf, though much more work needs to be done by WDNR to educate the Wisconsin citizenry on this subject. I also like the social survey which notes the positive view most people have for wolves. The discussion about and some emphasis on nonlethal methods to reduce conflict. Nonlethal interventions can be much more effective than lethal methods and should be emphasized. The importance of having tribal values and goals considered in management decisions.	I do not like that the committee is stacked with hunting groups. These groups represent a minority of Wisconsin citizens but they have a disproportionate say about how our resources are managed. This continues a disturbing trend amplified by Walker and Stepp, making resource management a political game. I don't agree that the objectives listed don't "indicate a level of importance" and that they are all equal priorities. The #1 objective of this plan should be to maintain this keystone species as an important part of repairing and maintaining healthy intact ecosystems, which provide a host of benefits to the state. All other objectives are secondary. Hunting should be nothing more than a management tool to achieve this, but with this plan hunting is a main management strategy. I think the WDNR is underestimating the number wolves illegally killed every year, or don't want to know what that number is. WDNR needs to acknowledge this is happening and to what extent. I have talked to WDNR field biologists who think this number is considerable. When hunting begins again, WDNR needs to take into consideration the illegal kill along with legally killed wolves. Those numbers combined certainly disrupts the wolves social dynamics. I don't agree the plan should be adaptable to "changing public preferences". It should only adapt to ensure the wolves role as a keystone species and part of a healthy sustainable ecosystem.	7	Thanks for your hard work putting the plan together. Not an easy task in this day and age. I appreciate the social survey being included. WDNR needs to fully recognize peoples increasing acceptance of wolves on the landscape and the role they play in nature. While possibly beyond the scope of this plan, but since it is a "hunting" method used as part of wolf management, something needs to be done about hound hunting. This sub group of hunters is aggressive, doesn't respect private property and their threats to people are well documented. I have had my share of run-ins with them here in N. WI. Unfortunately this group has a disproportionately large say in wildlife management matters. Also beyond the scope of this plan and in the hands of corrupt politicians, but I would like to mention it: we need to eliminate payments for depredation. Deer cause exponentially more damage than wolves, but I can't collect for the damage deer cause to my land (or vehicles).
Christine Mechenich	Most of it	Yes	Removing outdated numeric goals; respecting wishes of tribes; using a science-based approach; acknowledging the need for public education; recognizing the ecological value of wolves; some recognition of the intrinsic value of wolves.	Hunting wolves with dogs should be outlawed (which I realize is outside the jurisdiction of the plan), but at a minimum, dog training on wolves should be limited to times when the specific zone is open for wolf hunting.	9	Thank you for this thorough and thoughtful approach and the long-awaited updates. Also, in agreement with a Wisconsin's Green Fire recommendation, the number of licenses should be adequate to meet the harvest goals without a prolonged hunting season that could disrupt normal pack activities.

Carolita	All of it	No	We appreciate the efforts of all WDNR staff involved in updating the state's wolf management plan. Although we believe the current plan needs significant updating (see next section), we recognize the efforts and improvements made to the previous plan, including: ● Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. ● There is much greater recognition of the ecological role of wolves ● The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves ● The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed)	The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on (see reference list below): ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution ● The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. ● The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ○ A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings. ●Hounding or hound training, which are akin to allowing legalized dogfighting, should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public	4	The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. ○ Despite Act 169, which mandates a wolf hunting season, the department can still restrict the implementation of lethal methods by setting minimal quotas, including a quota of '0' wolves, restricting timing and methods. ○ Several studies have proven a proactive non-lethal approach leads to better conflict mitigation. ○ Lethal management often fails to provide a long-term solution to wolf predation and has the least consistent success rates when compared to non-lethal practices. In addition, there is significant evidence showing that lethal wolf management may be less functionally effective at mitigating subsequent livestock losses than non-lethal deterrents. ● The plan should require the implementation of abatement measures as well as the use of non-lethal conflict minimization techniques by domestic animal owners for the latter to receive compensation for confirmed predation. ● The plan also runs contrary to public values towards wolves (and omits mention of such majority values from the plan), despite department surveys evidencing that the broad public cares about wolves as individuals (and not just for the viability of the population). Given the recent liberalization of killing wolves by the state, it would be incredibly informative to note majority support of the following reasons for opposing a regulated wolf hunting/trapping season (which are all omitted from the plan): opposition to specific methods of harvest like hounds (64%) or traps (70%), feelings that hunting wolves is unnecessary (62%) or culturally offensive to Native American tribes (57%). ○ All such reasons convey majority disagreement with practices currently promoted and endorsed by the legislature and the WDNR, and such a conflict between managers and the public should not only be acknowledged, but foregrounded and carefully considered in policy (instead of dismissed). ○ Such decisions to omit literature or downplay evidence (e.g., such as majority opposition to killing wolves and their reasons) are contrary to principles of scientific integrity (e.g., present all relevant scientific evidence to the public) as well as ethics (e.g., disguising ethical decisions, such as recreational wolf killing, as robustly supported by science). ● Conflicting agency objectives (e.g., optimizing public hunting and conflict mitigation) are not only not acknowledged, but even misunderstood as harmonious, against the body of scientific evidence. That culminates in the prioritization of consumptive values and policies; e.g., according to the body of scientific literature, use of lethal methods, and 2 especially public hunts, are contrary to most objectives relevant to: harm mitigation, the wellbeing of wolves, their ecological roles, and their non-exploitative enjoyment (i.e., Objectives A, B, D and F). ● There is a stark lack of consideration for individual wolves, wolf population health (including wellbeing), and measurable indicators for assessing any harms barring disease prevalence (e.g., accounting for cortisol levels or other stress hormones, measures of pair/pack persistence) ● There is an inappropriate understanding and consideration of tribal worldviews about wolves. Tribal worldviews of wolves are misconstrued as 'cultural benefits' tribes receive from the existence of a wolf population, when in fact tribal worldviews consider each individual wolf as a person and relative. Cultural respect and sensitivity towards such views, shared by many non-tribal members, demand the strict mitigation of lethal measures, especially recreational killing, as opposed to their current promotion in the plan. ● In general, all omissions of scientific literature, the arbitrary prioritization of policy objectives, the rhetoric of the plan and the dismissal of public values and concerns for wolves point towards a biased, unscientific and instrumental view of wolves that promotes values contrary to broad public perspectives on wolves. ● 'SOM' wolf estimation methodology – From a recent critique: "The new methods sacrifice precision, but are believed to retain adequate accuracy and sensitivity to changing conditions for reliable decision-making. We review evidence for the accuracy, precision, and sensitivity of the new 'scaled occupancy model' (SOM) applied in Wisconsin. We conclude that the Wisconsin method would systematically overestimate wolf abundance by large (but currently incalculable) margins. Because Wisconsin, similar to other states, not only changed to unverified methods but also implemented widespread wolf killing, shortcomings in their estimates of wolf abundance may have far-reaching consequences for population viability and confidence in state wildlife managers. We discuss findings from Wisconsin alongside similar findings for other states' occupancy models being insensitive to human causes of mortality that have recently increased. Overall, Wisconsin's proposed method for estimating wolf abundance shows significant departures from best practices in scientific measurement. Verification will require independent replication and unbiased tests at multiple scales in multiple habitats under different human-induced mortality rates, and

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
						peer review before the new methods are considered reliable." (Treves & Santiago-Ávila, 2023)
	Most of it	No	I appreciate the efforts of all WDNR staff involved in updating the state's wolf management plan. (Treves & Santiago-Ávila, 2023)		
bob noffs	Most of it	Yes	not much	quota, allowing tribes an allocation if they are not going to use it. this is about wildlife management, not about exercising your ancestoral beliefs	2	20 yrs ago the wi dnr was a leader in wolf research. herd size for the state was determined to be 350. what happened to that?
Logan Huse	All of it	Yes	The non-numeric population goal.	The plan doesn't outline what the forest health currently is or what the deer carrying capacity is for the northern counties. This information needs to be readily available. The plan also needs to clearly state that if there is a wolf hunt that 50% of the tags go to the tribes.	7	The draft also needs to include the deer vehicle collisions and crop damage within wolf territory. Both prior to recovery and current damage.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
John Ziebell	Most of it	Yes	None, your plans do not take care of now and always kick the can down the road	the whole thing, maybe you should release 40 in Madison for pest control?	0	I have had them in my yard eating my pets! what's next a family member? take them off the list now. I do not believe they are pure wolf and have a lot of dog in them, they are to brave
Byron Froelich	Just the parts I am interested in	Yes	The portions about the interaction with the elk herds in the state, and the parts on the percentages of their diet that has been determined to be whitetail deer. The numbers showing the loss of livestock. The type of fencing that appears to work best for keeping wolves away from livestock. How the disposal methods of livestock carcasses can determine how likely it is to attract wolf predation.		6	
	Just the parts I am interested in	Yes	The fact that a plan is finally being updated.	Your plan allows for too many wolves in Wisconsin.	5	Make sure you are counting the wolves in farm country. If a farmer sees a wolf attacking their cattle they should be able to shoot it. With so many effective hunters and trappers willing to take care of issues, the government shouldn't normally have to pay government hunters or trappers to resolve a conflict. Allow larger traps like MB750s to be used prior to 12/1. Allow wolves to be night hunted. Increase the harvest quota in areas where the department is trying to get elk to thrive. Allow stronger breakaway devices to be used for cable restraints by wolf trappers. Do a more accurate count. Currently you have the population underestimated by too much. You should do listening sessions around the area in wolf country. Wolves have decimated the deer population in some areas to the point that it isn't worth buying a deer license for many. Don't allow a group like the Wolf Patrol on your committee. Past harvest quotas by the DNR for wolf seasons have not been high enough. They didn't put enough of a dent in the wolf population. WDNR needs to take a more firm stance against the antis. DNR higher ups should come to the areas where too much wolf depredation is occurring and discuss first hand so they can get a better feel for what is going on. The state should charge more for wolf preference points.
Yvonne Besyk	Most of it	Yes	I most like the creation of low quota zones around Tribal lands where the Tribes requested it - and that they were consulted. These lands are treaty-protected with documented wolf packs. This is important to me. Ideally, the plan would expand low quota zones beyond the few that are listed. I appreciate that the plan eliminates a numeric population goal, which was arbitrary. It is important to make sure the numbers of wolves are adaptable so they can incorporate best-available science and ecological changes. The plan is rightly focused on the ecological benefits of wolves. The plan reflects public opinions per the survey that was released along with the plan and finds that opinions toward wolves have grown significantly more favorable towards wolves. There is expressed commitment to science and continued research with partners and acknowledges that “keystone species such as wolves are an important component of a healthy ecosystem”. The iconic film about how wolves in Yellowstone restored balance should be viewed by all.	Would prefer a specific update timeframe.	10	The last wolf hunt was tragic. I pray it never happens again. Such an embarrassing thing in WI's history is extremely unfortunate. I'm encourage, however, by the draft wolf management plan.
Mary Mullen	Just the parts I am interested in	Yes	I like it when wolves are left alone to multiply and live in peace away from human trapping and shooting	I prefer there were no management zones at all. It needs to go back to total natural	1	I really hate when my dogs are trapped in wolf traps. Twice now this has happened.
	Most of it	Yes	the plan seems very comprehensive covering all aspects of wolf management; environmental effects, effects on prey, domestic animal effects, etc as well as implications to the overall health and well being of the wolves themselves.	I am vehemently against trapping. If wolves need to be eliminated, I believe out right shooting them is a much more humane way to eliminate them.	8	please consider doing away with the trapping of wolves altogether. You wouldn't want to subject your dog to a trap. Wolves etc experience the same amount of pain
Sherry weiland	Most of it	No	Proposed buffer zones around tribal reservations, recognition of the wolves ecological roles and no numerical goal of 350 wolves	Plan does not prioritize non-lethal management, does not stop hounding, does not require abatement measures and use of non-lethal conflict mimimization.	2	Please prioritize non-lethal management except in rare cases of self defense

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
neil messerschmidt	All of it	Yes	Please see entry in other comments section.	Please see entry in other comments section.	1	To Whom it may concern, I have held a Wisconsin bowhunting license for 57 years and hope that my dedication and years of experience give weight to the opinions I am about to share about Wisconsin's Wolf Management Plan and wolves in general. I spent a great deal of time over several days reading the plan and taking notes in order to make an educated assessment of it. I hope what I am writing is read and not just filed or discarded. In case you don't get past the first page, I am posting my basic message here and will also repeat it at the end. We have too many wolves the State needs to seek to manage their numbers as close to the 350-animal social carrying capacity number which was originally "sold to" sportsmen as the plan! The following are my comments and opinions regarding items as referenced by page number from the plan. Page19, Impacts of Human-mortality Several studies were cited and summarized as follows; "current research suggests as much as 24-29% of a wolf population can be removed via human-sourced mortality before populations begin to decline". By the State's own conservative estimates, we have over 1,100 wolves minimum which means up to 319 could be harvested annually before the overall population would go into decline. Page 20, Impacts of Regulated Harvests on Wolf Dynamics A 26-year study of collared wolves in Alaska (Borg et al. 2015) revealed that "breeder mortality and pack dissolution had no significant effects on either immediate or longer-term population dynamics in their study area, indicating that strong compensatory mechanisms may be able to reduce the negative impacts of breeder loss at the population level scale". This indicates that the argument of loss of the alpha male or female and possible dissolution of packs should not be considered as reason to prohibit hunting and trapping. Page 36, 2022 Wolf Attitudes Study (item5) Wolf hunting has the support of 46% of the public to 29% opposed. Hunting and trapping should be scheduled yearly once the federal protection is removed. Page 38, Wisconsin's Tribal Perspectives and Cultural Significance The State of Wisconsin asked for a written narrative on the cultural significance of wolves from the eleven tribes within the State as well as the Great Lakes Indian Fish and Wildlife Commission. Only the Commission and 3 of the eleven tribes responded. With all due respect to the tribes and their rights under the treaties signed by their ancestors, I don't think that with only 27% of the tribes responding we should be held hostage to not having a wolf season. In addition, since they claim the wolf is their sacred brother who they will not kill, when a season is again instituted and a quota set there should not be 50% allocated to the tribes unless the desired harvest number is automatically doubled to compensate for that. Otherwise, the wolf population will continue to explode until it reaches the biological carrying capacity which will be a continuing source of ire to deer hunters. We don't allow deer to reach the habitat's carrying capacity nor should we let the wolves. Page 46, Gray Wolves in Wisconsin The State has maintained that the re-introduction of wolves happened naturally. The last paragraph on page 46, however, reveals that the State did in fact assist in their expansion by relocating problem wolves to other counties within the State. Pages 47 & 48, Wolf Population Depictions by the Decades The depictions show that Wisconsin's wolf population grew from an estimate of 25 in 1980 to 1034 in 2020. Of particular note is the fact that in the span from 2010 to 2015 the population increased 6% while sustaining hunting losses during three consecutive years. By DNR accounting it went from 704 to 746. Interestingly that 746 is the same number of animals harvested by hunters during those three seasons (from page 52 of the report). This should give rise to a conclusion that either wolves are reproducing at an amazing rate, or the population estimate is far below reality. Page 50, Wisconsin Grey Wolf Population from 2000-2021 For the year 2020 the chart lists two sets of numbers for both pack numbers and total population. The population change went from 1,034 to 1195, an increase of 161 animals while the pack count went from 256 to 316, an increase of 60. It has been the DNR's claim that packs average 4 in number. With the new estimate of 60 additional packs at 4 per pack the increase in overall population should have been plus 240 animals not the 161 listed which would push the population total to 1,274 not 1,195. For those of us who pay attention to detail this only adds to the suspicion we are being deceived by the department. Page 52, Mortality of Wolves in Wisconsin Studies referenced on this page mention that mortality caused by hunting is partially offset by a reduction in natural mortality, in other words compensatory. The DNR justifies higher antlerless deer quotas to offset what would otherwise be compensatory losses. This adds support to having a sustained harvest of wolves in the State. Page 54, Biological Carrying Capacity The 2015 IBSE model referenced on this page (Stenglein et al.2015) predicted the "Wisconsin wolf population, without harvest, stabilize around 1,242 wolves (SD) after 50 years". From page 50 of this report there were estimated to be 746 wolves in 2015 and as I mentioned 2 paragraphs back was already probably 1,274 by 2020.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
						So according to the study the wolves have reached their biological carrying capacity in only 5 years, 1/10th of the time it was estimated to take. Once again it shows the need to hold regular hunting and trapping seasons to control the population. Pages 62 & 63, Wisconsin Gray Wolf Expenditures Wisconsin reached the original goal of 350 wolves by 2004 when the Stated estimate was 373. In that year the State's wolf program costs were $195,646 of which $76,867 was depredation compensation payments. By 2020 the estimated population has risen to 1,242 with yearly costs to the State reaching $315,266 and depredation compensation $242,528. That means that we spent $522 per wolf in 2004 compared to $253 per wolf today. That is an improvement, but I can't help but think of the uproar if the State had to spend an equivalent amount of money to maintain the deer herd. If the herd is 1.5 million, that cost would be $380,000,000. In 2020 the State paid out $760,000 for deer damage. That is $2 per deer, which is .8% of what costs were per wolf. The short of it is the State is spending too much money for merely the frivolity of having wolves on the landscape and not incorporating a hunting season with it. I say this while pointing out the hypocrisy of promoting the presence of wolves on the landscape of the north to try and appease the wolf-favoring population in the south who would not tolerate them in their urban setting. Page 125, Product C2c Zone Specific Harvest Tags The proposal to go to zone specific harvest tags to reduce the possibility of overharvest in an individual zone is an unnecessary step which will exacerbate an already unfair system which gives the advantage to trappers and hound hunters over those using predator calls. I speak from experience having drawn a harvest tag in 2013 intending to hunt zone 1 only to have it close in three days leaving me no alternative but to go to another zone to even have a chance. A better change would be to allocate method specific tags. We are never going to know what the sustainable wolf harvest is until we have regular seasons which are based on the rise or fall of animals taken from year to year. That system has worked for deer management. With that said, if over 600,000 deer hunters across all the seasons spanning 4 months, only harvest approximately 25% of the 1.5 million deer in the State, how can anyone realistically think hunters took out 25% of the wolf population in 2 days during the 2022 hunt? Either wolves are the dumbest animal on four legs or there are far more wolves than we are led to believe. CLOSING STATEMENT It would seem that money is no object with the DNR when it comes to wolf management so as an avid hunter I would like to see the State actively pursuing the de-listing of wolves in the courts as opposed to waiting for the federal government to move on it. Once de-listing happens, schedule hunting and trapping seasons with a balanced allocation of harvest tags made available to accommodate callers, trappers and hound hunters. Set the harvest goal at 29% of the estimated fall population yearly until the over-winter population estimate nears 350 animals which was the social carrying capacity number sold to the public when the wolf re-introduction got started.
Sue	All of it	Yes	I love the holistic and science based approach!! I love that our tribes along with other interests groups will have their say in this decision making process!!	I do not like anything to do with hounds hunting wolves or any other animal for that matter. What happened in the last wolf hunt was not ethical at all! Hounds should not be allowed to harass our wildlife.	7	I can't agree with hounds hunting wolves.
Catherine G. LeMay-Brown	All of it	Yes	1. The gray wolf has federally protected status, and thus, it deserves to have that protection in Wisconsin. 2. "keystone species, such as wolves, are an important component of a healthy eco-system." (pg. 13) 3. "They are highly effective at identifying weaknesses in their prey." (pg. 6) and thus, they could suppress or even eliminate CWD. They target sick individuals. (pg. 15-16.) 4. I appreciate the inclusion of our Native, First Nation people, and the fact, that for them, the wolf is sacred, it has cultural significance, and is part of their creation story. 5. we must continue to promote co-existence. (The wolf was here before humans.) 6. With the exception of the Gray Wolf population in the NW states, the Gray Wolf survives only in NE MN, N. WI and the UP. We must protect the Gray Wolf, for now, for the future. 7. The maintenance of The Pack, is essential for acquisition of food and survival of the pups. (pg. 20)	I do not DISLIKE any aspect of the 139 page long draft. This is an excellent document, for which I thank the DNR. However, I will maintain my firm stance, that the Gray Wolf must be protected, and not again become a game species.	9	I would like to see a strong and healthy wolf presence in Wisconsin, for now, and for the future, and for all days to come. Please continue the often difficult and frustration task of educating the public, as we must move away from the "Little Red Riding Hood" story, where the wolf is a rapacious beast. The story is an allegory, wherein little girls are warned of rapacious men. It is not the wolf who is rapacious. It is we humans, who are the rapacious beasts. Please continue to keep the Gray Wolf under protected status. It is the right thing to do. Thank you.
Thomas Klopf	Most of it	Yes	Plan considers the ecological value of wolves in controlling deer overpopulation. It also prevents the decimation of wolf pack numbers so that individual surviving wolves are not left to starve.	Killing of wolves by sportsmen has no value for meat.	10	It would be a tragedy to allow another slaughter of wolves to pacify a small number of sportsmen to the detriment of the ecological value of controlling deer numbers.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
	Most of it	Yes	Removing an arbitrary wolf population goal is important to make sure the best-available science is centered in wolf management The low quota zones are an important and welcome addition to the plan The plan is rightly focused on the ecological benefits of wolves		9	
Ron Weber	Most of it	Yes	No numeric goal as is used with most other big game species. Absolutely no scientific reason to manage to 350, 600, 1,000, whatever. Liked the framework for zones for future harvest seasons which hopefully are coming soon so wolves can finally be managed like all other big game animals and stop being a pawn in a political game.	Liked most of what I read, other than reimbursement for depredation to hunting dogs but the legislature has caudified that.	9	
maurice	Just the parts I am interested in	Yes	the effort that was put in to making this document deserves much credit, just does nothing in getting the wolf population under control.	most of those in memo's from Conservation Congress and the Wisconsin Wildlife Federation, CDAC 's in northern Wisconsin	1	I've known Dick (Scatman) Theil for 45 years and appreciate all the early work that he did for the DNR in the early years of wolf study. We have to many wolves now and need to control their population through hunting and trapping. We also need to take into account that the First Nation tribes will not participate in regulating wolf numbers.
A. Bassett	Most of it	No	There is much greater recognition of the ecological role of wolves. The adoption of proposed buffer zones around tribal reservations, where there were no buffer zones before. Wolves in WI will no longer be managed to reference to the old numerical goal of 350 wolves. The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves.	The current draft does not reflect the available science, and is missing a substantial amount of scientific literature on: Wolf ethology, sentience, sapience, sociability, agency and wellbeing - effectiveness of Non-lethal interventions, especially relative to lethal ones - the impact of widespread killing of wolves' physiology, behavior, wellbeing, social dynamics. The above scientific omissions, combined with the emphasis on and promotion of Sustainable Recreational Killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger interference. The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings. Hounding or hound training, which are akin to allowing of legalized dogfighting, should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public. The plan should prioritize wolf protections and concentrate solely on Non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. Despite Act 169, which mandates a wolf hunting season, the department can still restrict the implementation of lethal methods by setting minimal quotas, including a quota of '0' wolves, restricting timing and methods. Several studies have proven a pro-active Non-lethal approach leads to better conflict mitigation. Lethal management often fails to provide a long-term solution to wolf predation and has the least consistent success rates when compared to Non-lethal practices. In addition, there is significant evidence showing that lethal wolf management may be less functional effective at mitigating subsequent livestock losses than Non-lethal deterrents. The plan should require the implementation of abatement measures as well as the use of Non-lethal conflict minimization techniques by domestic animal owners for the latter to receive compensation for confirmed predation. The plan also runs contrary to Public Values towards Wolves (and omits mention of such majority values from the plan), despite department surveys evidencing that the broad public cares about wolves as individuals (and not just for the viability of the population). Given the recent liberalization of killing wolves by the state, it would be incredibly informative to note majority support of the following reasons for opposing a regulated wolf hunting/trapping season (which are all omitted from the plan): opposition to specific methods of harvest like hounds (64%) or traps (70%), feelings that hunting wolves is unnecessary (62%) or culturally offensive to Native American tribes (57%). All such reasons convey majority disagreements with practices currently promoted and endorsed by the legislature and the WDNR, and such conflict between managers and the public should not only be acknowledged, but foregrounded and carefully considered in policy (instead of dismissed). Such decisions to omit literature or downplay evidence (e.g., such as majority opposition to killing wolves and their reasons) are contrary to principles of scientific integrity (e.g., present all relevant scientific evidence to the public) as well as ethics (e.g., disguising ethical decisions, such as recreational wolf killings, as robustly supported by science). Conflicting agency objectives (e.g., optimizing public hunting and conflict mitigation) are not only not acknowledged, but even misunderstood as harmonious, against the body of scientific evidence. That	2	None.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
				culminates in the prioritization of consumptive values and policies; e.g., according to the body of scientific literature, use of lethal methods, and especially public hunts, are contrary to most objectives relevant to: harm mitigation, the wellbeing of wolves, their ecological roles, and their Non-exploitative enjoyment (i.e., Objectives A, B, D and F). There is a stark lack of consideration for individual wolves, wolf population health (including wellbeing), and measurable indicators for assessing any harms barring disease prevalence (e.g., accounting for cortisol levels or other stress hormones, measures of pair/pack persistence) There is an inappropriate understanding and consideration of tribal worldviews about wolves. Tribal worldviews of wolves are misconstrued as 'cultural benefits' tribes receive from the existence of a wolf population, when in fact tribal worldviews consider Each Individual Wolf as a Person and Relative. Cultural respect and sensitivity towards such views, shared by many non-tribal members, demand the strict mitigation of lethal measures, especially recreational killing, as opposed to their current promotion in the plan. In general, all omissions of scientific literature, the arbitrary prioritization of policy objectives, the rhetoric of the plan and the dismissal of public values and concerns For Wolves point towards a biased, unscientific and instrumental view of wolves that promotes values contrary to broad public perspectives on wolves. 'SOM' wolf estimation methodology - From a recent critique: The new methods sacrifice precision, but are believed to retain adequate accuracy and sensitivity to changing conditions for reliable decision-making. We review evidence for the accuracy, precision, and sensitivity of the new 'scaled occupancy model' (SOM) applied in Wisconsin. We conclude that the Wisconsin method would systematically overestimate wolf abundance by large (but currently incalculable) margins. Because Wisconsin, similar to other states not only changed to unverified methods but also implemented widespread wolf killing, shortcomings in their estimates of wolf abundance may have far-reaching consequences for population viability and confidence in state wildlife managers. We discuss findings from Wisconsin alongside similar findings for other states' occupancy models being insensitive to human causes of mortality that have recently increased. Overall, Wisconsin's proposed method for estimating wolf abundance shows significant departures from best practices in scientific measurement. Verification will require independent replication and unbiased tests at multiple scales in multiple habitats under different human-induced mortality rates, and peer review before the new methods are considered reliable." (Treves & Santiago-Avila, 2023).		
	All of it	Yes	The three goals of the plan, the zones, the idea of managing for objectives rather than for a number of animals	Must stop compensation for hunting dogs	10	
Golec	Most of it	Yes	All that PROTECT wolves. Public education is a plus since most wolf haters are "bar stool educated" about them.	I oppose any "harvesting" or hunting/trapping of wolves. I oppose reimbursing for killed or injured hunting dogs. A responsible pet owner wouldn't allow their precious pets to be put in a situation where injury is possible. Hunting with dogs is barbaric.	3	1.Possession of a wolf or wolf hybrid should be 100 percent illegal- no exceptions. 2. Hunting/trapping of wolves should NOT be allowed. The only exception should be IF a wolf attacks livestock within fenced property , or a pet/person in the immediate area of a home. In either case , the owner should immediately contact the DNR and leave the animals right where they were killed until a warden arrives to investigate. If the state is responsible for reimbursing hunters for the death or injury of their dogs in wolf territories, then it would make sense to reimburse car owners for wild animals that run out in front of them and cause damage to their vehicles. Why does mankind feel they have to interfere with nature? Nature takes care of itself. Finally - PLEASE stop referring to hunting animals as "harvesting". We don't farm/grow them like plants.
John Mundahl	Just the parts I am interested in	Yes	The goals are reasonable and science based.	Don't understand how wolves know the difference or boundaries between protected areas on reservations and other areas where they could be hunted.	7	I did not see restrictions for hunting during the winter when wolves are giving birth and raising pups. I did not see penalties for poisons being used and collateral damage to non targeted species. I would like to mention that I would appreciate these issues being mentioned. I would agree that a goal should be education to improve awareness of the role that wolves play in maintaining a healthy ecosystem and deer herd and that there should be a sustainable wolf population in this state. The hunting by dogs during the breeding season and poisoning of wolves is antithetical to both of those objectives and to the objectives mentioned about the humane treatment of wildlife. Speaking as a veterinarian I beleive that using dog hunting on any species is antithetical to both the humane treatment of the wildlife species and the humane treatment of the dogs.

Chris Albert	All of it	No	NOT having an population cap Emphasis on intrinsic value of wolves Inclusion of tribal viewpoints Suggestion of buffer zones around tribal lands Emphasis on non-lethal deterrents	There should be some areas with 0 hunting quota Hound training should be stopped The absolute ban on rehabbing wolves - some instances would prove possible. Recreational hunting and trapping to stop conflicts has no scientific basis- call it what it is - simply recreational An oversight committee consisting of biologists and professionals would be a good addition.	7	Although they in the minority, hunting and trapping interests are still overrepresented. I would like to see the plan called a coexistence plan, not a management plan.
Jim Servi	All of it	Yes	The biggest thing I appreciate is there appears to be a commitment to keeping wolves off the ESL and under state management with a regular plan wolf harvest season.	With a species as iconic and sensitive as wolves, I feel it's important to have a population goal. While I understand this will likely make no one happy, no matter what the number, I think it's important for effective management and to ensure that the great wolves do not go back on the ESL and avoid future lawsuits (I personally think these have been a waste of money that could have gone to other species that are actually endangered). That could even be a range and I would recommend 350-500. Another concern is that it seems this plan leans towards those that are more concerned about protecting all wolves than creating a balance, especially with those that live in wolf country. I live in wolf country that previously would not have been considered suitable habitat yet we have wolves on our farm on a regular basis. So frequently in fact, that our 12 year old chocolate lab, Maple, was killed in our front yard by a wolf. It was a horrible day. I think more consideration needs to be given to those that live and interact with wolves.	3	There will likely be a outcry of public opinion during this feedback window and I hope you show the flexibility to adjust the plan based on that feedback. Please don't stay rigid with a plan that does not have the support of the Wisconsin Conservation Congress (which I am a representative), the Wisconsin Wildlife Federation (which I am a member), and most other outdoor organizations. They are the ones most vested in conserving and balancing our natural resources because they utilize them often as part of their way of life.
Nina Perino	All of it	No	We appreciate the efforts of all WDNR staff involved in updating the state's wolf management plan. Although we believe the current plan needs significant updating (see next section), we recognize the efforts and improvements made to the previous plan, including: ● Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. ● There is much greater recognition of the ecological role of wolves ● The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves ● The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed)	The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on (see reference list below): ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution ● The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. ● The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ○ A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings. Hounding or hound training, which are akin to allowing legalized dogfighting, should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public.	5	The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. ○ Despite Act 169, which mandates a wolf hunting season, the department can still restrict the implementation of lethal methods by setting minimal quotas, including a quota of '0' wolves, restricting timing and methods. ○ Several studies have proven a proactive non-lethal approach leads to better conflict mitigation. ○ Lethal management often fails to provide a long-term solution to wolf predation and has the least consistent success rates when compared to non-lethal practices. In addition, there is significant evidence showing that lethal wolf management may be less functionally effective at mitigating subsequent livestock losses than non-lethal deterrents. I am in favor of increasing protections for wolves, requiring non-lethal conflict interventions and banning recreational killing.
	All of it	No	My understanding is that with the elimination of a statewide population goal, the DNR will be in charge of determining whether the wolf populations should be increased, decreased or remain the same, which seems like a move in the right direction but without evidence to back up that these populations will not continue to be slaughtered even under a new plan, it is fair to say that I'm skeptical.	I read that the new plan will work towards producing a wolf population that is sustainable to meeting harvest quotas. After hearing of the immense over slaughter of wolves in Wisconsin last year, my native state, I was disappointed to hear something along those lines. 218 wolves were killed over the span of four days, a number that is both unfathomable and a true atrocity. Stricter enforcement of poaching laws and lower quotas should both a consequence of prior behavior and a must to make it clear that this behavior is unacceptable.	5	I am a Wisconsin native with a masters in conservation biology and an avid conservationist. What happened last year in Wisconsin was heartbreaking and I found myself no longer desiring to be associated with such inhumane cruelty. Wolves are a keystone species and we have them to thank for the healthy ecosystem and animal populations that Wisconsiners enjoy so much. Their contribution to our planet and our surroundings is unparalleled and my hope with this long overdue revision, though far from perfect, is that we move in the right direction to protect them. I hope that this plan is a stepping stone to further improvement backed by science and research and fact.
Patrick Pergolsi	Most of it	Yes	Do whatever you can to save the wolves	Nothing	10	Whatever you can do to save the wolves as a plus for the state of Wisconsin

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Jensen Fiskin	Most of it	No	I'd like to start by acknowledging all the hard work of all WDNR personnel who have been instrumental in revising the wolf management plan for the state. As a college student looking to go into conservation, the work put into this plan is inspiring. Although I think updates to the plan are needed (as discussed in the following section), I can not turn a blind eye to the progress made in this plan. Specifically, advancements include: The previous target of 350 wolves as the desired population is no longer the guiding principle for managing wolves in Wisconsin. A heightened understanding of the crucial role wolves play in the ecosystem has been established. A social survey has been incorporated, which highlights the growing positive attitudes towards wolves, the greater awareness of their ecological significance, and a decrease in support for the reasons and methods used to kill them. Protective buffer zones around tribal reservations have been established for the first time, where none existed previously. It's crucial that the WDNR build off of progress like this to protect biodiversity and enable safe human-wildlife coexistence.	In general, the plan doesn't reflect the best available science. It is missing a substantial amount of scientific literature on wolf population abundance, ethology, and wellbeing; effectiveness of non-lethal interventions; and the impact of widespread killing on wolves' ecological relationships and well-being. This scientific omission leads to a biased plan in favor of lethal, recreational management. More specifically, the plan should strictly curtail any lethal management of wolves except in extremely rare circumstances. The department can legally do this by by setting minimal quotas, including a quota of '0' wolves, restricting timing and methods, which still complies with Act 169. This is necessary due to a growing body of research, such as the work done by Francisco J. Santiago-Ávila, Richard J. Chappell & Adrian Treves that has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings. Hounding is one example, which is especially cruel and has fallen out of public favor. Lastly, and most importantly, a growing body of research shows that lethal wolf management may be less effective at mitigating livestock loss than non-lethal options. Lethal management has the least consistent success rates when compared to non-lethal practices. So, the plan should require the implementation of non-lethal conflict minimization techniques by domestic animal owners for them to receive compensation, as well as abatement measures. As I mentioned before, the department surveys were helpful, indicating that the broad public cares about wolves as individuals (and not just for the viability of the population). Given the recent liberalization of hunting, the department must note majority support of the following reasons for opposing a regulated wolf hunting/trapping season (which are all omitted from the plan): opposition to specific methods of harvest like hounds (64%) or traps (70%), feelings that hunting wolves is unnecessary (62%) or culturally offensive to Native American tribes (57%). This data shows the public is at odds with practices currently promoted and endorsed by the legislature and the WDNR. Such decisions to omit literature or downplay evidence are contrary to principles of scientific integrity as well as ethics. This is a major fault of the plan. Lastly, there is a clear lack of proper consideration for individual wolf well-being, as well as indigenous connections to wolves. Tribal worldviews predominantly consider each individual wolf as a valuable relative. Cultural respect and sensitivity towards such views, shared by many non-tribal members, are at odds with lethal measures (especially the pathetic recreational killing) promoted in the plan. This plan is biased and misconstrued due to the omission of current scientific literature, the omission of survey data done by the department, and the general disregard for wolf well-being. It bows at the foot of old policy that is out of touch with public opinion and best practices. Again, the effort put into this plan was inspiring. However, it can be improved greatly by considering the most recent, and numerous scientific studies. Once that is done, I think it will be found that non-lethal management must take precedence. The wolves, greater biodiversity, and people of Wisconsin are counting on you to make this plan as scientifically rigorous as possible. Please do so.	5

Linda Serfass	Most of it	No	Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. There is much greater recognition of the ecological role of wolves. The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves. The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed).	The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on: ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution. The emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy. Wolves should not be viewed as a recreational opportunity for the minority who like to kill them. The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. The plan should require the implementation of abatement measures as well as the use of non-lethal conflict minimization techniques by domestic animal owners for the latter to receive compensation for confirmed predation. The plan also runs contrary to public values towards wolves (and omits mention of such majority values from the plan), despite department surveys evidencing that the broad public cares about wolves as individuals (and not just for the viability of the population). Given the recent liberalization of killing wolves by the state, it would be incredibly informative to note majority support of the following reasons for opposing a regulated wolf hunting/trapping season (which are all omitted from the plan): opposition to specific methods of harvest like hounds (64%) or traps (70%), feelings that hunting wolves is unnecessary (62%) or culturally offensive to Native American tribes (57%). Conflicting agency objectives (e.g., optimizing public hunting and conflict mitigation) are not only not acknowledged, but even misunderstood as harmonious, against the body of scientific evidence. That culminates in the prioritization of consumptive values and policies; e.g., according to the body of scientific literature, use of lethal methods, and especially public hunts, are contrary to most objectives relevant to: harm mitigation, the wellbeing of wolves, their ecological roles, and their non-exploitative enjoyment. There is a stark lack of consideration for individual wolves, wolf population health (including wellbeing), and measurable indicators for assessing any harms barring disease prevalence. Wolves deserve consideration of their individual right to live and should not be viewed as a collective mass, just as we (hopefully) view people. In general, all omissions of scientific literature, the arbitrary prioritization of policy objectives, the rhetoric of the plan and the dismissal of public values and concerns for wolves point towards a biased, unscientific and instrumental view of wolves that promotes values contrary to broad public perspectives on wolves.	1	
	All of it	Yes	Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. Greater recognition of the ecological role of wolves. Inclusion of a social survey, which notes positive views of wolves and increased opposition to the motives & methods for killing wolves. Adoption of proposed buffer zones around tribal reservations.	Current draft doesn't reflect the best available science and is missing a substantial amount of scientific literature on wolf ecology, sentience, sapience, sociability. Effectiveness of non-lethal interventions. The impact of widespread killing on wolves' physiology, behavior, wellbeing, & social dynamics. These science omissions combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy results in a biased plan running contrary to scientific evidence. The plan should curtail any lethal management of wolves except in extremely rare circumstances.	2	In general, all omissions of scientific literature, prioritization of policy objectives, rhetoric of the plan and dismissal of public values and concerns for wolves point towards a biased, unscientific and instrumental view of wolves.
	Most of it	No	We appreciate the efforts of all WDNR staff involved in updating the state's wolf management plan. Although we believe the current plan needs significant updating (see next section), we recognize the efforts and improvements made to the previous plan, including: ● Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. ● There is much greater recognition of the ecological role of wolves ● The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves ● The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed)	Lack of scientific data, recreational killing. Lack of considering individual wolves.	4	

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
	Most of it	Yes	It is a shame there wasn't a plan done before the reintroduction of the wolf but that would have been managing verses reacting to the human perspective.	The zones 1b are insane. So if I live next to a reservation boundary I have different rules. The zoning portion of your plan should be in the section 2 not section 4. You apparently have not listen to anyone one that helps pay your salaries. To limit a tax paying person the right to regulate them on their own lands is just insane. Either it is state regulated lands or tribal regulated lands. Anyone in those zones should pay the tribe the taxes if they have all the power on private lands it is apparent the DNR doesn't. Such a shame you at one time cared about the wildlife not the politics.	0	Maybe look at another close states wolf plan, maybe they could help you on the right path. Or at least much closer than this.
Melissa	Just the parts I am interested in	No	Wolf research and that residents are mostly favorable toward protecting a very healthy wolf population there.		5	Definitely I'd recommend lots of public education about the value of wolves, both on their own and in relationships with the environment and people. Please ensure wolves can be safe and plentiful. Thank you.
	All of it	Yes	A simple "goal number" doesn't work well and more location-specific measures, often on private land, may be necessary to deal with issues, while leaving the population in public areas largely untouched. Sport hunting should not be a control element. Use DNR hunters and trappers instead. The plan doesn't demand a kill to destroy the wolves to a certain cap level.	I live in the far north, and there really aren't many wolves creating problems and few to be seen with any regularity. The plan doesn't limit control measures to hotspots with problems. Wildlife control personnel should be in charge of regulating numbers, rather than sport hunters. Acts of the legislature can also distort any plan, which is and has been a problem. Keep the legislature out of the implementation, though I don't know how that could be accomplished.	6	Though I live in the north (Price County), I've sighted as many moose over the years as I have wolves.Never forget that they are partners in our environment and belong here. They are not numerous and serve to eliminate rodents and may be one reason we haven't had CWD reported here. The limits of the plan to not force anyone or anything to not distort or violate principles and goals.
P.Y	All of it	No	That you for conducting the updated public survey of 2022. Thank you for attempting to give voice to the indigenous nations within the state and their imperative relationship with the wolf species. This demonstrated the vast importance of opening our limited historical perception of this species to collaborate with nations that have the technological knowledge of thousands of years living peacefully among each other to teach and share.	Please see comments below	3	Thank you for this opportunity to provide feedback via testimony on your draft edition of The Wisconsin Wolf Management Plan of 2022. From 2003-2021 the USFWS has attempted to downlist grey wolves in the DPS. At each turn, other than from 2012-2014, judges throughout US courts have ruled in favor of keeping wolves under the ESA. Throughout this time the USFWS has continued development of a new delisting rule to designate and delist the Western Great Lakes DPS. Why does the USFWS continue to attempt to wrest grey wolves from the ESA protection when statistics/surveys have shown that from 2014-2020/21 the risk of human-wolf conflict and livestock depredation have decreased and the public's opinion, in wolf range, has increased sentiment for keeping wolf populations the same? Clearly the trend in wolf recovery, and assurance of their ongoing robust population, is not in favor of delisting and open hunts by the public, in the US or in WI specifically. Why is the USFWS hell bent on delisting? Statistically this claim from the draft report does not seem possible: "The number of farms with verified wolf depredations has averaged about 30 farms from 2011-2021. The highest number of individual farms with verified wolf depredations to date occurred in 2021 with 48 farms." The one year in which open hunting was allowed for the first time since 2014, and indeed was extremely controversial, you have more farm depredation issues by wolves than in all of recorded history? Were each of these 48 depredation claims absolutely verified to be wolf related? Did that include simple sighting of wolf presence in livestock areas or were they all absolutely verified injury to actual livestock? How can it be that the first year of open hunting, in 7 years, that killed 218 wolves also coincided with the greatest number of livestock depredations? That is something that needs USFWS immediate attention and research before any plan such as is being proposed in the draft for open hunting, in lieu of ESA protection, occurs. If your theory that culling the wolf population by yearly open hunting seasons will lessen wolf conflict, your own factual statistic shows you right there that indeed would not be the case. Or perhaps under the high tensions of conflict regarding that 2021 open hunt more farmers felt inclined to demonstrate how vicious wolves are and in need of culling by increasing their reports of depredation? Why has USFWS and the DPS not allocated any funds to non-lethal methods of wolf management? Your report signifies the success of non-lethal management methods in the livestock range lands of Idaho and illustrates the types of resources used in non-lethal abatement methods available. Why have compensation moneys not been earmarked in the state wolf depredation program (s. 29.888, Wis. Stats) for hands-on education and provision of non-lethal resources for land owners in fear of livestock depredation to begin training in use, and longitudinal study of application, of these humane methods? Many of your private funders of the depredation program would be delighted to contribute to just such a fund. Why is the USFWS not pursuing such alternative possibilities in the DPS? The plan should require the implementation of abatement methods such as the use of non-lethal conflict minimization techniques by domestic animal owners in order for the animal owners to receive compensation for confirmed predation. Under the "Wolf Related Conflicts" section how can you consider dog deaths as a reason for lethal hunting of wolves when you state clearly 85% of dogs killed are those used in hunting near wolf rendezvous sites and the majority are

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
						killed around bear baiting locations? Like the improper attendance to cattle carcasses you mention this will of course attract any predator to feed from at no fault of their own. These deaths are hugely irresponsible and inhumane human error issues, not a wolf predation issue. A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings - see study https://www.nature.com/articles/s41598-020-70837-x . Hounding or hound training should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public. Lastly, why has the 2008 PDM not been updated in the last 14 years? The 2008 PDM requires relevant data to be collected by state Department of Natural Resources, tribes, and federal land management agencies in Wisconsin, Minnesota, and Michigan and provided annually to the USFWS. Since the USFWS then conducts annual reviews based upon this information to evaluate potential threats to the species, specifically wolves, then surely more current understanding of wolf dispersal and affects to pack ecology needs to be included in any monitoring program. Wolf physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution are all changing factors as more science is gathered on their species - see research https://www.sciencedirect.com/science/article/pii/S0006320713003418?via%3Dihub. Thank you again for the opportunity to provide feedback on this vitally important issue of your current draft management plan. It is vital to truly address wolf recovery with the most current science not just for Wisconsin, but for the nation and wolves the world over.
Kevyn Quamme	All of it	Yes	That a plan is being developed	The lack of a measurable population goal and the inability to set and reach the science based quota. Knowing that that number that should be harvested can not be realized, mostly due to tribal policy to not participate.	1	Refer to WCC comments and WiWF comments along with actions by agencies and individuals that have to encounter the wolves daily.
Ra Szumal	Most of it	No	We appreciate the efforts of all WDNR staff involved in updating the state's wolf management plan. Although we believe the current plan needs significant updating (see next section), we recognize the efforts and improvements made to the previous plan, including: ● Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. ● There is much greater recognition of the ecological role of wolves ● The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves ● The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed)	Too many to list	4	Please revise this plan to further protect wolfs and limit the hunting and murdering of these wild animals. Please move humans away from their habitats
	Most of it	Yes	that damage payouts will continue	need a numerical population goal (350-400) surveys that are from people most affected by wolves	2	couls Wisconsin get involved in the delisting of the wolf?
	All of it	No	You dropped the goal of allowing just 350 wolves. You recognize (to a greater extent) that wolves play an crucial ecological role. You included a social survey that shows the public supports wolves and doesn't want them killed for fun or using heinous methods like hounds or traps. The inclusion of proposed buffer zones around tribal reservations.	The emphasis is still on promoting recreational killing as the main management strategy. It doesn't incorporate the best available science on wolf sentience, the importance of families, the impact of widespread killing on their social dynamics and physiology. It doesn't address the effectiveness of non-lethal interventions relative to lethal ones. Non-lethal practices work much better than lethal management, but your plan fails to address this. Lethal management should rarely be used and only for immediate defense of life. The public does NOT support the use of hounds, traps or other heinous methods.	3	The plan should prioritize wolf protection, not killing!! We want Wolves. They are important to our ecosystems. We want them to live in peace, free from the specter of constantly being hunted down. When there are conflicts with livestock, we want ranchers to use non-lethal methods. All recreational killing should be banned. The public doesn't support your plan as evidenced in your survey. The broad public actually CARES about wolves as individuals in addition to the viability of their population. They oppose a regulated hunting/trapping season, the use of hounds (64%) or traps (70%). They believe wolf hunting is unnecessary (62%) or culturally offensive to Native American tribes (57%). This should obviously be seriously considered in your strategy instead of being dismissed. Tribes view individual wolves as family relatives! Act 169 mandates a wolf hunting season, but that doesn't stop you from restricting timing and lethal methods and setting a Zero Quota.
Mary Jo Harings	Most of it	Yes	1. Removing an arbitrary wolf population goal is important to make sure the best available science is centered on wolf management. 2. The low quota zones are an important and welcome addition to the plan. 3. The plan is rightly focused on the ecological benefits of wolves.		9	Thank you for writing a wolf management plan that centers science, public input and tribal engagement-the core tenets of the best way to protect, conserve and sustain natural resources, especially gray wolves in Wisconsin.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
	Just the parts I am interested in	No	I dont like it , I want to protect the wolves and all wildlife.in favor of increasing protections for wolves, requiring non-lethal conflict interventions and banning recreational killing.	they need to be protected not killed		in favor of increasing protections for wolves, requiring non-lethal conflict interventions and banning recreational killing.
Chuck Jesse	Just the parts I am interested in	No	1. Wolves will no longer be managed by the old goal of 350 wolves. 2. Recognition of the ecological importance of wolves. 3. Proposed buffer zones around tribal reservations.	1. The current proposal doesn't reflect the best science regarding wolves. 2.The use of recreational killing as a management plan. 3. The plan doesn't stop lethal management. Again, for;low the science. 4.The plan should concentrate on non-lethal management. 5. The plan doesn't consider the public concerns over the protection of wolves.	2	The WDNR should protect the state's natural resources which include wolf protection.
G. Paxton	Just the parts I am interested in	No	In favor of increasing protections for wolves, requiring non-lethal conflict interventions and banning recreational killing.	Harming wolves.	5	In favor of increasing protections for wolves, requiring non-lethal conflict interventions and banning recreational killing.
John Masbaum	Just the parts I am interested in	Yes	Taking a look at the need to reduce the wolf population--reasons for	Useing past (ancient data) to support the growth of the wolf population--as there are many more people now and domestic animals which could be harmed by wolves	3	I wonder if the board really goes out and talks to local citizens where wolves have killed their dogs, where people have concern for their own and childrens safethy
Jamie dos santoa	All of it	No	The executive summary has a tone of what's in the best interest of the animal and balance with science and humans. Unfortunately the plan does not cooperate with that tone.	Page 67, wolf harvesting… you are using graft and laws that are old. 2012, plots from 2008.the term "game" is used from an older law- why are you trying to fit in to old language and law and not trying to change the law? The gray wolf is endangered, yet you're hunting it.	5	There is an ecological balance to strive for, you say it in the executive summary but you are using old data and thinking to work towards the right protections.
carol broll	Most of it	No	Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. ● There is much greater recognition of the ecological role of wolves ● The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves ● The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed)	The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on (see reference list below): ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution ● The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. ● The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ○ A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings. ○ Hounding or hound training, which are akin to allowing legalized dogfighting, should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public. ● The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. ○ Despite Act 169, which mandates a wolf hunting season, the department can still restrict the implementation of lethal methods by setting minimal quotas, including a quota of '0' wolves, restricting timing and methods. ○ Several studies have proven a proactive non-lethal approach leads to better conflict mitigation. ○ Lethal management often fails to provide a long-term solution to wolf predation and has the least consistent success rates when compared to non-lethal practices. In addition, there is significant evidence showing that lethal wolf management may be less functionally effective at mitigating subsequent livestock losses than non-lethal deterrents. ● The plan should require the implementation of abatement measures as well as the use of non-lethal conflict minimization techniques by domestic animal owners for the latter to receive compensation for confirmed predation. ● The plan also runs contrary to public values towards wolves (and omits mention of such majority values from the plan), despite department surveys evidencing that the broad public cares about wolves as individuals (and not just for the viability of the population). Given the recent liberalization of killing wolves by the state, it would be incredibly informative to note majority support of the following reasons for opposing a regulated wolf hunting/trapping season (which are all omitted from the plan): opposition to specific methods of harvest like hounds (64%) or traps (70%), feelings that hunting wolves is unnecessary (62%) or culturally offensive to Native American tribes (57%). ○ All such reasons convey majority disagreement with practices currently promoted and	4	

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
				endorsed by the legislature and the WDNR, and such a conflict between managers and the public should not only be acknowledged, but foregrounded and carefully considered in policy (instead of dismissed). ○ Such decisions to omit literature or downplay evidence (e.g., such as majority opposition to killing wolves and their reasons) are contrary to principles of scientific integrity (e.g., present all relevant scientific evidence to the public) as well as ethics (e.g., disguising ethical decisions, such as recreational wolf killing, as robustly supported by science). ● Conflicting agency objectives (e.g., optimizing public hunting and conflict mitigation) are not only not acknowledged, but even misunderstood as harmonious, against the body of scientific evidence. That culminates in the prioritization of consumptive values and policies; e.g., according to the body of scientific literature, use of lethal methods, and 2 especially public hunts, are contrary to most objectives relevant to: harm mitigation, the wellbeing of wolves, their ecological roles, and their non-exploitative enjoyment (i.e., Objectives A, B, D and F). ● There is a stark lack of consideration for individual wolves, wolf population health (including wellbeing), and measurable indicators for assessing any harms barring disease prevalence (e.g., accounting for cortisol levels or other stress hormones, measures of pair/pack persistence) ● There is an inappropriate understanding and consideration of tribal worldviews about wolves. Tribal worldviews of wolves are misconstrued as 'cultural benefits' tribes receive from the existence of a wolf population, when in fact tribal worldviews consider each individual wolf as a person and relative. Cultural respect and sensitivity towards such views, shared by many non-tribal members, demand the strict mitigation of lethal measures, especially recreational killing, as opposed to their current promotion in the plan. ● In general, all omissions of scientific literature, the arbitrary prioritization of policy objectives, the rhetoric of the plan and the dismissal of public values and concerns for wolves point towards a biased, unscientific and instrumental view of wolves that promotes values contrary to broad public perspectives on wolves. ● 'SOM' wolf estimation methodology – From a recent critique: "The new methods sacrifice precision, but are believed to retain adequate accuracy and sensitivity to changing conditions for reliable decision-making. We review evidence for the accuracy, precision, and sensitivity of the new 'scaled occupancy model' (SOM) applied in Wisconsin. We conclude that the Wisconsin method would systematically overestimate wolf abundance by large (but currently incalculable) margins. Because Wisconsin, similar to other states, not only changed to unverified methods but also implemented widespread wolf killing, shortcomings in their estimates of wolf abundance may have far-reaching consequences for population viability and confidence in state wildlife managers. We discuss findings from Wisconsin alongside similar findings for other states' occupancy models being insensitive to human causes of mortality that have recently increased. Overall, Wisconsin's proposed method for estimating wolf abundance shows significant departures from best practices in scientific measurement. Verification will require independent replication and unbiased tests at multiple scales in multiple habitats under different human-induced mortality rates, and peer review before the new methods are considered reliable."		
	All of it	Yes			10	If a wolf trapping season takes place in the future, please schedule it for winter months, not prime grouse hunting months of October and November. My bird dog's leg was caught in a wolf trap during the first wolf trapping season a number of years ago in October. It was not a pleasant experience.
	Just the parts I am interested in	Yes	Legal hunting	Move to allow population increase	1	At the time of reintroduction you said 350 wolves. I think the people that live in high populations of wolves should have the have the final say.

				that lethal wolf management may be less functionally effective at mitigating subsequent livestock losses than non-lethal deterrents. ● The plan should require the implementation of abatement measures as well as the use of non-lethal conflict minimization techniques by domestic animal owners for the latter to receive compensation for confirmed predation. ● The plan also runs contrary to public values towards wolves (and omits mention of such majority values from the plan), despite department surveys evidencing that the broad public cares about wolves as individuals (and not just for the viability of the population). Given the recent liberalization of killing wolves by the state, it would be incredibly informative to note majority support of the following reasons for opposing a regulated wolf hunting/trapping season (which are all omitted from the plan): opposition to specific methods of harvest like hounds (64%) or traps (70%), feelings that hunting wolves is unnecessary (62%) or culturally offensive to Native American tribes (57%). ○ All such reasons convey majority disagreement with practices currently promoted and endorsed by the legislature and the WDNR, and such a conflict between managers and the public should not only be acknowledged, but foregrounded and carefully considered in policy (instead of dismissed). ○ Such decisions to omit literature or downplay evidence (e.g., such as majority opposition to killing wolves and their reasons) are contrary to principles of scientific integrity (e.g., present all relevant scientific evidence to the public) as well as ethics (e.g., disguising ethical decisions, such as recreational wolf killing, as robustly supported by science). ● Conflicting agency objectives (e.g., optimizing public hunting and conflict mitigation) are not only not acknowledged, but even misunderstood as harmonious, against the body of scientific evidence. That culminates in the prioritization of consumptive values and policies; e.g., according to the body of scientific literature, use of lethal methods, and 2 especially public hunts, are contrary to most objectives relevant to: harm mitigation, the wellbeing of wolves, their ecological roles, and their non-exploitative enjoyment (i.e., Objectives A, B, D and F). ● There is a stark lack of consideration for individual wolves, wolf population health (including wellbeing), and measurable indicators for assessing any harms barring disease prevalence (e.g., accounting for cortisol levels or other stress hormones, measures of pair/pack persistence) ● There is an inappropriate understanding and consideration of tribal worldviews about wolves. Tribal worldviews of wolves are misconstrued as 'cultural benefits' tribes receive from the existence of a wolf population, when in fact tribal worldviews consider each individual wolf as a person and relative. Cultural respect and sensitivity towards such views, shared by many non-tribal members, demand the strict mitigation of lethal measures, especially recreational killing, as opposed to their current promotion in the plan. ● In general, all omissions of scientific literature, the arbitrary prioritization of policy objectives, the rhetoric of the plan and the dismissal of public values and concerns for wolves point towards a biased, unscientific and instrumental view of wolves that promotes values contrary to broad public perspectives on wolves. ● 'SOM' wolf estimation methodology – From a recent critique: "The new methods sacrifice precision, but are believed to retain adequate accuracy and sensitivity to changing conditions for reliable decision-making. I review evidence for the accuracy, precision, and sensitivity of the new 'scaled occupancy model' (SOM) applied in Wisconsin. I conclude that the Wisconsin method would systematically overestimate wolf abundance by large (but currently incalculable) margins. Because Wisconsin, similar to other states, not only changed to unverified methods but also implemented widespread wolf killing, shortcomings in their estimates of wolf abundance may have far-reaching consequences for population viability and confidence in state wildlife managers. I have discussed findings from Wisconsin alongside similar findings for other states' occupancy models being insensitive to human causes of mortality that have recently increased. Overall, Wisconsin's proposed method for estimating wolf abundance shows significant departures from best practices in scientific measurement. Verification will require independent replication and unbiased tests at multiple scales in multiple habitats under different human-induced mortality rates, and peer review before the new methods are considered reliable." (Treves & Santiago-Ávila, 2023)		
kym	Most of it	No	It's good to include tribal partners and scientific research to implement better protection for wolves.	Recreational killing needs to stop and a better solution is needed. The war on wolves must end and humans must stop pretending to be God killing at whatever is deemed inconvenient when there is a natural order in the wild that needs to be respected.	5	
David Witzlib	Most of it	Yes	None	This was all taken care of years ago and now you want to throw away everything that was agreed to	1	I know many retired people who worked for the DNR who totally disagree with the new plan

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
	Just the parts I am interested in	No			1	
lisa	Most of it	No	That wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. There is much greater recognition of the ecological role of wolves The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves. And the adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed)	The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on (see reference list below): wolf ethology, sentience, sapience, sociability, agency and wellbeing. effectiveness of non-lethal interventions, especially relative to lethal ones. The impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution. The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings. Hounding or hound training, which are akin to allowing legalized dogfighting, should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public. The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. Despite Act 169, which mandates a wolf hunting season, the department can still restrict the implementation of lethal methods by setting minimal quotas, including a quota of '0' wolves, restricting timing and methods. Several studies have proven a proactive non-lethal approach leads to better conflict mitigation. Lethal management often fails to provide a long-term solution to wolf predation and has the least consistent success rates when compared to non-lethal practices. In addition, there is significant evidence showing that lethal wolf management may be less functionally effective at mitigating subsequent livestock losses than non-lethal deterrents. The plan should require the implementation of abatement measures as well as the use of non-lethal conflict minimization techniques by domestic animal owners for the latter to receive compensation for confirmed predation. The plan also runs contrary to public values towards wolves (and omits mention of such majority values from the plan), despite department surveys evidencing that the broad public cares about wolves as individuals (and not just for the viability of the population). Given the recent liberalization of killing wolves by the state, it would be incredibly informative to note majority support of the following reasons for opposing a regulated wolf hunting/trapping season (which are all omitted from the plan): opposition to specific methods of harvest like hounds (64%) or traps (70%), feelings that hunting wolves is unnecessary (62%) or culturally offensive to Native American tribes (57%). All such reasons convey majority disagreement with practices currently promoted and endorsed by the legislature and the WDNR, and such a conflict between managers and the public should not only be acknowledged, but foregrounded and carefully considered in policy (instead of dismissed). Such decisions to omit literature or downplay evidence (e.g., such as majority opposition to killing wolves and their reasons) are contrary to principles of scientific integrity (e.g., present all relevant scientific evidence to the public) as well as ethics (e.g., disguising ethical decisions, such as recreational wolf killing, as robustly supported by science). Conflicting agency objectives (e.g., optimizing public hunting and conflict mitigation) are not only not acknowledged, but even misunderstood as harmonious, against the body of scientific evidence. That culminates in the prioritization of consumptive values and policies; e.g., according to the body of scientific literature, use of lethal methods, and especially public hunts, are contrary to most objectives relevant to: harm mitigation, the wellbeing of wolves, their ecological roles, and their non-exploitative enjoyment (i.e., Objectives A, B, D and F). There is a stark lack of consideration for individual wolves, wolf population health (including wellbeing), and measurable indicators for assessing any harms barring disease prevalence (e.g., accounting for cortisol levels or other stress hormones, measures of pair/pack persistence) There is an inappropriate understanding and consideration of tribal worldviews about wolves. Tribal worldviews of wolves are misconstrued as 'cultural benefits' tribes receive from the existence of a wolf population, when in fact tribal worldviews consider each individual wolf	2	thank you

				as a person and relative. Cultural respect and sensitivity towards such views, shared by many non-tribal members, demand the strict mitigation of lethal measures, especially recreational killing, as opposed to their current promotion in the plan. In general, all omissions of scientific literature, the arbitrary prioritization of policy objectives, the rhetoric of the plan and the dismissal of public values and concerns for wolves point towards a biased, unscientific and instrumental view of wolves that promotes values contrary to broad public perspectives on wolves. 'SOM' wolf estimation methodology – From a recent critique: "The new methods sacrifice precision, but are believed to retain adequate accuracy and sensitivity to changing conditions for reliable decision-making. We review evidence for the accuracy, precision, and sensitivity of the new 'scaled occupancy model' (SOM) applied in Wisconsin. We conclude that the Wisconsin method would systematically overestimate wolf abundance by large (but currently incalculable) margins. Because Wisconsin, similar to other states, not only changed to unverified methods but also implemented widespread wolf killing, shortcomings in their estimates of wolf abundance may have far-reaching consequences for population viability and confidence in state wildlife managers. We discuss findings from Wisconsin alongside similar findings for other states' occupancy models being insensitive to human causes of mortality that have recently increased. Overall, Wisconsin's proposed method for estimating wolf abundance shows significant departures from best practices in scientific measurement. Verification will require independent replication and unbiased tests at multiple scales in multiple habitats under different human-induced mortality rates, and peer review before the new methods are considered reliable." (Treves & Santiago-Ávila, 2023)		
Jon Way	Most of it	No	Not having a population cap like previously and recognizing the importance of wolves on the landscape.	Continued reliance on human hunting of an ecologically important carnivore. State wildlife agencies need to broaden their horizon to constantly catering to consumptive uses. Hunting with dogs is sickening.	6	State wildlife agencies need to broaden their horizon to constantly catering to consumptive uses. Wildlife watching users and ensuring ecologically important populations of wolves are being maintained is important and should be key tenets of the plan.
Gerald Bowman	Most of it	No	I am not in favor of any laws that harm wolves.	Trapping should be banned as well as killing wolves. They should be humanely trapped and transported to another site if that is really necessary.	1	
Kathy Marie Behl-Whiting	I have not read any of the draft plan	No				To the Editor: We can all expect to see wild animals, including coyotes, in our open spaces, parks and cities. It is now common and normal to see them during either the day or night. Coyotes are vocal when greeting family members and when reinforcing territory. Like most other wildlife, they don't vocalize when hunting so as not to attract competition. Coyotes are omnivorous, eating mostly rodents and rabbits, but also fruit, insects, vegetation, and carrion. Urban studies in both Chicago and Los Angeles show that less than 1% of a coyotes' diet is domestic cat. However, a coyote doesn't know the difference between a cat and a rabbit, so it's best to supervise pets at all times. To be 100% sure that no harm comes to our small domestic animals—from all manner of dangers, including cars, poisons, entrapment and coyotes/dogs/bobcats/owls—we need to supervise them carefully. That said, coyotes near human development are most likely encountered between dusk and early morning. Juvenile coyotes disperse in the fall (seeking mates and territory), so spotting them at any time of the day is not unusual. However, just because we don't see them often doesn't mean that they aren't around. What a coyote does best is stay out of our way. Here is the bad news: One coyote is killed every minute of every day in the U.S. What's their crime? Being seen. I think that most of us in any nature-appreciating part of the country would agree that to kill a beautiful animal because they dare to be seen is the real crime. Check out why relocating coyotes is not a viable solution (and, in fact, is illegal in many states): http://www.discoverwildcare.org/wildlife-resources/trapping-and-relocating-wildlife/). The reality is that we have wild neighbors and we need to learn how to coexist and reduce negative encounters. And there is good news: You can inform yourself about coyote biology and behavior, seasonal expectations, coyote hazing and deterrents, from Project Coyote. Find the information online at www.projectcoyote.org, and check out the Resources page: http://www.projectcoyote.org/resources/. There are numerous fact sheets and brochures that you can download and share/post in your neighborhood—including the free BE COYOTE AWARE sign (http://www.projectcoyote.org/wp-content/uploads/2015/05/Be_Coyote_Aware_Flyer_NPS_PC.pdf)—to help raise awareness about how to reduce negative encounters with coyotes. Additional helpful information: San Francisco Animal Care and Control's Living with Coyotes PSA (http://www.sfanimalcare.org/living-with-urban-wildlife/coyote-sightings/) How to Haze a Coyote - (https://www.youtube.com/watch?v=V0CS4_-sQDE).

	All of it	No	I appreciate the fact that the archaic numerically based management plan is under consideration for update in the first place. It is about time. I also appreciate the fact that the draft acknowledges most people indeed understand wolves as integral to a working and healthy ecosystem. Additionally it is brought to fore that most people find the also archaic wolf trapping and killing tactics used to be repugnant, dangerous, cruel, inefficient, and untenable, regardless of how people feel about wolves in the wild. The plan also acknowledges that the public understands that wolves are a keystone large carnivore that are necessary for robust healthy ungulate populations, and are part of our rapidly declining true wildlife. Thank you for considering buffer zones, and please also consider wildlife crossings that go under or over busy roadways as necessary.	The current draft is just ok. It does not address the most recent scientific findings that clearly demonstrate non-lethal population control strategies are far more effective in the long run, require less manpower, and non-injurious to the public, or other non-target animals. Killing wolves has deleterious effects on the health and numbers of other mammal populations and even negatively effects native vegetation. Indiscriminate killing also causes negative changes in behavior as seen in coyotes and other smaller canid species. Reformulating the same old story without modernizing technique and perspective based on current high quality science is shameful, and irresponsible. be leader and not a follower, and find the better way that ultimately supports recreational hunting of healthy ungulate populations, and also acknowledges that the majority of citizens want wild wolves to remain a part of our regional wildlife. STOP KILLING WOLVES! IT DOES NOT WORK. Providing compensation, education, and opportunity for alternative anti-predatory strategies to ranchers has proven successful and reduces conflict. Normalizing lethal means of control promotes poaching, illegal killing, and accidental killing of other animals including domestic pets. Tribes do not support killing wolves. The public does not support killing wolves. It is a small, loud, brazen minority that wish to increase and participate in recreational killing of these predators. Get it together. Stop doing the wrong thing for the wrong reasons.	3	
	All of it	No	Although the plan contains improvements compared to previous versions, it is far from reflecting the best available science, ethics and broad public values that should guide wolf policy and coexistence.	Although the plan contains improvements compared to previous versions, it is far from reflecting the best available science, ethics and broad public values that should guide wolf policy and coexistence.	0	Although the plan contains improvements compared to previous versions, it is far from reflecting the best available science, ethics and broad public values that should guide wolf policy and coexistence.
Shelley Ottenbrite	Just the parts I am interested in	No	I was pleased for the most part about the human cultural aspects of the plan. The research around deer hunter pressures as opposed to all other human beings was clear -- and it warrants targeted programing to address their perceived loss of deer harvest.	See, e.g., https://theintercept.com/2023/01/29/grizzly-bear-endangered-montana/. I believe Chris Servheen's observations about Republican lawmakers in Montana -- and how quickly extinction threats follow cannot be ignored. Ignoring such mega-threats, based on pandering rather than science, is equal to ignoring climate change -- which certainly deserved a subheading in the plan. Please create research investigations specifically for climate change, for deer hunter education/compensatory programming, and for the dangers of Republican lawmakers based on the current Montana experience.	7	The wolf's role in protecting carbon storing lands must be evaluated. Climate change is only fought by nature storing carbon. A healthy ecosystem must have predators to be its most functional. Climate change is an essential topic when considering endangered species, threats to existence and the species role in combatting carbon pollution.
Colleen Young	Most of it	No	There's not much to like. I don't see anything pro wolf. We need wolves in our eco system. We don't need cattle ranches and other giant meat producers. If you voted Dem then you voted to scale down and someday remove meat from your diet. I'm a Republican yet I am a Vegan for my health and for the animals.	It's basically biased. As usual hunters and farmers are pro killing wolves as they see them as competition plus they just enjoy killing animals.	1	People don't know enough about wildlife and wolves. People think they are coldblooded killers which they are not. Most people don't care because they believe it doesn't affect them. All nature and wildlife affects humans. The wolf management plan is just another plan to kill/cull wolves and to help cattle/meat producers which we don't need and which the Dems are planning to rid us of. People need to open their eyes and actually become aware of what's happening. We need wolves, not another cattle ranch.
	All of it	Yes	I appreciate the efforts of all WDNR staff involved in updating the state's wolf management plan. Although I believe the current plan needs significant updating (see next section), I recognize the efforts and improvements made to the previous plan, including: ● Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. ● There is much greater recognition of the ecological role of wolves ● The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves ● The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed)	● The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on (see reference list below): ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution ● The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. ● The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ○ A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings. ○ Hounding or hound training, which are akin to allowing legalized dogfighting, should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public. ● The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. ○ Despite Act 169, which mandates a wolf hunting season, the department can still restrict the implementation of lethal methods by setting minimal quotas, including a quota of '0' wolves, restricting timing and methods. ○ Several studies have proven a proactive non-lethal approach leads to better conflict mitigation. ○ Lethal management often fails to provide a long-term solution to wolf predation and has the least consistent success rates when compared to non-lethal practices. In addition, there is significant evidence showing that lethal wolf management may be less functionally effective at mitigating subsequent livestock losses than non-lethal deterrents. ● The plan should require the implementation	2	We must increase protections for wolves, requiring non-lethal conflict interventions and banning recreational killing.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
				of abatement measures as well as the use of non-lethal conflict minimization techniques by domestic animal owners for the latter to receive compensation for confirmed predation. ● The plan also runs contrary to public values towards wolves (and omits mention of such majority values from the plan), despite department surveys evidencing that the broad public cares about wolves as individuals (and not just for the viability of the population). Given the recent liberalization of killing wolves by the state, it would be incredibly informative to note majority support of the following reasons for opposing a regulated wolf hunting/trapping season (which are all omitted from the plan): opposition to specific methods of harvest like hounds (64%) or traps (70%), feelings that hunting wolves is unnecessary (62%) or culturally offensive to Native American tribes (57%). ○ All such reasons convey majority disagreement with practices currently promoted and endorsed by the legislature and the WDNR, and such a conflict between managers and the public should not only be acknowledged, but foregrounded and carefully considered in policy (instead of dismissed). ○ Such decisions to omit literature or downplay evidence (e.g., such as majority opposition to killing wolves and their reasons) are contrary to principles of scientific integrity (e.g., present all relevant scientific evidence to the public) as well as ethics (e.g., disguising ethical decisions, such as recreational wolf killing, as robustly supported by science). ● Conflicting agency objectives (e.g., optimizing public hunting and conflict mitigation) are not only not acknowledged, but even misunderstood as harmonious, against the body of scientific evidence. That culminates in the prioritization of consumptive values and policies; e.g., according to the body of scientific literature, use of lethal methods, and 2 especially public hunts, are contrary to most objectives relevant to: harm mitigation, the wellbeing of wolves, their ecological roles, and their non-exploitative enjoyment (i.e., Objectives A, B, D and F). ● There is a stark lack of consideration for individual wolves, wolf population health (including wellbeing), and measurable indicators for assessing any harms barring disease prevalence (e.g., accounting for cortisol levels or other stress hormones, measures of pair/pack persistence) ● There is an inappropriate understanding and consideration of tribal worldviews about wolves. Tribal worldviews of wolves are misconstrued as 'cultural benefits' tribes receive from the existence of a wolf population, when in fact tribal worldviews consider each individual wolf as a person and relative. Cultural respect and sensitivity towards such views, shared by many non-tribal members, demand the strict mitigation of lethal measures, especially recreational killing, as opposed to their current promotion in the plan. ● In general, all omissions of scientific literature, the arbitrary prioritization of policy objectives, the rhetoric of the plan and the dismissal of public values and concerns for wolves point towards a biased, unscientific and instrumental view of wolves that promotes values contrary to broad public perspectives on wolves. ● 'SOM' wolf estimation methodology – From a recent critique: "The new methods sacrifice precision, but are believed to retain adequate accuracy and sensitivity to changing conditions for reliable decision-making. We review evidence for the accuracy, precision, and sensitivity of the new 'scaled occupancy model' (SOM) applied in Wisconsin. We conclude that the Wisconsin method would systematically overestimate wolf abundance by large (but currently incalculable) margins. Because Wisconsin, similar to other states, not only changed to unverified methods but also implemented widespread wolf killing, shortcomings in their estimates of wolf abundance may have far-reaching consequences for population viability and confidence in state wildlife managers. We discuss findings from Wisconsin alongside similar findings for other states' occupancy models being insensitive to human causes of mortality that have recently increased. Overall, Wisconsin's proposed method for estimating wolf abundance shows significant departures from best practices in scientific measurement. Verification will require independent replication and unbiased tests at multiple scales in multiple habitats under different human-induced mortality rates, and peer review before the new methods are considered reliable.		
	All of it	No	None	All	0	You need to save wolves, not slaughter them.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Michael McFadzen	Most of it	Yes	Wolf Management Zones, Redrawing wolf zones across Wisconsin and creation of buffer zones around tribal reservations, continued use of a science-based management, and continued education and outreach efforts. Also Support rules to protect wolf den sites, Mandatory harvest registration and in-person certification requirements that should include requirements to provide biological samples as needed for monitoring and research. We also strongly support harvest registration within 8 hours.	The plan should include specific descriptions of how wolf populations in each zone will be managed to achieve goals outlined in the plan, including specific metrics to determine the health and sustainability of the population. • The plan should include a process to ensure enough licenses are issued for any legal hunt to assure quotas can be met in a reasonable time period in order to avoid overly long hunting and trapping seasons that carry into the breeding season. • The plan should limit training of dogs to only the periods when wolf hunting or trapping season is open in the zone. • The plan should include a specific timeline for implementation. • The plan should specifically identify funding allocation and funding sources. I recommend outlining how wolf populations in each zone will be managed to achieve goals outlined in the plan including defining "sustainable population," maximizing the potential for ecological benefits, and controlling the spread of diseases like Chronic Wasting Disease (CWD). • We recommend identifying specific metrics that will define successful wolf management in Wisconsin. support zone specific permits, we also support adequate issuing of licenses to avoid long extended hunting and trapping seasons. Do not support using dogs to hunt wolves. it is inhumane and dangerous to dogs and wolves. Do not support using traps for wolves, it is also inhumane and dangerous to other animals	5	I urge the Department to carefully consider the composition of the Wolf Advisory Committee to ensure it is representative of the broad range of wolf concerns across the state, particularly tribal concerns, and adequately represent the science needed to properly manage wolves in Wisconsin. Along with listed stakeholder groups on page 137, we recommend also including a new group for Wildlife/Conservation Science organizations. Documentation of the role that wolves play in regulating the spread of CWD within Wisconsin. Establishment of a wolf science advisory committee to ensure that the best available science is being integrated into operational actions. I recommend that WDNR periodically (possibly every 5 years), convene a scientific panel of experts in the biological and social science disciplines. I recommend that educational efforts include working with science teachers to effectively convey information on Wisconsin wolves. I strongly recommend the WDNR and NRB request statutory changes in the Wisconsin wolf hunting regulations under 2011 ACT 169. These regulations limit the Department's ability to fully use an adaptive management approach to managing the state wolf population
Wisconsin Sportsman	All of it	Yes	Unfortunately none of your plan solves the average number of conflicts with wolves each year particularly with livestock.	It's not a plan it's a wish list that will never materialize the killing of livestock and pets and hunting hounds is unacceptable the lose will never be made up with your depredation payments	1	Thinking that Wisconsin has enough room for wolves is just fantasy thinking by a bunch of people who want to feel good about a cause they think there right about
	Most of it	No	We appreciate the efforts of all WDNR staff involved in updating the state's wolf management plan. Although we believe the current plan needs significant updating (see next section), we recognize the efforts and improvements made to the previous plan, including: ● Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. ● There is much greater recognition of the ecological role of wolves ● The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves ● The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed)	● The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on (see reference list below): ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution ● The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. ● The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ○ A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings. ○ Hounding or hound training, which are akin to allowing legalized dogfighting, should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public. ● The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. ○ Despite Act 169, which mandates a wolf hunting season, the department can still restrict the implementation of lethal methods by setting minimal quotas, including a quota of '0' wolves, restricting timing and methods. ○ Several studies have proven a proactive non-lethal approach leads to better conflict mitigation. ○ Lethal management often fails to provide a long-term solution to wolf predation and has the least consistent success rates when compared to non-lethal practices. (Treves & Santiago-Ávila, 2023)		
	Just the parts I am interested in	Yes		Not setting a max number of wolves.	1	There are a overpopulation of wolves. The people counting dint do a accurate job of counting and want more wolves around. Drive any forest road in northern wi and you will see there are more then the population estimates tell uou
	Just the parts I am interested in	Yes	The fact that you actually and finally submitted a plan	1. A complete lack of a specific target number goal of total wolves in the state. 2. Extending the "no kill" zone around the Indian Reservations which removes the ability of landowners outside of the reservations to take wolves.	1	I am amazed at the lack of science that went into this plan. Absolutely the stupidest plan I've seen come out of the DNR. Normally your science and plans on all other species is well thought out and identifies specific goals and numbers. This plan looks like a bunch of Madison lefty animal lover hunter haters wrote this crap. The original plan was much better if you would have ever managed to that plan.
Michele Hryc	All of it	No	There is greater recognition as to the ecological role and value of wolves. There is inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves. The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed).	The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on: wolf ethology, sentience, sapience, sociability, agency and wellbeing; effectiveness of non-lethal interventions, especially relative to lethal ones; and the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution. The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings.	3	There needs to be an increased protections for wolves, an emphasis on non-lethal methods for solving human-wolf conflicts, and totally ban recreational killing of wolves.
Charles Boley	All of it	Yes	Clearly shown that people living in Wolf Range do not have as favorable views of higher wolf populations as those who don't live in Wolf Range areas.	A population objective base line needs to be established based on current landscape carrying capacity and not based on ancestral historical ideology. The landscape has changed and evolved.	2	Ideology and Historic perceptions and emotions do not best represent how to manage a species on a modern landscape. Population levels have to be guided by science while maintaining a balanced ecosystem. Does it make sense to reduce the Deer, Elk, Rabbit,Turkey, Grouse and Beaver populations to bolster a wolf population that is ultimately unsustainable on the modern Wisconsin landscape?
Joshua Johnson	Most of it	Yes		The part where the DNR supports false narratives to help theirs. Post the actual results from the questionnaire because I don't believe that WI residents want more wolves for a second. Anti wolf hunting groups were posting that survey on their pages for non wi residents to take (wolf patrol)	1	How can the DNR tell a land owner they can't hunt wolves on their own property because they are CLOSE TO a reservation.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Elizabeth Watts	Just the parts I am interested in	No	We appreciate the efforts of all WDNR staff involved in updating the state's wolf management plan. Although we believe the current plan needs significant updating (see next section), we recognize the efforts and improvements made to the previous plan, including: ● Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. ● There is much greater recognition of the ecological role of wolves ● The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves ● The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed)	The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on (see reference list below): ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution ● The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. ● The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ○ A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings. ○ Hounding or hound training, which are akin to allowing legalized dogfighting, should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public. ● The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. ○ Despite Act 169, which mandates a wolf hunting season, the department can still restrict the implementation of lethal methods by setting minimal quotas, including a quota of '0' wolves, restricting timing and methods. ○ Several studies have proven a proactive non-lethal approach leads to better conflict mitigation. ○ Lethal management often fails to provide a long-term solution to wolf predation and has the least consistent success rates when compared to non-lethal practices. In addition, there is significant evidence showing that lethal wolf management may be less functionally effective at mitigating subsequent livestock losses than non-lethal deterrents. ● The plan should require the implementation of abatement measures as well as the use of non-lethal conflict minimization techniques by domestic animal owners for the latter to receive compensation for confirmed predation. ● The plan also runs contrary to public values towards wolves (and omits mention of such majority values from the plan), despite department surveys evidencing that the broad public cares about wolves as individuals (and not just for the viability of the population). Given the recent liberalization of killing wolves by the state, it would be incredibly informative to note majority support of the following reasons for opposing a regulated wolf hunting/trapping season (which are all omitted from the plan): opposition to specific methods of harvest like hounds (64%) or traps (70%), feelings that hunting wolves is unnecessary (62%) or culturally offensive to Native American tribes (57%). ○ All such reasons convey majority disagreement with practices currently promoted and endorsed by the legislature and the WDNR, and such a conflict between managers and the public should not only be acknowledged, but foregrounded and carefully considered in policy (instead of dismissed). ○ Such decisions to omit literature or downplay evidence (e.g., such as majority opposition to killing wolves and their reasons) are contrary to principles of scientific integrity (e.g., present all relevant scientific evidence to the public) as well as ethics (e.g., disguising ethical decisions, such as recreational wolf killing, as robustly supported by science). ● Conflicting agency objectives (e.g., optimizing public hunting and conflict mitigation) are not only not acknowledged, but even misunderstood as harmonious, against the body of scientific evidence. That culminates in the prioritization of consumptive values and policies; e.g., according to the body of scientific literature, use of lethal methods, and 2 especially public hunts, are contrary to most objectives relevant to: harm mitigation, the wellbeing of wolves, their ecological roles, and their non-exploitative enjoyment (i.e., Objectives A, B, D and F). ● There is a stark lack of consideration for individual wolves, wolf population health (including wellbeing), and measurable indicators for assessing any harms barring disease prevalence (e.g., accounting for cortisol levels or other stress hormones, measures of pair/pack persistence) ● There is an inappropriate understanding and consideration of tribal worldviews about wolves. Tribal worldviews of wolves are misconstrued as 'cultural benefits' tribes receive from the existence of a wolf population, when in fact tribal worldviews consider each individual wolf as a person and relative. Cultural respect and sensitivity towards such views, shared by many non-tribal members, demand the strict mitigation of lethal measures, especially recreational killing, as opposed to their current promotion in the plan. ● In general, all omissions of scientific literature, the arbitrary prioritization of policy objectives, the rhetoric of the plan and the dismissal of public	4	

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
				values and concerns for wolves point towards a biased, unscientific and instrumental view of wolves that promotes values contrary to broad public perspectives on wolves. ● 'SOM' wolf estimation methodology – From a recent critique: "The new methods sacrifice precision, but are believed to retain adequate accuracy and sensitivity to changing conditions for reliable decision-making. We review evidence for the accuracy, precision, and sensitivity of the new 'scaled occupancy model' (SOM) applied in Wisconsin. We conclude that the Wisconsin method would systematically overestimate wolf abundance by large (but currently incalculable) margins. Because Wisconsin, similar to other states, not only changed to unverified methods but also implemented widespread wolf killing, shortcomings in their estimates of wolf abundance may have far-reaching consequences for population viability and confidence in state wildlife managers. We discuss findings from Wisconsin alongside similar findings for other states' occupancy models being insensitive to human causes of mortality that have recently increased. Overall, Wisconsin's proposed method for estimating wolf abundance shows significant departures from best practices in scientific measurement. Verification will require independent replication and unbiased tests at multiple scales in multiple habitats under different human-induced mortality rates, and peer review before the new methods are considered reliable." (Treves & Santiago-Ávila, 2023)		
Lirael Armstrong	Most of it	No	I like that you are no longer using a number of 350 wolves as a goal. We need many more than 350 to have a healthy wolf population with family cohesion and a strong genetic pool. Wolves do so much to keep the entire ecosystem healthy.	There needs to be more stress on NON LETHAL means of dealing with wolves.	3	There is so much public support for wolves and this draft does not address that the majority of humans would like to protect wolves and see their numbers increase. For thousands of years before humans took their land, wolves kept the plant life and animal life healthy. Humans in 2023 know the value of wolves. This draft must reflect the values and desires of the majority of human population who want wolf protections extended and increased. Thank you for listening.
	Just the parts I am interested in	No	What I like: I appreciate the efforts of all WDNR staff involved in updating the state's wolf management plan. Although I believe the current plan needs significant updating (see next section), I recognize the efforts and improvements made to the previous plan, including: ● Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. ● There is much greater recognition of the ecological role of wolves ● The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves ● The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed)	What I don't like: ● The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on (see reference list below): ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution ● The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. ● The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ○ A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings. ○ Hounding or hound training, which are akin to allowing legalized dogfighting, should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public. Eric berg	Most of it	Yes	None of it,I don't like any of it	The fact that we can't figure a legitimate number to keep the population under control enough to keep the hounds,amd peoples pets amd livestock safe	2	
Mark	All of it	Yes	That we at least have a start here, not much else.	There is no cap in your plane, thats a must. The counties must have a say in the areas of higher populations. No indian reservation should control private land owner rights. The plan contains no trigger points of when control measures begin. Anytime a trigger would be hit, set measures need to occur, control measures. Lethal control is a must have tool.	1	Every county should be a zone, monitored and managed. Counties with zero population should not impose upon counties with population that require management. thee is room for wolves on the landscape, in a managable number, in areas of true wildnerness. Wolves have never co-existed with man, there will always be conflict. They are more prolific than the DNR wants to admit.
Nicole Hoekstera	Just the parts I am interested in	No		wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution	2	
	All of it	Yes	Non-numeric population goals	Continued focus on recreational killing as a depredations "tool." It isn't.	7	•Close areas where there are rare - to - no livestock depredations exclusive of people's dogs to recreational killing; •Stop allowing hound training and hound use in known/posted wolf territory; •Stop rewarding/reimbursing hounders for being stupid, cruel and inhumane; •Stop catering to the disproven, archaic fallacy that predators "need to be managed" where "managed" = killed •Recreational killing of wild canids = game farming. This is not good, humane, ethical policy, based on the best available science.
Liz	Most of it	No				Please provide further/increased protections for wolf populations by banning recreational killing and using non-lethal conflict interventions.
Bill Rademaker	Most of it	Yes	I do like the research portions and the need to continue to do research and attempt to have a somewhat accurate count of the wolf population as well as the prey they consume, especially white tailed deer.	I do understand the reasoning behind setting quotas by zone. However, I am concerned about the lack of any hard quota numbers in the plan - That makes it very difficult to support the plan. I am concerned that the quotas will be set way to low in this scenario. I also do not like the notion of restricting hunting permits to specific zones. If there are reasonably established harvest quotas for each zone, then you could restrict hunters to an initial zone, but then allow hunters to go to any zone statewide when the quota has been reached on their initial zone. In that way, the initial hunt will be a more disbursed quality hunt, and hunters will still have an opportunity to hunt in other zones if their zone quota is filled quickly. Without this flexibility, there is a likely possibility that some zones will be under harvested.	2	I have hunted in the northern 1/2 of the state all of my life. The deer hunting experience in the big woods has become very little more than a nature walk in recent years since the wolf and bear populations have been allowed to grow to outrageous levels. The only way to see any deer numbers at all is by baiting them - a practice that should be banned.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Mickey v. Br.	Just the parts I am interested in	No	- the former number of 350 wolves. has been dropped - better insight by recognizing the ecological role in keeping up an healthy environment by wolves - it's positive to include public surveys - stronger opposition to the massacre of these precious wildlife creatures - buffer zones, very important	- I don't see much of scientific referrals/literature about the wolf - why not refer to the effectiveness of non-lethal interventions! - wolves should be protected, NOT massacred, nor sadistically trapped! - no hounding! - no compensation for any livestock kill unless the owner can prove that he truly tried to protect his sheep/livestock!	4	I hope that respect for the wolf will be the headline. Murdering this magnificent creature is a sin
	Most of it	Yes	DNR required to have a harvest season	Population estimate is much higher than perceived, harvesting zones should be expanded, wolf-human conflicts are higher than reported, human safety not addressed enough,	1	People who have to live with wolves everyday should be given much more input into how wolves are managed than the people who are far removed from wolf occupied territory. We can live with wolves if we can manage to keep the population as originally intended at 350 wolves.
Alison James	Most of it	No	Nothing I believe.	Everything.	1	I kept thinking of the initial list of supporters of this plan. They read like a Who's Who in hunting and killing. This plan is justification for hunting and trying to exterminate wolves to the detriment of domestic livestock. Nothing more.
Evelyn McNeil Coltman	Most of it	No	Like that it recognizes ecological value of wolves and how they shape the environment as well as being shaped by the environment. Like that there will be buffer zones around tribal areas.	Did not like general acceptance that recreational killing is ok. Management should be non-lethal. Acceptance of recreational killing leads to tendency to overkill and promotes a general lack of reverence for the role of wolves. Hunting with dogs should be illegal. Indigenous people valued wolves as sacred and as individuals. Hunting wolves for sport does not. Should prioritize non-lethal approaches to wolf management with very little management expected. The public does not like hunting of wolves, and scientific evidence indicates that there is a very shallow tipping point from control to eradication when hunting wolves. Best not to do it at all. Just because I am not from Wisconsin does not mean that my comments should weigh less in the debate. Wolves belong to all of us - not just people in Wisconsin.	2	When hunting organizations pay dues for hunting that go directly to pay salaries of management entities, those management entities usually try to please the people who contribute to their salary. This arrangement is wrong. people who do not hunt or even those who do not believe at all in hunting should have an equal voice as well as an equal role in management of wildlife species - including wolves.
	All of it	No	The survival of wolves and being an important part of our ecosystem.	None	10	
	Just the parts I am interested in	Yes	Most none of it all prejudice against landowners that have to live with the problem	DNR uses based on incomplete information. Some units not even tracked and where is the lone wolf data!	2	The fact is latest wolf season closed in under two days
David	All of it	Yes			10	
	Just the parts I am interested in	Yes	None	Tools used to count wolfs	1	Not all units tracking done the same
Jared Brenner	I have not read any of the draft plan	No	I appreciate the efforts of all WDNR staff involved in updating the state's wolf management plan. Although I believe the current plan needs significant updating, Irecognize the efforts and improvements made to the previous plan, including: ● Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. ● There is much greater recognition of the ecological role of wolves. ● The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves. ● The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed).	The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on: ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing. ○ effectiveness of non-lethal interventions, especially relative to lethal ones. ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution. ● The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. ● The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ○ A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killing.	2	
Rick Mier	All of it	No	None it reads like it was drafted in the 1920s Wisconsin tourism would flourish if the whole State government wasn't so narrow minded	All of it Wisconsinettes need a updated Natural Resources	1	If Bear Hounders and Safari Int are paying for everything in Wisconsin by all means cater to them like you have been…Good Luck …
	Just the parts I am interested in	No	I genuinely appreciate the great efforts of all WDNR staff involved in updating the state's wolf management plan. Still, the current plan needs significant updating (see next section), but I want to recognize the efforts and improvements made to the previous plan, including: ● Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. ● There is much greater recognition of the ecological role of wolves ● The	The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature concerning ○ wolf ethology, sentience, sapience, sociability, agency and well-being; ○ effectiveness of non-lethal interventions, especially relative to lethal ones; ○ the impact of widespread killing on wolves' physiology, behavior, well-being, social dynamics, ecological relationships and evolution ● The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being	4	DON'T SLAUGHTER WOLVES!! The plan should prioritize wolf protections and concentrate solely on NON-LETHAL management of wolves in response to livestock conflicts to ensure ethical coexistence. ○ Despite Act 169, which mandates a wolf hunting season, the department can still restrict the implementation of lethal methods by setting minimal quotas, including a quota of '0' wolves, restricting timing and methods. ○ Several studies have proven a proactive non-lethal approach leads to better conflict mitigation. ○ Lethal management often fails to provide a long-term solution to wolf predation, and has the least consistent success rates when compared to non-lethal practices. In addition, there is

			inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves ● The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed)	more recent, numerous and of stronger inference. ● The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ○ A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings. Hounding or hound training, which are akin to allowing legalized dog fighting, should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public.		significant evidence showing that lethal wolf management may be less functionally effective at mitigating subsequent livestock losses than non-lethal deterrents. ● The plan should require the implementation of abatement measures as well as the use of non-lethal conflict minimization techniques by domestic animal owners for the latter to receive compensation for confirmed predation. ● The plan also runs contrary to public values towards wolves (and omits mention of such majority values from the plan), despite department surveys evidencing that the broad public cares about wolves as individuals (and not just for the viability of the population). Given the recent liberalization of killing wolves by the state, it would be incredibly informative to note majority support of the following reasons for opposing a regulated wolf hunting/trapping season (which are all omitted from the plan): opposition to specific methods of harvest like hounds (64%) or traps (70%), feelings that hunting wolves is unnecessary (62%) or culturally offensive to Native American tribes (57%). ○ All such reasons convey majority disagreement with practices currently promoted and endorsed by the legislature and the WDNR, and such a conflict between managers and the public should not only be acknowledged, but foregrounded and carefully considered in policy (instead of dismissed). ○ Such decisions to omit literature or downplay evidence (e.g., such as majority opposition to killing wolves and their reasons) are contrary to principles of scientific integrity (e.g., present all relevant scientific evidence to the public) as well as ethics (e.g., disguising ethical decisions, such as recreational wolf killing,as robustly supported by science). ● Conflicting agency objectives (e.g., optimizing public hunting and conflict mitigation) are not only not acknowledged, but even misunderstood as harmonious, against the body of scientific evidence. That culminates in the prioritization of consumptive values and policies; e.g., according to the body of scientific literature, use of lethal methods, and 2 especially public hunts, are contrary to most objectives relevant to: harm mitigation, the well-being of wolves, their ecological roles, and their non-exploitative enjoyment (i.e., Objectives A, B, D and F). ● There is a stark lack of consideration for individual wolves, wolf population health (including well-being), and measurable indicators for assessing any harms barring disease prevalence (e.g., accounting for cortisol levels or other stress hormones, measures of pair/pack persistence) ● There is an inappropriate understanding and consideration of tribal worldviews about wolves. Tribal worldviews of wolves are misconstrued as 'cultural benefits' tribes receive from the existence of a wolf population, when in fact tribal worldviews consider each individual wolf as a person and relative. Cultural respect and sensitivity towards such views, shared by many non-tribal members, demand the strict mitigation of lethalmeasures, especially recreational killing, as opposed to their current promotion in the plan. ● In general, all omissions of scientific literature, the arbitrary prioritization of policy objectives, the rhetoric of the plan and the dismissal of public values and concerns for wolves point towards a biased, unscientific and instrumental view of wolves that promotes values contrary to broad public perspectives on wolves. ● 'SOM' wolf estimation methodology – From a recent critique: "The new methods sacrifice precision, but are believed to retain adequate accuracy and sensitivity to changing conditions for reliable decision-making. We review evidence for the accuracy, precision, and sensitivity of the new 'scaled occupancy model' (SOM) applied in Wisconsin. We conclude that the Wisconsin method would systematically overestimate wolf abundance by large (but currently incalculable) margins. Because Wisconsin, similar to other states, not only changed to unverified methods but also implemented widespread wolf killing, shortcomings in their estimates of wolf abundance may have far-reaching consequences for population viability and confidence in state wildlife managers. We discuss findings from Wisconsin alongside similar findings for other states' occupancy models being insensitive to human causes of mortality that have recently increased. Overall, Wisconsin's proposed method for estimating wolf abundance shows significant departures from best practices in scientific measurement. Verification will require independent replication and unbiased tests at multiple scales in multiple habitats under different human-induced mortality rates, and peer review before the new methods are considered reliable." (Treves & Santiago-Ávila, 2023)
[redacted]	Most of it	Yes	N/A	I'm not interested in all the scientific data and/or public opinions from people that don't have a clue	1	First off we need to have an idea how many an area can support and then come up with a realistic population goal before we can set up a management plan.
Irene Roos	All of it	No				please save our wildlife

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Susanna	All of it	No	It was a typical report	Though not mentioned specifically once again officials are toadying to special interest groups. Who came up with "nutshells?"	1	It looks as though there is minimal improvement, but it doesn't reflect majority public ethics. It doesn't reflect the best science with regard to management. It certainly doesn't reflect ethics - AT ALL. Clearly, you are toadying to groups who want to bring them to extinction in the wild. Also, recreational killing is a very repugnant idea.
Ron McGill	All of it	No	I appreciate that there are some improvements in protection of wolfs, but it does not go nearly far enough.	I just like that this plant does not protect wolves enough at. We need to see iincreased protections for wolves, non-lethal conflict interventions and a ban on recreational killing.	1	I write to urge increasing protections for wolves, requiring non-lethal conflict interventions and banning recreational killing!
	Just the parts I am interested in	No	We appreciate the efforts of all WDNR staff involved in updating the state's wolf management plan. Although we believe the current plan needs significant updating (see next section), we recognize the efforts and improvements made to the previous plan, including: ● Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. ● There is much greater recognition of the ecological role of wolves ● The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves ● The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed)	The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on (see reference list below): ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution ● The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. ● The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ○ A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings. ○ Hounding or hound training, which are akin to allowing legalized dogfighting, should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public. ● The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. ○ Despite Act 169, which mandates a wolf hunting season, the department can still restrict the implementation of lethal methods by setting minimal quotas, including a quota of '0' wolves, restricting timing and methods. ○ Several studies have proven a proactive non-lethal approach leads to better conflict mitigation. ○ Lethal management often fails to provide a long-term solution to wolf predation and has the least consistent success rates when compared to non-lethal practices. 				benefits' tribes receive from the existence of a wolf population, when in fact tribal worldviews consider each individual wolf as a person and relative. Cultural respect and sensitivity towards such views, shared by many non-tribal members, demand the strict mitigation of lethal measures, especially recreational killing, as opposed to their current promotion in the plan. ● In general, all omissions of scientific literature, the arbitrary prioritization of policy objectives, the rhetoric of the plan and the dismissal of public values and concerns for wolves point towards a biased, unscientific and instrumental view of wolves that promotes values contrary to broad public perspectives on wolves. ● 'SOM' wolf estimation methodology – From a recent critique: "The new methods sacrifice precision, but are believed to retain adequate accuracy and sensitivity to changing conditions for reliable decision-making. We review evidence for the accuracy, precision, and sensitivity of the new 'scaled occupancy model' (SOM) applied in Wisconsin. We conclude that the Wisconsin method would systematically overestimate wolf abundance by large (but currently incalculable) margins. Because Wisconsin, similar to other states, not only changed to unverified methods but also implemented widespread wolf killing, shortcomings in their estimates of wolf abundance may have far-reaching consequences for population viability and confidence in state wildlife managers. We discuss findings from Wisconsin alongside similar findings for other states' occupancy models being insensitive to human causes of mortality that have recently increased. Overall, Wisconsin's proposed method for estimating wolf abundance shows significant departures from best practices in scientific measurement. Verification will require independent replication and unbiased tests at multiple scales in multiple habitats under different human-induced mortality rates, and peer review before the new methods are considered reliable." (Treves & Santiago-Ávila, 2023)

Silamith	All of it	No	We appreciate the efforts of all WDNR staff involved in updating the state's wolf management plan. Although we believe the current plan needs significant updating, we recognize the efforts and improvements made to the previous plan, including: ● Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. ● There is much greater recognition of the ecological role of wolves ● The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves ● The adoption of proposed buffer zones around tribal reservations	● The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on (see reference list below): ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution ● The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. ● The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ○ A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings. ○ Hounding or hound training, which are akin to allowing legalized dogfighting, should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public. ● The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. ○ Despite Act 169, which mandates a wolf hunting season, the department can still restrict the implementation of lethal methods by setting minimal quotas, including a quota of '0' wolves, restricting timing and methods. ○ Several studies have proven a proactive non-lethal approach leads to better conflict mitigation. ○ Lethal management often fails to provide a long-term solution to wolf predation and has the least consistent success rates when compared to non-lethal practices. In addition, there is significant evidence showing that lethal wolf management may be less functionally effective at mitigating subsequent livestock losses than non-lethal deterrents. ● The plan should require the implementation of abatement measures as well as the use of non-lethal conflict minimization techniques by domestic animal owners for the latter to receive compensation for confirmed predation. ● The plan also runs contrary to public values towards wolves (and omits mention of such majority values from the plan), despite department surveys evidencing that the broad public cares about wolves as individuals (and not just for the viability of the population). Given the recent liberalization of killing wolves by the state, it would be incredibly informative to note majority support of the following reasons for opposing a regulated wolf hunting/trapping season (which are all omitted from the plan): opposition to specific methods of harvest like hounds (64%) or traps (70%), feelings that hunting wolves is unnecessary (62%) or culturally offensive to Native American tribes (57%). ○ All such reasons convey majority disagreement with practices currently promoted and endorsed by the legislature and the WDNR, and such a conflict between managers and the public should not only be acknowledged, but foregrounded and carefully considered in policy (instead of dismissed). ○ Such decisions to omit literature or downplay evidence (e.g., such as majority opposition to killing wolves and their reasons) are contrary to principles of scientific integrity (e.g., present all relevant scientific evidence to the public) as well as ethics (e.g., disguising ethical decisions, such as recreational wolf killing, as robustly supported by science). ● Conflicting agency objectives (e.g., optimizing public hunting and conflict mitigation) are not only not acknowledged, but even misunderstood as harmonious, against the body of scientific evidence. That culminates in the prioritization of consumptive values and policies; e.g., according to the body of scientific literature, use of lethal methods, and 2 especially public hunts, are contrary to most objectives relevant to: harm mitigation, the wellbeing of wolves, their ecological roles, and their non-exploitative enjoyment (i.e., Objectives A, B, D and F).	2	Follow the science, research and data of qualified professionals.
Frances Goff	I have not read any of the draft plan	No	Coming from Management perspective, as opposed to eradication	You can't manage wolves as you do domestic animals	5	someone who knows better has failed to define the problem
Darlene McNulty	Just the parts I am interested in	Yes	Like the use of science to develop and adjust the plan.	I'm really against the use of dogs to hunt any animal. It seems as though most of the dogs killed were hunting dogs, not ordinary pets. It also seems as though a very large number of dollars is paid out for the lost of a hunting dog. If hunters insist on using dogs, they should not expect any payment if a dog is killed by an animal that is protecting it's territory and pack.	8

	Most of it	Yes	none of the plan. what has happened to " scientifically sound" management.	NO management goal of wolf numbers.	2	As a land owner in Adams county i am very disturbed by the lack of due diligence as i see on the part of the DNR to come up with a viable plan for wolf management . With all of the "scientifically sound" data you have how is it that you cannot set a management goal for wolf population? How is it that the DNR denies any sizeable numbers of wolfs in an area until the land owners send in current pictures and then you state a new designated pack name for wolves. The same with the Black bear. I as a land owner and hunter am tired of reviewing my spring/early summer game camera pictures and getting wolves carry fawns past the cameras. 3 in 2021 and 2 in 2022. I have these cameras on 40 acres, what is happening in the remaining acreage around my property. lets put a "scientifically sound" program with numbers together and actually manage our resources.

Tracy	Most of it	No	That it recognizes the ecological importance of wolves. And there is a greater acceptance of wolves by the public	More emphasis needs to be placed on non-lethal methods of scaring away wolves. Also the barbaric practice of killing off a family member only leads to worse behavior by the remaining pack.	2	We can't keep killing these incredible predators. People spend thousands of $$$ to go to places like Yellowstone just to see them. They are a vital part of our ecosystem.

Juanita	I have not read any of the draft plan	No	It is good that some of it has improved.Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. ● There is much greater recognition of the ecological role of wolves ● The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves ● The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed)	That it continues to include killing wolves as an option and... The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on (see reference list below): ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution ● The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. ● The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ○ A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings. ○ Hounding or hound training, which are akin to allowing legalized dogfighting, should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public.	4	Conflicting agency objectives (e.g., optimizing public hunting and conflict mitigation) are not only not acknowledged, but even misunderstood as harmonious, against the body of scientific evidence. That culminates in the prioritization of consumptive values and policies; e.g., according to the body of scientific literature, use of lethal methods, and 2 especially public hunts, are contrary to most objectives relevant to: harm mitigation, the wellbeing of wolves, their ecological roles, and their non-exploitative enjoyment (i.e., Objectives A, B, D and F). ● There is a stark lack of consideration for individual wolves, wolf population health (including wellbeing), and measurable indicators for assessing any harms barring disease prevalence (e.g., accounting for cortisol levels or other stress hormones, measures of pair/pack persistence) ● There is an inappropriate understanding and consideration of tribal worldviews about wolves. Tribal worldviews of wolves are misconstrued as 'cultural benefits' tribes receive from the existence of a wolf population, when in fact tribal worldviews consider each individual wolf as a person and relative. Cultural respect and sensitivity towards such views, shared by many non-tribal members, demand the strict mitigation of lethal measures, especially recreational killing, as opposed to their current promotion in the plan. ● In general, all omissions of scientific literature, the arbitrary prioritization of policy objectives, the rhetoric of the plan and the dismissal of public values and concerns for wolves point towards a biased, unscientific and instrumental view of wolves that promotes values contrary to broad public perspectives on wolves. ● 'SOM' wolf estimation methodology – From a recent critique: "The new methods sacrifice precision, but are believed to retain adequate accuracy and sensitivity to changing conditions for reliable decision-making. We review evidence for the accuracy, precision, and sensitivity of the new 'scaled occupancy model' (SOM) applied in Wisconsin. We conclude that the Wisconsin method would systematically overestimate wolf abundance by large (but currently incalculable) margins. Because Wisconsin, similar to other states, not only changed to unverified methods but also implemented widespread wolf killing, shortcomings in their estimates of wolf abundance may have far-reaching consequences for population viability and confidence in state wildlife managers. We discuss findings from Wisconsin alongside similar findings for other states' occupancy models being insensitive to human causes of mortality that have recently increased. Overall, Wisconsin's proposed method for estimating wolf abundance shows significant departures from best practices in scientific measurement. Verification will require independent replication and unbiased tests at multiple scales in multiple habitats under different human-induced mortality rates, and peer review before the new methods are considered reliable." (Treves & Santiago-Ávila, 2023)
Magnus Kinder	All of it	Yes	What we like: We appreciate the efforts of all WDNR staff involved in updating the state's wolf management plan. Although we believe the current plan needs significant updating (see next section), we recognize the efforts and improvements made to the previous plan, including: ● Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. ● There is much greater recognition of the ecological role of wolves ● The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves ● The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed)	What we don't like: ● The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on (see reference list below): ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution ● The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. ● The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ○ A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings. ○ Hounding or hound training, which are akin to allowing legalized dogfighting, should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public. ● The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. ○ Despite Act 169, which mandates a wolf hunting season, the department can still restrict the implementation of lethal methods by setting minimal quotas, including a quota of '0' wolves, restricting timing and methods. ○ Several studies have proven a proactive non-lethal approach leads to better conflict mitigation. ○ Lethal management often fails to provide a long-term solution to wolf predation and has the least consistent success rates when compared to non-lethal practices. In addition, there is significant evidence showing that lethal wolf management may be less functionally effective at mitigating subsequent livestock losses than non-lethal deterrents. ● The plan should require the implementation of abatement measures as well	2	PROTECT ESSENTIAL WOLVES at all costs. Use science based studies and NON-LETHAL methods only!

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
				as the use of non-lethal conflict minimization techniques by domestic animal owners for the latter to receive compensation for confirmed predation. ● The plan also runs contrary to public values towards wolves (and omits mention of such majority values from the plan), despite department surveys evidencing that the broad public cares about wolves as individuals (and not just for the viability of the population). Given the recent liberalization of killing wolves by the state, it would be incredibly informative to note majority support of the following reasons for opposing a regulated wolf hunting/trapping season (which are all omitted from the plan): opposition to specific methods of harvest like hounds (64%) or traps (70%), feelings that hunting wolves is unnecessary (62%) or culturally offensive to Native American tribes (57%). ○ All such reasons convey majority disagreement with practices currently promoted and endorsed by the legislature and the WDNR, and such a conflict between managers and the public should not only be acknowledged, but foregrounded and carefully considered in policy (instead of dismissed). ○ Such decisions to omit literature or downplay evidence (e.g., such as majority opposition to killing wolves and their reasons) are contrary to principles of scientific integrity (e.g., present all relevant scientific evidence to the public) as well as ethics (e.g., disguising ethical decisions, such as recreational wolf killing, as robustly supported by science). ● Conflicting agency objectives (e.g., optimizing public hunting and conflict mitigation) are not only not acknowledged, but even misunderstood as harmonious, against the body of scientific evidence. That culminates in the prioritization of consumptive values and policies; e.g., according to the body of scientific literature, use of lethal methods, and 2 especially public hunts, are contrary to most objectives relevant to: harm mitigation, the wellbeing of wolves, their ecological roles, and their non-exploitative enjoyment (i.e., Objectives A, B, D and F). ● There is a stark lack of consideration for individual wolves, wolf population health (including wellbeing), and measurable indicators for assessing any harms barring disease prevalence (e.g., accounting for cortisol levels or other stress hormones, measures of pair/pack persistence) ● There is an inappropriate understanding and consideration of tribal worldviews about wolves. 			methods are considered reliable." (Treves & Santiago-Ávila, 2023)			
Serhii Pavlinski	All of it	Yes	What we like: We appreciate the efforts of all WDNR staff involved in updating the state's wolf management plan. Although we believe the current plan needs significant updating (see next section), we recognize the efforts and improvements made to the previous plan, including: ● Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. ● There is much greater recognition of the ecological role of wolves ● The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves ● The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed)	What we don't like: ● The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on (see reference list below): ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution ● The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. ● The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ○ A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings. ○ Hounding or hound training, which are akin to allowing legalized dogfighting, should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public. ● The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. ○ Despite Act 169, which mandates a wolf hunting season, the department can still restrict the implementation of lethal methods by setting minimal quotas, including a quota of '0' wolves, restricting timing and methods. ○ Several studies have proven a proactive non-lethal approach leads to better conflict mitigation. ○ Lethal management often fails to provide a long-term solution to wolf predation and has the least consistent success rates when compared to non-lethal	2	Let's PROTECT WOLVES because they are absolutely ESSENTIAL and VITAL to a healthy ecosystem.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
				practices. In addition, there is significant evidence showing that lethal wolf management may be less functionally effective at mitigating subsequent livestock losses than non-lethal deterrents. ● The plan should require the implementation of abatement measures as well as the use of non-lethal conflict minimization techniques by domestic animal owners for the latter to receive compensation for confirmed predation. ● The plan also runs contrary to public values towards wolves (and omits mention of such majority values from the plan), despite department surveys evidencing that the broad public cares about wolves as individuals (and not just for the viability of the population). Given the recent liberalization of killing wolves by the state, it would be incredibly informative to note majority support of the following reasons for opposing a regulated wolf hunting/trapping season (which are all omitted from the plan): opposition to specific methods of harvest like hounds (64%) or traps (70%), feelings that hunting wolves is unnecessary (62%) or culturally offensive to Native American tribes (57%). ○ All such reasons convey majority disagreement with practices currently promoted and endorsed by the legislature and the WDNR, and such a conflict between managers and the public should not only be acknowledged, but foregrounded and carefully considered in policy (instead of dismissed). ○ Such decisions to omit literature or downplay evidence (e.g., such as majority opposition to killing wolves and their reasons) are contrary to principles of scientific integrity (e.g., present all relevant scientific evidence to the public) as well as ethics (e.g., disguising ethical decisions, such as recreational wolf killing, as robustly supported by science). ● Conflicting agency objectives (e.g., optimizing public hunting and conflict mitigation) are not only not acknowledged, but even misunderstood as harmonious, against the body of scientific evidence. That culminates in the prioritization of consumptive values and policies; e.g., according to the body of scientific literature, use of lethal methods, and 2 especially public hunts, are contrary to most objectives relevant to: harm mitigation, the wellbeing of wolves, their ecological roles, and their non-exploitative enjoyment (i.e., Objectives A, B, D and F). ● There is a stark lack of consideration for individual wolves, wolf population health (including wellbeing), and measurable indicators for assessing any harms barring disease prevalence (e.g., accounting for cortisol levels or other stress hormones, measures of pair/pack persistence) ● There is an inappropriate understanding and consideration of tribal worldviews about wolves. Tribal worldviews of wolves are misconstrued as 'cultural benefits' tribes receive from the existence of a wolf population, when in fact tribal worldviews consider each individual wolf as a person and relative. Cultural respect and sensitivity towards such views, shared by many non-tribal members, demand the strict mitigation of lethal measures, especially recreational killing, as opposed to their current promotion in the plan. ● In general, all omissions of scientific literature, the arbitrary prioritization of policy objectives, the rhetoric of the plan and the dismissal of public values and concerns for wolves point towards a biased, unscientific and instrumental view of wolves that promotes values contrary to broad public perspectives on wolves. ● 'SOM' wolf estimation methodology – From a recent critique: "The new methods sacrifice precision, but are believed to retain adequate accuracy and sensitivity to changing conditions for reliable decision-making. We review evidence for the accuracy, precision, and sensitivity of the new 'scaled occupancy model' (SOM) applied in Wisconsin. We conclude that the Wisconsin method would systematically overestimate wolf abundance by large (but currently incalculable) margins. Because Wisconsin, similar to other states, not only changed to unverified methods but also implemented widespread wolf killing, shortcomings in their estimates of wolf abundance may have far-reaching consequences for population viability and confidence in state wildlife managers. We discuss findings from Wisconsin alongside similar findings for other states' occupancy models being insensitive to human causes of mortality that have recently increased. Overall, Wisconsin's proposed method for estimating wolf abundance shows significant departures from best practices in scientific measurement. Verification will require independent replication and unbiased tests at multiple scales in multiple habitats under different human-induced mortality rates, and peer review before the new methods are considered reliable." (Treves & Santiago-Ávila, 2023)

Laura Long	All of it	No	WI Draft WMP Talking Points What we like: We appreciate the efforts of all WDNR staff involved in updating the state's wolf management plan. Although we believe the current plan needs significant updating (see next section), we recognize the efforts and improvements made to the previous plan, including: ● Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. ● There is much greater recognition of the ecological role of wolves ● The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves ● The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed) What we don't like: ● The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on (see reference list below): ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution ● The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. ● The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ○ A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings.	WI Draft WMP Talking Points What we like: We appreciate the efforts of all WDNR staff involved in updating the state's wolf management plan. Although we believe the current plan needs significant updating (see next section), we recognize the efforts and improvements made to the previous plan, including: ● Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. ● There is much greater recognition of the ecological role of wolves ● The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves ● The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed) What we don't like: ● The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on (see reference list below): ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution ● The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. ● The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ○ A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings.	1	Wolves have an essential role in the existence of healthy ecosystems and biodiversity. Wolves also have inherent value and fundamental rights to live free of human-caused suffering and also have a right to their lives, which must only be taken in the case of EXTREME circumstances where all non-lethal methods to reduce conflict have been implemented and failed.
	Just the parts I am interested in	No	Although the plan contains improvements compared to previous versions, it is far from reflecting the best available science, ethics and broad public values that should guide wolf policy and coexistence.	Although the plan contains improvements compared to previous versions, it is far from reflecting the best available science, ethics and broad public values that should guide wolf policy and coexistence.	3	Although the plan contains improvements compared to previous versions, it is far from reflecting the best available science, ethics and broad public values that should guide wolf policy and coexistence.
	All of it	Yes		I agree with the regulation of hunting, but we need to have a season every year. There are may too many wolves in Northern Wisconsin. When you see more wolves than deer during the rifle season, something is really wrong.	1	The state of Wisconsins estimate to how many wolves is way off. Please reconsider opening up hunting again to help control them and bring back our deer herd
T Yazdi	Most of it	No	- That wolves in Wisconsin will no longer be managed by reference to the old numerical goal of 350 wolves. - That there is much greater recognition of the ecological role of wolves - The inclusion of a social survey, noting the increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves - The adoption of proposed buffer zones around tribal reservations	- The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on: - wolf ethology, sentience, sapience, sociability, agency and wellbeing - effectiveness of non-lethal interventions, especially relative to lethal ones - the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution - The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. - The plan should STRICTLY curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. - A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings.	4	Thank you for trying to make it possible for wolves to survive and hopefully thrive, in Wisconsin and in the entire country.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
	I have not read any of the draft plan	No	Help wolves	More specific	6	Leave wolves alone
Craig D Butler	Most of it	Yes	I can't say I like any element	There needs to be a population goal stated.	3	The plan needs to be science based and not in anyway political!
	All of it	Yes	None	Wolves are not being managed in Wisconsin. There is zero trust amongst property owners and deer hunters with the WI DNR regarding wolf management.	1	We regularly have wolves at our Sawyer county hunting shack. They approach with little caution. They have approached us while hunting with no fear. They are not being managed. Instead the DNR pretend their hands are tied by Federal regulations and court rulings.
	Most of it	No	Wolves are essential to a healthy ecosystem, which was acknowledged. Overall, the general public has an affinity for wolves.	The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. Anything less than that is unethical, unnecessary and barbaric. Non-lethal methods should be used to deal with ALL wild animals, always.	4	My preference is that you have staff or volunteers set up outside a grocery store, Walmart/Target, or gas station and take a survey of regular people and see what the consensus is. I strongly believe that most people want to see wolves protected. There's a whole lot of folks who don't consider themselves activists or feel like "you can't fight city hall", etc so they don't take the time to do things like what I'm doing right now. This is an important issue and as such, your organization has a responsibility to find out how people truly feel instead of letting special interests (hunters, trappers) control the narrative.
Mike Reilly	Just the parts I am interested in	Yes	Depredation on Livestock, Domestic Pets and Hunting Dogs.	Buffer zone around Reservations No Set Number on Population	1	When The Hunters in This State Agreed to Reintroduce The Wolf We Had a Goal of 350 Because We New if you Don't We Would End up With What We have Now, Farmers,Ranchers and Property owners Loosing out
Adam Smith	Most of it	No	Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. There is much greater recognition of the ecological role of wolves. The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves. The adoption of proposed buffer zones around tribal reservations.	The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on: * wolf ethology, sentience, sapience, sociability, agency and wellbeing; * effectiveness of non-lethal interventions, especially relative to lethal ones; and * the impact of widespread killing on wolves' physiology, behaviour, wellbeing, social dynamics, ecological relationships and evolution These scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan which runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. The plan should curtail strictly any lethal management of wolves except in extremely rare circumstances of immediate defence of life. A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings. Hounding or hound training should be illegal or, at the very least, severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public. The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. Despite Act 169, which mandates a wolf hunting season, the department can still restrict the implementation of lethal methods by setting minimal quotas, including a quota of '0' wolves, restricting timing and methods. Several studies have proven a proactive non-lethal approach leads to better conflict mitigation. Lethal management often fails to provide a long-term solution to wolf predation and has the least consistent success rates when compared to non-lethal practices. In addition, there is significant evidence showing that lethal wolf management may be less functionally effective at mitigating subsequent livestock losses than non-lethal deterrents. The plan should require the implementation of abatement measures as well as the use of non-lethal conflict minimization techniques by domestic animal owners for the latter to receive compensation for confirmed predation. The plan runs contrary to public values towards wolves (and omits mention of such majority values from the plan), despite department surveys evidencing that the broad public cares about wolves as individuals (and not just for the viability of the population). Given the recent liberalization of killing wolves by the state, it would be informative to note majority support of the following reasons for opposing a regulated wolf hunting/trapping season (which are all omitted from the plan): opposition to specific methods of harvest like hounds (64%) or traps (70%), feelings that hunting wolves is unnecessary (62%) or culturally offensive to Native American tribes (57%). All such reasons convey majority disagreement with practices currently promoted and endorsed by the legislature and the WDNR, and such a conflict between managers and the public should not only be acknowledged, but foregrounded and carefully considered in policy (instead of dismissed). Such decisions to omit literature or downplay evidence (e.g.	5	

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
				such as majority opposition to killing wolves and their reasons) are contrary to principles of scientific integrity (e.g. present all relevant scientific evidence to the public) as well as ethics (e.g. disguising ethical decisions, such as recreational wolf killing, as robustly supported by science). Conflicting agency objectives (e.g. optimizing public hunting and conflict mitigation) are not acknowledged and misunderstood as harmonious, against the body of scientific evidence. That culminates in the prioritization of consumptive values and policies; e.g. according to the body of scientific literature, use of lethal methods, and especially public hunts, are contrary to most objectives relevant to: harm mitigation, the wellbeing of wolves, their ecological roles, and their non-exploitative enjoyment (i.e. Objectives A, B, D and F). There is a lack of consideration for individual wolves, wolf population health (including wellbeing) and measurable indicators for assessing any harms barring disease prevalence (e.g. accounting for cortisol levels or other stress hormones, measures of pair/pack persistence). There is an inappropriate understanding and consideration of tribal worldviews about wolves. Tribal worldviews of wolves are misconstrued as 'cultural benefits' tribes receive from the existence of a wolf population, when in fact tribal worldviews consider each individual wolf as a person and relative. Cultural respect and sensitivity towards such views, shared by many non-tribal members, demand the strict mitigation of lethal measures, especially recreational killing, as opposed to their current promotion in the plan. In general, all omissions of scientific literature, the arbitrary prioritization of policy objectives, the rhetoric of the plan and the dismissal of public values and concerns for wolves point towards a biased, unscientific and instrumental view of wolves that promotes values contrary to broad public perspectives on wolves. 'SOM' wolf estimation methodology – From a recent critique: "The new methods sacrifice precision, but are believed to retain adequate accuracy and sensitivity to changing conditions for reliable decision-making. We review evidence for the accuracy, precision, and sensitivity of the new 'scaled occupancy model' (SOM) applied in Wisconsin. We conclude that the Wisconsin method would systematically overestimate wolf abundance by large (but currently incalculable) margins. Because Wisconsin, similar to other states, not only changed to unverified methods but also implemented widespread wolf killing, shortcomings in their estimates of wolf abundance may have far-reaching consequences for population viability and confidence in state wildlife managers. We discuss findings from Wisconsin alongside similar findings for other states' occupancy models being insensitive to human causes of mortality that have recently increased. Overall, Wisconsin's proposed method for estimating wolf abundance shows significant departures from best practices in scientific measurement. Verification will require independent replication and unbiased tests at multiple scales in multiple habitats under different human-induced mortality rates, and peer review before the new methods are considered reliable." (Treves & Santiago-Ávila, 2023).		
John Bush	All of it	Yes	The counting method would be ok if all areas were counted.	The fact that there is not a number of wolves for the management plan to aim for. The buffer zone around reservations takes up private land and is too large.	1	The plan looks like it was written by a bunch of bureaucrats that expended much effort but produced very little that farmers, land owners and hunters would like. There was a question in the draft about trusting the DNR. Since Gov Evers came into office the DNR and The Natural Resources Board along with the Conservation Congress have not been cooperating and that makes for a zero trust situation. I hate to send you all back to work if this is what will come out of it but something better needs to happen. I don't think anyone want the wolves to go away again but the state was promised a number of 350. Make it happen.
	All of it	Yes	research as related to population...backstory	most	1	I feel there should be populations to populate tribal lands. the packs that leave tribal lands should be eliminated. No reason at all to have wolves determine game populations, property valuations and recreationaly use of private and state land..As state land is the peoples
Victoria Blach	Most of it	Yes	Education on wolf population, area of population, personal preventative measures for protecting domesticated animals.	Wolf conflict section is very subjective and does not appear that there is enough data on real danger to contained domestic animals and humans.	1	The last "harvest" was a disaster. Very little control over the depopulation of the wolf and holding it at a time when females are pregnant or giving birth is ridiculous. You can not compare the population of deer, elk or even bear with a wolf population. Personal responsibility for pets should be taken seriously and using hunting dogs for other harvests such as bear only skews the data for a wolf attack.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
	Most of it	Yes	not much at all. I for one do not believe much of the statistics that are in there. Using data from foreign countries in my opinion is useless. They have an entirely different mentality on hunting and animals and in my opinion its because they rarely encounter any animals in a truly wild environment, kind of like alot of the bigger city animal activist groups	The amount of people that were surveyed about wolves. I am a hunter and have never meet a hunter who has taken a wolf survey. I dont feel like people who never encounter wildlife in the woods, or dont own land where the wolves live should have much to say about wolf populations. Has anyone ever heard someone say they bought hunting land for wolf packs? I hunt in northern Marinette county where there is an abundance of wolves, and over the last 25 years there is less and less small game, and deer on the landscape up there. The last few years even the amount of song birds seems to be dwindling. You tell me that the wolves feed on the sick and weak, well dont the rest of the predators do the same? Wolves, bear, coyotes, and bobcats or do wolves only clean up the sick and weak? Even the once abundant coyote populations seem to be less. Its rare to hear coyote packs howling in our area when the wolve numbers are higher....does that mean less coyotes now or they are getting smarter to survive? Our deer populations are extremely low so why let the apex predator run unmanaged? Lets look at the deer per square mile population, and then take into account the various predator populations in those areas, and then throw in the number of hunters per acre in that area and see how many deer are left for hunters, and viewers Every year we lose more and more land to development so how can we keep increasing the predator populations? We dont discuss the population of wolves in relation to the amount of truely suitable wolf habitat, and then include the deer population in that area. If the deer is the #1 hunted animal why aren't we spending more money to get deer populations up higher. Lets take the money spent fixing wolf issues and use it to improve whitetail habitat on public land and not rely on the private landowner to do that kind of thing? Controlled burns, better tree plantings, creation of planned types of bedding and feeding cover etc. As a person that pays for hunting and fishing priviledges I should have more say than someone who does not pay! If you dont pay the same taxes and amount of voluntary donations as I do through license fees and sporting goods taxes etc., then your opinion doesn't matter as much. Why should you not pay and I do and you get the same amount of say in the matter. As far as activists groups the same goes.....if they are not putting money in to maintain the landscape to support those types of animal and the animals themselves they should not have a say. Just because they pull on someones heartstrings and raise money for lawyers does not make it right for them to control what needs to be controlled by sound science and what people are paying for.	1	
tom savage	Most of it	Yes	Being scientific	The plan is to conveluted.It's not black or white to me	2	The draft plan is like this response format. why do have to do or say ten things before you get the crux, of it. I don't believe what I say will matter in the scheme of things. I can only imagine the amount of work that went into this.To me the plan is to watered down because I believe It tries to palcate to all stake holders. In my world there are winners and losers. Not that ,that is what the outcome of a wolf plan should be. You can study this survey and or wolf population dynamics to death. Set a goal, pick a number, see if you pass or fail. Looks like wolves are here to stay wether you like it or not. This plan does not support my political affliation, my belief of the creation story, or my belief of what's in the wolves best interest as whole moving forward. Thank-you for an opportunity to express my thoughts.
	Just the parts I am interested in	Yes	good to curb the harms from trophy hunting & trapping wolves but the quotas in the 'subzones 1B and 2B' should be ZERO wolf numbers should be self-regulating and genetically diverse with no numerical limit. Put all info about wolves on your website, TRANSPARENCY good to manage 'chronic wolf conflicts' individually	do NOT train hounds for wolf managment, it's going to cause dogfights and social chaos for wolves. Wolves need federal protection from Endangered Species Act, NOT trophy hunts Objective C, benefits from Wolf population, should emphasize need for an APEX Predator (wolf) in the ecosystem, not trophy hunts.	1	
	Most of it	Yes			6	
Rural Resident	All of it	Yes	I am not comfortable that the plan considers rural citizens and living with wolves	I don't see that we will manage ag areas for no wolves as we did previously. We never Managed per our stated plan in the past. Constant interference from groups and individuals using the courts	2	The Conservation Congress had agreed to 350 wolves by vote of congress voters. The courts have ignored the fact that farmers and sportsman are bearing the cost and adjustments to the lives caused by the increasing wolf population.
	Most of it	Yes		Not having a measurable goal. We are currently way over the past goal of 350 and we have issues. We need a numerical goal to know where we are at.	1	We need an adopted plan in place ASAP, so that we can implement management practices as soon as they are delisted by the Federal Govt!!
Mark McGuire	Most of it	Yes		I dislike trapping and hunting of wolves for sport. As a cabin owner in Port Wing Wi, and a deer hunter, I like the ecological role that wolves play in the forest and think any hunting and trapping seasons will be heavy handed, lightly regulated and result in a reduced wolf population	2	

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
James N Werner	Just the parts I am interested in	Yes	That there may be a hunting and trapping season in the furure. That farmers and ranchers are some what compensated for the loses of there livestock.	There are no population goal in the plan. The goal should be 350 for the state. There is to wide of a low harvest area around resverations.	3	The management plan is too vague and open to interpretation. The plan is not writen to keep wovles being managed at a reasonable level by hunting and trapping
Lee Sensenbrenner	Most of it	Yes	I thought it was interesting to see all the data on conflicts, depredation and where wolves are found -- far further south than I'd imagined. It seems like a well thought out, thorough draft that makes clear what is statutorily required and what the aims of wolf conservation are.	I don't know how you dislike information. I'd wish more people in Wisconsin would support a wolf population, but I don't like that you report what surveys show.	9	Thank you for your ongoing efforts to arrive at scientific approaches that protect the wolf population and respect the people who have varying views about the issue.
	Most of it	Yes	Removing quotas. Focus on ecological benefits of wolves, low quota zones around Tribal lands	Plan for regular plan updates is not included. DNR should prioritize non-lethal options to reduce wolf and livestock conflicts. DNR should regulate hound training better.	8	
Kristine Harings	Just the parts I am interested in	Yes	No more quotas, lower quota zones around Tribal lands, committing to science and research	Using the word "harvest". Use the word KILLING wolves as that is what is meant by harvesting. Use hunting and trapping instead of harvesting. Trapping should be eliminated as it is cruel and inhumane. Eliminate use of hunting dogs as cruel to wolves and dogs. Stop the $2,500 compensation for hunting dog kills (that's the hunter's fault for using them).	6	I would like to reiterate ending the use of trapping as a means of "harvesting". It is cruel and inhumane.
Justin Loehrke	All of it	Yes	I personally like that the state is going away from the numeric population goal as the current model has some flaws that tend to be abused. To make sure this is not abused, I wish we had some additional criteria around the variables that are going to be used to make decision on if we have too few, too many, or the right number of wolves on the landscape.	I do not think zone 6 should have lost as much land mass as it did in this update. Zone 6 was never designed to be wolf habitat and just because we have had a few wolves take up residency, doesn't mean we should be encouraging them to stay. More importantly, this decision will impact land use in those areas impacted. The water quality side of the DNR and a host of other government agencies are spending lots of time and dollars trying to get the agriculture community to get more animals out on the landscape in these high priority watersheds. A wolf population doesn't aide in this effort. I would encourage the DNR to put back as much of the land that falls within the high priority watersheds in zone 6 to eliminate this conflict. Parts of Waupaca, Shawano, Portage, etc Improving water quality should be far more important than a token wolf population that will cause conflict to arise as the agriculture community tries to bring animals out of confinement.	9	I appreciate the state finally working to get this across the finish line. For too long, we continued to kick the can down the road instead of working through our differences.
Mary Jo Harings	Just the parts I am interested in	Yes	1. Removing an arbitrary wolf population goal is important to make sure the best available science is centered on Wolf management. 2. The low quota zones are an important and welcome addition to the plan. 3. The plan is rightly focused on the ecological benefits of wolves.		9	Dogs being used to hunt wolves should be discontinued. It is cruel and inhumane to the dogs and wolves. Trapping should also stop. Trapping is also cruel and inhumane.
	Just the parts I am interested in	Yes		No population goal. It should be 350, which calculates to 5 per county. The plan should require relocations of excess wolves to those Wisconsin Counties that have fewer than 5.	0	
Tom	Just the parts I am interested in	Yes		Not having a plan for carrying capacity of wolves is irresponsible and shows the plan is not focused on actual management of wolves. It is clear the plan is focused on special interest groups and not the overall well being of Wisconsin's forests, animals and residents.	1	Scrap this draft and take the comments from Wisconsin residents to write the new plan.
	Just the parts I am interested in	Yes		No population limit. 5 wolves per county results in 350 for the entire state.	0	If the wolf count exceeds 5 in any county the excess should be relocated to southern counties that have fewer than 5. Relocations into Dane County should be first and highest priority so legislators and DNR officials see them killing pets and livestock.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
	Most of it	No	I appreciate the efforts of all WDNR staff involved in updating the state's wolf management plan. I support efforts and improvements made to the previous plan, including: ● Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. ● There is much greater recognition of the ecological role wolves play in balancing an ecosystem. ● The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to killing wolves. ● The adoption of proposed buffer zones around tribal reservations.	The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on: ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution ● The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. ● The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ○ A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings. ○ Hounding or hound training, which are akin to allowing legalized dogfighting, should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public. ● The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. ○ Despite Act 169, which mandates a wolf hunting season, the department can still restrict the implementation of lethal methods by setting minimal quotas, including a quota of '0' wolves, restricting timing and methods. ○ Several studies have proven a proactive non-lethal approach leads to more effective conflict mitigation. ○ Lethal management often fails to provide a long-term solution to wolf predation and has the least consistent success rates when compared to non-lethal practices. In addition, there is significant evidence showing that lethal wolf management may be less functionally effective at mitigating subsequent livestock losses than non-lethal deterrents. ● The plan should require the implementation of abatement measures as well as the use of non-lethal conflict minimization techniques by domestic animal owners in order for them to receive compensation for confirmed predation. ● The plan also runs contrary to public values towards wolves (and omits mention of such majority values from the plan), despite department surveys evidencing that the broad public cares about wolves as individuals. Given the recent liberalization of killing wolves by the state, it would be incredibly informative to note majority support of the following reasons for opposing a regulated wolf hunting/trapping season (which are all omitted from the plan): opposition to specific methods of harvest like hounds (64%) or traps (70%), feelings that hunting wolves is unnecessary (62%) or culturally offensive to Native American tribes (57%). ○ All such reasons convey majority disagreement with practices currently promoted and endorsed by the legislature and the WDNR, and such a conflict between managers and the public should not only be acknowledged, but foregrounded and carefully considered in policy. ○ Such decisions to omit literature or downplay evidence (such as majority opposition to killing wolves and their reasons) are contrary to principles of scientific integrity where all relevant scientific evidence is presented to the public as well as ethics which suggest recreational wolf killing is robustly supported by science when that is not the case. ● Conflicting agency objectives (optimizing public hunting and conflict mitigation) are not only not acknowledged, but even misunderstood as harmonious, against the body of scientific evidence. That culminates in the prioritization of consumptive values and policies There is a stark lack of consideration for individual wolves, wolf population health, and measurable indicators for assessing any harms barring disease prevalence (e.g., accounting for cortisol levels or other stress hormones, measures of pair/pack persistence) ● There is an inappropriate understanding and consideration of tribal worldviews about wolves. Tribal worldviews of wolves are misconstrued as 'cultural benefits' tribes receive from the existence of a wolf population, when in fact tribal worldviews consider each individual wolf as a person and relative. Cultural respect and sensitivity towards such views, shared by many non-tribal members, demand the strict mitigation of lethal measures, especially recreational killing, as opposed to their current promotion in the plan. ● In general, all omissions of scientific literature, the arbitrary prioritization of policy objectives, the rhetoric of the plan and the dismissal of public values and concerns for wolves point towards a biased, unscientific and instrumental view of wolves that promotes values contrary to broad public perspectives on wolves.	1	

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
	Just the parts I am interested in	Yes		No population goal. It should be 350, 5 per county.	0	The plan should include relocating wolves to southern Wisconsin from northern counties. Relocations should start into Dane County first.
	Just the parts I am interested in	Yes		No population goal. It should be 350.	0	
	Just the parts I am interested in	Yes		No population goal. It should be 350.	0	
	Just the parts I am interested in	Yes		No population goal. It should be 350.	0	
	Just the parts I am interested in	Yes		Lack of population goal.	0	
	Just the parts I am interested in	Yes		There is no population target goal. That goal should be 350.	0	
	Just the parts I am interested in	Yes		There is no population target goal. It should be 350.	0	
	Just the parts I am interested in	Yes		The lack of a population target goal. The northern counties requested a 350 goal. Why are they ignored?	0	There are too many wolves in Northern Wisconsin. The plan is ignores that. It should plan to reduce the number below 350.
	Just the parts I am interested in	Yes		The plan lacks a target population goal. It should be 5 per county. When more than 5 wolves exist in a county they must be relocated to southern Wisconsin until there are 5 wolves in each Wisconsin county statewide. That is 350 wolves statewide.	0	The plan must include establishing wolves in Dane County. Then the legislators and DNR hierarchy can have a first hand view of them killing pets and livestock. Then they can also experience the fear of having children attacked in your yard or on your property.
	Just the parts I am interested in	Yes		The plan lacks a population target. It should be 350, with no more than 5 wolves per county.	0	The plan must include establishing wolves in Dane County. The state arboretum property could support three or four wolves. The plan should include establishing wolves in all State wild and scenic areas in Southern Wisconsin.
	Just the parts I am interested in	Yes		There is no target wolf population. The target population should be 350 statewide. With 72 counties that should be no more than 5 per county.	0	There is no consideration for establishing wolves in Southern Wisconsin. The plan should include efforts to establish wolves in Dane and Milwaukee Counties, since many wolf protection organizations are in these counties they should have wolves in their counties. The people of these counties should be able to experience the thrill of having pets and livestock killed by wolves like those of northern counties.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
	All of it	Yes	I like that the draft plan does include all of the background. I think the background is important when determining what the population should be.	I dislike that there is no numeric goal. I live in Northern WI where there are way too many wolves. This population needs to get under control.	2	I think the DNR sugarcoats what it is like living among wolves, that is evident in the public surveys which show the public's willingness to live among wolves. I have children and we are afraid to play outside without a pistol handy because there are wolves everywhere. The population has skyrocketed, and the numbers show that we don't have the prey to support a growing wolf population. Look at upper Michigan where wolves have absolutely decimated the deer population. This is indicative of the direction that Wisconsin is heading unless the DNR listens to science, and opens the hunting season back up.
Ned Gannon	All of it	Yes	Slowly, the plan has begun to consider citizen voices other than interested hunting groups, for example, Green Fire. But hunting groups still have an inequitable say in policy. And so do politicians and the NRB.	Allowing dogs and hounds to be used in any wolf hunt is contradictory to Objective B reducing conflicts, no? I need this explained to me in layman's terms.	6	Science needs to outweigh hunting preferences and traditions. We are in a new era and we don't even know yet what the true capacity of wolves for the state is.
Laurence Holyoak	Just the parts I am interested in	No	We appreciate the efforts of all WDNR staff involved in updating the state's wolf management plan. Although we believe the current plan needs significant updating (see next section), we recognize the efforts and improvements made to the previous plan, including: ● Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. ● There is much greater recognition of the ecological role of wolves ● The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves ● The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed)	The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on (see reference list below): ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution	1	I have a Master's Degree in Applied Animal Behavior and Animal Welfare. I have studied these issues. Animal welfare is very important to me.
Michael Sullivan	All of it	Yes	in WI will no longer be managed by reference to the old numerical goal of 350 wolves. There is much greater recognition of the ecological role of wolves. The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves The adoption of proposed buffer zones around tribal reservations.	The scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings. ○ Hounding or hound training, which are akin to allowing legalized dogfighting, should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the public.	1	To conclude that the Wisconsin method would systematically overestimate wolf abundance by large (but currently incalculable) margins. Because Wisconsin, similar to other states, not only changed to unverified methods but also implemented widespread wolf killing, shortcomings in their estimates of wolf abundance may have far-reaching consequences for population viability and confidence in state wildlife managers. We discuss findings from Wisconsin alongside similar findings for other states' occupancy models being insensitive to human causes of mortality that have recently increased. Overall, Wisconsin's proposed method for estimating wolf abundance shows significant departures from best practices in scientific measurement. Verification will require independent replication and unbiased tests at multiple scales in multiple habitats under different human-induced mortality rates, and peer review before the new methods are considered reliable."
	Just the parts I am interested in	Yes			0	Why isn't there any plan to introduce wolves to southern Wisconsin? Dane County and Milwaukee County should have as many wolves as any Northern County. Then those people can enjoy wolves eating their pets and killing their livestock. There should be plan provisions for releasing wolv
Joe Knight	Most of it	Yes	The history of wolves. The maps showing the number of wolf packs from 1980 to 2020 were good. The Native American creation stories were neat. The chart showing the mortality of radio-collared wolves was interesting.	The plan is a document written by biologists for biologists. The length and language are a challenge for just plain folks. The idea of managing wolves by zones is interesting, but you need to have some numeric goals. More on that later.	8	You need to provide some numbers for wolves in your various zones, with the possible exception of zone 6, where we'll assume wolves are just passing through. Without some numeric goal or statement of carrying capacity, social and biological, for each zone. Without that the default number is 350 for a statewide population That number probably doesn't meet the spirit or letter of state and federal endangered species laws. Sorry, but we're a society that likes numbers, whether it is quarterback ratings or salaries of CEOs or statewide deer kills, the length of game fish...The first goal in your plan is to "ensure a healthy and sustainable wolf population to fulfill its ecological roles. Don't we need to define about how many that might be? At least within a broad range? You will be issuing a specific number of wolf hunting permits. How do you know how many to issue if you don't have at least a broad population goal for each zone? You will be keeping track of the number of wolves killed each year. In-person registration would be a good idea. But again, how do you know if the wolf kill is within goals or not if you don't have a number in mind, and how do you know if too many wolves are being killed and you need to close the season early if you don't have a goal for each zone? The plan has a goal of ensuring a healthy and sustainable wolf population to fulfill its ecological role. Good. How many might that be? Does fulfilling its ecological role include taking deer with cwd? Might be something to emphasize. Good luck.
Shirley Robinson	All of it	Yes	It is very informative and accurate.	It is very long and I think that a lot of the people that hate wolves would not take the time to read all of it because their minds are already made up and nothing you say could convince them to change their way of thinking.	10	The wolf haters won't be happy until all the wolves are dead. They are the vocal ones. I have lived in wolf country for many years and have never had a problem with them. I don't agree with the hunters who want a population goal of 350 or less wolves .

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Bruce Dahl	I have not read any of the draft plan	Yes	No comment	No comment	5	I got a good look at a wolf trotting thru the backyard. It was much bigger than dogs they own. Black top, white below. Distinctive tracks in snow. Approx 2 mo. ago. BGDahl
	Just the parts I am interested in	Yes			0	The DNR has failed miserably in protecting the safety and rights of northern Wisconsin citizens by allowing large numbers of wolves to harm farmers, deer hunters, and rural families. As long as we do not have the ability to remove wolves from our farms and private properties to protect our pets, farm animals the DNR has failed. This plan is inadequate because it fails to provide northern property owners with relief from the curse of too many wolves.
Margaret Webster	Most of it	Yes	developing wolf conflict mitigation plan to focus on non lethal deterrent methods to mitigate the already rare conflicts with livestock is a step in right direction. limiting depradation of hunting dogs could be fixed by eliminating hunting with hounds for bear and wolves, as well as not allowing training of hounds during summer pup season. I believe increased transparency in information abut wolves is important as the mission of DNR is stated to include concerns of all citizens - not just trophy hunters and trappers.	I strongly disagree with the season for training hounds. Dog fighting is immoral and this is state sanctioned dog fighting. The plan in general puts an emphasis on trophy hunting and trapping, which does not reflect the intent of many citizens- not many of us just kill for fun or bragging rights (or to make sure there are enough other animals to kill -since many wolf hunters have stated that the reason they applied for wolf license is to make sure there are enough deer to kill - per your survey results reported in plan)	5	This plan is an improvement, but still lacking. All citizens deserve input that is actually heard- not just hunters and trappers. (and yes, I have sat in on WCC committee meetings and know my voice was not heard, or maybe heard, but just completely disregarded). There is no reason that a hunting season be mandated by state statutes. I would like to believe we have moved beyond the 1800s with state bounties. I realize that is not an issue to be addressed by this wolf plan, but I believe is a large driving force for some of your decisions. I would like to thank all the wildlife scientists who have contributed to what we know about wolves, and actually adhere to data, and not just anecdotes. I learned a lot by reading the wolf management plan.
	All of it	Yes		need greater control management numbers	1	people don't believe it
michael Schueller	Most of it	Yes	enjoyed the areaq of the history of wolves	it is over whelming. The average person is not going to read it.	5	I am opposed to the Wisconsin Wolf Plan as it currently written. We have owned property in Oneida County since 1995. We built a hunting cabin and had built a great tradition of family and friends enjoying the fall hunting seasons. Especially the bow and gun deer seasons. This heritage is about to get lost, as this past gun season, my 16 year old grandson did not want to hunt up there. He said, “There are no deer up there.” We have stopped bow hunting the property several years ago, because of lack of deer sightings. We have kept a record of the number of deer sightings during the gun deer season since 1995. Our group of 4-5 hunters, hunting 3-4 days of the season would see 60-70 deer in the late 1990’s and early 2000’s. In 2020 we saw 3, in 2021 we saw 7, in 2022 we saw 6, hunting 7 days of the nine day season. What needs changing on the plan? The plan needs a specific goal on wolf numbers. I agree with several of the conservation groups that this goal should be topped at 350 wolves. While there are other predators on the landscape that effect the recruitment of the deer herd, I believe it has been the uncontrolled growth of wolves in the last 20 years that has had the greatest impact on the reduction of the northern deer herd. I also feel that the opinions of residents, farmers, and property owners in northern Wisconsin, that are impacted the most by the growth of the wolves, should carry more weight than the individual from southern Wisconsin, who may not witnessed what has happened in the north woods. I believe that it is part of the DNR philosophy to continue the great hunting heritage that we have in Wisconsin. However, if grandson’s don’t want to hunt up north and deer camps close this great tradition is lost. So, let’s start by getting the wolf population under control. Respectfully, Mike Schueller [redacted] Wausau, WI, 54403
David Walters	All of it	Yes	Maintaining a modest wolf population in the State.	Allowing the wolf packs to grow beyond 350 animals.	4	Researchers must realize that wolves and people can not successfully co-exist. People will be hurt or worse and the wolves will need to be removed again. Let hunters and other interested parties manage the wolves and not the leftist judges in DC!
Allen	Just the parts I am interested in	Yes		I quote "provide your thoughts on the draft plan's content, as well as anything you believe is missing and should be included". How in the hell can you draft a wolf management plan and not have a population goal?? In a business setting, tell me how you can evaluate the success of any plan without a measurable goal? I hope you can see the frustration of having a 350 goal and then have 3 times over that in the woods.(legal proceedings being a separate issue that affects this) Leave the goal at 350 and manage to it!	1	

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Victoria Palen	Most of it		1. More use of GPS collars. 2. More education of the public, especially OUTSIDE the wolf-occupied areas. 3. More info released to the public and media (via press releases??) but not just on web site. 4. Annual release of summaries of abundance and distribution.	1. NO actual numerical goal or even maximum or minimum numbers are given. How can you measure any progress? "Healthy and sustainable" populations are already exceeded and these words really mean nothing concrete.2. Talking about economic benefit from tourism (comparing to Yellowstone is entirely ludicrous) or other means but, at the same time, proposing fewer roads in public lands where wolves are makes no sense. 3. Why are you dropping the 350 "goal" when your quoted wolf expert says that numbers are very hard to reduce once wolves are established!! (Why should Wisconsin have more wolves than Montana which has about double the land area and lots more wilderness?) 4. How can you "continue" rigorous monitoring of populations when you have excluded lone wolves, the reservation wolves (and the sub-zones??) and those in areas where no volunteers have been found to do tracking? 5. Why are the 1B sub zones bigger in area than the reservations they surround, especially when there are known depredations in those areas? 6. I think part of the repeated depredation problem is that lethal removal is not used soon enough. If nothing bad happens to wolves attacking livestock, they will not stay away. Any dog trainer can explain this. 7.Are your phones monitored 24/7, not just "7days a week"? Reporting within 8 hours of recovery is not possible if they are not. 8. In the case of grazing animals like beef cattle or sheep, confining them near the barn for calving or lambing actually can increase problems with neonatal disease. Bringing them in every night is stressful for all. Building a fence (that would keep wolves out) around 40 or more acres of pasture would be expensive. Who pays?? Lethal control would be lots cheaper, with no maintenance costs, especially if the landowner can apply it him/her self. 9. You should be considering wolf populations in suitable habitat, not in marginal habitat and not in every place wolves occupy. Try to eliminate them from places without much suitable habitat. (This is like the people who want them restored to all their "formerly occupied territory" before delisting. It might be OK except that the homeless in D.C. would be the ones in danger, not the people proposing this.)	3	The first nearly 100 pages, before we get to the actual plan, seem to be designed to wear people down before they get to the plan. There seems to be a lot of repetition of somewhat confusing and undefined terms like "holistic and adaptive" or "scaled occupancy" or "scientific basis". Even living in wolf-occupied country I almost never see the media carry any stories about wolf depredations. I know that wolves have been in the Meadow Valley/Necedah area for years and yet people from around central Wisconsin sometimes ask how close the wolves are getting "to us" now. (They are HERE.)
Joe Y.	Most of it	No	Wolves image as being ecologically beneficial to its role in the environment and the growing majority of Americans opposed to hunting wolves.	The need to manage the wolf population. We know the real motive is to supply hunters with yet another trophy in the form of a wolf. No need for management.	5	Any person well informed or familiar with wolf ecology knows the importance of the effectiveness of the pack and when the pack is disrupted or fragmented as a result of hunting, the hierarchy is ruptured and the pack functionality and role in the nature of things is ineffective.
John Bates	All of it	Yes	that it's adaptive, scientific, collaborative, holistic, reviewable annually, and educational.	I don't like bear hunters being reimbursed for the loss of hunting dogs or for their bear costs. They understand the risks - they put their dogs in the way of those risks - they should assume the costs of those risks. The public should not pay for the risks inherent in their hunt. Period. I know this is an attempt to ward off additional poaching by buying them off - calling a spade a spade here - but I don't believe it's deserved. I understand also that this is a statute.	9	While I believe there are greater risks involved with hunting wolves due to their pack structure than there are with hunting other animals, I can live with a prescribed hunt in areas with significant farm conflicts. I don't support on open hunt everywhere. I also support not identifying a specific target number, though I'd like to see a range that will be a target to attempt to stay within - say 1,000 to 1,300. Thank you for all the ecological background information - very much appreciated. If read by those involved in the decision making, it should provide the necessary factual basis for making sane decisions. Thank you for such an informative, thorough, exhaustive plan.
Charles Cote	Just the parts I am interested in	Yes				Advice...the plan is your job. Just...make sense...be fair to as many sides as possible...don't change in mid stream...be as transparent as possible. People are watching. An early goal was set years ago...it was met and far exceeded. Now it appears that the goal has shifted upward...a lot. Maybe for good, maybe not, but to many average people you are changing the game as you go. Not a great idea. Thank you for being there for us.
Megan Lankenau	Most of it	No	I appreciate that you are valuing the ecological contribution of wolves and that you are no longer capping the number at 350. I also like the buffer zones around tribal reservations	Your draft lacks inclusion of non lethal management of wolves. I disagree that recreational killing should be a main management strategy and that the science supporting this method is not included. I don't think that lethal management of wolves should be part of the plan at all. I would like the plan to focus on managing wolves humanely and eliminating the possibility, as much as possible, of illegal killings. I also do not support the inclusion of hound training as part of this plan. Again, not humane and akin to dog fighting.	4	I don't think your plan accounts for the contributions that wolves bring to the environment, the public's values towards wolves and tribal worldviews about wolves, and I don't think wolves should be hunted or trapped as part of an ecological management strategy.
	Just the parts I am interested in	Yes	I like the fact that wolves are being managed, However, each year shows an increased livestock kill which leads me to believe that currently there are too many wolves	I didn't see anywhere in the draft where the DNR relocated or planted wolves in various areas which I have been lead to believe. It simply shows the wolves expanded into Wisconsin from Minnesota	4	I've seen wolves while hunting deer on my property. With 292 wolf packs in the state, with each wolf taking an estimated 15-19 deer, I believe there are too many wolves and need to be drastically reduced. 20 years ago I had friends who saw more wolves than deer while hunting.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
mike kortenhof	All of it	Yes	It's a plan. We need a plan.	I feel that we need to have a count on the number of wolfs we have in the state. If you don't harvest more wolfs form the zones that they are over populated in, your doing no good. The way you have the harvest numbers set for the zones, most of the wolfs will live in a small area. So the number of wolfs we want sould be adjusted to fit that amount of land. This would be way less then 300 wolfs. The worst part about this plan is that almost every statment is left open. There is nothing that the DNR can be held accountable for. I feel that this was written by a group of attorney's that made sure that the plan will not say anything.	1	I'm sure several good people put a lot of hard work into this plan. It's sad that that it was all hacked up to say nothing.
Susan Kiser	All of it	Yes	- Removing an arbitrary wolf population goal is important to make sure the number of wolves are adaptable, so they can be based on the best available science and ecological changes. - The plan creates a low quota zones around Tribal lands where tribes requested it. This update is an important and welcome addition. Ideally, expanding the plan beyond listed zones would be great. - The plan rightly focuses on ecological benefits of wolves. - Public opinion has grown significantly more favorable towards wolves. - There is an expressed commitment to science and continued research with partners who acknowledge the importance of wolves in a healthy ecosystem. Science and continued research along with public education about wolves are key.	the indecision about lethal vs non-lethal management of wolves where humans and livestock are concerned	9	
	All of it	Yes	I like that we have an updated plan.	There is no goal for wolf numbers.	3	
Lacey Levitt	Just the parts I am interested in	No	I support the greater recognition of the ecological role of wolves and the inclusion of a social survey. I am glad that wolf management will no longer center around the old numerical goal of 350 wolves.	I am troubled by the lack of up to date scientific data included and reflected in the plan. Sadly, there is also a lack of consideration for individual wolves, wolf population health and wellbeing), and measurable indicators for assessing any harms barring disease prevalence. The plan does not reflect the diverse opinions with regard to recreational wolf hunting including the sizeable population of the country and state that oppose it. The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances (i.e., immediate defense of life). The plan should prioritize wolf protections and concentrate solely on non-lethal management of livestock conflicts. The plan should require that animal "owners" implement abatement measures and the use of non-lethal conflict minimization techniques in order for them to receive compensation for confirmed predation.		
Helen Hartman	All of it	Yes	It's thoroughness and basis in science, plus the in-depth information about wolf biology.	I do not find anything about the plan to dislike.	10	It's sensible and does a good job of balancing diverse opinions on a very controversial topic.
Kerry Gentile	All of it	No	We appreciate the efforts of all WDNR staff involved in updating the state's wolf management plan. Although we believe the current plan needs significant updating (see next section), we recognize the efforts and improvements made to the previous plan, including: ● Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. ● There is much greater recognition of the ecological role of wolves ● The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves ● The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed)	The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on (see reference list below): ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution ● The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. ● The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ○ A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings. ○ Hounding or hound training, which are akin to allowing legalized dogfighting, should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public. ● The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. ○ Despite Act 169, which mandates a wolf hunting season, the department can still restrict the implementation of lethal methods by setting minimal quotas, including a quota of '0' wolves, restricting timing and methods. ○ Several studies have proven a proactive non-lethal approach leads to better conflict mitigation. ○ Lethal management often fails to provide a long-term solution to wolf predation and has the least consistent success rates when compared to non-lethal practices. In addition, there is significant evidence showing that lethal wolf management may be less functionally effective at mitigating subsequent	4	

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
				livestock losses than non-lethal deterrents. ● The plan should require the implementation of abatement measures as well as the use of non-lethal conflict minimization techniques by domestic animal owners for the latter to receive compensation for confirmed predation. ● The plan also runs contrary to public values towards wolves (and omits mention of such majority values from the plan), despite department surveys evidencing that the broad public cares about wolves as individuals (and not just for the viability of the population). Given the recent liberalization of killing wolves by the state, it would be incredibly informative to note majority support of the following reasons for opposing a regulated wolf hunting/trapping season (which are all omitted from the plan): opposition to specific methods of harvest like hounds (64%) or traps (70%), feelings that hunting wolves is unnecessary (62%) or culturally offensive to Native American tribes (57%). ○ All such reasons convey majority disagreement with practices currently promoted and endorsed by the legislature and the WDNR, and such a conflict between managers and the public should not only be acknowledged, but foregrounded and carefully considered in policy (instead of dismissed). ○ Such decisions to omit literature or downplay evidence (e.g., such as majority opposition to killing wolves and their reasons) are contrary to principles of scientific integrity (e.g., present all relevant scientific evidence to the public) as well as ethics (e.g., disguising ethical decisions, such as recreational wolf killing, as robustly supported by science). ● Conflicting agency objectives (e.g., optimizing public hunting and conflict mitigation) are not only not acknowledged, but even misunderstood as harmonious, against the body of scientific evidence. That culminates in the prioritization of consumptive values and policies; e.g., according to the body of scientific literature, use of lethal methods, and 2 especially public hunts, are contrary to most objectives relevant to: harm mitigation, the wellbeing of wolves, their ecological roles, and their non-exploitative enjoyment (i.e., Objectives A, B, D and F). ● There is a stark lack of consideration for individual wolves, wolf population health (including wellbeing), and measurable indicators for assessing any harms barring disease prevalence (e.g., accounting for cortisol levels or other stress hormones, measures of pair/pack persistence) ● There is an inappropriate understanding and consideration of tribal worldviews about wolves. Tribal worldviews of wolves are misconstrued as 'cultural benefits' tribes receive from the existence of a wolf population, when in fact tribal worldviews consider each individual wolf as a person and relative. Cultural respect and sensitivity towards such views, shared by many non-tribal members, demand the strict mitigation of lethal measures, especially recreational killing, as opposed to their current promotion in the plan. ● In general, all omissions of scientific literature, the arbitrary prioritization of policy objectives, the rhetoric of the plan and the dismissal of public values and concerns for wolves point towards a biased, unscientific and instrumental view of wolves that promotes values contrary to broad public perspectives on wolves. ● 'SOM' wolf estimation methodology – From a recent critique: "The new methods sacrifice precision, but are believed to retain adequate accuracy and sensitivity to changing conditions for reliable decision-making. We review evidence for the accuracy, precision, and sensitivity of the new 'scaled occupancy model' (SOM) applied in Wisconsin. We conclude that the Wisconsin method would systematically overestimate wolf abundance by large (but currently incalculable) margins. Because Wisconsin, similar to other states, not only changed to unverified methods but also implemented widespread wolf killing, shortcomings in their estimates of wolf abundance may have far-reaching consequences for population viability and confidence in state wildlife managers. We discuss findings from Wisconsin alongside similar findings for other states' occupancy models being insensitive to human causes of mortality that have recently increased. Overall, Wisconsin's proposed method for estimating wolf abundance shows significant departures from best practices in scientific measurement. Verification will require independent replication and unbiased tests at multiple scales in multiple habitats under different human-induced mortality rates, and peer review before the new methods are considered reliable." (Treves & Santiago-Ávila, 2023)		
	Just the parts I am interested in	Yes		What exactly is your number of wolves for the state. There are quotas for every game harvested in this state and how it is managed. If your goal is to have 350 wolves why are there more then 1,500 wolves here? You need to manage them just like other game harvested.	0	You need to look closer at the numbers in the northern part of this state as we are over populated with wolves and is not helping the other wildlife here. Too many changes the eco system and creates other problems!!!

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Spiros G. Villis	All of it	Yes	● The elimination of a numerical target population ● The importance of the ecological benefits of wolves and inclusion of tribal values and knowledge. ● The attempt to minimize the impacts of a recreational hunt by adopting buffer zones around tribal lands, shortening reporting requirements and making hunting licenses zone specific. ● Emphasizes the use of non-lethal methods to reduce conflicts.	● Absent is a commitment by DNR to work with the legislature to overturn PA 169 and remove payments for hunting hounds, killed by wolves. ● Hound training must be stopped. ● The plan should establish a zero hunting quota to protect wolves in our national forests and other areas prime habitat. ● The recreational hunting/trapping to reduce conflicts has no scientific basis. ● At a minimum, DNR should ban the use of dogs to hunt wolves in our national forests. ● There is considerable uncertainty in estimating wolf populations based on the occupancy model and should not be used solely to determine population. ● The plan should include an oversight committee which is comprised of biologists and professionals. On a scale from 1-10, how would you rate your overall support for the draft wolf management plan as written. (Suggested response 7) Please provide any other comments related to the current draft wolf management plan: Overall, the plan is good; however, the Committee was overrepresented by hunting organizations even though they represent the minority opinion of Wisconsinites. Too much emphasis was placed on the killing of wolves rather than co-existence.	4	Reference list (studies not integrated into the current draft wolf plan) 3 Adams, L. G., Stephenson, R. O., Dale, B. Kelli Villis	All of it	Yes	We appreciate the efforts of all WDNR staff involved in updating the state's wolf management plan. Although we believe the current plan needs significant updating (see next section), we recognize the efforts and improvements made to the previous plan, including: ● Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. ● There is much greater recognition of the ecological role of wolves ● The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves ● The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed)	● The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on (see reference list below): ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution ● The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. ● The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ○ A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings. ○ Hounding or hound training, which are akin to allowing legalized dogfighting, should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public. ● The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. ○ Despite Act 169, which mandates a wolf hunting season, the department can still restrict the implementation of lethal methods by setting minimal quotas, including a quota of '0' wolves, restricting timing and methods. ○ Several studies have proven a proactive non-lethal approach leads to better conflict mitigation. ○ Lethal management often fails to provide a long-term solution to wolf predation and has the least consistent success rates when compared to non-lethal practices. In addition, there is significant evidence showing that lethal wolf management may be less functionally effective at mitigating subsequent livestock losses than non-lethal deterrents. ● The plan should require the implementation of abatement measures as well as the use of non-lethal conflict minimization techniques by domestic animal owners for the latter to receive compensation for confirmed predation. ● The plan also runs contrary to public values towards wolves (and omits mention of such majority values from the plan), despite department surveys evidencing that the broad public cares about wolves as individuals (and not just for the viability of the population). Given the recent liberalization of killing wolves by the state, it would be incredibly informative to note majority support of the following reasons for opposing a regulated wolf hunting/trapping season (which are all omitted from the plan): opposition to specific methods of harvest like hounds (64%) or traps (70%), feelings that hunting wolves is unnecessary (62%) or culturally offensive to Native American tribes (57%). ○ All such reasons convey majority disagreement with practices currently promoted and endorsed by the legislature and the WDNR, and such a conflict between managers and the public should not only be acknowledged, but foregrounded and carefully considered in policy (instead of dismissed). ○ Such decisions to omit literature or downplay evidence (e.g., such as majority opposition to killing wolves and their reasons) are contrary to principles of scientific integrity (e.g., present all relevant scientific evidence to the public) as well as ethics (e.g., disguising ethical decisions, such as recreational wolf killing, as robustly supported by science). ● Conflicting agency objectives (e.g., optimizing public hunting and conflict mitigation) are not only not acknowledged, but even misunderstood as harmonious, against the body of scientific evidence. That culminates in the prioritization of consumptive values and policies; e.g., according to the body of scientific literature, use of lethal methods, and 2 especially public hunts, are contrary to most objectives relevant to: harm mitigation, the wellbeing of wolves, their ecological roles, and their non-exploitative enjoyment (i.e., Objectives A, B, D and F). ● There is a stark lack of consideration for individual wolves, wolf population health (including wellbeing), and measurable indicators for assessing any harms barring disease prevalence (e.g., accounting for cortisol levels or other stress hormones, measures of pair/pack persistence) ● There is an inappropriate understanding and consideration of tribal worldviews about wolves. Tribal worldviews of wolves are misconstrued as 'cultural benefits' tribes receive from the existence of a wolf population, when in fact tribal worldviews consider each individual wolf as a person and relative. Cultural respect and sensitivity towards such views, shared by many non-tribal members, demand the strict mitigation of lethal measures, especially recreational killing, as opposed to their current promotion in the plan. ● In general, all omissions of scientific literature, the arbitrary prioritization of policy objectives, the rhetoric of the plan and the dismissal of public	4	Reference list (studies not integrated into the current draft wolf plan) 3 Adams, L. 				values and concerns for wolves point towards a biased, unscientific and instrumental view of wolves that promotes values contrary to broad public perspectives on wolves. ● 'SOM' wolf estimation methodology – From a recent critique: "The new methods sacrifice precision, but are believed to retain adequate accuracy and sensitivity to changing conditions for reliable decision-making. We review evidence for the accuracy, precision, and sensitivity of the new 'scaled occupancy model' (SOM) applied in Wisconsin. We conclude that the Wisconsin method would systematically overestimate wolf abundance by large (but currently incalculable) margins. Because Wisconsin, similar to other states, not only changed to unverified methods but also implemented widespread wolf killing, shortcomings in their estimates of wolf abundance may have far-reaching consequences for population viability and confidence in state wildlife managers. We discuss findings from Wisconsin alongside similar findings for other states' occupancy models being insensitive to human causes of mortality that have recently increased. Overall, Wisconsin's proposed method for estimating wolf abundance shows significant departures from best practices in scientific measurement. Verification will require independent replication and unbiased tests at multiple scales in multiple habitats under different human-induced mortality rates, and peer review before the new methods are considered reliable." 	All of it	Yes		Lack of a population goal. How can you manage the wolf population without a goal?	1	
	Most of it	Yes	Listening to the tribal input about responsibility and nonlethal methods.	Objective C: Hunting and trapping the wolves. Why not increase benefits through tourism?	2	Why are hunting and trapping groups part of the committee?
Edward F. Vlach	All of it	Yes	1. Overall history of wolves in Wi. Mgt. must now shift from recovery to sustainability. Rported wolve never re-introduced in WI, came from MN. This should be emphasized more as many folks accuse WI DNR of bringing wolves into state. Population numbers continually referred to even by USFWS. Plan mentioned 2020 -21 overwintering pop. was approx. 1,126 wolves.	1.Good explanation of tribal lands. But knowing tribal members do not hunt or trap wolves why do we give them tags. 2. Talk about population numbers throughout plan but then has a lack of specific population goals for the state. Whether 350, 450, 500 or whatever - give the public something. 3.How come no mention of beaver as also being a favored foo. Mostly mention white tail deer. 4. Should not compare WI to Yellowstone as example of non-consumptive use. Folks are not driving up from large cities in south WI to observe wolves, wolves are found mostly in large tracts of public lands where city folfs do not hang out.	7	The plan is written to be politically correct. Nothing in plan that says state will fight to de-list wolves. Even USFWS agrees our present population meets dellisdting goals.
Kathy Wendling	All of it	Yes	1. Removing the arbitrary wolf population goal and using science to guide decisions. 2. Focuses on ecological benefits, especially in core wolf areas such as zones 1, 2 & 5. 3. Creates buffer zones around reservations. 4.	Not much information about how the public will be educated about dealing with wolf damage by non-lethal means.	9	1.There needs to be a strong commitment to science and continued research. 2. There needs to be a strong commitment to local control of wolf poaching.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
			Continues emphasis on intergraded management of wolf conflicts using both lethal and non-lethal controls.			
	Most of it	Yes	The thoroughness and the basis on facts and scientific analysis. The focus on the benefits of wolves and education of the public. Removal of specific numbers of wolves to kill and instead basis on best estimate of wolf population and ability to maintain a healthy population	there needs to be more focus on non-lethal measures to respond to wolves. Loss of livestock, pets, and hunting dogs should evaluate the extent that the individual was responsible due to a failure to take adequate measures to protect the lost animals. More control of hunting with dogs and reduced or eliminated use of trapping.	9	
	Just the parts I am interested in	No	What we like: We appreciate the efforts of all WDNR staff involved in updating the state's wolf management plan. Although we believe the current plan needs significant updating (see next section), we recognize the efforts and improvements made to the previous plan, including: ● Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. ● There is much greater recognition of the ecological role of wolves ● The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves ● The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed)	The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on (see reference list below): ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution ● The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. ● The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ○ A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings. ○ Hounding or hound training, which are akin to allowing legalized dogfighting, should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public. ● The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. ○ Despite Act 169, which mandates a wolf hunting season, the department can still restrict the implementation of lethal methods by setting minimal quotas, including a quota of '0' wolves, restricting timing and methods. ○ Several studies have proven a proactive non-lethal approach leads to better conflict mitigation. ○ Lethal management often fails to provide a long-term solution to wolf predation and has the least consistent success rates when compared to non-lethal practices. In addition, there is significant evidence showing that lethal wolf management may be less functionally effective at mitigating subsequent livestock losses than non-lethal deterrents. ● The plan should require the implementation of abatement measures as well as the use of non-lethal conflict minimization techniques by domestic animal owners for the latter to receive compensation for confirmed predation. ● The plan also runs contrary to public values towards wolves (and omits mention of such majority values from the plan), despite department surveys evidencing that the broad public cares about wolves as individuals (and not just for the viability of the population). Given the recent liberalization of killing wolves by the state, it would be incredibly informative to note majority support of the following reasons for opposing a regulated wolf hunting/trapping season (which are all omitted from the plan): opposition to specific methods of harvest like hounds (64%) or traps (70%), feelings that hunting wolves is unnecessary (62%) or culturally offensive to Native American tribes (57%). ○ All such reasons convey majority disagreement with practices currently promoted and endorsed by the legislature and the WDNR, and such a conflict between managers and the public should not only be acknowledged, but foregrounded and carefully considered in policy (instead of dismissed). ○ Such decisions to omit literature or downplay evidence (e.g., such as majority opposition to killing wolves and their reasons) are contrary to principles of scientific integrity (e.g., present all relevant scientific evidence to the public) as well as ethics (e.g., disguising ethical decisions, such as recreational wolf killing, as robustly supported by science). ● Conflicting agency objectives (e.g., optimizing public hunting and conflict mitigation) are not only not acknowledged, but even misunderstood as harmonious, against the body of scientific evidence. That culminates in the prioritization of consumptive values and policies; e.g., according to the body of scientific literature, use of lethal methods, and especially public hunts, are contrary to most objectives relevant to: harm mitigation, the wellbeing of wolves, their ecological roles, and their non-exploitative enjoyment (i.e., Objectives A, B, D and F). ● There is a stark lack of consideration for individual wolves, wolf population health (including wellbeing), and measurable indicators for assessing any harms barring disease prevalence (e.g.,	3	

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
				accounting for cortisol levels or other stress hormones, measures of pair/pack persistence) ● There is an inappropriate understanding and consideration of tribal worldviews about wolves. Tribal worldviews of wolves are misconstrued as 'cultural benefits' tribes receive from the existence of a wolf population, when in fact tribal worldviews consider each individual wolf as a person and relative. Cultural respect and sensitivity towards such views, shared by many non-tribal members, demand the strict mitigation of lethal measures, especially recreational killing, as opposed to their current promotion in the plan. ● In general, all omissions of scientific literature, the arbitrary prioritization of policy objectives, the rhetoric of the plan and the dismissal of public values and concerns for wolves point towards a biased, unscientific and instrumental view of wolves that promotes values contrary to broad public perspectives on wolves. ● 'SOM' wolf estimation methodology – From a recent critique: "The new methods sacrifice precision, but are believed to retain adequate accuracy and sensitivity to changing conditions for reliable decision-making. We review evidence for the accuracy, precision, and sensitivity of the new 'scaled occupancy model' (SOM) applied in Wisconsin. We conclude that the Wisconsin method would systematically overestimate wolf abundance by large (but currently incalculable) margins. Because Wisconsin, similar to other states, not only changed to unverified methods but also implemented widespread wolf killing, shortcomings in their estimates of wolf abundance may have far-reaching consequences for population viability and confidence in state wildlife managers. We discuss findings from Wisconsin alongside similar findings for other states' occupancy models being insensitive to human causes of mortality that have recently increased. Overall, Wisconsin's proposed method for estimating wolf abundance shows significant departures from best practices in scientific measurement. Verification will require independent replication and unbiased tests at multiple scales in multiple habitats under different human-induced mortality rates, and peer review before the new methods are considered reliable." (Treves & Santiago-Ávila, 2023)		
Karen Murray	All of it	Yes	I like that there is no population number	I am highly opposed to hound hunting of bears, and wolves	6	
	Just the parts I am interested in	No	Recognition of wolves' value and role in the ecosystem; buffer zones around tribal areas.	Allowance of recreation killing of wolves, hounding, and other lethal strategies for management.	3	Please reconsider the extent of positive public attitudes toward wolves (including regard for individual wolves, wolf intelligence, social structures, valuable role in ecosystems), and please emphasize non-lethal solutions to human-wolf conflict and benefits of wolves, such as the presence of wolves increasing deer vigilance, thereby decreasing vehicular collisions with deer and associated costs. Please do not allow recreational killing, trapping, hounding or other inhumane treatment of wolves.
MaryBeth Aldrich	Most of it	Yes	The plan acknowledges the benefits of wolves. The plan does not set a specific population goal. The plan establishes low quota zones in the area that Native Populations requested.	Personally I do not like the use of dogs for wolf hunting but I believe the process for creating the plan was a fair one.	9	
Diane	All of it	Yes	I understand the need to address human-wolf conflicts or individual wolves for those situations. Rather than issuing permits to individuals, allow the Safari Club to tactically cull.	Trapping should not be an option. It is barbaric and inhumane.	5	I hope it will reduce the likelihood of a repeat of last hunting season - totally irresponsible overharvesting and embarrassing to our the State of WI
Nathan	All of it	Yes				Open season 365 days a year each hunter gets 10 tags can apply for more. In three years we won't have a wolf problem.

Hector	Just the parts I am interested in	No	● Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. ● There is much greater recognition of the ecological role of wolves ● The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves ● The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed)	● The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on (see reference list below): ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution ● The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. ● The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ○ A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings. ○ Hounding or hound training, which are akin to allowing legalized dogfighting, should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public. ● The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. ○ Despite Act 169, which mandates a wolf hunting season, the department can still restrict the implementation of lethal methods by setting minimal quotas, including a quota of '0' wolves, restricting timing and methods. ○ Several studies have proven a proactive non-lethal approach leads to better conflict mitigation. ○ Lethal management often fails to provide a long-term solution to wolf predation and has the least consistent success rates when compared to non-lethal practices. In addition, there is significant evidence showing that lethal wolf management may be less functionally effective at mitigating subsequent livestock losses than non-lethal deterrents. ● The plan should require the implementation of abatement measures as well as the use of non-lethal conflict minimization techniques by domestic animal owners for the latter to receive compensation for confirmed predation. ● The plan also runs contrary to public values towards wolves (and omits mention of such majority values from the plan), despite department surveys evidencing that the broad public cares about wolves as individuals (and not just for the viability of the population). Given the recent liberalization of killing wolves by the state, it would be incredibly informative to note majority support of the following reasons for opposing a regulated wolf hunting/trapping season (which are all omitted from the plan): opposition to specific methods of harvest like hounds (64%) or traps (70%), feelings that hunting wolves is unnecessary (62%) or culturally offensive to Native American tribes (57%). ○ All such reasons convey majority disagreement with practices currently promoted and endorsed by the legislature and the WDNR, and such a conflict between managers and the public should not only be acknowledged, but foregrounded and carefully considered in policy (instead of dismissed). ○ Such decisions to omit literature or downplay evidence (e.g., such as majority opposition to killing wolves and their reasons) are contrary to principles of scientific integrity (e.g., present all relevant scientific evidence to the public) as well as ethics (e.g., disguising ethical decisions, such as recreational wolf killing, as robustly supported by science). ● Conflicting agency objectives (e.g., optimizing public hunting and conflict mitigation) are not only not acknowledged, but even misunderstood as harmonious, against the body of scientific evidence. That culminates in the prioritization of consumptive values and policies; e.g., according to the body of scientific literature, use of lethal methods, and 2 especially public hunts, are contrary to most objectives relevant to: harm mitigation, the wellbeing of wolves, their ecological roles, and their non-exploitative enjoyment (i.e., Objectives A, B, D and F). ● There is a stark lack of consideration for individual wolves, wolf population health (including wellbeing), and measurable indicators for assessing any harms barring disease prevalence (e.g., accounting for cortisol levels or other stress hormones, measures of pair/pack persistence) ● There is an inappropriate understanding and consideration of tribal worldviews about wolves. Tribal worldviews of wolves are misconstrued as 'cultural benefits' tribes receive from the existence of a wolf population, when in fact tribal worldviews consider each individual wolf as a person and relative. Cultural respect and sensitivity towards such views, shared by many non-tribal members, demand the strict mitigation of lethal measures, especially recreational killing, as opposed to their current promotion in the plan. ● In general, all omissions of scientific literature, the arbitrary prioritization of policy objectives, the rhetoric of the plan and the dismissal of public	4	Please consider the right of every one of God's creatures to live their lives without the fear of being hunted down by people who should know better. What happened to good Christian values of love and compassion? Thank you.

				values and concerns for wolves point towards a biased, unscientific and instrumental view of wolves that promotes values contrary to broad public perspectives on wolves. ● 'SOM' wolf estimation methodology – From a recent critique: "The new methods sacrifice precision, but are believed to retain adequate accuracy and sensitivity to changing conditions for reliable decision-making. We review evidence for the accuracy, precision, and sensitivity of the new 'scaled occupancy model' (SOM) applied in Wisconsin. We conclude that the Wisconsin method would systematically overestimate wolf abundance by large (but currently incalculable) margins. Because Wisconsin, similar to other states, not only changed to unverified methods but also implemented widespread wolf killing, shortcomings in their estimates of wolf abundance may have far-reaching consequences for population viability and confidence in state wildlife managers. We discuss findings from Wisconsin alongside similar findings for other states' occupancy models being insensitive to human causes of mortality that have recently increased. Overall, Wisconsin's proposed method for estimating wolf abundance shows significant departures from best practices in scientific measurement. Verification will require independent replication and unbiased tests at multiple scales in multiple habitats under different human-induced mortality rates, and peer review before the new methods are considered reliable." (Treves & Santiago-Ávila, 2023)		
Debra Floyd	Just the parts I am interested in	No	There is much more acknowledgement of the ecological role of wolves, and the social survey's increased opposition to the methods and motives of wolf killing.	I would like for the plan to strictly limit the lethal management of wolves to extreme circumstances, and require abatement techniques and non-lethal conflict measures. I would like for the opinion of all citizens to have equal voice and be reflected in the plan, rather than just protecting the interests of cattle ranchers.	3	I believe more, and more current science obtained from legitimate wolf research should be studied and included before this wolf plan is finalized. Thank you for what you have already accomplished on this plan, and thank you for the opportunity to submit my comments.
CJ	All of it	Yes	The facts on mortality of elk herd trying to be built	The plan needs to have a higher harvest of wolves to control population. We have family cabin in Douglas county for 25 years . We are very skilled hunters and have harvest a lot of deer in past with archery and firearm . When there are no deer to see or harvest interests are lost by all . Are kids are hunters but hard to try keep family tradition going when we may not see a deer . Has changed dramatically since wolf population has blown up . If the DNR does not act now the future of hunting will be none and DNR license revenue will be 0 . Our family is very saddened by this thought , that great north woods tradition will be gone .	1	I think wolves can coexist but need to be controlled by hunting with having no predators. The sportsman should be listened to or the future sportsman will be none . I believe the population is higher than studies are stated .
Nancy	Just the parts I am interested in	Yes	make sure the best-available science is centered in wolf management The low quota zones are an important and welcome addition to the plan The plan is rightly focused on the ecological benefits of wolves	Arbitrary population number. Rationale for hunting. This is a Keystone species.	9	Please consider that wolves (like the wolves of Yellowstone have proven) are a keystone species and can benefit the overall environment.

christine travers	Most of it	No	I appreciate that you sought out a variety of opinions, particularly of the Indian tribes in the state. It is interesting to me to hear their views that we have no right to "manage" our brothers. They view each wolf as a unique individual as well as part of a family. It is rare to have a government document include such an view, so in this sense, progress has been made. It appears that the number of animals, including livestock, killed by wolves is very small and the money spend to "manage" them has grown exponentially over the years. More people are killed by domesticated dogs. The view of the people towards wolves is slowly changing as well to a more positive one, as your report notes. It is my view that the risk from wolves is very small to either people or animals. A small number of lost cattle is a small price to pay to keep a place in the world for wolves. Cattle are the animals that do not really belong on this land.	I would wish there were less lethal ways of controlling what is perceived to be the threat from wolves. I do not believe at all in hunting, especially with dogs or helicopters, trapping or poisoning them. I do support: ● The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed) What could be improved in the report: ● The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on: ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution ● The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. ● The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ○ A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings. ○ Hounding or hound training, which are akin to allowing legalized dogfighting, should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public. ● The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. ○ Despite Act 169, which mandates a wolf hunting season, the department can still restrict the implementation of lethal methods by setting minimal quotas, including a quota of '0' wolves, restricting timing and methods. ○ Several studies have proven a proactive non-lethal approach leads to better conflict mitigation. ○ Lethal management often fails to provide a long-term solution to wolf predation and has the least consistent success rates when compared to non-lethal practices. In addition, there is significant evidence showing that lethal wolf management may be less functionally effective at mitigating subsequent livestock losses than non-lethal deterrents. ● The plan should require the implementation of abatement measures as well as the use of non-lethal conflict minimization techniques by domestic animal owners for the latter to receive compensation for confirmed predation. ● The plan also runs contrary to public values towards wolves (and omits mention of such majority values from the plan), despite department surveys evidencing that the broad public cares about wolves as individuals (and not just for the viability of the population). Given the recent liberalization of killing wolves by the state, it would be incredibly informative to note majority support of the following reasons for opposing a regulated wolf hunting/trapping season (which are all omitted from the plan): opposition to specific methods of harvest like hounds (64%) or traps (70%), feelings that hunting wolves is unnecessary (62%) or culturally offensive to Native American tribes (57%). ○ All such reasons convey majority disagreement with practices currently promoted and endorsed by the legislature and the WDNR, and such a conflict between managers and the public should not only be acknowledged, but foregrounded and carefully considered in policy (instead of dismissed). ○ Such decisions to omit literature or downplay evidence (e.g., such as majority opposition to killing wolves and their reasons) are contrary to principles of scientific integrity (e.g., present all relevant scientific evidence to the public) as well as ethics (e.g., disguising ethical decisions, such as recreational wolf killing, as robustly supported by science). ● Conflicting agency objectives (e.g., optimizing public hunting and conflict mitigation) are not only not acknowledged, but even misunderstood as harmonious, against the body of scientific evidence. That culminates in the prioritization of consumptive values and policies; e.g., according to the body of scientific literature, use of lethal methods, and 2 especially public hunts, are contrary to most objectives relevant to: harm mitigation, the wellbeing of wolves, their ecological roles, and their non-exploitative enjoyment (i.e., Objectives A, B, D and F). ● There is a stark lack of consideration for individual wolves, wolf population health (including wellbeing), and measurable indicators for assessing any harms barring disease prevalence (e.g., accounting for cortisol levels or other stress hormones, measures of pair/pack persistence) ● There is an inappropriate understanding and consideration of tribal worldviews about wolves. Tribal worldviews of wolves are misconstrued as 'cultural benefits' tribes receive from the existence of a wolf population, when in fact tribal worldviews consider each individual wolf as a person and relative. Cultural respect and	5	Less killing of wolves, more conservation and support for wolf families and allowing them to occupy more space (with buffer zones). Less focus on the very few negative interactions with cattle. My goodness, people kill millions of cows per year and eat them! No recreational killing of any animals.

(Treves & Santiago-Ávila, 2023) Rating: 4-5 Reference list (studies not integrated into the current draft wolf plan)		
BETH WILMOTH	Most of it	Yes	Removing an arbitrary wolf population goal. The plan is rightly focused on the ecological benefits of wolves. The plan creates low quota zones around tribal lands where the tribes requested it		9	

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
	Most of it	Yes	I do like seeing the many data charts, lists, etc. as this helps me decipher the results of the effect that wolves have on other species and livestock. This also allows me to come to the conclusion that WI has far too many wolves to have this much livestock losses, dog kills, and even the astronomically high kill rate on elk by wolves. Thank you for opening my eyes to how many elk are killed by wolves, it's laughable and sad at the very same time. Bravo!	No. 1: The DNR must have a numeric population goal. I believe the population goal should be 350 and the DNR must do everything they can to get this population down to that number. This number can be increased or decreased based upon how the population is thriving at 350, livestock depredation levels, deer population levels, etc. Also, the DNR is literally throwing away good money after bad, in regards to the northern elk herd, which is being used to feed the wolf packs in this area. By your own elk kill data, the vast majority of elk mortality is from wolves. Great job guys, some real good elk recovery efforts gone to waste here. DECREASE THE WOLF population where this northern elk want to thrive. The agency can always make population adjustments in the future. Many entities have formal positions on the goal of 350 being maintained. These include the latest vote from the Conservation Congress spring hearings, Question No. 47, "Do you support a population management goal of 350 wolves or less for the state of Wisconsin." That question was supported in 69 counties with a vote of 12,978 in favor, 6,410 opposed. The Wisconsin Wildlife Federation, Wisconsin Farm Bureau, and the Wisconsin Cattlemen's Association all favor 350 or fewer wolves in Wisconsin. Between 2010 and 2017, 36 county boards (half of all counties) passed wolf control resolutions favoring a population goal of 350 or 350 wolves or less. In 2021-22, 16 county boards passed new wolf control resolutions, favoring 350 or 350 wolves or less, and nine counties decided to send in their previously passed resolution. Some Wisconsin towns have also passed similar resolutions. The Wisconsin wolf management plan needs a numeric population goal and 350 is where it needs to be. No. 2: Extensive expansion of primary and secondary wolf habitat designations. See draft plan Page 70 to view the previous zones. For the DNR's proposed new management zones, see pages 103 or 158. Zones 1, 2, and 5 are designated as primary wolf habitat, while zones 3 and 4 are termed "secondary" wolf habitat. Zone 6 is low priority for wolves. The new plan expands zones 1, 2, and 5 into areas that were previously considered secondary habitat, expands Zone 3 into previously designated low priority habitat, and dramatically moves Zone 4 into areas previously designated as unsuitable wolf habitat. The Zone 6 unsuitable wolf territory is considerably reduced. This leaves 36 counties completely in the unsuitable wolf habitat Zone 6, a huge reduction in where Wisconsin will discourage wolves if tools ever become available. None of these changes are based on science of where wolves can successfully live. The rationalization for these changes is that wolves are now living in these areas, so they must be suitable wolf habitat, and will be encouraged. Wolf zones should be based on an analysis of suitable wolf habitat considering biological and social analysis. No. 3: Public opinions. The DNR quietly conducted a public opinion survey in 2022, sent to 8,750 addresses, with over-sampling done for addresses in wolf-occupied areas. While this methodology is promoted as sampling residents who are familiar with wolves, most addresses in wolf country are still in villages, cities, or concentrated around lakes. Therefore, many who are not exposed to wolves in rural wolf counties would receive these surveys, and the responses reflect this bias. Also, the survey was eight pages long, provided answers in some questions that could be interpreted as favoring wolf expansion and protection, used phrases and words that are hard to define, and provided an unequal response to questions that bend the numbers towards favoring more wolves. No. 4: I am very angry with the WI DNR in that it took a lawsuit to force them to hold their last wolf hunt. This was a pathetic move by your agency so as to try and not hold a wolf hunt to appease the wolf protection supporters. I want to see the DNR schedule and hold another wolf hunt, this time with real meaningful harvest goals to reduce the population down to 350 animals, as soon as any federal de-listing occurs. When zones are closed literally 1-2 days after the wolf hunt season opens, because the reported quotas have been met, this screams to everyone that there are too many wolves in these zones and the harvest numbers must be raised. The DNR cannot hide from the fact that there aren't enough wolves on the landscape, the opposite is true.	1	Set the wolf population goal to 350 animals, hold hunts to get WI down to this goal, manage the population at this level and use additional studies to see if a good balance exists between a 350 animal wolf population with livestock kills, deer populations, dog kills, and human interactions.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Amelia Bifano	Most of it	Yes	The plan removes a numeric population goal: Removing an arbitrary wolf population goal is important to make sure the numbers of wolves are adaptable, so they can be based on best-available science and ecological changes. The plan creates low quota zones around Tribal lands where the Tribes requested it: These lands are treaty-protected with documented wolf packs. Making this update is an important and welcome addition to the plan. Ideally, the plan would expand these zones beyond just the few that are listed. The plan is rightly focused on the ecological benefits of wolves The plan is reflective of the public opinions survey that was released along with the plan and finds that opinions toward wolves have grown significantly more favorable towards wolves There is expressed commitment to science and continued research with partners and acknowledges that “keystone species such as wolves are an important component of a healthy ecosystem”	n/a	10	Thank you for the time and efforts you've put in to protect Wisconsin's wolves. I feel very strongly about this initiative.
Susan Cole	Most of it	No	I like that wolves wont be managed using the old goal of 350 individuals. And it pleases me that you are recognizing the ecological role wolves play.	The plan needs to strictly limit the lethal management of wolves (except for the extremely rare instances when a true threat exists). Hounding should be banned - this is cruel to the dogs and wolves alike. The state's method for estimating wolf numbers shows alarming departures from best practices in scientific management - it is still too highly influenced by anti-wolf factions.	3	There have been numerous studies showing that wolves have only a negligible effect of livestock numbers - allow wolves to regulate themselves - in Nature, they would anyway.
Catherine Frizat	Most of it	No	No more management referencing old numerical goal of 350 wolves. Buffer zones near tribal reservations	Plan does not reflect best available science in particular on effectiveness of non lethal interventions, impact of killing of wolves on packs social dynamics, etc.	6	Plan should prohibit any lethal management of wolves except of rare circumstances of defence of life
Frank Koresh	Most of it	Yes	The historic information of the wolf in Wisconsin.	The information from the "public perception" surveys. These data points are very misleading, as the surveys themselves were designed to give the answers that the pro-wolf groups were looking for, from the way the questions and answers were worded, to the way that the respondents were selected assured that the surveys would give the results that they wanted.	0	The plan is a complete failure to the people of this state, and especially to the sportsmen and woman of this state. The number one thing that needs to change in this plan is that there MUST BE A POPULATION GOAL DETERMINED, and this population goal NEEDS TO BE 350 OR LESS wolves in this state. The overwhelming support for the number has been shown multiple times by the votes in the Conservation Congress Spring hearings. Next, the area designated for wolf habitat needs to be left the way it was in the previous plan. Just because the wolves are there now does not automatically make that area suitable wolf habitat. The wolves in this state are currently out of control, and they need to be pushed back into the area of the state that was initially designated for them. Any area that has agriculture on the landscape needs to be kept free of wolf populations. Farmers are having a hard enough time with the modern economy, the last thing they need are preventable losses perpetrated on them by a the DNR for allowing the wolves to spread into areas of the state that they have no business being in. The DNR needs to listen to the rural residents in the area of wolf populations, their opinions and feedback needs to be weighed much more heavily than those that live in cities or villages, and the people that live in the major cities of the state, or the southern third of the state should have little or no input on this issue. Set a population limit, 350 OR LESS, and stick to it.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Brianna Hager	All of it	No	I believe the current plan needs significant updating (see next section). I recognize the efforts and improvements made to the previous plan, including: ● Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. ● There is much greater recognition of the ecological role of wolves ● The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves ● The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed)	● The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on (see reference list below): ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution ● The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. Time and again 'management' via hunting has proved to be wildly unsuccessful. It generally only breeds bloodlust and overkilling. Meanwhile, 'management' via hunting is undoubtedly unnecessary. Wolf packs, as are all predators, self sustaining and limiting. The amount of wolves that an ecosystem can hold are the PROPER amount that the land itself and the surrounding prey source calls for. Thus, in my opinion, it is only the greed of humans who dictate when (quite frankly not enough) the current populace number is 'too many'. ● The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ○ A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings. ○ Hounding or hound training, which are akin to allowing legalized dogfighting, should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public. ● The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. ○ Despite Act 169, which mandates a wolf hunting season, the department can still restrict the implementation of lethal methods by setting minimal quotas, including a quota of '0' wolves, restricting timing and methods. ○ Several studies have proven a proactive non-lethal approach leads to better conflict mitigation. ○ Lethal management often fails to provide a long-term solution to wolf predation and has the least consistent success rates when compared to non-lethal practices. In addition, there is significant evidence showing that lethal wolf management may be less functionally effective at mitigating subsequent livestock losses than non-lethal deterrents. ● The plan should require the implementation of abatement measures as well as the use of non-lethal conflict minimization techniques by domestic animal owners for the latter to receive compensation for confirmed predation. ● The plan also runs contrary to public values towards wolves (and omits mention of such majority values from the plan), despite department surveys evidencing that the broad public cares about wolves as individuals (and not just for the viability of the population). Given the recent liberalization of killing wolves by the state, it would be incredibly informative to note majority support of the following reasons for opposing a regulated wolf hunting/trapping season (which are all omitted from the plan): opposition to specific methods of harvest like hounds (64%) or traps (70%), feelings that hunting wolves is unnecessary (62%) or culturally offensive to Native American tribes (57%). ○ All such reasons convey majority disagreement with practices currently promoted and endorsed by the legislature and the WDNR, and such a conflict between managers and the public should not only be acknowledged, but foregrounded and carefully considered in policy (instead of dismissed). ○ Such decisions to omit literature or downplay evidence (e.g., such as majority opposition to killing wolves and their reasons) are contrary to principles of scientific integrity (e.g., present all relevant scientific evidence to the public) as well as ethics (e.g., disguising ethical decisions, such as recreational wolf killing, as robustly supported by science). ● Conflicting agency objectives (e.g., optimizing public hunting and conflict mitigation) are not only not acknowledged, but even misunderstood as harmonious, against the body of scientific evidence. That culminates in the prioritization of consumptive values and policies; e.g., according to the body of scientific literature, use of lethal methods, and 2 especially public hunts, are contrary to most objectives relevant to: harm mitigation, the wellbeing of wolves, their ecological roles, and their non-exploitative enjoyment (i.e., Objectives A, B, D and F). ● There is a stark lack of consideration for individual wolves, wolf population health (including wellbeing), and measurable indicators for assessing any harms barring disease prevalence (e.g., accounting for cortisol levels or other stress hormones, measures of pair/pack persistence) ● There is an inappropriate understanding and consideration of tribal worldviews about wolves. Tribal worldviews of wolves are misconstrued as 'cultural	4	Put plans in place to encourage the instruction of study, science, and intelligence. Break the cycle of hatred.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
				benefits' tribes receive from the existence of a wolf population, when in fact tribal worldviews consider each individual wolf as a person and relative. Cultural respect and sensitivity towards such views, shared by many non-tribal members, demand the strict mitigation of lethal measures, especially recreational killing, as opposed to their current promotion in the plan. ● In general, all omissions of scientific literature, the arbitrary prioritization of policy objectives, the rhetoric of the plan and the dismissal of public values and concerns for wolves point towards a biased, unscientific and instrumental view of wolves that promotes values contrary to broad public perspectives on wolves. ● 'SOM' wolf estimation methodology – From a recent critique: "The new methods sacrifice precision, but are believed to retain adequate accuracy and sensitivity to changing conditions for reliable decision-making. We review evidence for the accuracy, precision, and sensitivity of the new 'scaled occupancy model' (SOM) applied in Wisconsin. We conclude that the Wisconsin method would systematically overestimate wolf abundance by large (but currently incalculable) margins. Because Wisconsin, similar to other states, not only changed to unverified methods but also implemented widespread wolf killing, shortcomings in their estimates of wolf abundance may have far-reaching consequences for population viability and confidence in state wildlife managers. We discuss findings from Wisconsin alongside similar findings for other states' occupancy models being insensitive to human causes of mortality that have recently increased. Overall, Wisconsin's proposed method for estimating wolf abundance shows significant departures from best practices in scientific measurement. Verification will require independent replication and unbiased tests at multiple scales in multiple habitats under different human-induced mortality rates, and peer review before the new methods are considered reliable." (Treves & Santiago-Ávila, 2023)		
Patricia Juday	Most of it	Yes				For the health and benefit of wolves and the environment it is critical to incorporate the recommendations of WGF's Wildlife Work Group.
Susan Repp	All of it	No	Real education for the population on wolves as this paper shows, history, significance with regards to the environment and ecosystem. Why they are important for us to protect them	I am not native American but I understand their position on the wolves, their voices need to be heard but it appears there is little of that going to happen. The 'Harvesting' is basically killing for sport, keeping their numbers down which is not really living in mutual existence with them. People chose where they live, the land is not only for humans but for the animals	2	The majority of the population support wolves yet the plan allows special interest groups to monopolize the conversation i.e. hunters, ranchers, anti-wolf individuals. We need to reflect the majority of voices and scientific information for support of wolves not negative bias and imagined threats. Killing just to kill is not a plan.
	Just the parts I am interested in	Yes		No joint plan between state and federal to keep politics out. How do you verify wolf numbers when not all wolfs are counted . A set number of wolfs should be at original total	2	Original plan of 350 should stand. Deer and elk recovery will never happen, because it's to late already. Sportsmen will never see game like it was 20 years ago.thats the demise of the deer camps in northern Wisconsin. Along with lost revenue to local business.the DNR let the sportsmen down by not doing something a lot earlier. Now special interest and politics are in charge of all of Wisconsin sportsmen future.
Maggie R	All of it	Yes	I like the perspectives and input of all the tribes. I agree that wolves (Mo ewe) are brothers and sisters and they do not need to be "managed" but the focus should be on stewardship and nonlethal co-existence. I am not a tribal member for transparency sake. I also like the information on Gray Wolf biology and ecology. It tells me that the WI DNR has knowledge of that science.	I dislike the section on "harvesting" wolves. I do not support harvesting of wolves but rather I support education and non lethal co - existence. Minnesota DNR has done an outstanding job of public education that Wisconsin DNR should emulate. The "Voyager Wolf Project" in Minnesota is amazing and I have learned a lot from their YouTube videos (trail cams, etc.).	1	Though reading this plan I see the Wisconsin DNR knows the intimate social structure, biology and ecology of Gray wolves and that fact makes the decision to allow a wolf hunt (Feb. 2021) which slaughtered 216 wolves in only 3 days (and the hunt had to be cut short) whereby there was almost zero accountability or proper organization absolutely disgusting and reprehensible. Needless to say, some pregnant females were killed and the social structure consequently negatively impacted. My biggest concern is the incompetence at the WI DNR which allowed such a debacle and tragedy to occur. I am embarrassed for my home state Wisconsin by the WI DNR. Needless to say, I am grateful Gray Wolves are back on the endangered species list. If for some reason they are off again, what changes and accountability and transparency have been put in place by WI DNR to Prevent another tragedy and incompetent debacle like the one that occurred in Feb. 2021?
Cheryl Mach	All of it	No	It's been updated since 2007 with an updated 2022 public survey.	This plan is still hunter-human-centric with an emphasis on wolf-negativity, predation and control; especially using barbaric, old fashioned, and cruel means...i.e. trapping and hunting with hounds. Instead of focusing on the negative, the DNR needs to take a more positive view of the role wolves play in the natural ecology, their sentience, intelligence and family dynamics, and focus instead on the non-lethal approach to managing the population. There is such a thing as non-lethal management practices that work. Wolf hunting should be the last resort and not used for "recreational" purposes....no matter how hunters try to obfuscate the real reasons why they hunt predators---it's only for enjoyment and bragging rights!	5	Let's start looking at predators as a good thing for the environment and using our brains to to get away from killing anything that moves as the first response to a situation.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
C Dahl	Most of it	Yes	There's nothing to like.	Lack of 350 population goal. Lack of reasonable hunting opportunities. No realistic plan to get the numbers of wolves in check. Excessive buffer spaces around reservations.	1	Throw it out and start over. This time listen to the hunter groups and the people that live in wolf territory instead of the Dane County liberals and the animal rights lobby. Follow the guidance of the 350 animal goal passed by multiple county boards; that is the will of the people that live in wolf territory.
	Just the parts I am interested in	Yes	Not having a set population number.		9	None
Linda Davis	All of it	No	The recognition of the ecological role of wolves.	The lethal management of wolves except in the immediate defense of life.	1	
Tia Simon	Most of it	No	Public education efforts. Let's finally actually educate the public, and hunters, that wolves are not in a "dangerous" category. They do not hunt people and do not want to hunt farm animals. I'm so tired of the myths, hype, lies, and hollywood falsities that have left wolves one of the most persecuted animals in America. Shame on us. Let's get the real science out there. The ecological role of wolves, thier passive nature with people, and their incredible sentience (they make better families than humans do) needs to be known. We have much to learn from them.	Trapping, use of dogs, and use of technology to kill wolves today is dated and unacceptable. These are gruesome, horrific, disrespectful methods that have no place in society anymore. In fact, hunting is becoming a less popular sport due in part to such unsportsmanlike and unethical methods, as we hunters hunt for food and for our health. Trapping was, a long, long, long time ago how people caught necessary food while today, at the expense of all, it is for tradition (more understandable) or sheer profit without any food from the wolf at all (completely unacceptable). We need to stop supporting old, dated methods that are torturous just because some special interest groups are loud and have money to lobby. I hope I needn't have to explain why traps, dogs and technology to kill an endangered, exploited, highly intelligent, sentient being is intolerable. Let's be enlightened and finally accept that our fellow animals are are important and necessary to Earth, America's and state's welfare and wellbeing as we are - or more so. We're in an extinction crisis, a biodiversity crash, a climate crisis and a human overpopulation crisis, and your report demonstrates out-of-control poaching and illegal killing of wolves. It does not account for uncollared poached or illegally killed wolves which we may assume are equal to or potentially a greater percent than the collared wolves. Where are these figured into the plan, as they will each and all significantly - greatly - affect wolf success? These four issues must be included to affect future outcomes. We may also assume that disease will increase, not remain the same or decrease, as ecosystem health continues to decline. Please add this factor as well. All conflict plans should be non-lethal, using only humane interventions. All of them. All recreational take should be eliminated. Wolves are not a source of American food and there is no reason beyond personal greed to allow such killing of our publicly shared wildlife, especially iconic, highly intelligent, revered and sentient wildlife. We can, as a nation and states, make far more profit from protecting wolves than killing them. The plan has but a tiny, tiny, tiny percent of land designated in full protection of wolves. Wolves, to create viable families, pass on healthy genetics and properly teach their young, as well as to balance ecosystems, must have more full-protection areas. These are the areas where we know wolves thrive, and this drives tourism, especially ecotourism, which is, and will continue to become, far, far more popular than trophy hunting.	4	Unfortunately, this plan looks like those of the past that have left our nation and our states in a wildlife crisis. Wolves balance ecosystems. To bring back ecosystem health, and thus our wealth, we must revise this plan to increase the number of wolves, and their range, significantly. I am finally saddened that this public comment period was not part of prior plan proposals. What of democracy? Thank you.
William Schroeder	Most of it	Yes		I would like to see the depredation numbers return to where they were at the turn of the century. The chart on page 74 is alarming. I would like to see the wolf population return to the original goal of 350 animals. Keep the number there for ten years and depredation at that time.	1	As the wolf population continues to increase there is going to be more and more contact with human activity. There needs to be a balance and right now that balance appears to be out of whack.
Mr and Mrs Coppola	Most of it	No	We support increasing protections for wolves, and educating people and stop with the “big bad wolf” myths	It’s difficult to believe only a few Wisconsinites support non lethal use. Please educate.	5	Ideally non-lethal conflict interventions and banning recreational killing is a must
Victoria	All of it	No			10	
Marianne Lazarus	All of it	No	There are several very positive and progressive in this plan such as, including the respect of buffer zones for tribal reservations. The increasingly more positive view of public resect and understanding of and wolves. The expanded understanding of the plan to the ecological value that wolves bring to the environment. The increased opposition by the public as to culling wolves by the number, and the methods of awareness of the motives and methods of such.	The lack of scientific data that shows that how the impact of killing of each individual corresponds to the growing awareness of wolves being creatures of sentience. Science has found that wolves are important to wolves, the public and the environment. Much more research on the effectiveness of non-lethal measures to control population and provide positive benefits to industries, sporting, the public at large and the wolves themselves. Data shows that we can live habitably with each other. There are scientific facts that prove that wolves are valuable to other wolves, to the public, the evolution of our wolf population, and the ecological stability of the forests and wilderness areas.	4	Do more scientific research. The plans does not touch hound use in management of populations. This is little more than legal dogfighting, it is cruel and does not need to be used. Public opposition to the cruel culling and methods used by the public are in the majority. Look at the data. Conflict resolution is a well know and valued resource which needs to be explored by this plan. Wolf management need to change. This plan definitely needs more scientific review on how wolf killing negatively impacts our entire system.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
	All of it	Yes		No population limits on wolf management.	1	This proposed plan is so biased toward "no wolf management". I live in eastern Oneida County and own nearly 400 acres. There are at least two (2) wolf packs in this area. I have owned and hunted this property for 49 years. Wolves are raising havoc with the deer population and has ruined my deer hunting. I have lost four deer hunters in my camp because of this wolf population. The hunting traditions are deteriorating. Wolf kills have been within 100 yards of my home on the property. I have to carry a sidearm when I am not hunting, doing forestry and land management work. I can live with the 350 wolf goal as originally proposed. What the DNR is now proposing is totally unacceptable.
	All of it	Yes			0	You have destroyed generations of family hunting traditions in the north woods with your complete lack of action and catering to the liberal wacko propagandists. It is near impossible to get kids involved with hunting when there are next to no deer because the wolves have decimated the deer herd. And for what? So an extremely small minority of liberal wackos can feel all warm and fuzzy. Quit procrastinating and do your job of managing these out of control predators. THEY ARE NOT ENDANGERED! Stop the lies. There are thousands of wolves in wild places where they belong and are thriving just fine in Canada, Alaska, etc. We do not need them murdering livestock and family pets where they do not belong. Use some common sense. Remove the "endangered" lie from the discussion already. Who cares what the historical range is. Things have changed. We cannot have them killing pets and livestock where they do not belong.
Dennis W. Holland, Ph.D.	Most of it	No	- Appreciate the proposal to include consideration of Native American perspectives, specifically the proposal to provide buffer zones around reservations. - Proposal to eliminate specific numerical management of wolves (e.g. the "350" number). - Scientific input in the plan. For example, identifying the ecological value of wolves and their importance in managing natural resources. -The more positive view of wolves found in the ""social survey" which may assist in reducing inhumane destruction of wolves and even the absurd outdated motives for wolf killing.	- The plan does not appropriately address the sentiments of society regarding the ecological value of wolves, the inhumane methods of killing wolves and their right to exist. - The plan fails to address the full body of available scientific research reflecting the damage done through inhumane and unnecessary killing of wolves. Lethal management of wolves should be should be rare and justified according to current scientific research. - Generally the plan does not go far enough to address the value of wolves, the need to maintain appropriate population, the inhumanity of the lethal wolf "management" methods. A much broader assessment and utilization of available scientific research should dominate the discussions and body of the "plan". Finally, as mentioned above, the plan does address some inclusion of Native American perspectives. However, it does not fully address the cultural aspects of the tribal relationship with wolves. More input from the tribal communities of Wisconsin is imperative.	5	Wolves are a necessary part of creation. Our Creator does NOT make mistakes! I applaud the WDNR for taking on this important task. I only ask that all available pertinent scientific research be reviewed and included in the further development of this plan.
Kathlene Henry-Gorman	All of it	No	I appreciate the efforts of all WDNR staff involved in updating the state's wolf management plan, and the opportunity you have created to voice my opinion concerning the WWMP. I recognize several efforts and improvements made to the previous plan which include: ● Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. ● There is much greater recognition of the ecological role of wolves in keeping ecosystems healthy. They help keep deer and elk populations in check, which can benefit many other plant and animal species. The carcasses of their prey also help to redistribute nutrients and provide food for other wildlife species, like grizzly bears and scavengers. ● The inclusion of a social survey, which notes increased positive views of wolves, and increased opposition to the motives and methods for killing and controlling wolves. ● The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed.	The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on the following: 1. Wolf ethology, sentience, sapience, sociability, agency and wellbeing, 2. Effectiveness of non-lethal interventions, especially relative to lethal ones, 3. The impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution. ● The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. My greatest concerns comes down to what I consider the following important points: The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings. Hounding or hound training, which are akin to allowing legalized dogfighting, should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public.	5	
Dale Kluth	All of it	Yes		Lack of a population goal and expansion of wolf habitat designations	1	I object to the proposed wolf management plan because, among other things it lacks a population goal. That goal should be 350 wolves as was originally proposed when wolves were introduced to Wisconsin The reasons being; 1. A goal of 350 wolves was overwhelmingly supported by the vote count at the spring conservation congress. 2. That number was also supported by 25 county boards,Wisconsin Farm Bureau, Wisconsin wildlife federation and Wisconsin cattlemen's association. 3. The WDNR has initiated a program to open up private land for hunting and other recreation, meanwhile leaving wolves destroy the hunting on all the public lands in northern Wisconsin. 4. Wolves are NOT endangered and Wisconsin is NOT the place to have large numbers of them.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
	Most of it	Yes	Strategy C3: Encourage non-consumptive recreational and cultural opportunities associated with wolves.	1. Doesn't specifically address solving the problem of the recent overharvest. 2. Strategy A5 Maintain sustainable populations of wolf primary prey because we already have too many deer on the landscape, if we increase deer for both humans and wolves we'll never lower deer levels in the state. 3. Providing compensation for hunting dog losses.	7	
Roberta M. Rieck	Most of it	Yes	See below	See below	1	I adopt and endorse the comments of John F. Ebbott, Jefferson County, as my own comments.
	Just the parts I am interested in	No	Recognition of the ecological role of wolves; social surveys	Lacking the latest available science when discussing recreational killing and other lethal means of population control.	5	
John Czyzewski	All of it	Yes	I like that The Wisconsin DNR is taking public input and want to maintain a healthy Wolf population.	I dislike the random numbers being thrown out for illegal kills and pouching. You don't know them I dislike the percentage rate you feel is allowable for a wolf hunt .much to high. If there is a hunt I dislike the minimal amount charged for a hunting permit. ridiculously low. I don't see the numbers from the last wolf hunt that was a disaster.	4	As far as trust in the DNR , look at the last disastrous hunt in Wisconsin. so not to much trust. I don't think I saw the numbers from that any where. I could be wrong.
Elizabeth Marie	All of it	Yes	Good historical information.	1. Where is the population goal. Without a goal you don't really have a plan. 2. Where is the estimated population by zone? 3. The word Holistic doesn't belong in a wolf management plan. 4. Too many anti-hunting and wolf advocates on the committee. 5. Properties adjacent to the reservation shouldn't be treated any different than all other non reservation properties. 6. Looks more like a wolf expansion plan. 7. To mention potential eco tourism because of wolfs is a joke. They aren't like Elk that are predictable. Hunting tourism lost far outweighs any pie in the sky wolf tourism. 8. Residents located in wolf territory should have most of the say in acceptable wolf levels. Don't include large cities like Wausau. 9.	1	
Michelle Talhami	Most of it	Yes	I appreciate options to reign in harms caused by trophy hunting and trapping as the following: - Creation of subzones 1B and 2B to minimize wolf harvest in areas adjacent to large tribal reservations within wolf range; however, I believe quotas in subzones should be zero to more effectively provide a buffer area for wolves who live on or adjacent to reservations. - Pursing administrative rules to reduce registration time for wolves killed by trophy hunters and trappers to eight hours (Product C2a). - Limiting wolf licenses to be valid only in a specific zone (Product C2c). The DNR was correct to remove a numerical population management goal from the plan. Wolf populations should not be managed for a specific number, but rather the goal should be for the state to have a self-sustaining, self-regulating, and genetically diverse population that maintains connection with wolf populations in neighboring states and fulfills their ecological roles. I appreciate the commitment to making information about wolves transparent and easily accessible to the public. All information about wolf population dynamics, mortality, and conflicts should be readily accessible on the department's website. Developing wolf conflict mitigation plans focused on non-lethal deterrent methods for farms with chronic wolf problems (Product B1h) is a step in the right direction to mitigating already rare conflicts with livestock in a way that supports public values and the best available science. I also appreciate the strategies related to increasing public education related to the implementation of nonlethal conflict deterrent methods.	Establishing a season to train hounds for wolf trophy hunting is irresponsible and amounts to state-sanctioned dogfighting (Product C2h). Such a season will undoubtedly increase conflict, create social chaos among wolves, and lead to increased harassment of nontarget wildlife and trespass issues with landowners. Overall, the plan puts an alarming emphasis on trophy hunting and trapping wolves when they are not protected under the Federal Endangered Species Act. While I understand Wisconsin law mandates the state hold such seasons when wolves are not federally protected, the plan should recommend this law be changed, similar to the way it recommends other changes to other state statutes. It is very disappointing that the majority of strategies under Objective C - Provide Multiple Benefits Associated with the Wolf Population are related to trophy hunting and trapping. Wolves provide many benefits, particularly related to biodiversity and the ecosystem, disease reduction and preventing deer-vehicle collisions, and those ideas should be the focus of this objective. Only a very small portion of Wisconsin's population is interested in trophy hunting and trapping wolves, whereas all Wisconsinites benefit from the ecological services wolves provide. A higher emphasis should be placed on nonlethal conflict deterrence methods in Section 3 and Section 4, Objective B. Scientific studies demonstrate that killing wolves, particularly through trophy hunting and trapping, can lead to increased conflicts, while nonlethal deterrents can be highly effective at deterring conflicts when used correctly. Product B1f, to 'utilize the wolf harvest zones/subzones and public harvest season to address conflicts by directing licensed wolf hunters and trappers to areas of conflict' goes against the best available science and should be removed. Particularly in Section 1, there should be a more robust discussion of the harms killing wolves has to their social dynamics. Numerous scientific studies have demonstrated that killing a single wolf can create social chaos and rip wolf families apart, potentially leading to increased conflicts with humans. The plan seems to include irrational 'perceived' harms from wolves as potential justifications for reducing wolf numbers by killing them. Yet, wolves do not threaten human life, the livestock industry, or hunters' ability to hunt deer. Wolf attacks on humans in the lower 48 states have never been documented. Wolves take far less than 1% of Wisconsin's livestock. And, Wisconsin's deer herd is robust. Rather than using irrational fears or 'perceived' loss of deer hunting opportunities as justifications for killing, the DNR should rather focus on providing robust public education to correct such misinformation. The plan should include a provision to update it at least every five to ten years rather than being 'valid until replaced'.	5	Wisconsin has a responsibility to craft an updated wolf management plan that supports a healthy, genetically diverse, and socially stable wolf population and is rooted in the best available science and traditional ecological knowledge, ethics, and public values. As a keystone species, the benefits wolves provide ripple throughout our ecosystem and have been instrumental in restoring biological diversity. While there are many scientific studies documenting the consequences of killing wolves, there is not a single one that provides the justification for killing such intelligent and social animals who provide so many ecological and cultural benefits. This draft should be revised to meet this responsibility by: - Recommending policy changes to eliminate the mandate that Wisconsin hold a trophy hunting and trapping season on wolves when they are not federally protected. - Further discussing and emphasizing a clear prioritization of nonlethal methods for preventing conflicts with livestock. - Including a strong commitment to give all Wisconsinites a seat at the table in guiding wolf policy. Based on the 2022 public attitudes survey detailed in the wolf plan, the majority of Wisconsinites clearly value wolves and want them to thrive in Wisconsin. These values should be more proportionately represented in groups that have influence over wolf policy.
	All of it	Yes	None of it	You must have a population goal. To leave it open ended is an insult to everyone.	1

JCB Heffernan	All of it	Yes	Anything that has to do with the possible effect of wolves on CWD and Lyme disease and the native american view of wolves and wolf history.		9	one litle detail not mentioned is the hiostorical wipeout of the beaver population and how that may have contributed to the decline of wolves to some extent--we have decimated so many things as we have "settled" the US that it may be hard to keep track of what ways we have influenced the destruction of our natural spaces and our ecology and influenced disease in general in our human population...
Clayton King	Most of it	Yes	I don't like it at all. It is socially based not science based! We need to go back to what we were already using and follow it. And the 1st thing that needs to be done is to step up to the federal government and get them taken off of the Endangered species list.	It is social based not science based.	1	In my opinion the people that are for this protecting the wolves is trying to take away deer hunting from the people, and let the dogs eat all of them and that's gonna be very bad for our state when we lose all the money that deer hunting generates.
John Tomten	Most of it	Yes	I'm grateful that the DNR has finally released the long overdue plan... be it 2 days after the general election. I'm happy that there is finally a "plan".	Overall, the plan is politically biased! Let's remove our governors from this equation. We need common sense and responsible management by the DNR, without political influence. I believe that 95% of our DNR's employees and scientists are actual friends of the sportsmen and women of our state. But, overall, I believe that the top 5% of upper management needs a thorough house cleaning! The plan is expanding the acceptable wolf range area into areas that are inappropriate for wolves and will create more conflict. This is not fair to the wolves or our fellow citizens. Since half of the counties in our state want a 350 or less management population goal, why are you expanding the wolf range and NOT listing a number? This plan is simply ridicules and will create more future problems than it will resolve the issues of today.	3	I agree that we need a small population of wolves in Wisconsin to add to our state's diversity. But, that said, there are large areas of northern Wisconsin which may be able to handle this with controlled population, but NOT the entire state, which seems to be where this plan is eventually heading. So, what is the maximum wolf population goal??? 350, 500, 2500, or 3000 to 5000??? Without a number, how can this be considered a management plan?? Also, I do not agree with the current "scientific wolf count". There are far too many ways to influence the "occupancy modeling" system... way too many variables and outside influences. I feel that we need to return to actual snow tracking and howling methods and that they need to be fully funded so that they can actually support "on-the-ground" science. The population needs to be COUNTED versus the current guessing game with it's obvious political influences! Also, the tribes have a say in this... if they don't want to hunt wolves on their tribal lands, hey, that's okay. But, that should be the extent of it and they shouldn't be allowed to simply trash their permits if there is a hunting season. this makes no sense to me. Thank you for the opportunity to voice my concerns.
Richard Kite	All of it	Yes	We appreciate the efforts of all WDNR staff involved in updating the state's wolf management plan. Although we believe the current plan needs significant updating (see next section), we recognize the efforts and improvements made to the previous plan, including: ● Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. ● There is much greater recognition of the ecological role of wolves ● The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves ● The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed	The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on (see reference list below): ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution ● The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. ● The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ○ A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings. ○ Hounding or hound training, which are akin to allowing legalized dogfighting, should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public. ● The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. ○ Despite Act 169, which mandates a wolf hunting season, the department can still restrict the implementation of lethal methods by setting minimal quotas, including a quota of '0' wolves, restricting timing and methods. ○ Several studies have proven a proactive non-lethal approach leads to better conflict mitigation. ○ Lethal management often fails to provide a long-term solution to wolf predation and has the least consistent success rates when compared to non-lethal practices. In addition, there is significant evidence showing that lethal wolf management may be less functionally effective at mitigating subsequent livestock losses than non-lethal deterrents. ● The plan should require the implementation of abatement measures as well as the use of non-lethal conflict minimization techniques by domestic animal owners for the latter to receive compensation for confirmed predation. ● The plan also runs contrary to public values towards wolves (and omits mention of such majority values from the plan), despite department surveys evidencing that the broad public cares about wolves as individuals (and not just for the viability of the population). Given the recent liberalization of killing wolves by the state, it would be incredibly informative to note majority support of the following reasons for opposing a regulated wolf hunting/trapping season (which are all omitted from the plan): opposition to specific methods of harvest like hounds (64%) or traps (70%), feelings that hunting wolves is unnecessary (62%) or culturally offensive to Native American tribes (57%). ○ All such reasons convey majority disagreement with practices currently promoted and	5	

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
				endorsed by the legislature and the WDNR, and such a conflict between managers and the public should not only be acknowledged, but foregrounded and carefully considered in policy (instead of dismissed). ○ Such decisions to omit literature or downplay evidence (e.g., such as majority opposition to killing wolves and their reasons) are contrary to principles of scientific integrity (e.g., present all relevant scientific evidence to the public) as well as ethics (e.g., disguising ethical decisions, such as recreational wolf killing, as robustly supported by science). ● Conflicting agency objectives (e.g., optimizing public hunting and conflict mitigation) are not only not acknowledged, but even misunderstood as harmonious, against the body of scientific evidence. That culminates in the prioritization of consumptive values and policies; e.g., according to the body of scientific literature, use of lethal methods, and 2 especially public hunts, are contrary to most objectives relevant to: harm mitigation, the wellbeing of wolves, their ecological roles, and their non-exploitative enjoyment (i.e., Objectives A, B, D and F). ● There is a stark lack of consideration for individual wolves, wolf population health (including wellbeing), and measurable indicators for assessing any harms barring disease prevalence (e.g., accounting for cortisol levels or other stress hormones, measures of pair/pack persistence) ● There is an inappropriate understanding and consideration of tribal worldviews about wolves. Tribal worldviews of wolves are misconstrued as 'cultural benefits' tribes receive from the existence of a wolf population, when in fact tribal worldviews consider each individual wolf as a person and relative. Cultural respect and sensitivity towards such views, shared by many non-tribal members, demand the strict mitigation of lethal measures, especially recreational killing, as opposed to their current promotion in the plan. ● In general, all omissions of scientific literature, the arbitrary prioritization of policy objectives, the rhetoric of the plan and the dismissal of public values and concerns for wolves point towards a biased, unscientific and instrumental view of wolves that promotes values contrary to broad public perspectives on wolves. ● 'SOM' wolf estimation methodology – From a recent critique: "The new methods sacrifice precision, but are believed to retain adequate accuracy and sensitivity to changing conditions for reliable decision-making. We review evidence for the accuracy, precision, and sensitivity of the new 'scaled occupancy model' (SOM) applied in Wisconsin. We conclude that the Wisconsin method would systematically overestimate wolf abundance by large (but currently incalculable) margins. Because Wisconsin, similar to other states, not only changed to unverified methods but also implemented widespread wolf killing, shortcomings in their estimates of wolf abundance may have far-reaching consequences for population viability and confidence in state wildlife managers. We discuss findings from Wisconsin alongside similar findings for other states' occupancy models being insensitive to human causes of mortality that have recently increased. Overall, Wisconsin's proposed method for estimating wolf abundance shows significant departures from best practices in scientific measurement. Verification will require independent replication and unbiased tests at multiple scales in multiple habitats under different human-induced mortality rates, and peer review before the new methods are considered reliable." (Treves & Santiago-Ávila, 2023)		
Mark Bullard	Most of it	Yes	Nothing	I was originally in support of having wolves return to Norther Wisconsin with the agreed quota of 350. Not sure who or why our current wildlife managers don't want to have that in this plan or even say that they support it. Our deer herd has been decimated in the wolf areas. Tourism is way down and many hunters don't even bother going to the once sacred areas of norther Wisconsin. Listen to the hunters that are out there. Obviously the wolf numbers are out of control when 216 can be shot in two days with limited amount of tags.	1	Listen to the hunters in northern Wisconsin, not anti hunting groups. Get the wolf hunt back.
	I have not read any of the draft plan	Yes				The deer population is Wisconsin is way too high. Historically, it would have never been this high. I know this is a touchy subject, and hunters want a deer every year, but I think that expectation is unrealistic. The deer population wreaks havoc on our forest health. There are plenty of examples/studies that show healthy regeneration of forest ecosystems in areas that have been fenced off for deer vs. adjacent areas that have not. Lack of that forest regeneration on a broader scale greatly affects other species. I have admittedly not read the plan. However, if it calls for reducing the wolf herd, it should then also call for greatly reducing the deer herd as well...hopefully down to pre-settlement numbers. If the latter doesn't happen with reduced predation, then the ecosystem will be even more out of whack. For the record, my son and I hunt deer so this isn't coming from a non-hunter.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Anna Enderle	Most of it	Yes	I really like that there are refuge areas where no wolves will be harvested, and I'm glad Wisconsin's Native tribes were consulted so that tribal lands can be these refuge areas. I like that plan includes outreach and education to increase Wisconsinites' knowledge of and interest in wolves. The plan also addresses the key role that wolves play in the ecosystem and acknowledges their ecological importance. I also like that the plan acknowledges that having corridors for wolves to move between packs is key to having a healthy, sustainable population.	I might have missed it, but I didn't see any criteria that explained the harvest quotas for wolves. I think it would be beneficial to have it clearly written out what the metrics are when discussing how many wolf tags will be available.	9	Thank you for your hard work! I'm excited to see the effects of the plan in the years to come.
	Most of it	No	The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves. The adoption of proposed buffer zones around tribal reservations and the plan now seems to recognize the ecological role of wolves.	The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on (see reference list below): ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution ● The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. ● The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ○ A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings. ○ Hounding or hound training, which are akin to allowing legalized dogfighting, should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public. ● The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. ○ Despite Act 169, which mandates a wolf hunting season, the department can still restrict the implementation of lethal methods by setting minimal quotas, including a quota of '0' wolves, restricting timing and methods. ○ Several studies have proven a proactive non-lethal approach leads to better conflict mitigation. ○ Lethal management often fails to provide a long-term solution to wolf predation and has the least consistent success rates when compared to non-lethal practices. In addition, there is significant evidence showing that lethal wolf management may be less functionally effective at mitigating subsequent livestock losses than non-lethal deterrents. ● The plan should require the implementation of abatement measures as well as the use of non-lethal conflict minimization techniques by domestic animal owners for the latter to receive compensation for confirmed predation. ● The plan also runs contrary to public values towards wolves (and omits mention of such majority values from the plan), despite department surveys evidencing that the broad public cares about wolves as individuals (and not just for the viability of the population). Merlin Van Buren	All of it	Yes	I like that it is adaptable to the different areas. I like that it is more based on science and not opinion or politics.	Hunting is still too high of a priority.	7	There are not too many wolves. The state can sustain a much higher population.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
S Stewart	All of it	No	- Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. - There is much greater acknowledgement of the ecological role and value of wolves - The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves - The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed).	The current draft does not seem connected to up to date and excellent available science, and is missing a substantial amount of scientific literature which is vast and well documented and easily attainable on a bunch of wolf facts (documented and documented well). Facts about wolf ethology, sentience, sapience, sociability, agency and wellbeing. Facts about the effectiveness of non-lethal interventions, especially in contrast with lethal ones. Facts about the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution. Instead, there seems a bias that is oriented towards human need to kill wolves. Which simply does not make sense and is not backed but as useful for management. In fact, it never makes sense to kill wolves except when it is a (rare, to say the least) life or death situation. Any other reasons only increase violence towards wolves by illegal means as well as those deemed legal. Killing wolves, or any animal, with dog packs, is unsportsmanlike and completely unnecessary and is not approved of by the general public. It's akin to dog fighting. Which is illegal! In essence, the plan should focus on prioritizing wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. This is backed by reams of excellent science and wolf studies! Furthermore, the plan should require the implementation of abatement measures as well as the use of non-lethal conflict minimization techniques by domestic animal owners if they are to receive compensation for confirmed predation. There is just too much bias towards hunting and trapping when this is not what the broad public wants at all. The public LIKES wolves and cares about wolves as real and valued animals. The plan keeps acting as though this is not true and as though the intent is to back up undocumented reasons why old methods of supposed wolf management (for example, hunting and trapping quotas) make sense. When they don't. The quotas could be set at zero and more up to date actual public and research data. In general, all omissions of scientific literature, the arbitrary prioritization of policy objectives, the rhetoric of the plan and the dismissal of public values and concerns for wolves point towards a biased, unscientific and instrumental view of wolves that promotes values contrary to broad public perspectives on wolves. We find this depressing and are also depressed by the underappreciation of the actual wolf populations and lack of care for that and the lack of understanding of Native American value of wolves. This plan needs a lot of improvement and the good news is that there are loads of studies with data for how to improve the plan!	4	Please actually do a true literature search and learn about all the many ways wolves matter and can be understood and managed in nonlethal ways. This issue is terribly handled these days in Montana, where we live, so we are delighted by your openness to hearing from people who know about and care about wolves!

This plan needs a lot of improvement and the good news is that there are loads of studies with data for how to improve the plan!	5	Please actually do a true literature search and learn about all the many ways wolves matter and can be understood and managed in nonlethal ways. This issue is terribly handled these days in Montana, where we live, so we are delighted by your openness to hearing from people who know about and care about wolves!
Linda Weitzer	Most of it	Yes	Removing an arbitrary wolf population goal Plan is rightly focused on the ecological benefit of wolves Plan creates low quota zones around Tribal lands where the Tribes requested it	DNR should better regulate hound training on wolves There is currently no guidance in plan for next review or update	9	
	Just the parts I am interested in	Yes	That the DNR would base a plan on actual wolf numbers. A plan based on "zones".	Hunting with dogs, such harassment of wildlife and is it any wonder, dogs are hurt? No to hunting with dogs, no to trapping. The deer population here in Mercer is exploding, we need the wolves.	5	My compliments, it does look extensive and well thought out. A summary would have been nice, I mean how many people are going to read 178 pages? Did I miss something...how many are you going to be allowed to be killed? So it is dependent on the Zone? The lottery?
	Most of it	No	-There is recognition of the ecological role of wolves - Inclusion of buffer zones around tribal lands	-Continues to promote recreational killing as an effective management method despite ample evidence to the contrary -Hound training? Really?? That's just barbaric and the antithesis of actual science -Plan should mandate non-lethal methods BEFORE lethal methods	4	
Jeff Craig	All of it	Yes	I like that it is extremely thorough, discussing all aspects of State management of a specific wild mammal.	I think for the general public, there needs to be a summary of the most important points of the complete report.	10	
Mickey v. Br.	Just the parts I am interested in	No			7	I urge you to support increasing protections for wolves, requiring non-lethal conflict interventions and banning recreational killing! Thank you
	Most of it	Yes	It has good information on range and depredation.	There should be a specific number. A season must be set. Residents in wolf country should carry the most weight.	1	The WWF position should be taken very seriously. They are right on all counts.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
	Most of it	Yes	Natural predation as a CWD control method thinks outside the box. Fairly comprehensive cites of wolf data from other states is helpful in forming opinions and viewpoints.	Elk/wolf mortality data disregards (estimated) yearly wolf and elk populations and/or herd/pack locations which likely change and have an impact on predation success. Elk herd numbers appear fairly quantifiable and historically not disputed in comparison to wolf numbers. Elk mortality relative to elk herd size on an annual basis would be helpful, as would annual wolf based elk mortality relative to individual elk herd annual recruitment estimates.	1	Hunter success rate in past wolf hunts not adequately considered as a population estimating metric. An arbitrary geographic line drawn to show historic range of any species is not relevant if historic habitat changes are not considered. Humans are here to stay (unfortunately?), so balance of wildlife populations in modern, reduced habitats as well as human activities such as whitetail deer hunting and economic impacts must be adequately balanced. Human/hunter pushback was significant at a wolf population estimate far below today's "estimate". Set Statewide wolf population goal at 350 combined count with Upper Michigan as early Federal guidance indicated.
	All of it	No	● Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. ● There is much greater recognition of the ecological role of wolves ● The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves ● The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed)	● The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on (see reference list below): ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution ● The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ● The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence ● The plan also runs contrary to public values towards wolves (and omits mention of such majority values from the plan), despite department surveys evidencing that the broad public cares about wolves as individuals (and not just for the viability of the population). Given the recent liberalization of killing wolves by the state, it would be incredibly informative to note majority support of the following reasons for opposing a regulated wolf hunting/trapping season (which are all omitted from the plan): opposition to specific methods of harvest like hounds (64%) or traps (70%), feelings that hunting wolves is unnecessary (62%) or culturally offensive to Native American tribes (57%). ● There is a stark lack of consideration for individual wolves, wolf population health (including wellbeing), and measurable indicators for assessing any harms barring disease prevalence (e.g., accounting for cortisol levels or other stress hormones, measures of pair/pack persistence) ● There is an inappropriate understanding and consideration of tribal worldviews about wolves. ● In general, all omissions of scientific literature, the arbitrary prioritization of policy objectives, the rhetoric of the plan and the dismissal of public values and concerns for wolves point towards a biased, unscientific and instrumental view of wolves that promotes values contrary to broad public perspectives on wolves.	3	
	Just the parts I am interested in	Yes	i liked two of the three primary objectives. have a sustainable wolf population and reduce wolf conflicts - both achievable with a much smaller population than current.	not having a specific population goal and allowing buffer zones around Indian reservations.	2	
	Most of it	No	Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. There is much greater recognition of the ecological role of wolves. The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves. Paul Moss	Just the parts I am interested in	No	I appreciate the efforts of all WDNR staff involved in updating the state's wolf management plan. Although I believe the current plan needs significant updating (see next section), I recognize the efforts and improvements made to the previous plan, including: ● Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. ● There is much greater recognition of the ecological role of wolves ● The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves ● The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed)	The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on: ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution ● The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. ● The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ○ A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings. ○ Hounding or hound training, which are akin to allowing legalized dogfighting, should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public. ● The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. ○ Despite Act 169, which mandates a wolf hunting season, the department can still restrict the implementation of lethal methods by setting minimal quotas, including a quota of '0' wolves, restricting timing and methods. ○ Several studies have proven a proactive non-lethal approach leads to better conflict mitigation. ○ Lethal management often fails to provide a long-term solution to wolf predation and has the least consistent success rates when compared to non-lethal practices. In addition, there is significant evidence showing that lethal wolf management may be less functionally effective at mitigating subsequent livestock losses than non-lethal deterrents. ● The plan should require the implementation of abatement measures as well as the use of non-lethal conflict minimization techniques by domestic animal owners for the latter to receive compensation for confirmed predation. ● The plan also runs contrary to public values towards wolves (and omits mention of such majority values from the plan), despite department surveys evidencing that the broad public cares about wolves as individuals (and not just for the viability of the population). Given the recent liberalization of killing wolves by the state, it would be incredibly informative to note majority support of the following reasons for opposing a regulated wolf hunting/trapping season (which are all omitted from the plan): opposition to specific methods of harvest like hounds (64%) or traps (70%), feelings that hunting wolves is unnecessary (62%) or culturally offensive to Native American tribes (57%). ○ All such reasons convey majority disagreement with practices currently promoted and endorsed by the legislature and the WDNR, and such a conflict between managers and the public should not only be acknowledged, but foregrounded and carefully considered in policy (instead of dismissed). ○ Such decisions to omit literature or downplay evidence (e.g., such as majority opposition to killing wolves and their reasons) are contrary to principles of scientific integrity (e.g., present all relevant scientific evidence to the public) as well as ethics (e.g., disguising ethical decisions, such as recreational wolf killing, as robustly supported by science). ● Conflicting agency objectives (e.g., optimizing public hunting and conflict mitigation) are not only not acknowledged, but even misunderstood as harmonious, against the body of scientific evidence. That culminates in the prioritization of consumptive values and policies; e.g., according to the body of scientific literature, use of lethal methods, and especially public hunts, are contrary to most objectives relevant to: harm mitigation, the wellbeing of wolves, their ecological roles, and their non-exploitative enjoyment (i.e., Objectives A, B, D and F). ● There is a stark lack of consideration for individual wolves, wolf population health (including wellbeing), and measurable indicators for assessing any harms barring disease prevalence (e.g., accounting for cortisol levels or other stress hormones, measures of pair/pack persistence) ● There is an inappropriate understanding and consideration of tribal worldviews about wolves. Tribal worldviews of wolves are misconstrued as 'cultural benefits' tribes receive from the existence of a wolf population, when in fact tribal worldviews consider each individual wolf as a person and relative. Cultural respect and sensitivity towards such views, shared by many non-tribal members, demand the strict mitigation of lethal measures, especially recreational killing, as opposed to their current promotion in the plan. ● In general, all omissions of scientific literature, the arbitrary prioritization of policy objectives, the rhetoric of the plan and the dismissal of public values and concerns for wolves point towards a biased, unscientific and	1	Thank you for your consideration of these comments.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
				instrumental view of wolves that promotes values contrary to broad public perspectives on wolves. ● 'SOM' wolf estimation methodology – From a recent critique: "The new methods sacrifice precision, but are believed to retain adequate accuracy and sensitivity to changing conditions for reliable decision-making. We review evidence for the accuracy, and sensitivity of the new 'scaled occupancy model' (SOM) applied in Wisconsin. The Wisconsin method would systematically overestimate wolf abundance by large (but currently incalculable) margins. Because Wisconsin, similar to other states, not only changed to unverified methods but also implemented widespread wolf killing, shortcomings in their estimates of wolf abundance may have far-reaching consequences for population viability and confidence in state wildlife managers. Overall, Wisconsin's proposed method for estimating wolf abundance shows significant departures from best practices in scientific measurement. Verification will require independent replication and unbiased tests at multiple scales in multiple habitats under different human-induced mortality rates, and peer review before the new methods are considered reliable.		
Don	All of it	No	In general, a lot of good effort went into the research associated with the plan. There's acknowledgement of the importance that wolves play in the ecosystem.	The plan should not be taking into consideration fear and ignorance when it comes to science-based determination of the wolf management plan. Attitudes towards wolves can be directly attributed to the lack of education and the historical general negative consensus of the population, very much like the negative perception of sharks. Any support for killing for the sake of killing (e.g. killing to challenge one's self) should not be considered a valid reason. Trapping kills indiscriminately and can harm domesticated animals just the same. If the justification of protecting domesticated animals is sufficient to kill wolves, then the same reason can be used to eliminate trapping. Those that support culling and killing of wolves provide no peer reviewed scientific data to support their views, only unsubstantiated stories. The plan does not go far enough to support non-lethal deterrent methods which have been proven successful. Any justification to cull wolves based on hunting dog conflict should not be considered at input within the plan. Wolves are not preying on these dogs, this is an active conflict initiated by the dogs and dog owners.	4	
Paul Olson	All of it	Yes	N/A	No number for wolf harvest —need the number to be 350	1	The plan should be made with the residents that live in the wolf areas in mind—not the southern part of the State
Samantha Robbins	Most of it	Yes	I appreciate the transparency to the public around wolves. I like that there is a focus on non-lethal methods for farms with wolf conflicts (B1h) and like that there are strategies for increasing public education around non-lethal methods.	I strongly disagree with having a season to train hounds for wolf trophy hunting (C2h). This is problematic for both hounds and wolves and is no better than dog fighting. There needs to be more discussion around the effects wolf trophy hunting can have on the wolf population and packs given these are pack animals with strong social dynamics. I dislike that so many strategies for Objective C are related to wolf trophy hunting and trapping. This is not something that many Wisconsinites are interested in partaking in and there are many benefits the wolf population brings to the ecosystem. I feel the focus should be less on trophy hunting and trapping wolves and more on recommending changing the law that requires this cruel and unhealthy practice to take place whenever wolves are not federally protected.	4	Wisconsin needs to create a wolf management plan that is backed by science and supports a healthy and stable wolf population. The science supports the fact that the negative consequences of killing wolves far outweigh the benefits. This plan needs to be updated to recommend to eliminate the mandatory wolf trophy hunt, increase emphasis on nonlethal methods, and better reflect how the majority of Wisconsinites feel about wolves, which is that we value them and we don't want them to be killed for sport or when nonlethal methods are sufficient.
	Just the parts I am interested in	Yes		I most dislike the fact that the DNR is attempting to remove a specific number of wolf they are trying to manage to. Every sportsperson I speak with or am aware of (including myself) fully disrespect the DNR, do not trust them, and totally are of the opinion that there are way more wolfs than the approx. 950 the state indicates there are. By eliminating the need to manage to a number the DNR can go on lying to the sportsperson that there is a lower number than actual. It is a travesty what has happened to Wisconsin and the wolf population.	0	I have been hunting the NE quarter of Wisconsin and purchased property in 1988. For the approximate first 20 years there were plenty of deer seen during a season and many opportunities for a harvest. During the last ten years or so I have hunted and most days (bow and gun season) myself and hunting partners see zero deer. During gun season I typically will be in the woods and hunt 50 - 55 hours. Total deer observed can usually be counted on one hand. Virtually every night we hear wolves and routinely see them on our cameras. As a life long hunter there is no doubt in my mind why the state is loosing young hunters (and old) - why would you hunt, go up North and/or purchase property, buy a hunting license, or manage property when you do not respect the DNR, do not believe they are honest or will be held accountable.
Collins	All of it	Yes	Better than what I expected because in the DNR zoom meetings every action, plan received opposition.	I do not support delisting the wolves of WI., the Southern Rockies. I expect non-lethal measures for management. New fencing, that reports being effective for livestock protection made available to ranchers, farmers.	3	Considering, there are wolves being relocated, released in the Colorado Southern Rockies, I believe all the surrounding states should support the effort, plan. Again, keep the wolves of the Southern Rockies under ESA protection to make the entire plan a success. I have never supported trapping, snares or hounding. In addition, perspective! hunters need to be educated on hunting, firearm safety.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
henry haas	Just the parts I am interested in	Yes	I don't like any of the draft plan as written	we need to manage wolf populations just like all the other species in this state in a biologically wayand not political!!!!	1	We need a number that the landscape can support
Andrea	Most of it	Yes	I like the creation of Subzones 1B and 2B. But I do think the quota in those should be set at zero. I also appreciate Product C2a, Product C2c, and Product B1h. I like the removal of a numerical population management goal from the plan. I am glad to see the commitment to making info about wolves transparent and accessible to us. We should always be able to know what is going on with every aspect of our state and state's decisions.	I do not like establishing a season to train hounds for wolf trophy hunting, Product C2h. It's irresponsible. Overall I feel it very disappointing that the plan puts an unnerving emphasis on trophy hunting and trapping wolves, and I see this under Objective C, Provide Multiple Benefits Associated with the Wolf Population. A tiny portion of Wisconsin's population is interested in trophy hunting. But all of us benefit from what wolves provide, such as reduction in disease and preventing collisions with deer and our cars.	2	Wisconsin has a responsibility to create a wolf management plan rooted in science, Traditional Ecological Knowledge, ethics and public values. Any of these resources will show you the benefits wolves provide. And none of them will show a good reason to justify killing these incredible animals. This draft still needs revision to gain my full support, including: eliminating WI to hold a trophy hunting and trapping season on wolves when they aren't federally protected; prioritizing nonlethal methods when there are conflicts with livestock (a cow's life is not worth more than a wolf's); and a commitment to give ALL OF US a voice in guiding wolf policy.
JOHN F OLSON	Most of it	Yes	A thoughtful, inclusive plan that brings science and human values/concerns together. Not managing by a numeric population goal. The focus of lethal & non-lethal tools to those specific areas of chronic depredations. The effort to increase public involvement in research and management (observations, cameras, tracking, and collaring of trapped incidentals). The development of a single Wolf Advisory Committee. Issue permits based on past success rates, staying away from the "circus" atmosphere of 2012-14 (and 2021), where too many permits were issued. Managing wolves by zone, not as a statewide population. Buffer zones around established reservation boundaries allows the state and tribes to work together to protect local packs while still allowing control tools where depredation occurs within these zones. Developing a more thoughtful management approach where population management will occur across most of WI while pack management may occur around established tribal reservations.	Continue to be displeased with the lack of control on the widespread use of trailing hounds and all terrain vehicles and auto vehicles in the pursuit. Need to have mandatory registration with carcass submission. Carcasses can provide important information such as: age, gender, repro status, health, contaminants, etc.	9	I was the furbearer biologist for the department for 23 years, a member of the Wolf Recovery Team, and then a member of the Wolf Science Team. Was directly involved with this species for 30 years, from 1985 to 2014 and developed the trapping regulations for wolves. A couple of reflections include: *Respect all viewpoints but remember that it's the ultimate responsibility of the department to "protect and enhance" natural resources for the state. Having said that, it's important that statewide user groups have a voice at the "table" but make it clear that the tribes are not just another user group, they truly have significant rights as a sovereign entity and will be conferred with on a continual basis. *Provide voluntary wolf trapping workshops across the state whenever a harvest is planned. At these workshops stress rules & regulations, trapper responsibilities, ethics, humane traps, and respect for others. Stress thoughtful use of social media - what you may think looks OK may be repulsive to others and impact the future of such management and the use of humane, regulated trapping. *DO NOT do what we did in 2012-2014 (and then what the DNR Board did in 2021) and issue so many permits that intense competition occurred in the field and caused harvest seasons to be shut down in days. If you manage the issuance of permits by past success rates it will reduce the "circus" atmosphere, minimize the exposure of the harvest, and provide those with permits more of a quality experience. The argument of issuing lots of permits so the season can be shut down quickly is wrong. If a reasonable number of permits are issued most of the impacts highlighted by others (pack disruption, tracking interference, etc.) will be minimal at best. With the intense drive to catch a wolf before the season was shut down (2012-14 and again in 2021), it created an atmosphere of greed and caused folks to do things they should not have (set lots of traps near roads and on trails so they could check them quickly; catch grouse hunter dogs at record levels; cause overlap and interference between harvesters, etc.). I'd consider the elk harvest model as an example of one to consider where fewer permits allow a controlled harvest and a quality experience. *Stay with a single Wolf Advisory Committee! The experience we had with having two wolf committees in the past wasn't productive as it gave those not on the Science Committee the feeling that they really were not part of the process because when we would meet with them it was always a defensive role, trying to convince user groups of what "our science says". With a single committee it does create the possibility of "grand standing" by vocal individuals, but this can be prevented in large part through the use of a third-party, trained facilitator. The Beaver Task Force was just that - a single, (large) committee with everyone at the table (agencies, statewide organizations, tribes, GLIFWC, etc.). With user groups hearing the science firsthand and having the opportunity to talk about it and ask questions, resulted in amazing compromise. But I was convinced that the key was the trained facilitator, bringing respect of each other forefront, and defusing polarized views. *Thanks for asking! Good luck.
	Just the parts I am interested in	Yes	The fact that the comment period was extended 30 days.	Only a bunch of bureaucrats could devise a plan of approximately 170 pages & expect public comment.1) no quota, 2) biased feedback 3) too much reference to " scientific data / research ", 4) expansion of primary & secondary wolf habit not understood 5) not enough sympathy for residents who ACTUALLY live in wolf areas	1	I am hopeful for a meaningful improvement in the plan. However, until the leadership in Madison changes, I have very little hope. Thank you.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
	Just the parts I am interested in	No	1. Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. 2. There is much greater recognition of the ecological role of wolves 3. The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves 4. The adoption of proposed buffer zones around tribal reservations.	1. The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on wolf ethology, sentience, sapience, sociability, agency and wellbeing, effectiveness of non-lethal interventions, the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution 2. The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings. Hounding or hound training, which are akin to allowing legalized dogfighting, should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public. 3. The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. Despite Act 169, which mandates a wolf hunting season, the department can still restrict the implementation of lethal methods by setting minimal quotas, including a quota of '0' wolves, restricting timing and methods. In addition, there is significant evidence showing that lethal wolf management may be less functionally effective at mitigating subsequent livestock losses than non-lethal deterrents. 4. The plan should require the implementation of abatement measures as well as the use of non-lethal conflict minimization techniques by domestic animal owners for the latter to receive compensation for confirmed predation. 5. The plan also runs contrary to public values towards wolves (and omits mention of such majority values from the plan), despite department surveys evidencing that the broad public cares about wolves as individuals (and not just for the viability of the population). 6. There is a stark lack of consideration for individual wolves, wolf population health (including wellbeing), and measurable indicators for assessing any harms barring disease prevalence (e.g., accounting for cortisol levels or other stress hormones, measures of pair/pack persistence).		
Jennifer Argelander	All of it	Yes	A very balanced approach; a good focus on the ecological benefits of wolves; low quota zones are tribal lands; removing an arbitrary wolf population goal; good data	That dogs are still part of the hunting plan--upsetting that as the years went by, by the last hunt 86% of the kills used dogs. A hunt should be between the hunter and the hunted. A cruel practice. And how can trapping be humane in any sense? That should be outlawed.	8	It was well written and covered a lot of information
Ross Shrago	Just the parts I am interested in	Yes	Abatement measures.	I can't tell whether money used for reimbursement purposes might be better used to provide abatement measures for farmers. I'm not a big fan of reimbursing hunters for injury and loss of their dogs	10	It's a good plan
	Most of it	Yes	Attention to the issues of overharvesting.	Trophy hunters of any kind, that do not hunt for subsistence, but for the shear rush of pulling the trigger and killing something, are not hunters at all, but weak individuals that do not understand the natural balance. Especially how humankind has disrupted that balance more than any other living thing.	1	We need to manage the human population. Farms with animals should be required to fence all areas that could result in a predator/prey conflict. It's not the wolf's fault that we pen animals in concentrations that encourage predation.
Barbara Dahlgren	All of it	Yes	I like that a few true conservation stakeholders were involved to ensure there was some mention of "non-consumptive users" being able to enjoy Wisconsin's wolves by having some in existence.	A lot of the plan is based on reports of wolf depredation reports that are often inaccurate and false and serve a main purpose of fearmongering against wolves. Then, there were surveys asking this public that has been made to fear wolves how they view them, which obviously leads the public (especially those in wolf country) to fear wolves and want them gone. There was also a lot of attention to wolf disease, and a short bit about how Wisconsin does not rehabilitate them, another excuse to slaughter lots of wolves. If our places were reversed, I would not like to be slaughtered for catching a disease or simply for existing. And of course, what was left unsaid was exactly what the Wolf Committee recommends, which is to kill as many wolves as possible, and to have a management goal of around 500, which is obscene. This was a long report with a lot of nebulous language to cloak the true goal of rampant killing of wolves that have every right to exist, and are a valuable part of our Wisconsin ecosystem, particularly as predators to other animals that also carry diseases and can be troublesome to humans. I implore you to reconsider this overmanagement plan, and opt for a vision that truly has conservation at the heart rather than human recreation and human caused problems with wolf eradication solutions.	1	I would like to see wolf conservation groups at the table when deciding how to handle wolves. I would like to see farmers who are very vocal about deer destruction issues at the table. When humans go hunting out in wolf territory or decide to live in the wilderness of Wisconsin, they should not be seen as supposed victims. The wolves are, especially since the massive killing spree of the last wolf hunt. Humans are part of nature, not it's overall managers. In fact, most efforts we feel confident in as managers tend to backfire on us with unintended consequences. We need to have more respect for the ecological circumstances we inhabit as a small portion of the resident life here rather than "managing" our neighbors out of existence.

				values and concerns for wolves point towards a biased, unscientific and instrumental view of wolves that promotes values contrary to broad public perspectives on wolves. ● 'SOM' wolf estimation methodology – From a recent critique: "The new methods sacrifice precision, but are believed to retain adequate accuracy and sensitivity to changing conditions for reliable decision-making. We review evidence for the accuracy, precision, and sensitivity of the new 'scaled occupancy model' (SOM) applied in Wisconsin. We conclude that the Wisconsin method would systematically overestimate wolf abundance by large (but currently incalculable) margins. Because Wisconsin, similar to other states, not only changed to unverified methods but also implemented widespread wolf killing, shortcomings in their estimates of wolf abundance may have far-reaching consequences for population viability and confidence in state wildlife managers. We discuss findings from Wisconsin alongside similar findings for other states' occupancy models being insensitive to human causes of mortality that have recently increased. Overall, Wisconsin's proposed method for estimating wolf abundance shows significant departures from best practices in scientific measurement. Verification will require independent replication and unbiased tests at multiple scales in multiple habitats under different human-induced mortality rates, and peer review before the new methods are considered reliable."		
MARV GIFFEY	Just the parts I am interested in	Yes	very little,173 out 176 pages of boring	any part involving politicians and no science backed special interest group	1	keep POLITICIANS out of the DNR. They are destroying this state!!!
Jeanne Bourdeau	All of it	Yes	Respect for science	Hounding wolves is inhumane and should be illegal	9	Incorporate a requirement for responsible agriculture practices that minimize depredations. Ban hounding. Eliminate bounties paid to bear hunters for dog depredations
	Just the parts I am interested in	Yes	not much	most. when you introduced wolves it was supposed to be 350 and no more that should not change. I have worked with Dairy Farmers in central Wisconsin for 45 years, Talking with the owners they do not wish to see the wolf population increase, Generally the farms have plenty deer. You get into the more forested areas the deer do not exist like they use to. During the 80's and 90's I trapped many beaver throughout Taylor and Prince counties. I still hunt the forest a couple days each season we see very few deer, but we like to go there as this is where we were brought up hunting. Fortunately we have land of our own now where we get our deer I do have wolves travel my property fortunately none stay. If you get back down to the 350 plan as was supposed to be maybe we can save the TAX payer 100,000 dollars a year as the last 7 years we are paying towards increasing depredation.	1	350 was the plan and still should be the only plan. Thanks for your time

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Wisconsin Conservation Congress	All of it	Yes	None; this plan is a complete do over.	The entire draft plan; this plan is a complete do over		Position of the Wisconsin Conservation Congress concerning the current Draft Wolf Management Plan January 13, 2023 Without a new Wolf Management Plan, federal law will not allow us to self-manage the state's robust, newly recovered, still growing wolf population. No meaningful controls will be put in place in Wisconsin until a plan is in place, and wolves are again delisted. Over the preceding years, the Wisconsin Conservation Congress and the public which they represent have been frustrated by work stoppages and delays in the preparation of the plan. The final plan is long overdue and has been overdue for many years. The Wisconsin Conservation Congress opposes the Draft Wolf Management Plan as posted for the following reasons: Wolf population levels should be monitored, and management prescriptions should be designed to maintain a stated population ceiling. The draft plan proposes to manage wolves based upon measurable criteria reflecting important biological and social factors; a system which has become popular with wildlife managers in and outside of Wisconsin. The Wisconsin Conservation Congress believes that it is important that we track population levels, and that we apply appropriate controls before the anticipated biological and social factors become unmanageable. The committee opposes the reactive management of wolves which is proposed by the draft plan. (The Congress' historic position is that the population ceiling should be 350 wolves.) The concerns of people living within wolf range must be considered separately and with greater concern than the more idealistic concerns of their metropolitan counterparts. Whether the restored species is tigers in Nepal, elephants in Africa, or wolves in Wisconsin, the burden of restoration is born by the local rural residents, not by the distant folks in Madison, Milwaukee or Waukesha. Wisconsin can do better than that. This plan spends a lot of ink rationalizing support from wolf zone residents and itemizing the benefits already provided to them to offset wolf conflicts. Measurable, documentable thresholds must be established which trigger control actions. Local rural residents must be intimately involved in establishing and monitoring those thresholds. Areas which are not identified by the current plan as wolf range should not be classified by this plan as primary or secondary wolf habitat, even if those areas are now occupied by wolves.
Lila Zastrow and Dave Hendrickson	Most of it	Yes	Removing numeric goals Redrawing wolf zones and creating buffer zones population monitoring science-based management zone specific harvest permits, mandatory harvest registration, and in-person certification requirements, education and outreach.	It should; return wolf range in western Lincoln County zones 2 & 3 describe management of wolves in each zone to sustain a healthy population. Issue enough licenses that quotas are met in a reasonable time period that avoids breeding season. train dogs only during hunting/trapping season in each zone. specific timeline for implementation. identify funding allocation and sources.	6	Restore a standing Wolf Advisory Committee that is representative of the broad range of wolf concerns across the state. have a follow-up public survey after a final Plan is approved by the Natural Resources Board. continue education on the value of wolf populations Restore a standing Wolf Advisory Committee that is representative of the broad range of wolf concerns across the state. have a follow-up public survey after a final Plan is approved by the Natural Resources Board. continue education on the value of wolf populations tRestore a standing Wolf Advisory Committee that is representative of the broad range of wolf concerns across the state. have a follow-up public survey after a final Plan is approved by the Natural Resources Board. continue education on the value of wolf populations Restore a standing Wolf Advisory Committee that is representative of the broad range of wolf concerns across the state. have a follow-up public survey after a final Plan is approved by the Natural Resources Board. continue education on the value of wolf populations.
Paul Van Berkel	All of it	Yes	Science based decision making. Inclusive of urban, rural,tribal, trappers, hunters, farmers, campers, hikers, interests, concerns and views. No quotas but ongoing effort to reach and maintain a self-limiting population befitting the habitat.	None	10	
Kristine Barbieri	Just the parts I am interested in	No	- emphasis on monitoring and research - recognition of the value wolves have on the ecosystem - inclusion of surveys that reflect more positive attitudes towards wolves and higher disdain towards killing them	- Only non-lethal management methods should be considered unless someone's life is in immediate danger. Domestic animal owners should be assisted in utilizing non-lethal conflict minimization and abatement techniques and this should be a requirement for getting compensated for confirmed depredations. - Hunting wolves should not be allowed. Wolves are self-regulating in balance with their prey. The term "wolf harvest" is nonsensical - no one eats wolves, hence there is no harvest. It is just plain killing. To mitigate, Act 169, which mandates a wolf hunting season, the department can simply set a quota of 0 wolves.	5

Bill Woodbridge	Most of it	No	Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. There is much greater recognition of the ecological role of wolves The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves	The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on: ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution. ● The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ○ A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings. Hounding or hound training, which are akin to allowing legalized dogfighting, should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public. The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. Despite Act 169, which mandates a wolf hunting season, the department can still restrict the implementation of lethal methods by setting minimal quotas, including a quota of '0' wolves, restricting timing and methods. Several studies have proven a proactive non-lethal approach leads to better conflict mitigation. Lethal management often fails to provide a long-term solution to wolf predation and has the least consistent success rates when compared to non-lethal practices. In addition, there is significant evidence showing that lethal wolf management may be less functionally effective at mitigating subsequent livestock losses than non-lethal deterrents. The plan should require the implementation of abatement measures as well as the use of non-lethal conflict minimization techniques by domestic animal owners for the latter to receive compensation for confirmed predation. ● The plan also runs contrary to public values towards wolves (and omits mention of such majority values from the plan), despite department surveys evidencing that the broad public cares about wolves as individuals (and not just for the viability of the population). Given the recent liberalization of killing wolves by the state, it would be incredibly informative to note majority support for opposing a regulated wolf hunting/trapping season (which are all omitted from the plan): opposition to specific methods of harvest like hounds (64%) or traps (70%), feelings that hunting wolves is unnecessary (62%) or culturally offensive to Native American tribes (57%). ○ All such reasons convey majority disagreement with practices currently promoted and endorsed by the legislature and the WDNR, and such a conflict between managers and the public should not only be acknowledged, but foregrounded and carefully considered in policy (instead of dismissed). According to the body of scientific literature, use of lethal methods, and especially public hunts, are contrary to most objectives relevant to: harm mitigation, the wellbeing of wolves, their ecological roles, and their non-exploitative enjoyment. ● In general, all omissions of scientific literature, the arbitrary prioritization of policy objectives, the rhetoric of the plan and the dismissal of public values and concerns for wolves point towards a biased, unscientific and instrumental view of wolves that promotes values contrary to broad public perspectives on wolves.	1	The Wisconsin SOM method would systematically overestimate wolf abundance by large (but currently incalculable) margins. Because Wisconsin not only changed to unverified methods but also implemented widespread wolf killing, shortcomings in their estimates of wolf abundance may have far-reaching consequences for population viability and confidence in state wildlife managers. Wisconsin occupancy models are insensitive to human causes of mortality that have recently increased. Overall, Wisconsin's proposed method for estimating wolf abundance shows significant departures from best practices in scientific measurement. Verification will require independent replication and unbiased tests at multiple scales in multiple habitats under different human-induced mortality rates, and peer review before the new methods are considered reliable.

Shawn Sullivan	Most of it	No	None of it as it pertains to hunting and any type of the killing of wolves	The plan also runs contrary to public values towards wolves (and omits mention of such majority values from the plan), despite department surveys evidencing that the broad public cares about wolves as individuals (and not just for the viability of the population). Given the recent liberalization of killing wolves by the state, it would be incredibly informative to note majority support of the following reasons for opposing a regulated wolf hunting/trapping season (which are all omitted from the plan): opposition to specific methods of harvest like hounds (64%) or traps (70%), feelings that hunting wolves is unnecessary (62%) or culturally offensive to Native American tribes (57%). ○ All such reasons convey majority disagreement with practices currently promoted and endorsed by the legislature and the WDNR, and such a conflict between managers and the public should not only be acknowledged, but foregrounded and carefully considered in policy (instead of dismissed). ○ Such decisions to omit literature or downplay evidence (e.g., such as majority opposition to killing wolves and their reasons) are contrary to principles of scientific integrity (e.g., present all relevant scientific evidence to the public) as well as ethics (e.g., disguising ethical decisions, such as recreational wolf killing, as robustly supported by science	1	There is an inappropriate understanding and consideration of tribal worldviews about wolves. Tribal worldviews of wolves are misconstrued as 'cultural benefits' tribes receive from the existence of a wolf population, when in fact tribal worldviews consider each individual wolf as a person and relative. Cultural respect and sensitivity towards such views, shared by many non-tribal members, demand the strict mitigation of lethal measures, especially recreational killing, as opposed to their current promotion in the plan. Also, 'SOM' wolf estimation methodology – From a recent critique: "The new methods sacrifice precision, but are believed to retain adequate accuracy and sensitivity to changing conditions for reliable decision-making. We review evidence for the accuracy, precision, and sensitivity of the new 'scaled occupancy model' (SOM) applied in Wisconsin. We conclude that the Wisconsin method would systematically over estimate wolf abundance by large (but currently incalculable) margins. Because Wisconsin, similar to other states, not only changed to unverified methods but also implemented widespread wolf killing, shortcomings in their estimates of wolf abundance may have far-reaching consequences for population viability and confidence in state wildlife managers. We discuss findings from Wisconsin alongside similar findings for other states' occupancy models being insensitive to human causes of mortality that have recently increased. Overall, Wisconsin's proposed method for estimating wolf abundance shows significant departures from best practices in scientific measurement. Verification will require independent replication and unbiased tests at multiple scales in multiple habitats under different human-induced mortality rates, and peer review before the new methods are considered reliable
Julia Orr	Most of it	No	I like that you took out the number of wolves to be "managed". Wolves should be able to self-regulate in order to balance the ecosystem effectively. I also appreciate your efforts to lessen the negative impact hunting and trapping has on the wolf population. Hunting and trapping do nothing to regulate wolf populations.	Creating a season to train dogs to hunt wolves is barbaric in nature and while on one hand, you are endeavoring to mitigate the issues around hunting and trapping wolves, on the other you are giving people a hall pass to do just that. Again, it seems you are kowtowing to hunters and trappers with an inordinate amount of people who hunt on your committee.	5	Provide a provision that allows all Wisconsin residents a seat at the table with a vote of some kind. Remove the mandate that calls for a hunting season on wolves. The wolves in Yellowstone clearly provide millions of dollars in tourist revenue. Wisconsin should consider a bold move forward to protect wolves and bring in tourist dollars to the area.
Michele LaPorte	All of it	No	Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. ● There is much greater recognition of the ecological role of wolves ● The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves ● The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed)	T he current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on (see reference list below): ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution ● The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. ● The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ○ A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings	4	
Tim Wycoff	All of it	Yes	The proposed education programs which focus on specific categories or groups of people. Also the inclusion of the Native Americans' perspectives and rights. The emphasis on the science and ecology.	I'm opposed to the idea of wolf hunting/trapping for recreation, although I see the need for some controls on the population. We could eliminate some of the cost of the reparations program by banning bear hunting with dogs and/or bait.	9	I'm impressed with the thoroughness given to the subject and the inclusion of a wide range of interested parties. Thank-you!
	Just the parts I am interested in	Yes	The new zone boundaries make more sense. Subzones 1B and 2B should be managed by the tribes or zero quota. Making destroying dens illegal. Reduce reporting time even further to 4 or 2 hours to prevent 2022 debacle. Cell phones make this possible.	Don't allow trapping, bait or dogs at all. It's all just cruelty unlike a clean shot from a real hunter. Bear hunters take their dogs into the woods at their own risk. They are also cruel to their own dogs. Threshold for sustainable Wolf population needs be much higher.	2	I appreciate the research and thought that was put this. I chiefly believe that the desires of wolf and bear hunters should be at the bottom of the list. A healthy sustainable wolf population benefits the entire north woods. Livestock should be protected and compensated for. People need to be smart with their pets. I live in Iron County. It's a beautiful wonderful place.

(Treves & Santiago-Ávila, 2023)		
Richard J. Martin	Most of it	Yes	1. use of Adaptive Wildlife Management 2. Figure 33 in Section 4: Wisconsin Wolf Management Plan--The circular diagram is good. It clearly displays a continuous process 3. Table 13 in Section 4. A good concise over view of the Objectives 4. The use of the words 'collaborative and science-based management' 5. Including figures in Sections 2 from both the 2014 & 2022 public attitude surveys. 6. Inclusion of Native Nation Tribal views and desires in all sections 7. The establishment and maintenance of a Wolf Advisory Committee that meets at least annually. 8. Education at county fairs and sport shows around the state.	1. Summary Tables showing Objectives, Strategies, and Products (the information printed in bold in last part of Section 4)--one for each Objective--would be very helpful and could be formatted in educational materials. 2. Missing a product that provides an informative summary delivered during the annual Spring Hearings.	10	Well done! This is exactly the management plan Wisconsin has needed for gray wolves for at least the last 10 years. I can see dislike and conflict from many stakeholder groups such as not more aggressively removing wolves involved in domestic animal conflicts or for the products related to hunting dog conflict resolutions. That said, this proposed management plan takes a thoughtful, middle-of-the-road path.
	Most of it	Yes			10	
	Most of it	Yes			10	
Neal Steiner	Just the parts I am interested in	No	The fact that wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. There is much greater recognition of the ecological role of wolves. The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves. The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed).	That the current draft does not reflect the best available science, and is missing a substantial amount of scientific literature: ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution. The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ○ A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings. ○ Hounding or hound training, which are akin to allowing legalized dogfighting, should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public.	4	Thank you for considering my comments.
	All of it	Yes		Not setting a structured hunting or trapping season to regulate the wolf population to sustainable numbers.	1	The wolf and white man are one in the same. The wolf will kill everything it can to multiply. Then, it will kill more to feed the pack. It will kill until everything is dead and can no longer support the pack. The white man is the same they are greedy and kill with no thoughts of the future. That is why the DNR was created to keep the white man from killing everything. If not for regulating how the white man hunts, there would be nothing left for the future. The DNR needs to regulate the wolf in the same manner to ensure future game for the next generation.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
	Just the parts I am interested in	Yes	That at least hunting and trapping is mentioned for wolf management	That hunting and trapping is not mentioned as being essential to wolf management. That wolves are underestimated. That the state's elk program has been seriously hindered by wolves. It could be a goldmine, with dozens of bull tags available annually. No reason we shouldn't have as many elk as Michigan by now, except for wolves! That "undetermined" isn't mentioned as "likely" when it comes to wolf depredation on elk. That the public isn't told how resilient wolves are, that even aggressive hunting/trapping barely keeps up with new pup recruitment. That Wisconsin's average pack size is estimated so small, a full animal less than the U.P. That so many square miles of habitat isn't surveyed and thus not included in wolf population estimates.	1	A population goal must be set. That number should not exceed what a majority of northern counties have indicated they'd support, 100-350. DNR must also let the public know that the annual "count" errs on the low end. DNR must take into account the economic value of deer and elk to Wisconsin (and the DNR budget) vs. pandering to animal activists, many who don't even live in wolf country.
	Most of it	Yes	None of it ! This is joke when there is no set population goal.	No population goal, at all ! Too much expansion of habitat designations. Taking surveys in large cities where people have had no first hand experience, other than nature shows they see on TV.	1	Instead of using the facts to set a population goal, this is based largely on appeasing the liberal public sentiment instead of managing. This is not in any way, shape or form a plan. More of a publicity stunt, since nothing has been done to date to resolve the issue.
	All of it	Yes	None	All of it	1	Stop hunting wolves. The deer heard is out of control. The American famer can not take it anymore, Deer are eating the same crop the farmer needs to feed his heard. Release more agricultural tags. Release more doe tags. Extend the gun hunting season. Get out of your office and see what realy is going on.
Keely	Most of it	No	We appreciate the efforts of all WDNR staff involved in updating the state's wolf management plan. 				provide a long-term solution to wolf predation and has the least consistent success rates when compared to non-lethal practices. In addition, there is significant evidence showing that lethal wolf management may be less functionally effective at mitigating subsequent livestock losses than non-lethal deterrents. The plan should require the implementation of abatement measures as well as the use of non-lethal conflict minimization techniques by domestic animal owners for the latter to receive compensation for confirmed predation. The plan also runs contrary to public values towards wolves (and omits mention of such majority values from the plan), despite department surveys evidencing that the broad public cares about wolves as individuals (and not just for the viability of the population). Given the recent liberalization of killing wolves by the state, it would be incredibly informative to note majority support of the following reasons for opposing a regulated wolf hunting/trapping season (which are all omitted from the plan): opposition to specific methods of harvest like hounds (64%) or traps (70%), feelings that hunting wolves is unnecessary (62%) or culturally offensive to Native American tribes (57%). ○ All such reasons convey majority disagreement with practices currently promoted and endorsed by the legislature and the WDNR, and such a conflict between managers and the public should not only be acknowledged, but foregrounded and carefully considered in policy (instead of dismissed). ○ Such decisions to omit literature or downplay evidence (e.g., such as majority opposition to killing wolves and their reasons) are contrary to principles of scientific integrity (e.g., present all relevant scientific evidence to the public) as well as ethics (e.g., disguising ethical decisions, such as recreational wolf killing, as robustly supported by science). Conflicting agency objectives (e.g., optimizing public hunting and conflict mitigation) are not only not acknowledged, but even misunderstood as harmonious, against the body of scientific evidence. That culminates in the prioritization of consumptive values and policies; e.g., according to the body of scientific literature, use of lethal methods, and 2 especially public hunts, are contrary to most objectives relevant to: harm mitigation, the wellbeing of wolves, their ecological roles, and their non-exploitative enjoyment (i.e., Objectives A, B, D and F). There is a stark lack of consideration for individual wolves, wolf population health (including wellbeing), and measurable indicators for assessing any harms barring disease prevalence (e.g., accounting for cortisol levels or other stress hormones, measures of pair/pack persistence) There is an inappropriate understanding and consideration of tribal worldviews about wolves. Tribal worldviews of wolves are misconstrued as 'cultural benefits' tribes receive from the existence of a wolf population, when in fact tribal worldviews consider each individual wolf as a person and relative. Cultural respect and sensitivity towards such views, shared by many non-tribal members, demand the strict mitigation of lethal measures, especially recreational killing, as opposed to their current promotion in the plan. In general, all omissions of scientific literature, the arbitrary prioritization of policy objectives, the rhetoric of the plan and the dismissal of public values and concerns for wolves point towards a biased, unscientific and instrumental view of wolves that promotes values contrary to broad public perspectives on wolves. 'SOM' wolf estimation methodology – From a recent critique: "The new methods sacrifice precision, but are believed to retain adequate accuracy and sensitivity to changing conditions for reliable decision-making. We review evidence for the accuracy, precision, and sensitivity of the new 'scaled occupancy model' (SOM) applied in Wisconsin. We conclude that the Wisconsin method would systematically overestimate wolf abundance by large (but currently incalculable) margins. Because Wisconsin, similar to other states, not only changed to unverified methods but also implemented widespread wolf killing, shortcomings in their estimates of wolf abundance may have far-reaching consequences for population viability and confidence in state wildlife managers. We discuss findings from Wisconsin alongside similar findings for other states' occupancy models being insensitive to human causes of mortality that have recently increased. Overall, Wisconsin's proposed method for estimating wolf abundance shows significant departures from best practices in scientific measurement. Verification will require independent replication and unbiased tests at multiple scales in multiple habitats under different human-induced mortality rates, and peer review before the new methods are considered reliable."

James T Mattson	Just the parts I am interested in	Yes		I rifle deer hunt in Douglas county, we do drives all day. The number of drives where wolf tracks are observed within our party is nearing 50%. Result; a lack of bucks. With the lack of a specific wolf population goal within this bill coupled with the fact that the actual wolf population in Wisconsin is approaching 1000, which is well over the established "goal" of 350, this bill is woefully off target and completely illogical regardless of ANY other provisions within the bill.	0	It's time that these bureaucrats writing such bills conceived by such uninformed or politically poisoned views be called out publicly and overridden.
Mark Lanser	Most of it	Yes	Very comprehensive	Lack of visual graphs in some of the human opinion data	4	I can't understand how we'll know if we fall below federal delisting limit if we don't manage to a specific population goal. Also, are there going to be opportunities for those who live and recreate in wolf country to give opinions and experiences regarding wolves in their region. Finally, I saw nothing that will reassure my family that it is safe to walk alone without a firearm in wolf country.
JJK	All of it	Yes	not much	need lessor quota for northern wi. North of US Hwy 2 the deer are getting pounded by wolves. Survival of the Deer are severely impacted by snow depths.	3	North of US Hwy 2 has to many wolves. This is reflected in Deer harvest numbers. This plan needs to take into account that deer numbers are most abundant in the farm land areas. Northern WI has more woodlands than farms. Adjust numbers for wolf reduction in the northern woodlands. more wolves than deer!
Jason Matthys	Most of it	Yes	I like how the plan uses scientific studies to come to a plan. Unfortunately scientific studies can be skewed and misleading. Look at all the research done on the effectiveness of masks in the reduction of Covid 19. After years of intense research, scientific studies came out both supporting and refuting the effectiveness of masks. I think there is plenty of science out there to both support and refute the effectiveness of a wolf hunt.	It becomes pretty evident that the plan is written by someone who wants an unlimited number of wolves in the state. Pro-hunting views in this draft are regarded with a dismissive tone. The plan should also give a higher weight to the opinions of the people who are forced to live with the wolf population.	1	Not all people who live in the area affected by the population agree. It would be interesting to survey just those people.
	All of it	No	I like that wolves will no longer be managed by reference to the old numerical goal of 350 wolves. There is much greater recognition of the ecological role of wolves. The inclusion of a social survey, which notes increased positive views of wolves. I also like the buffer zone proposal. knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves	The current draft does not reflect the best available science, and is missing a substantialamount of scientific literature on wolf ethology, sentience, sapience, sociability, agency and wellbeing, effectiveness of non-lethal interventions, especially relative to lethal ones, the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution. It essentially treats wolves as creatures made for our edification and management as opposed to apex predators that are ESSENTIAL to a healthy ecosystem and biodiversity - all which we as humans depend on for survival. Also, there is an inappropriate understanding and consideration of tribal worldviews about wolves. Tribal worldviews of wolves are misconstrued as 'cultural benefits' tribes receive from the existence of a wolf population, when in fact tribal worldviews consider each individual wolf as a person and relative. Cultural respect and sensitivity towards such views, shared by many non-tribal members, demand the strict mitigation of lethal measures, especially recreational killing, as opposed to their current promotion in the plan. In general, all omissions of scientific literature, the arbitrary prioritization of policy objectives, the rhetoric of the plan and the dismissal of public values and concerns for wolves point towards a biased, unscientific and instrumental view of wolves that promotes values contrary to broad public perspectives on wolves.	4	Please consider sound science and the state of our planet when making decisions about wolf management. For reference please see the following short video about the reintroduction of wolves to Yellowstone National Park: ny.pbslearningmedia.org/resource/a58e3ca2-52ab-45f5-87ac-26ee0d681146/wolves-of-yellowstone-earth-a-new-wild/?student=true

J. Anne Hamner	Most of it	No	I believe the current plan needs significant updating. I recognize the efforts and improvements made to the previous plan, including: ● Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. ● There is much greater recognition of the ecological role of wolves ● The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves ● The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed)	The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on (see reference list below): ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution ● The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. ● The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ○ A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings. ○ Hounding or hound training, which are akin to allowing legalized dogfighting, should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public. ● The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. ○ Despite Act 169, which mandates a wolf hunting season, the department can still restrict the implementation of lethal methods by setting minimal quotas, including a quota of '0' wolves, restricting timing and methods. ○ Several studies have proven a proactive non-lethal approach leads to better conflict mitigation. ○ Lethal management often fails to provide a long-term solution to wolf predation and has the least consistent success rates when compared to non-lethal practices. In addition, there is significant evidence showing that lethal wolf management may be less functionally effective at mitigating subsequent livestock losses than non-lethal deterrents. ● The plan should require the implementation of abatement measures as well as the use of non-lethal conflict minimization techniques by domestic animal owners for the latter to receive compensation for confirmed predation. ● The plan also runs contrary to public values towards wolves (and omits mention of such majority values from the plan), despite department surveys evidencing that the broad public cares about wolves as individuals (and not just for the viability of the population). Given the recent liberalization of killing wolves by the state, it would be incredibly informative to note majority support of the following reasons for opposing a regulated wolf hunting/trapping season (which are all omitted from the plan): opposition to specific methods of harvest like hounds (64%) or traps (70%), feelings that hunting wolves is unnecessary (62%) or culturally offensive to Native American tribes (57%). ○ All such reasons convey majority disagreement with practices currently promoted and endorsed by the legislature and the WDNR, and such a conflict between managers and the public should not only be acknowledged, but foregrounded and carefully considered in policy (instead of dismissed). ○ Such decisions to omit literature or downplay evidence (e.g., such as majority opposition to killing wolves and their reasons) are contrary to principles of scientific integrity (e.g., present all relevant scientific evidence to the public) as well as ethics (e.g., disguising ethical decisions, such as recreational wolf killing, as robustly supported by science). ● Conflicting agency objectives (e.g., optimizing public hunting and conflict mitigation) are not only not acknowledged, but even misunderstood as harmonious, against the body of scientific evidence. 	Just the parts I am interested in	Yes	I found the background information on grey wolves very helpful.	Objective C gives too much emphasis to trophy hunting and trapping.	5	The plan should include efforts to remove the mandate that Wisconsin hold a trophy hunting and trapping season on wolves when they are not federally protected. In addition, there should be more promotion of nonlethal methods for preventing conflicts with livestock.
Elizabeth	Just the parts I am interested in	No	None	Killing wolves	1	
	All of it	No	Recognizing changing attitudes towards wolves and that negative attitudes are not based in science and fact. Creating buffer zones in tribal areas.	Lethal methods instead of non-lethal methods to deal with livestock conflict. Allowing recreational hunting at all. Permitting cruel hounding and trapping methods.	5	Wolves are an important and fundamental part of the ecosystem. They should not be hunted and killed for fun.
	Just the parts I am interested in	Yes		Trapping is a terrible way to kill an animal. It should be eliminated. Killing an animal for sake of a trophy is just immature and a total disregard for the value of a life.	2	Re-introducing an endangered species or an extinct species to a particular location is irresponsible when it is known all along that it's population is going to have to be controlled unnaturally. Any idiot would know that it's all about the $.
Sandra	Just the parts I am interested in	No	That you're finally acknowledging the important role wolves play in healthy ecosystems. And that you're getting rid of the arbitrary numerical limit on how many wolves should be allowed to exist in WI.	That you plan to 'manage' the wolf population with hounding and hunting. This always results in too many licenses being issued and completely undercuts the goal of a healthy worlf population. And you need to include current science. What is the point of putting together a plan of any kind if you're just ignoring available information?!	4	Require non-lethal population management instead of turning this into a gift for hunters. And follow the [redacted] science!
Greg Rosas	Just the parts I am interested in	No	We appreciate the efforts of all WDNR staff involved in updating the state's wolf management plan. Although we believe the current plan needs significant updating (see next section), we recognize the efforts and improvements made to the previous plan, including: ● Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. ● There is much greater recognition of the ecological role of wolves ● The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves ● The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed)	The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on (see reference list below): ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution ● The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. ● The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ○ A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings. ○ Hounding or hound training, which are akin to allowing legalized dogfighting, should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public.	3	The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
	Just the parts I am interested in	Yes	The plan removes a numeric population goal: Removing an arbitrary wolf population goal is important to make sure the numbers of wolves are adaptable, so they can be based on best-available science and ecological changes. The plan creates low quota zones around Tribal lands where the Tribes requested it: These lands are treaty-protected with documented wolf packs. Making this update is an important and welcome addition to the plan. Ideally, the plan would expand these zones beyond just the few that are listed. The plan is rightly focused on the ecological benefits of wolves The plan is reflective of the public opinions survey that was released along with the plan and finds that opinions toward wolves have grown significantly more favorable towards wolves There is expressed commitment to science and continued research with partners and acknowledges that "keystone species such as wolves are an important component of a healthy ecosystem"		10	
Mary Green	All of it	Yes	The potential for ecotourism; protecting den sites, utilizing science for maintenance of wolf populations.	Increases in hunting and trapping. I believe the trapping methods allowed are very inhumane and barbaric. I also do not like dog training just prior to and during mating seasons.	4	I think there is way too much emphasis on hunting and trapping and not enough on non-lethal control methods.
Valerie Cruz	Just the parts I am interested in	No	Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. ● There is much greater recognition of the ecological role of wolves ● The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves ● The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed	The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on (see reference list below): ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution ● The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. ● The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ○ A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings. ○ Hounding or hound training, which are akin to allowing legalized dogfighting, should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public. ● The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. ○ Despite Act 169, which mandates a wolf hunting season, the department can still restrict the implementation of lethal methods by setting minimal quotas, including a quota of '0' wolves, restricting timing and methods. ○ Several studies have proven a proactive non-lethal approach leads to better conflict mitigation. ○ Lethal management often fails to provide a long-term solution to wolf predation and has the least consistent success rates when compared to non-lethal practices. In addition, there is significant evidence showing that lethal wolf management may be less functionally effective at mitigating subsequent livestock losses than non-lethal deterrents. ● The plan should require the implementation of abatement measures as well as the use of non-lethal conflict minimization techniques by domestic animal owners for the latter to receive compensation for confirmed predation. ● The plan also runs contrary to public values towards wolves (and omits mention of such majority values from the plan), despite department surveys evidencing that the broad public cares about wolves as individuals (and not just for the viability of the population). Given the recent liberalization of killing wolves by the state, it would be incredibly informative to note majority support of the following reasons for opposing a regulated wolf hunting/trapping season (which are all omitted from the plan): opposition to specific methods of harvest like hounds (64%) or traps (70%), feelings that hunting wolves is unnecessary (62%) or culturally offensive to Native American tribes (57%). ○ All such reasons convey majority disagreement with practices currently promoted and endorsed by the legislature and the WDNR, and such a conflict between managers and the public should not only be acknowledged, but foregrounded and carefully considered in policy (instead of dismissed). ○ Such decisions to omit literature or downplay evidence	4	

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
				(e.g., such as majority opposition to killing wolves and their reasons) are contrary to principles of scientific integrity (e.g., present all relevant scientific evidence to the public) as well as ethics (e.g., disguising ethical decisions, such as recreational wolf killing, as robustly supported by science). ● Conflicting agency objectives (e.g., optimizing public hunting and conflict mitigation) are not only not acknowledged, but even misunderstood as harmonious, against the body of scientific evidence. That culminates in the prioritization of consumptive values and policies; e.g., according to the body of scientific literature, use of lethal methods, and especially public hunts, are contrary to most objectives relevant to: harm mitigation, the wellbeing of wolves, their ecological roles, and their non-exploitative enjoyment (i.e., Objectives A, B, D and F). ● There is a stark lack of consideration for individual wolves, wolf population health (including wellbeing), and measurable indicators for assessing any harms barring disease prevalence (e.g., accounting for cortisol levels or other stress hormones, measures of pair/pack persistence) ● There is an inappropriate understanding and consideration of tribal worldviews about wolves. Tribal worldviews of wolves are misconstrued as 'cultural benefits' tribes receive from the existence of a wolf population, when in fact tribal worldviews consider each individual wolf as a person and relative. Cultural respect and sensitivity towards such views, shared by many non-tribal members, demand the strict mitigation of lethal measures, especially recreational killing, as opposed to their current promotion in the plan. ● In general, all omissions of scientific literature, the arbitrary prioritization of policy objectives, the rhetoric of the plan and the dismissal of public values and concerns for wolves point towards a biased, unscientific and instrumental view of wolves that promotes values contrary to broad public perspectives on wolves. ● 'SOM' wolf estimation methodology – From a recent critique: "The new methods sacrifice precision, but are believed to retain adequate accuracy and sensitivity to changing conditions for reliable decision-making. We review evidence for the accuracy, precision, and sensitivity of the new 'scaled occupancy model' (SOM) applied in Wisconsin. We conclude that the Wisconsin method would systematically overestimate wolf abundance by large (but currently incalculable) margins. Because Wisconsin, similar to other states, not only changed to unverified methods but also implemented widespread wolf killing, shortcomings in their estimates of wolf abundance may have far-reaching consequences for population viability and confidence in state wildlife managers. We discuss findings from Wisconsin alongside similar findings for other states' occupancy models being insensitive to human causes of mortality that have recently increased. Overall, Wisconsin's proposed method for estimating wolf abundance shows significant departures from best practices in scientific measurement. Verification will require independent replication and unbiased tests at multiple scales in multiple habitats under different human-induced mortality rates, and peer review before the new methods are considered reliable." (Treves & Santiago-Ávila, 2023)		
Ellen Sims	Most of it	Yes	The plan addresses wolf-related conflict & resolve The plan removes a numeric population goal: Removing an arbitrary wolf population goal is important to make sure the numbers of wolves are adaptable, so they can be based on best-available science and ecological changes. The plan creates low quota zones around Tribal lands where the Tribes requested it: These lands are treaty-protected with documented wolf packs. Making this update is an important and welcome addition to the plan. Ideally, the plan would expand these zones beyond just the few that are listed. The plan is rightly focused on the ecological benefits of wolves The plan is reflective of the public opinions survey that was released along with the plan and finds that opinions toward wolves have grown significantly more favorable towards wolves There is expressed commitment to science and continued research with partners and acknowledges that "keystone species such as wolves are an important component of a healthy ecosystem"		9	Thank you

kim davis	Most of it	No	better recognition of the ecological role of wolves	The current draft plan does not reflect the best available science. It promotes sustainable recreational killing and consumptive users as a main management strategy. This results in a biased plan that runs contrary to scientific evidence. The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. The arbitrary prioritization of policy objectives, the rhetoric of the plan and the dismissal of public values and concerns for wolves point towards a biased, unscientific and instrumental view of wolves that promotes values contrary to broad public perspectives on wolves. The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. Several studies have proven a proactive non-lethal approach leads to better conflict mitigation. The draft plan also runs contrary to public values towards wolves (and omits mention of such majority values from the plan), despite department surveys evidencing that the broad public cares about wolves as individuals (and not just for the viability of the population).	0	Wolves have been scientifically linked to healthy ecosystems and should demand our highest protections.
	All of it	No	There is much greater recognition of the ecological role of wolves which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed)	The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. Hounding or hound training, which are akin to allowing legalized dogfighting, should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public.	5	In general, all omissions of scientific literature, the arbitrary prioritization of policy objectives, the rhetoric of the plan and the dismissal of public values and concerns for wolves point towards a biased, unscientific and instrumental view of wolves that promotes values contrary to broad public perspectives on wolves.
Paula Kleintjes Neff	Most of it	Yes	Using objective scientific methods and resulting data to inform management decisions in an ever -changing landscape. Keeping politics and science deniers out of the decision- making process. All the while, respecting humans and other species that are part of the greater ecosystems that sustain healthy wolf populations. I support the removal of the arbitrary cap of the state wolf population size.	I am not in support of public hunts but rather in support of “take” if and when justified by professionals, including tribal members. I sense often that the wolf has become the scapegoat for anti- government sentiment and individuals, despite the fact that government lands are public lands managed to be accessible to all. I’m a bit skeptical of allowing public opinion by individuals residing outside the Great Lakes DPS to influence the plan. I trust our WDNR wolf biologists and their work with scientists in MN and MI with whom wolves may cross our state borders.	9	So glad to finally see a new plan. It’s greatly needed. Now let’s just keep our anti- wolf and anti-science politicians and their cronies away from managing our precious natural heritage and resources. Leave biodiversity conservation to the experts.
	I have not read any of the draft plan	No	I don't know, and I only know 'elements' in terms of like: Hydrogen, Helium, Lithium, or wood, metal, earth, water, fire	I don't know.	9	?
Janet Moyles	All of it	No	Wolves in WI will no longer be managed by reference to the old numerical goal of 350 Wolves. Greater recognition of the ecological value of Wolves. Inclusion of a social survey, which notes increased positive views of Wolves. Adoption of proposed buffer zones around tribal reservations.	The current draft doesn't reflect the best available science, and is missing substantial amount of scientific literature on: Wolf ethology, sentience, sapience, sociability, agency & wellbeing. Effectiveness of non-lethal interventions. Impact of widespread killing on wolves' physiology, behaviour, wellbeing, & social dynamics. The scientific omissions and the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy results in a biased plan contrary to scientific evidence. The pla should strictly curtail any lethal management of wolves except in extremely rare circumstances.	2	All omissions of scientific literature, the arbitrary prioritization of policy objectives, the rhetoric of the plan and the dismissal of public values & concerns for wolves point towards a biased, unscientific view.
	Most of it	Yes		No quota, would like 350 or less	2	Low deer numbers in the north can't recover with such a high wolf population. I hunt Douglas, Washburn and Barron counties and have for 42 years. Even in mild winters the deer number increases are minimal. Land values are decreasing as are hunter numbers in the north due to low deer numbers. Comparing this year to last etc shows little. Compare numbers to the late 90s and early 2000s and the reduction is drastic
Courtney Roach	Most of it	Yes	I like that it appears that WDNR is trying to use science to guide the wolf management plan	I think that quotas for hunting should be solely based on science and not public opinion. I don't think people should be able to hunt wolves (or bears) with dogs, it seems both inhumane to the hunting dogs as well as the game animals. In addition, it does not seem like a fair hunt	5	We have 640 acres in Florence county and get many wolves on our trail cameras. We enjoy seeing them and think they have a net benefit on the ecosystem as we have a large over abundance of deer in our woods and agriculture crops. We did see a drastic drop in wolf numbers on camera after the most recently wolf hunting/trapping season. We are open to a wolf season if the science supports it. I don't think fear and ignorant public opinion should weigh in and pressure science.

	All of it	No	It is good that wolves in WI will no longer be managed by reference to the old numerical goal of 350 individuals. There is much greater recognition of the ecological role of wolves in the draft. The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves, is good. The adoption of proposed buffer zones around tribal reservations where previously no buffer zones existed is good.	The current draft does not reflect the best available science, and is missing a substantial scientific literature on wolf ethology, sentience, sapience, sociability, agency and wellbeing; on effectiveness of non-lethal interventions, especially relative to lethal ones; and the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution. These omissions, combined with the emphasis on and promotion of recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence, despite much of that evidence being more recent, numerous and of stronger inference. The plan should strictly curtail lethal management of wolves except in extremely rare circumstances of immediate defense of life. A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that allowing liberalized killing of wolves results in a direct increase in the hazard and incidence of illegal killings. Hounding or hound training, which are akin to allowing legalized dogfighting, should be illegal or severely restricted, as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public. The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. Despite Act 169, which mandates a wolf hunting season, the department can still restrict the implementation of lethal methods by setting minimal quotas, including a quota of '0' wolves, restricting timing and methods. Several studies have proven a proactive non-lethal approach leads to better conflict mitigation. Lethal management often fails to provide a long-term solution to wolf predation and has the least consistent success rates when compared to non-lethal practices. In addition, there is significant evidence showing that lethal wolf management may be less effective at mitigating subsequent livestock losses than non-lethal deterrents. The plan should require the implementation of abatement measures as well as the use of non-lethal conflict minimization techniques by domestic animal owners for the latter to receive compensation for confirmed predation. The plan also runs contrary to public values towards wolves (and omits mention of such majority values), despite department surveys evidencing that the broad public cares about wolves as individuals (and not just for the viability of the population). Given the recent liberalization of killing wolves by the state, it would be informative to note majority support of the following reasons for opposing a regulated wolf hunting/trapping season (which are all omitted from the plan): opposition to specific methods of harvest like hounds (64%) or traps (70%), feelings that hunting wolves is unnecessary (62%) or culturally offensive to Native American tribes (57%). All such reasons convey majority disagreement with practices currently promoted and endorsed by the legislature and the WDNR, and such a conflict between managers and the public should not only be acknowledged, but foregrounded and carefully considered in policy (instead of dismissed). Such decisions to omit literature or downplay evidence (such as majority opposition to killing wolves and their reasons) are contrary to principles of scientific integrity (e.g., present all relevant scientific evidence to the public) as well as ethics (by disguising ethical decisions, such as recreational wolf killing, as robustly supported by science). Conflicting agency objectives (e.g., optimizing public hunting and conflict mitigation) are not only not acknowledged, but even misrepresented as harmonious, against the body of scientific evidence. That culminates in the prioritization of consumptive values and policies. According to the body of scientific literature, use of lethal methods, and especially public hunts, are contrary to the objectives of harm mitigation, wellbeing of wolves, their ecological roles, and their non-exploitative enjoyment (i.e., Objectives A, B, D and F). There is a stark lack of consideration for individual wolves, wolf population health (including wellbeing), and measurable indicators for assessing any harms barring disease prevalence (e.g., accounting for cortisol levels or other stress hormones, measures of pair/pack persistence). There is an inappropriate understanding and consideration of tribal worldviews about wolves. Tribal worldviews of wolves are misconstrued as 'cultural benefits' tribes receive from the existence of a wolf population, when in fact tribal worldviews consider each individual wolf as a person and relative. Cultural respect and sensitivity towards such views, shared by many non-tribal members, demand the strict mitigation of lethal measures, especially recreational killing, as opposed to their current promotion in the plan. In general, all omissions of scientific literature, the arbitrary prioritization of policy objectives, the rhetoric of the plan and the dismissal of public values and concerns for wolves point to a biased, unscientific and instrumental view of wolves that promotes values contrary to broad public perspectives on wolves.	4

				towards a biased, unscientific and instrumental view of wolves that promotes values contrary to broad public perspectives on wolves. ● 'SOM' wolf estimation methodology – From a recent critique: "The new methods sacrifice precision, but are believed to retain adequate accuracy and sensitivity to changing conditions for reliable decision-making. We review evidence for the accuracy, precision, and sensitivity of the new 'scaled occupancy model' (SOM) applied in Wisconsin. We conclude that the Wisconsin method would systematically overestimate wolf abundance by large (but currently incalculable) margins. Because Wisconsin, similar to other states, not only changed to unverified methods but also implemented widespread wolf killing, shortcomings in their estimates of wolf abundance may have far-reaching consequences for population viability and confidence in state wildlife managers. We discuss findings from Wisconsin alongside similar findings for other states' occupancy models being insensitive to human causes of mortality that have recently increased. Overall, Wisconsin's proposed method for estimating wolf abundance shows significant departures from best practices in scientific measurement. Verification will require independent replication and unbiased tests at multiple scales in multiple habitats under different human-induced mortality rates, and peer review before the new methods are considered reliable." Michael Seidman	Just the parts I am interested in	Yes	The plan removes a numeric population goal: Removing an arbitrary wolf population goal is important to make sure the numbers of wolves are adaptable, so they can be based on best-available science and ecological changes. The plan creates low quota zones around Tribal lands where the Tribes requested it: These lands are treaty-protected with documented wolf packs. Making this update is an important and welcome addition to the plan. Ideally, the plan would expand these zones beyond just the few that are listed. The plan is rightly focused on the ecological benefits of wolves The plan is reflective of the public opinions survey that was released along with the plan and finds that opinions toward wolves have grown significantly more favorable towards wolves There is expressed		9

			commitment to science and continued research with partners and acknowledges that “keystone species such as wolves are an important component of a healthy ecosystem”			
sharon franco	All of it	No	I do not like the plan.	the part about killing wolves.	0	I feel that you are not understanding that you can't just decimate the wolf population. Each species is vital to our world and we have to coexist. You can't just kill off a species. You need to come up with a better plan.
	All of it	No	We appreciate the efforts of all WDNR staff involved in updating the state’s wolf management plan. Although we believe the current plan needs significant updating (see next section), we recognize the efforts and improvements made to the previous plan, including: ● Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. ● There is much greater recognition of the ecological role of wolves ● The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves ● The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed)	The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on (see reference list below): ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves’ physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution ● The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. ● The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ○ A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings. Hounding or hound training, which are akin to allowing legalized dogfighting, should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public. ● The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. ○ Despite Act 169, which mandates a wolf hunting season, the department can still restrict the implementation of lethal methods by setting minimal quotas, including a quota of ‘0’ wolves, restricting timing and methods. ○ Several studies have proven a proactive non-lethal approach leads to better conflict mitigation. ○ Lethal management often fails to provide a long-term solution to wolf predation and has the least consistent success rates when compared to non-lethal practices. In addition, there is significant evidence showing that lethal wolf management may be less functionally effective at mitigating subsequent livestock losses than non-lethal deterrents. ● The plan should require the implementation of abatement measures as well as the use of non-lethal conflict minimization techniques by domestic animal owners for the latter to receive compensation for confirmed predation. ● The plan also runs contrary to public values towards wolves (and omits mention of such majority values from the plan), despite department surveys evidencing that the broad public cares about wolves as individuals (and not just for the viability of the population). Given the recent liberalization of killing wolves by the state, it would be incredibly informative to note majority support of the following reasons for opposing a regulated wolf hunting/trapping season (which are all omitted from the plan): opposition to specific methods of harvest like hounds (64%) or traps (70%), feelings that hunting wolves is unnecessary (62%) or culturally offensive to Native American tribes (57%). ○ All such reasons convey majority disagreement with practices currently promoted and endorsed by the legislature and the WDNR, and such a conflict between managers and the public should not only be acknowledged, but foregrounded and carefully considered in policy (instead of dismissed). ○ Such decisions to omit literature or downplay evidence (e.g., such as majority opposition to killing wolves and their reasons) are contrary to principles of scientific integrity (e.g., present all relevant scientific evidence to the public) as well as ethics (e.g., disguising ethical decisions, such as recreational wolf killing, as robustly supported by science). ● Conflicting agency objectives (e.g., optimizing public hunting and conflict mitigation) are not only not acknowledged, but even misunderstood as harmonious, against the body of scientific evidence. That culminates in the prioritization of consumptive values and policies; e.g., according to the body of scientific literature, use	4	Reference list (studies not integrated into the current draft wolf plan) Adams, L. 				of lethal methods, and especially public hunts, are contrary to most objectives relevant to: harm mitigation, the wellbeing of wolves, their ecological roles, and their non-exploitative enjoyment (i.e., Objectives A, B, D and F). ● There is a stark lack of consideration for individual wolves, wolf population health (including wellbeing), and measurable indicators for assessing any harms barring disease prevalence (e.g., accounting for cortisol levels or other stress hormones, measures of pair/pack persistence) ● There is an inappropriate understanding and consideration of tribal worldviews about wolves. Tribal worldviews of wolves are misconstrued as 'cultural benefits' tribes receive from the existence of a wolf population, when in fact tribal worldviews consider each individual wolf as a person and relative. Cultural respect and sensitivity towards such views, shared by many non-tribal members, demand the strict mitigation of lethal measures, especially recreational killing, as opposed to their current promotion in the plan. ● In general, all omissions of scientific literature, the arbitrary prioritization of policy objectives, the rhetoric of the plan and the dismissal of public values and concerns for wolves point towards a biased, unscientific and instrumental view of wolves that promotes values contrary to broad public perspectives on wolves. ● 'SOM' wolf estimation methodology – From a recent critique: "The new methods sacrifice precision, but are believed to retain adequate accuracy and sensitivity to changing conditions for reliable decision-making. We review evidence for the accuracy, precision, and sensitivity of the new 'scaled occupancy model' (SOM) applied in Wisconsin. We conclude that the Wisconsin method would systematically overestimate wolf abundance by large (but currently incalculable) margins. Because Wisconsin, similar to other states, not only changed to unverified methods but also implemented widespread wolf killing, shortcomings in their estimates of wolf abundance may have far-reaching consequences for population viability and confidence in state wildlife managers. We discuss findings from Wisconsin alongside similar findings for other states' occupancy models being insensitive to human causes of mortality that have recently increased. Overall, Wisconsin's proposed method for estimating wolf abundance shows significant departures from best practices in scientific measurement. Verification will require independent replication and unbiased tests at multiple scales in multiple habitats under different human-induced mortality rates, and peer review before the new methods are considered reliable." Jill Dione	All of it	No	We appreciate the efforts of all WDNR staff involved in updating the state's wolf management plan. Although we believe the current plan needs significant updating (see next section), we recognize the efforts and improvements made to the previous plan, including: ● Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. ● There is much greater recognition of the ecological role of wolves ● The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves ● The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed)	● The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on (see reference list below): ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution ● The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. ● The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ○ A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings. ○ Hounding or hound training, which are akin to allowing legalized dogfighting, should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public. ● The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. ○ Despite Act 169, which mandates a wolf hunting season, the department can still restrict the implementation of lethal methods by setting minimal quotas, including a quota of '0' wolves, restricting timing and methods. ○ Several studies have proven a proactive non-lethal approach leads to better conflict mitigation. ○ Lethal management often fails to provide a long-term solution to wolf predation and has the least consistent success rates when compared to non-lethal practices. In addition, there is significant evidence showing that lethal wolf management may be less functionally effective at mitigating subsequent livestock losses than non-lethal deterrents. ● The plan should require the implementation of abatement measures as well as the use of non-lethal conflict minimization techniques by domestic animal owners for the latter to receive compensation for confirmed predation. ● The plan also runs contrary to public values towards wolves (and omits mention of such majority values from the plan), despite department surveys evidencing that the broad public cares about wolves as individuals (and not just for the viability of the population). Given the recent liberalization of killing wolves by the state, it would be incredibly informative to note majority support of the following reasons for opposing a regulated wolf hunting/trapping season (which are all omitted from the plan): opposition to specific methods of harvest like hounds (64%) or traps (70%), feelings that hunting wolves is unnecessary (62%) or culturally offensive to Native American tribes (57%). ○ All such reasons convey majority disagreement with practices currently promoted and endorsed by the legislature and the WDNR, and such a conflict between managers and the public should not only be acknowledged, but foregrounded and carefully considered in policy (instead of dismissed). ○ Such decisions to omit literature or downplay evidence (e.g., such as majority opposition to killing wolves and their reasons) are contrary to principles of scientific integrity (e.g., present all relevant scientific evidence to the public) as well as ethics (e.g., disguising ethical decisions, such as recreational wolf killing, as robustly supported by science). ● Conflicting agency objectives (e.g., optimizing public hunting and conflict mitigation) are not only not acknowledged, but even misunderstood as harmonious, against the body of scientific evidence. That culminates in the prioritization of consumptive values and policies; e.g., according to the body of scientific literature, use of lethal methods, and 2 especially public hunts, are contrary to most objectives relevant to: harm mitigation, the wellbeing of wolves, their ecological roles, and their non-exploitative enjoyment (i.e., Objectives A, B, D and F). ● There is a stark lack of consideration for individual wolves, wolf population health (including wellbeing), and measurable indicators for assessing any harms barring disease prevalence (e.g., accounting for cortisol levels or other stress hormones, measures of pair/pack persistence) ● There is an inappropriate understanding and consideration of tribal worldviews about wolves. Tribal worldviews of wolves are misconstrued as 'cultural benefits' tribes receive from the existence of a wolf population, when in fact tribal worldviews consider each individual wolf as a person and relative. Cultural respect and sensitivity towards such views, shared by many non-tribal members, demand the strict mitigation of lethal measures, especially recreational killing, as opposed to their current promotion in the plan. ● In general, all omissions of scientific literature, the arbitrary prioritization of policy objectives, the rhetoric of the plan and the dismissal of public	4

				values and concerns for wolves point towards a biased, unscientific and instrumental view of wolves that promotes values contrary to broad public perspectives on wolves. ● 'SOM' wolf estimation methodology – From a recent critique: "The new methods sacrifice precision, but are believed to retain adequate accuracy and sensitivity to changing conditions for reliable decision-making. We review evidence for the accuracy, precision, and sensitivity of the new 'scaled occupancy model' (SOM) applied in Wisconsin. We conclude that the Wisconsin method would systematically overestimate wolf abundance by large (but currently incalculable) margins. Because Wisconsin, similar to other states, not only changed to unverified methods but also implemented widespread wolf killing, shortcomings in their estimates of wolf abundance may have far-reaching consequences for population viability and confidence in state wildlife managers. We discuss findings from Wisconsin alongside similar findings for other states' occupancy models being insensitive to human causes of mortality that have recently increased. Overall, Wisconsin's proposed method for estimating wolf abundance shows significant departures from best practices in scientific measurement. Verification will require independent replication and unbiased tests at multiple scales in multiple habitats under different human-induced mortality rates, and peer review before the new methods are considered reliable." (Treves & Santiago-Ávila, 2023		
Jamie Shields	Most of it	No	We appreciate the efforts of all WDNR staff involved in updating the state's wolf management plan. Although we believe the current plan needs significant updating (see next section), we recognize the efforts and improvements made to the previous plan, including: ● Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. ● There is much greater recognition of the ecological role of wolves ● The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves ● The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed)	The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on (see reference list below): ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution ● The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. ● The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ○ A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings. ○ Hounding or hound training, which are akin to allowing legalized dogfighting, should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public. ● The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. ○ Despite Act 169, which mandates a wolf hunting season, the department can still restrict the implementation of lethal methods by setting minimal quotas, including a quota of '0' wolves, restricting timing and methods. ○ Several studies have proven a proactive non-lethal approach leads to better conflict mitigation. ○ Lethal management often fails to provide a long-term solution to wolf predation and has the least consistent success rates when compared to non-lethal practices. (Treves & Santiago-Ávila, 2023)		
	Just the parts I am interested in	Yes	I appreciate that the plan calls for a science-based management approach to wolf conservation.	I would like to see specific descriptions of how wolf populations in each zone will be managed to achieve goals outlined in the plan, including specific metrics to determine the health and sustainability of the population.	5	

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Susan Everhard	Most of it	Yes	Removing an arbitrary wolf population goal is important to make sure the best-available science is centered in wolf management The low quota zones are an important and welcome addition to the plan The plan is rightly focused on the ecological benefits of wolves		9	
Mark M Giese	Just the parts I am interested in	Yes	I like reining in the harms caused by trophy hunting and trapping and efforts to be transparent.	I don't like establishing a season for training hounds for wolf trophy hunting. There is a need for a higher emphasis on nonlethal conflict deterrence methods. The plan should be updated every 5 years.	4	The goal should be a socially-stable, genetically-diverse wolf population and to allow all Wisconsinites a seat at the table in guiding wolf policy. Thank you.
Robin Van Tassell	Most of it	No		● The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on (see reference list below): ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution ● The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. ● The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ○ A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings.	4	
Lisa Goodrich	Just the parts I am interested in	No	Thank you for getting rid of the stupid 350 number of wolves. Thank you for the buffer zones around native lands.	The current draft doesn't include enough research and science. These are sentient creatures and this is largely ignored in this draft. There need to be better options, other than killing for conflict.	3	Project Coyote has done a wonderful writeup of this plan. It's worth reviewing. https://widnr.widen.net/s/kpfkd8nr2n/draft_wisconsin_wolf-management_plan_nov2022
Brian St. Aubin	Just the parts I am interested in	Yes	History and biology of the wolf		1	I am retired and for most of the year I live in Bayfield county north of Iron River. I believe there are two many wolves. They are eating the deer to the point where it is hard to hunt and see deer anymore. This winters deep snow keeps the heard down, we don't need wolves eating them. I heard a NPR program where the moose hunters in Alaska have to cull the wolves or there wouldn't be any moose for the native Americans. We need to that here in upper WI. When I see deer tracks I see wolf tracks as well. Please remove the wolf from upper WI so that future people can see deer. Wolves are a good thing for Yellowstone park since you can't hunt elk and bison there. Wolves are destroying the hunting opportunities in WI. Thanks
Ciel Ishatova	All of it	Yes	I appreciated especially the documents submitted by the various Wisconsin tribes, and the outlook and values they represent. I think this outlook is reflected in the scientific aspects of the plan, esp. the impact of wolves on the larger ecosystem, including how humans interact with the ecosystem. The plan needs to respect Native land and wolves on/near this land, specifically no hunting on/near Native land, and using least harmful interventions when human/wolf conflicts occur (hunting/killing the least desirable means of resolving conflict). Not determining the population number of wolves, but allowing wolves to be self-sustaining, self-regulating and genetically healthy. Increased public education to inform about how wolves positively impact things like deer/car crashes and tick borne lyme disease	I don't like wolf trophy hunting or trapping wolves, and I don't like using dogs for the purpose of hunting wolves (or bears). I believe the emphasis should be on wolf impact on biodiversity and a healthy ecosystem, not on trophy hunting or trapping. I subscribe to the Native peoples attitude of not controlling or subjugating a "brother", but respecting the wolf's contribution to a healthy world for humans and other living beings.	4	Wolves do not threaten humans, livestock or deer hunting. These are irrational fears and fuel misinformation. Killing wolves has negative consequences for all aspects of the environment, and promoting this kind of killing degrades humanity and promotes unnecessary violence.
Linda Vista	All of it	Yes	Helping wolves	Killing wolves	4	I like to keep wolves alive
	All of it	Yes	1. The plan removes a numeric population goal 2. The plan creates low quota zones around Tribal lands where the Tribes requested it. 3. The plan is focused on the ecological benefits of wolves 4. The plan is reflective of the public opinions survey that was released along with the plan and finds that opinions toward wolves have grown significantly become more favorable. 5. There is expressed	the tribal zones are more limited than is ideal.	10

				values and concerns for wolves point towards a biased, unscientific and instrumental view of wolves that promotes values contrary to broad public perspectives on wolves. ● 'SOM' wolf estimation methodology – From a recent critique: "The new methods sacrifice precision, but are believed to retain adequate accuracy and sensitivity to changing conditions for reliable decision-making. We review evidence for the accuracy, precision, and sensitivity of the new 'scaled occupancy model' (SOM) applied in Wisconsin. We conclude that the Wisconsin method would systematically overestimate wolf abundance by large (but currently incalculable) margins. Because Wisconsin, similar to other states, not only changed to unverified methods but also implemented widespread wolf killing, shortcomings in their estimates of wolf abundance may have far-reaching consequences for population viability and confidence in state wildlife managers. We discuss findings from Wisconsin alongside similar findings for other states' occupancy models being insensitive to human causes of mortality that have recently increased. Overall, Wisconsin's proposed method for estimating wolf abundance shows significant departures from best practices in scientific measurement. Verification will require independent replication and unbiased tests at multiple scales in multiple habitats under different human-induced mortality rates, and peer review before the new methods are considered reliable." [redacted]	Most of it	Yes	I like that a comprehensive study is being performed. I also appreciate the detail provided in order for opinions to be formulated.	I am not sure of the process of decision making that will take place in order to effect the plan. If decisions are made by people living below Hwy 8, then I do not believe that the plan will have the interest of Northern Wisconsin in mind. We have the majority of the wolf population. I have them on my property on a regular basis.	4	Please overweight the opinions of Northern Wisconsin residents over those in southern Wisconsin. If you consider them equal, then let's distribute the wolf population equally around the state. I like to hunt deer but have not sighted the quality of racked bucks as we have enjoyed in the past. I do realize that there are other factors that affect deer population. Bears, automobiles, etc. However, the wolf population needs to be more controlled in the north. Please consider a weighted approach to the decision process and your Northern wisconsin residents.
	Just the parts I am interested in	Yes	Removing an arbitrary wolf population goal. The plan is rightly focused on the ecological benefits of wolves. The plan creates low quota zones around tribal lands where the tribes requested it.		9	

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Geoff Robinson	Just the parts I am interested in	Yes	I appreciate the attempt to plan wolf management from a scientific perspective. I am impressed by the level of detail and effort put into the plan.	There was no conclusion that would summarize the various proposals in the plan - just a lot of detailed information. I was distressed by the fact that a significant number of killings were "Illegal" rather than planned. This suggests something is not right about managing the wolf population in practice.	5	Please see above concerning illegal killings of wolves. A much better handle is needed here. Perhaps very severe penalties for those caught violating authorized wolf hunting limits.
Mike Hunter	Just the parts I am interested in	Yes	The state needs a wolf hunt every year, our deer herd in northern Wi is in very poor shape!	The DNR has no idea how many wolfs are in the northern zones or in the state.	0	You need to spend as much time on our deer. At one time we had 9 hunters for deer season, now its myself and my grandson, Its hard to get someone to hunt when you don't see deer!
	All of it	No	Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. ● There is much greater recognition of the ecological role of wolves ● The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves ● The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed)	The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on (see reference list below): ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution ● The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. ● The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ○ A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings. ○ Hounding or hound training, which are akin to allowing legalized dogfighting, should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public.	1	The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. ○ Despite Act 169, which mandates a wolf hunting season, the department can still restrict the implementation of lethal methods by setting minimal quotas, including a quota of '0' wolves, restricting timing and methods. ○ Several studies have proven a proactive non-lethal approach leads to better conflict mitigation. ○ Lethal management often fails to provide a long-term solution to wolf predation and has the least consistent success rates when compared to non-lethal practices. In addition, there is significant evidence showing that lethal wolf management may be less functionally effective at mitigating subsequent livestock losses than non-lethal deterrents. ● The plan should require the implementation of abatement measures as well as the use of non-lethal conflict minimization techniques by domestic animal owners for the latter to receive compensation for confirmed predation. ● The plan also runs contrary to public values towards wolves (and omits mention of such majority values from the plan), despite department surveys evidencing that the broad public cares about wolves as individuals (and not just for the viability of the population). Given the recent liberalization of killing wolves by the state, it would be incredibly informative to note majority support of the following reasons for opposing a regulated wolf hunting/trapping season (which are all omitted from the plan): opposition to specific methods of harvest like hounds (64%) or traps (70%), feelings that hunting wolves is unnecessary (62%) or culturally offensive to Native American tribes (57%). ○ All such reasons convey majority disagreement with practices currently promoted and endorsed by the legislature and the WDNR, and such a conflict between managers and the public should not only be acknowledged, but foregrounded and carefully considered in policy (instead of dismissed). ○ Such decisions to omit literature or downplay evidence (e.g., such as majority opposition to killing wolves and their reasons) are contrary to principles of scientific integrity (e.g., present all relevant scientific evidence to the public) as well as ethics (e.g., disguising ethical decisions, such as recreational wolf killing, as robustly supported by science). ● Conflicting agency objectives (e.g., optimizing public hunting and conflict mitigation) are not only not acknowledged, but even misunderstood as harmonious, against the body of scientific evidence. That culminates in the prioritization of consumptive values and policies; e.g., according to the body of scientific literature, use of lethal methods, and especially public hunts, are contrary to most objectives relevant to: harm mitigation, the wellbeing of wolves, their ecological roles, and their non-exploitative enjoyment (i.e., Objectives A, B, D and F). ● There is a stark lack of consideration for individual wolves, wolf population health (including wellbeing), and measurable indicators for assessing any harms barring disease prevalence (e.g., accounting for cortisol levels or other stress hormones, measures of pair/pack persistence) ● There is an inappropriate understanding and consideration of tribal worldviews about wolves. Tribal worldviews of wolves are misconstrued as 'cultural benefits' tribes receive from the existence of a wolf population, when in fact tribal worldviews consider each individual wolf as a person and relative. Cultural respect and sensitivity towards such views, shared by many non-tribal members, demand the strict mitigation of lethal measures, especially recreational killing, as opposed to their current promotion in the plan. ● In general, all omissions of scientific literature, the arbitrary prioritization of policy objectives, the rhetoric of the plan and the dismissal of public values and concerns for wolves point towards a biased, unscientific and instrumental view of wolves that promotes values contrary to broad public perspectives on wolves.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Janet Brandt	Most of it	Yes	Removing numeric goals. Redrawing wolf zones across Wisconsin and creation of buffer zones around tribal reservations. Rigorous focus on wolf population monitoring Use of a science-based management approach to wolf conservation. Zone specific harvest permits, mandatory harvest registration, and in-person certification requirements.	Would want the plan to include: Specific descriptions of how wolf populations in each zone will be managed to achieve goals outlined in the plan, including specific metrics. A process to ensure enough licenses are issued for any legal hunt to assure quotas can be met in a reasonable time period in order to avoid overly long hunting and trapping seasons that carry into the breeding season. Limit training of dogs to only the periods when wolf hunting or trapping season is open in the zone. Restore a standing Wolf Advisory Committee.	7	I support all the work that was done by the WGF Wildlife Work Group and recommend that their summary recommendations be taken into consideration.
	All of it	Yes	Removing the numeric goals from the wolf plan. Redrawing the wolf zones across Wisconsin and the creation of buffer zones around tribal reservations. The focus on wolf population monitoring and a science-based approach. Zone specific harvest permits with mandatory harvest registration and in-person certification requirements.	Change Lincoln County's core wolf zone back to zone 2 (from zone 3). Specify how wolf populations will bemanaged in each zone. Include a process to ensure licenses are issued for any legal hunt to have quotas met within a reasonable time frame to avoid elongated hunting seasons. Limit training of dogs to only the periods when the season is open. identify funding sources for wolf population management.	3	the plan should bring back the Wolf Advisory Committee and do a follow-up public attitudes survey after plan approval.
Kelly Mehring	All of it	No	Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. ● There is much greater recognition of the ecological role of wolves ● The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves ● The adoption of proposed buffer zones around tribal reservations	The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on (see reference list below): ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution ● The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. ● The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ○ A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings. ○ Hounding or hound training, which are akin to allowing legalized dogfighting, should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public. ● The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. ○ Despite Act 169, which mandates a wolf hunting season, the department can still restrict the implementation of lethal methods by setting minimal quotas, including a quota of '0' wolves, restricting timing and methods. ○ Several studies have proven a proactive non-lethal approach leads to better conflict mitigation. ○ Lethal management often fails to provide a long-term solution to wolf predation and has the least consistent success rates when compared to non-lethal practices. In addition, there is significant evidence showing that lethal wolf management may be less functionally effective at mitigating subsequent livestock losses than non-lethal deterrents. ● The plan should require the implementation of abatement measures as well as the use of non-lethal conflict minimization techniques by domestic animal owners for the latter to receive compensation for confirmed predation. ● The plan also runs contrary to public values towards wolves (and omits mention of such majority values from the plan), despite department surveys evidencing that the broad public cares about wolves as individuals (and not just for the viability of the population). Given the recent liberalization of killing wolves by the state, it would be incredibly informative to note majority support of the following reasons for opposing a regulated wolf hunting/trapping season (which are all omitted from the plan): opposition to specific methods of harvest like hounds (64%) or traps (70%), feelings that hunting wolves is unnecessary (62%) or culturally offensive to Native American tribes (57%). ○ All such reasons convey majority disagreement with practices currently promoted and endorsed by the legislature and the WDNR, and such a conflict between managers and the public should not only be acknowledged, but foregrounded and carefully considered in policy (instead of dismissed). ○ Such decisions to omit literature or downplay evidence (e.g., such as majority opposition to killing wolves and their reasons) are contrary to principles of scientific integrity (e.g., present all relevant scientific evidence to the public) as well as ethics (e.g., disguising ethical decisions, such as recreational wolf killing, as robustly supported by science). ● Conflicting agency objectives (e.g., optimizing public hunting and conflict mitigation) are not only not acknowledged, but even misunderstood as harmonious, against the body of scientific evidence. That culminates in the prioritization of consumptive values and policies; e.g., according to the body of scientific	4	Wildlife belongs to all of us, in the public trust, & the majority is non-consumptive.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
				literature, use of lethal methods, and 2 especially public hunts, are contrary to most objectives relevant to: harm mitigation, the wellbeing of wolves, their ecological roles, and their non-exploitative enjoyment (i.e., Objectives A, B, D and F). ● There is a stark lack of consideration for individual wolves, wolf population health (including wellbeing), and measurable indicators for assessing any harms barring disease prevalence (e.g., accounting for cortisol levels or other stress hormones, measures of pair/pack persistence) ● There is an inappropriate understanding and consideration of tribal worldviews about wolves. Tribal worldviews of wolves are misconstrued as 'cultural benefits' tribes receive from the existence of a wolf population, when in fact tribal worldviews consider each individual wolf as a person and relative. Cultural respect and sensitivity towards such views, shared by many non-tribal members, demand the strict mitigation of lethal measures, especially recreational killing, as opposed to their current promotion in the plan. ● In general, all omissions of scientific literature, the arbitrary prioritization of policy objectives, the rhetoric of the plan and the dismissal of public values and concerns for wolves point towards a biased, unscientific and instrumental view of wolves that promotes values contrary to broad public perspectives on wolves. ● 'SOM' wolf estimation methodology – From a recent critique: "The new methods sacrifice precision, but are believed to retain adequate accuracy and sensitivity to changing conditions for reliable decision-making. We review evidence for the accuracy, precision, and sensitivity of the new 'scaled occupancy model' (SOM) applied in Wisconsin. We conclude that the Wisconsin method would systematically overestimate wolf abundance by large (but currently incalculable) margins. Because Wisconsin, similar to other states, not only changed to unverified methods but also implemented widespread wolf killing, shortcomings in their estimates of wolf abundance may have far-reaching consequences for population viability and confidence in state wildlife managers. We discuss findings from Wisconsin alongside similar findings for other states' occupancy models being insensitive to human causes of mortality that have recently increased. Overall, Wisconsin's proposed method for estimating wolf abundance shows significant departures from best practices in scientific measurement. Verification will require independent replication and unbiased tests at multiple scales in multiple habitats under different human-induced mortality rates, and peer review before the new methods are considered reliable." (Treves & Santiago-Ávila, 2023)		
Lynn Armentrout	Most of it	Yes	1. Having wolf management be science-centered and tailored to changing conditions rather than dependent on arbitrary population numbers. 2. The low quota zones around Tribal lands. 3. Focusing on the ecological benefit of wolves.		9	
Patricia	Most of it	No	The adoption of proposed buffer zones, opposition to the mothives and methods for killing wolves	Hounding or hound trainning which are akin to allowing legalized dogfigthing Wolf hunting season	4	
Zach Carobine	All of it	Yes	I like the idea of wolves being around. But not as many as there are they need to be managed. It's not like they are spread out evenly through out the whole state. They are in concentrated areas and river deer population suffers for that.	The population goal	3	There are way too many wolves up north. And now I'm seeing them on trail cameras just south of Shawano by me. Just a matter of time before this deer population starts declining

Verification will require independent replication and unbiased tests at multiple scales in multiple habitats under different human-induced mortality rates, and peer review before the new methods are considered reliable." (Treves & Santiago-Ávila, 2023)		
Julie Fitzpatrick	All of it	Yes	I like the recommendations to minimize wolf harvests near large tribal reservations, but the quota in these new Subzones should be set at zero to protect wolves who live on or near reservations. Making rules to reduce registration time for wolves killed by trophy hunters to 8 hours and limiting wolf licenses to be valid in only one specific zone are both useful elements. Removing the specific population goal from the plan makes sense. The goal should be more holistic, to have a healthy population of wolves that connect with wolves near them and fulfill their ecological purpose. Keeping wolf news transparent and public is important. Finding non-lethal deterrent methods for farmers and the public is important.	Encouraging wolf trophy hunting by creating a season to train hounds is not in the best interest of landowners, nontarget wildlife, wolves, or the public in general. Trophy hunters are a tiny, vicious, violent minority that do not reflect the values of Wisconsin. No state-sanctioned dogfighting. Wolf trapping also benefits a tiny number of individuals and does not reflect the values of most Wisconsinites. The plan should call for the elimination of the state law that mandates seasons for these activities. Objective C needs to be rewritten to focus on the ecological benefits provided by wolves, not on the trophy hunting and trapping, which only benefit a very small minority of Wisconsinites. Ecological benefits, such as species biodiversity, natural population control and disease reduction of other species, and reduction of deer-vehicle collisions help many more Wisconsinites than hunting and trapping. Hunting and trapping increase the overall levels of violence in our state, sanctioning the killing of animals for sport, increasing conflict and gun use, and teaching our children that people should feel entitled to use animals for their own gain without thought to the needs of the animal or its place in the natural world. Non-lethal deterrents should be emphasized and targeted for improvement. There needs to be a better understanding of the effect of killing even a single wolf, which can destroy the social dynamics of a wolf family unit and increase conflicts with humans. References in the plan to false information about wolves need to be removed. There are no documented wolf attacks in Wisconsin or 48 other states. Less than 1% of livestock are lost to wolves and can be compensated. The deer herd is robust and kept healthy by removal of the weakest deer by wolves. Public education about wolves is important and should begin with this plan, which should include a provision for updating more specific than "valid until it is replaced."	5	The draft is a good start, but it still misses many points. The plan should support a healthy, genetically diverse and socially stable wolf population, because wolves are a keystone species in our ecosystem. The plan should be rooted in the best available science, rather than catering to hunters and trappers who do NOT represent the best interests of the wolves or the majority of Wisconsinites. There is no justification for killing wolves or any other animal for sport. All lives matter. The attitudes survey detailed in the draft plan clearly shows that Wisconsinites value wolves and want them to thrive. These values must be reflected in the plan. At a minimum, the plan should: 1. Recommend the elimination of the state mandate for a hunting and trapping season on wolves. 2. Focus the resolution of wolf conflicts with humans on non-lethal methods. 3. Recommend changes in DNR perspective to increase public input outside the hunting and trapping community and put higher value on science-based resources.
	I have not read any of the draft plan	No	Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. ● There is much greater recognition of the ecological role of wolves ● The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves ● The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed)	The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature. The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life.	3	
	Just the parts I am interested in	Yes	I appreciated the recommendations for controlling trophy hunting and wolf trapping.	Training hounds for wolf hunts will cause more conflicts with wolves. In section 1, there should be more discussion on how killing a wolf harms wolf families and again can cause more conflicts with wolves.	7	Wisconsin has a responsibility to craft a plan that helps not hurts healthy wolf populations. They are a keystone species that need more protection.

Steve Holmes	All of it	Yes	Nothing	Please see below.	2	I've never had a plan without a goal, you need to have a population goal. Get one. Don't understand why when we had a few packs they averaged 5 per pack. As the packs increased the wolves per pack declined and I don't understand why. From 1979 to 2021 legal wolf mortality was 1248 animals of 2041 as stated. Not sure if this is a bid deal. There have been 75 human health and safety issues with no injuries or deaths YET. It seems to me you are ok with that but at some point there will be an injury or death, are you prepared for the heat when you do NOTHING to reduce the wolf numbers. Wolves have no fear of people and their numbers are increasing but you are happy to educate us about wolves. You need to allow us to reduce the numbers of wolves. The wolves are killing the deer herd in the north. Deer hunters are quiting hunting because they don't see deer, the wolves are killing them. The funds will be declining too. Very disappointed in the DNR over the past decade and this wolf management plan isn't bringing my trust back.
Adam Mills	All of it	No	Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. There is much greater recognition of the ecological role of wolves The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed).	The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ○ A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings.Hounding or hound training, which are akin to allowing legalized dogfighting, should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public.	3	
Brian Matthys	All of it	Yes	The survey of attitudes towards the wolf presence in Wiscosin was very interesting	I strongly disagree with the DNR not establishing a 350 max population that was promised to the public when the wolf was reintroduced	2	The DNR refers to the wolf as an Apex predator. There is no provision for the population control of the wolf population in Wisconsin. I am not opposed to having wolves in Wisconsin but every species of game has population control methods except for the wolf!
Shelby Kortenhof-Struck	Most of it	Yes	The science based approach. The sensitivity to the tribes.	Do not approve of hunting wolves with dogs. Do not approve of quotas.	10	Good work by the DNR despite the anti-science Republican legislators in this state. Keep fighting for what is right for the environment.
	Most of it	Yes			2	
James	Just the parts I am interested in	No		You need to do a better job in taking care of the Wolves. It seems to me that the majority of your citizens feel the same way you should be protecting them not allowing them to be slaughtered .	5	It could be better than your proposals
	Most of it	No	We appreciate the efforts of all WDNR staff involved in updating the state's wolf management plan. Although we believe the current plan needs significant updating (see next section), we recognize the efforts and improvements made to the previous plan, including: ● Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. ● There is much greater recognition of the ecological role of wolves ● The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves ● The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed)	● The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on (see reference list below): ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution ● The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. ● The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ○ A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings. ○ Hounding or hound training, which are akin to allowing legalized dogfighting, should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public. ● The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. ○ Despite Act 169, which mandates a wolf hunting season, the department can still restrict the implementation of lethal methods by setting minimal quotas, including a quota of '0' wolves, restricting timing and methods. ○ Several studies have proven a proactive non-lethal approach leads to better conflict mitigation. ○ Lethal management often fails to provide a long-term solution to wolf predation and has the least consistent success rates when compared to non-lethal practices. In addition, there is significant evidence showing that lethal wolf management may be less functionally effective at mitigating subsequent livestock losses than non-lethal deterrents. ● The plan should require the implementation of abatement measures as well as the use of non-lethal conflict minimization techniques	0	

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
				by domestic animal owners for the latter to receive compensation for confirmed predation. ● The plan also runs contrary to public values towards wolves (and omits mention of such majority values from the plan), despite department surveys evidencing that the broad public cares about wolves as individuals (and not just for the viability of the population). Given the recent liberalization of killing wolves by the state, it would be incredibly informative to note majority support of the following reasons for opposing a regulated wolf hunting/trapping season (which are all omitted from the plan): opposition to specific methods of harvest like hounds (64%) or traps (70%), feelings that hunting wolves is unnecessary (62%) or culturally offensive to Native American tribes (57%). ○ All such reasons convey majority disagreement with practices currently promoted and endorsed by the legislature and the WDNR, and such a conflict between managers and the public should not only be acknowledged, but foregrounded and carefully considered in policy (instead of dismissed). ○ Such decisions to omit literature or downplay evidence (e.g., such as majority opposition to killing wolves and their reasons) are contrary to principles of scientific integrity (e.g., present all relevant scientific evidence to the public) as well as ethics (e.g., disguising ethical decisions, such as recreational wolf killing, as robustly supported by science). ● Conflicting agency objectives (e.g., optimizing public hunting and conflict mitigation) are not only not acknowledged, but even misunderstood as harmonious, against the body of scientific evidence. That culminates in the prioritization of consumptive values and policies; e.g., according to the body of scientific literature, use of lethal methods, and especially public hunts, are contrary to most objectives relevant to: harm mitigation, the wellbeing of wolves, their ecological roles, and their non-exploitative enjoyment (i.e., Objectives A, B, D and F). ● There is a stark lack of consideration for individual wolves, wolf population health (including wellbeing), and measurable indicators for assessing any harms barring disease prevalence (e.g., accounting for cortisol levels or other stress hormones, measures of pair/pack persistence) ● There is an inappropriate understanding and consideration of tribal worldviews about wolves. Tribal worldviews of wolves are misconstrued as 'cultural benefits' tribes receive from the existence of a wolf population, when in fact tribal worldviews consider each individual wolf as a person and relative. Cultural respect and sensitivity towards such views, shared by many non-tribal members, demand the strict mitigation of lethal measures, especially recreational killing, as opposed to their current promotion in the plan. ● In general, all omissions of scientific literature, the arbitrary prioritization of policy objectives, the rhetoric of the plan and the dismissal of public values and concerns for wolves point towards a biased, unscientific and instrumental view of wolves that promotes values contrary to broad public perspectives on wolves. ● 'SOM' wolf estimation methodology – From a recent critique: "The new methods sacrifice precision, but are believed to retain adequate accuracy and sensitivity to changing conditions for reliable decision-making. We review evidence for the accuracy, precision, and sensitivity of the new 'scaled occupancy model' (SOM) applied in Wisconsin. We conclude that the Wisconsin method would systematically overestimate wolf abundance by large (but currently incalculable) margins. Because Wisconsin, similar to other states, not only changed to unverified methods but also implemented widespread wolf killing, shortcomings in their estimates of wolf abundance may have far-reaching consequences for population viability and confidence in state wildlife managers. We discuss findings from Wisconsin alongside similar findings for other states' occupancy models being insensitive to human causes of mortality that have recently increased. Overall, Wisconsin's proposed method for estimating wolf abundance shows significant departures from best practices in scientific measurement. Verification will require independent replication and unbiased tests at multiple scales in multiple habitats under different human-induced mortality rates, and peer review before the new methods are considered reliable." (Treves & Santiago-Ávila, 2023)		
Jim B-axa	Most of it	Yes	It explains that there isn't a wolf population problem. 48 farm animals losses compared to the slaughter of wolves? There is a severe imbalance and the state is listening to the few complaining than reviewing the scientific data. Reduce the numbers of wolves allowed to be hunted and killed for trophies.	It is over exaggerated for reasoning with regards on the number of wolves allowed to be terminated.	0	Science provides a clear example of how wolves can manage their population better than human intervention. You are literally shooting yourselves in the foot with the thinking in this plan.
	Most of it	Yes	Understanding the wolf pack family and history	trophy hunting, trapping, using dogs to hunt wolves - like putting a car against an army tank	2	Too much emphasis on reducing the wolves, hunting, trapping (the most inhumane option on the planet), trophy hunting is horrible

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
YB	Just the parts I am interested in	No	The Plan is well presented and supported with data, maps, and tables.	The document is too long and full of unnecessary detail.	5	The Plan discusses wolves as if they were inanimate objects we should 'manage'. Please understand that they are intelligent beings, who have shared the Planet with us for thousands of years. They are a keystone species in the wilding process of natural habitats. They have a right to their continued existence and we should be working together to make that a reality.
	All of it	No	What I like: We appreciate the efforts of all WDNR staff involved in updating the state's wolf management plan. Although we believe the current plan needs significant updating (see next section), we recognize the efforts and improvements made to the previous plan, including: ● Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. ● There is much greater recognition of the ecological role of wolves ● The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves ● The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed) What I don't like: ● The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on (see reference list below): ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution ● The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. ● The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ○ A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings. ○ Hounding or hound training, which are akin to allowing legalized dogfighting, should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public. 	Just the parts I am interested in	No	Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. ● There is much greater recognition of the ecological role of wolves ● The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves ● The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed)	The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on (see reference list below): ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution ● The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. ● The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ○ A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings. ○ Hounding or hound training, which are akin to allowing legalized dogfighting, should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public	5	The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. ○ Despite Act 169, which mandates a wolf hunting season, the department can still restrict the implementation of lethal methods by setting minimal quotas, including a quota of '0' wolves, restricting timing and methods. ○ Several studies have proven a proactive non-lethal approach leads to better conflict mitigation. ○ Lethal management often fails to provide a long-term solution to wolf predation and has the least consistent success rates when compared to non-lethal practices. In addition, there is significant evidence showing that lethal wolf management may be less functionally effective at mitigating subsequent livestock losses than non-lethal deterrents.
James grant	Most of it	Yes	A generalized holistic approach to population, with an emphasis on non lethal control methods	Not taking into account falsified depredation reporting. Not addressing the negative effect on packs, of lethal control and it's subsequent increase in live stock depredation caused by pack disruption	5	I would like to see more emphasis included in the plan, to deal with illegal wolf killing. If the poaching isn't stopped no regulation will have legitimate outcome
[redacted]	Most of it	No	I appreciate the efforts of all WDNR staff involved in updating the state's wolf management plan. Although I do think the current plan needs significant updating (see next section), I also recognize the improvements made to the previous plan, such as: (i) wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves; (ii) the much greater recognition of the ecological role of wolves; (iii) the inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves; and (iv) the adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed).	The current draft does not reflect the best available science and is missing a substantial amount of scientific literature on (i) wolf ethology, sentience, sapience, sociability, agency and wellbeing; (ii) effectiveness of non-lethal interventions, especially relative to lethal ones; and (iii) the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution. The aforementioned scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings. Hounding or hound training, which are akin to allowing legalized dogfighting, should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public. The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. Despite Act 169, which mandates a wolf hunting season, the department can still restrict the implementation of lethal methods by setting minimal quotas, including a quota of '0' wolves, restricting timing and methods. Several studies have proven a proactive non-lethal approach leads to better conflict mitigation. Lethal management often fails to provide a long-term solution to wolf predation and has the least consistent success rates when compared to non-lethal practices. In addition, there is significant evidence showing that lethal wolf management may be less functionally effective at mitigating subsequent livestock losses than non-lethal deterrents. The plan should require the implementation of abatement measures as well as the use of non-lethal conflict minimization techniques by domestic animal owners for the latter to receive compensation for confirmed predation. The plan also runs contrary to public values towards wolves (and omits mention of such majority values from the plan), despite department surveys evidencing that the broad public cares about wolves as individuals (and not just for the viability of the population). Given the recent liberalization of killing wolves by the state, it would be incredibly informative to note majority support of the following reasons for opposing a regulated wolf hunting/trapping season (which are all omitted from the plan): (i) opposition to specific methods of harvest like hounds (64%) or traps (70%); and (ii) feelings that hunting wolves is unnecessary (62%) or culturally offensive to Native American tribes (57%). All such reasons convey majority disagreement with practices currently promoted and endorsed by the legislature and the WDNR, and such a conflict between managers and the public should not only be acknowledged, but foregrounded and carefully considered in policy (instead of dismissed). Such decisions to omit literature or downplay evidence (e.g., such as majority opposition to killing wolves and their reasons) are contrary to principles of	5	In general, all omissions of scientific literature, the arbitrary prioritization of policy objectives, the rhetoric of the plan and the dismissal of public values and concerns for wolves point towards a biased, unscientific and instrumental view of wolves that promotes values contrary to broad public perspectives on wolves.

				scientific integrity (e.g., present all relevant scientific evidence to the public) as well as ethics (e.g., disguising ethical decisions, such as recreational wolf killing, as robustly supported by science). Conflicting agency objectives (e.g., optimizing public hunting and conflict mitigation) are not only not acknowledged, but even misunderstood as harmonious, against the body of scientific evidence. That culminates in the prioritization of consumptive values and policies; e.g., according to the body of scientific literature, use of lethal methods, and especially public hunts, are contrary to most objectives relevant to: harm mitigation, the wellbeing of wolves, their ecological roles, and their non-exploitative enjoyment (i.e., Objectives A, B, D and F). There is a stark lack of consideration for individual wolves, wolf population health (including wellbeing), and measurable indicators for assessing any harms barring disease prevalence (e.g., accounting for cortisol levels or other stress hormones, measures of pair/pack persistence).		
Ronit Corry	Most of it	No	Thank you for the efforts and improvements made to the previous plan, including: Wolves in WI will not be managed by reference to the old goal of 350 wolves. I like the recognition of the ecological role of wolves. I like the understanding of their ecological roles and the opposition to the motives and methods. for killing wolves. I like the adoption of the proposed buffer zones around tribal reservations. Thank you.	Please all the current scientific literature available: Wolf ethology, sentience, sapience, sociability, agency and wellbeing. ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution With the missing science as well as the wanting to keep recreational killing, the plan is biased. The plan should not involve any killing of wolves except in extremely rare cases. Please note: A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings. Hounding or hound training, which is very much like legalized dogfighting, should not be allowed as it is extremely cruel to wolves as well as hounds and is not supported by the majority of hunters or most of the public.	4	
	Most of it	Yes	extended time frame for public input.	don't think the count and estimations are accurate. Pack size and not counting lone wolves. Numbers are too low. You know we have atleast 950-1100 in the state.	2	the initial plan was for 300-350. We are way above that, and have been for a few years. So what is the BIG hold up? Quit favoring animal activists and do a manage hunt for 350. They are not going off the face of the earth! You drag this out just like CWD. Sat on it for 18-20 years and look at it...you haven't done a F...n thing about it yet!! Wonder why license sales keep declining...go figure.Start by shutting down EVERY deer farm across the country, and not spending our money on them either. The DNR thinks WI. elk herd at Clam L. is really growing!!?? For as long as it's been,...NOT... it Sucks! It should be way higher....TOO MANY WOLVES.!!
Jennifer Valentine	Most of it	No	We appreciate the efforts of all WDNR staff involved in updating the state's wolf management plan. Although we believe the current plan needs significant updating (see next section), we recognize the efforts and improvements made to the previous plan, including: ● Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. ● There is much greater recognition of the ecological role of wolves ● The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves ● The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed)	● The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution ● The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. ● The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ○ A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings. ○ Hounding or hound training, which are akin to allowing legalized dogfighting, should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public. ● The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. ○ Despite Act 169, which mandates a wolf hunting season, the department can still restrict the implementation of lethal methods by setting minimal quotas, including a quota of '0' wolves, restricting timing and methods. ○ Several studies have proven a proactive non-lethal approach leads to better conflict mitigation. ○ Lethal management often fails to provide a long-term solution to wolf predation and has the least consistent success rates when compared to non-lethal practices. 				also runs contrary to public values towards wolves (and omits mention of such majority values from the plan), despite department surveys evidencing that the broad public cares about wolves as individuals (and not just for the viability of the population). Given the recent liberalization of killing wolves by the state, it would be incredibly informative to note majority support of the following reasons for opposing a regulated wolf hunting/trapping season (which are all omitted from the plan): opposition to specific methods of harvest like hounds (64%) or traps (70%), feelings that hunting wolves is unnecessary (62%) or culturally offensive to Native American tribes (57%). ○ All such reasons convey majority disagreement with practices currently promoted and endorsed by the legislature and the WDNR, and such a conflict between managers and the public should not only be acknowledged, but foregrounded and carefully considered in policy (instead of dismissed). ○ Such decisions to omit literature or downplay evidence (e.g., such as majority opposition to killing wolves and their reasons) are contrary to principles of scientific integrity (e.g., present all relevant scientific evidence to the public) as well as ethics (e.g., disguising ethical decisions, such as recreational wolf killing, as robustly supported by science). ● Conflicting agency objectives (e.g., optimizing public hunting and conflict mitigation) are not only not acknowledged, but even misunderstood as harmonious, against the body of scientific evidence. That culminates in the prioritization of consumptive values and policies; e.g., according to the body of scientific literature, use of lethal methods, and 2 especially public hunts, are contrary to most objectives relevant to: harm mitigation, the wellbeing of wolves, their ecological roles, and their non-exploitative enjoyment (i.e., Objectives A, B, D and F). ● There is a stark lack of consideration for individual wolves, wolf population health (including wellbeing), and measurable indicators for assessing any harms barring disease prevalence (e.g., accounting for cortisol levels or other stress hormones, measures of pair/pack persistence) ● There is an inappropriate understanding and consideration of tribal worldviews about wolves. Tribal worldviews of wolves are misconstrued as 'cultural benefits' tribes receive from the existence of a wolf population, when in fact tribal worldviews consider each individual wolf as a person and relative. Cultural respect and sensitivity towards such views, shared by many non-tribal members, demand the strict mitigation of lethal measures, especially recreational killing, as opposed to their current promotion in the plan. ● In general, all omissions of scientific literature, the arbitrary prioritization of policy objectives, the rhetoric of the plan and the dismissal of public values and concerns for wolves point towards a biased, unscientific and instrumental view of wolves that promotes values contrary to broad public perspectives on wolves. ● 'SOM' wolf estimation methodology – From a recent critique: "The new methods sacrifice precision, but are believed to retain adequate accuracy and sensitivity to changing conditions for reliable decision-making. We review evidence for the accuracy, precision, and sensitivity of the new 'scaled occupancy model' (SOM) applied in Wisconsin. We conclude that the Wisconsin method would systematically overestimate wolf abundance by large (but currently incalculable) margins. Because Wisconsin, similar to other states, not only changed to unverified methods but also implemented widespread wolf killing, shortcomings in their estimates of wolf abundance may have far-reaching consequences for population viability and confidence in state wildlife managers. We discuss findings from Wisconsin alongside similar findings for other states' occupancy models being insensitive to human causes of mortality that have recently increased. Overall, Wisconsin's proposed method for estimating wolf abundance shows significant departures from best practices in scientific measurement. Verification will require independent replication and unbiased tests at multiple scales in multiple habitats under different human-induced mortality rates, and peer review before the new methods are considered reliable." (Treves & Santiago-Ávila, 2023)		
Jeffrey L Widell MD	Most of it	Yes	The concept of "Total Quota" Is no longer an overarching theme. Reducing the time of registering a "kill" is critical for real time assessment of population loss. "Second chance" to live. the various non lethal options to mitigate conflict with livestock is preferable. Thanks for emphasizing that. Accepting that tribal zones are essentially safe harbor and thus Limiting Wolf killing in proximity to tribal zones. This satisfies the implicit understanding that wolves may unknowingly wander a few miles outside of theses "safe zones"	The concept of trapping is archaic. Allowing an intelligent social animal to slowly succumb in a trap.or violently self amputate to save it's Pups or fight off hound dogs with GPS collars enables and perpetuates a sadistic element of human behavior. Hunters from other states don't need to come here demanding to "do us a favor" and help us manage our non existent "wolf problem" I believe Wisconsin should lead the nation by example in Scientific coexistence with wolves. We need to better appreciate and give weight to the attitudes of the general population of Wisconsinites regarding the selfish and barbaric tactics of the trophy hunting industry.	7	Thanks for allowing me to express my concerns. They are real. I which I could get more involved. I am a critical care physician in Milwaukee, and I know a thing or two about empathy, pain suffering and the importance of social networks

Lisa Bey	Most of it	Yes			9	
	I have not read any of the draft plan	No	Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. There is much greater recognition of the ecological role of wolves The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed)	The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on (see reference list below): ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution ● The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. ● The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ○ A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings.	5	
Hannah Lee	Most of it	Yes	I appreciate the inclusion of many sides of the issue. I feel the report is balanced. I very. much appreciate the efforts to curb trophy hunting, which I consider to be immoral: taking the life of a living creature - especially one as threatened as wolves - for the enhancement of your own ego is, in my opinion pathological, cruel, and obscene. Trophy hunting should be illegal and the consequences of violation should be severe and the number of wolves that can be hunted for trophies should be reduced to zero, throughout the state, not just in the designated subzones 1B and 1C, making Product C2a irrelevant. I appreciate the removal of a numerical population goal from the plan. The goal should be to have a self-sustaining, self-regulating, and genetically diverse population that can maintain its connection with wolf populations in neighboring states and fulfill their ecological roles. I also want to thank you for making this information transparent and available to the public. It will help us advise you better. Further, wolf conflict mitigation plans that focus on non-lethal means of control are totally a step in the right direction. Efforts to educate farmers in ways to protect their livestock and pets from harm should be part of the whole picture in this regard. (OF NOTE: I do not consider hunting dogs that are trained to kill bear, wolves, and other wildlife as "pets" or "livestock," and neither should the state. These are working dogs trained to kill, and as such should not be eligible for reimbursement.) So, thank you for your hard work on this very sensitive issue.	I strongly object to establishing a season for training dogs for trophy hunting. It amounts to state-sponsored dogfighting, which is one of the most cruel activities humans engage in, as is trophy hunting. NO TROPHY HUNTING IN WISCONSIN, and NO SUPPORT for it; on the contrary, it should be illegal, with strong penalties for violations. I would even go further and say that dogs already trained for trophy hunting should be confiscated or purchased, and re-trained to do activities that are useful and helpful instead of cruel and destructive* (*they should not be killed because of their training! They are innocent and likely not aggressive unless commanded.) Establishing a season to train trophy-hunting dogs would lead to all kinds of trespassing violations among landowners, social chaos among wolves, and harassment of non-target wildlife. Overall, the plan puts an alarming emphasis on trophy hunting and trapping wolves at a time when they are not protected by the Endangered Species Act. I understand that state law demands the holding of such seasons when wolves are not federally protected, but the plan should recommend that this law be changed, similar to the way it recommends changes to other state statutes. It is quite disturbing and very disappointing to see that the majority of strategies under Objective C, "Provide Multiple Benefits Associated with the Wolf Population," are related to trophy hunting and trapping. These are NOT benefits; they are encouragements to cruelty and disregard for ecosystems. Wolves themselves - the benefits THEY provide to the ecosystems they serve, and to biodiversity - should be the focus of this segment of the plan, not the thrill that some bloodthirsty narcissist can get from killing a wolf. The crucial role of wolves in the ecosystem, their help in reducing deer-vehicle accidents and reducing disease should be highlighted in this plan, and should be the focus of "Benefits." All Wisconsinites benefit from the presence and activities of wolves, whereas only a tiny portion of the population wants to hunt for trophies; why kowtow to such a small (and cruel) minority? The report should place a higher priority on non-lethal methods of conflict deterrence in Sections 3 and 4, Objective B. Scientific studies have already shown that ikilling wolves, especially via trophy hunting and trapping, can lead to increased conflicts, whereas nonlethal methods can be even more effective when used correctly. Product B1f "To utilize wolf harvest zones/subzones and public harvest season. to address conflicts by directing icensed wolf hunters and trappers to areas of conflict" goes against the best available science and should be removed altogether. THERE SHOULD BE A MORE ROBUST DISCUSSION, particularly in Section 1, about the great harm that killing of wolves does and has done to their social dynamics. Numerous scientific studies have demonstrated that killing a single wolf can create social chaos - as each individual wolf in a family has a particular role - and can tear families apart, potentially leading to increased conflicts with humans. The plan also includes "perceived" and irrational harms from wolves as potential justification for reducing wolf numbers by killing them. This does nothing but further mythology from fairy tales and folklore imported by European settlers. Wolves do NOT threaten human lives, the livestock industry, or the hunters' ability to hunt deer. Wolves take far less than 1% of Wisconsin's livestock, and there has never been a documented case of a wolf attack on a human in the lower 48 states. The DNR should focus on providing robust public education to correct misinformation and these irrational "perceptions," instead of using them to justify killing wolves. Finally, the plan should include a provision that it be updated at least every 5 years, rather than simply being "valid until it is replaced." The world is changing too fast for that.	10	Your job is incredibly hard, but you've done it well. Even though significant changes should be made in order to align this plan with the best available science,Traditional Ecological Knowledge, and social values, this plan is a vast improvement over the previous plan. However, he planning process allows the DNR Board - the same Board that pushed for high killing quotas that resulted in the bloodbath we saw in the recent past when wolves lost their Endangered Species protection - to alter the plan in any way they see fit, and I am deeply fearful that they will use the plan's low numerical ratings to justify. making harmful and destructive changes that will undo the progress that has been made here. I pray that will not happen. As a keystone species, wolves' benefits ripple throughout our ecosystem and have been instrumental in restoring ecological biodiversity. While there are many scientific studies documenting the consequences of killing wolves, there is not a single one that provides a sound justification for killing such intelligent, social animals who provide such ecological and cultural benefit. Wisconsin has a responsibility to craft an updated wolf management plan that supports a healthy, genetically diverse, socially stable wolf population and is rooted in the best available science and Traditional Ecological Knowledge, public values, and ETHICS. This draft must be revised to meet that responsibility by: - Recommending policy changes that eliminate the mandate that Wisconsin hold a trophy hunting and trapping season on wolves when they are not federally protected. - Further exploring and prioritizing non-lethal methods for preventing conflicts with livestock. - Recommending the elimination and of trophy hunting, of training dogs for that purpose, and establishing consequences for such activities - Including a strong commitment to giving ALL Wisconsinites a seat at the table in guiding wolf policy. Based on the 2022 public attitudes survey detailed in the wolf plan, the majority of Wisconsinites value wolves and want them to thrive in Wisconsin. These values should be more proportionately represented in groups and boards that influence wolf policy.
