	Most of it	No	We appreciate the efforts of all WDNR staff involved in updating the state's wolf management plan. Although we believe the current plan needs significant updating (see next section), we recognize the efforts and improvements made to the previous plan, including: ● Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. ● There is much greater recognition of the ecological role of wolves ● The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves ● The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed)	● The current draft does not reflect the best available science. We appreciate the efforts of all WDNR staff involved in updating the state's wolf management plan. Although we believe thce, and is missing a substantial amount of scientific literature on (see reference list below): ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution ● The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. ● The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ○ A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings. ○ Hounding or hound training, which are akin to allowing legalized dogfighting, should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public. ● The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. ○ Despite Act 169, which mandates a wolf hunting season, the department can still restrict the implementation of lethal methods by setting minimal quotas, including a quota of '0' wolves, restricting timing and methods. ○ Several studies have proven a proactive non-lethal approach leads to better conflict mitigation. ○ Lethal management often fails to provide a long-term solution to wolf predation and has the least consistent success rates when compared to non-lethal practices. In addition, there is significant evidence showing that lethal wolf management may be less functionally effective at mitigating subsequent livestock losses than non-lethal deterrents. ● The plan should require the implementation of abatement measures as well as the use of non-lethal conflict minimization techniques by domestic animal owners for the latter to receive compensation for confirmed predation. ● The plan also runs contrary to public values towards wolves (and omits mention of such majority values from the plan), despite department surveys evidencing that the broad public cares about wolves as individuals (and not just for the viability of the population). Given the recent liberalization of killing wolves by the state, it would be incredibly informative to note majority support of the following reasons for opposing a regulated wolf hunting/trapping season (which are all omitted from the plan): opposition to specific methods of harvest like hounds (64%) or traps (70%), feelings that hunting wolves is unnecessary (62%) or culturally offensive to Native American tribes (57%). ○ All such reasons convey majority disagreement with practices currently promoted and endorsed by the legislature and the WDNR, and such a conflict between managers and the public should not only be acknowledged, but foregrounded and carefully considered in policy (instead of dismissed). ○ Such decisions to omit literature or downplay evidence (e.g., such as majority opposition to killing wolves and their reasons) are contrary to principles of scientific integrity (e.g., present all relevant scientific evidence to the public) as well as ethics (e.g., disguising ethical decisions, such as recreational wolf killing, as robustly supported by science). ● Conflicting agency objectives (e.g., optimizing public hunting and conflict mitigation) are not only not acknowledged, but even misunderstood as harmonious, against the body of scientific evidence. That culminates in the prioritization of consumptive values and policies; e.g., according to the body of scientific literature, use of lethal methods, and 2 especially public hunts, are contrary to most objectives relevant to: harm mitigation, the wellbeing of wolves, their ecological roles, and their non-exploitative enjoyment (i.e., Objectives A, B, D and F). ● There is a stark lack of consideration for individual wolves, wolf population health (including wellbeing), and measurable indicators for assessing any harms barring disease prevalence (e.g., accounting for cortisol levels or other stress hormones, measures of pair/pack persistence) ● There is an inappropriate understanding and consideration of tribal worldviews about wolves. Tribal worldviews of wolves are misconstrued as 'cultural benefits' tribes receive from the existence of a wolf population, when in fact tribal worldviews consider each individual wolf as a person and relative. Cultural respect and sensitivity towards such views, shared by many non-tribal members, demand the strict mitigation of lethal measures, especially recreational killing, as opposed to their current promotion in the plan. ● In general, all omissions of scientific literature, the arbitrary	4

				prioritization of policy objectives, the rhetoric of the plan and the dismissal of public values and concerns for wolves point towards a biased, unscientific and instrumental view of wolves that promotes values contrary to broad public perspectives on wolves. ● 'SOM' wolf estimation methodology – From a recent critique: "The new methods sacrifice precision, but are believed to retain adequate accuracy and sensitivity to changing conditions for reliable decision-making. We review evidence for the accuracy, precision, and sensitivity of the new 'scaled occupancy model' (SOM) applied in Wisconsin. We conclude that the Wisconsin method would systematically overestimate wolf abundance by large (but currently incalculable) margins. Because Wisconsin, similar to other states, not only changed to unverified methods but also implemented widespread wolf killing, shortcomings in their estimates of wolf abundance may have far-reaching consequences for population viability and confidence in state wildlife managers. We discuss findings from Wisconsin alongside similar findings for other states' occupancy models being insensitive to human causes of mortality that have recently increased. Overall, Wisconsin's proposed method for estimating wolf abundance shows significant departures from best practices in scientific measurement. Verification will require independent replication and unbiased tests at multiple scales in multiple habitats under different human-induced mortality rates, and peer review before the new methods are considered reliable." (Treves & Santiago-Ávila, 2023)		
Joan McCormick	All of it	Yes	Zero.	All.	0	I am appalled that we kill these precious animals. They belong In Wisconsin as much as humans do.
Tracy Ouellette	Just the parts I am interested in	No	Using science to set goals rather than arbitrary numbers, and including public opinion rather than only special interests. Respect for tribal boundaries with buffer zones to protect animals that are considered important to tribal culture	Reliance on recreational killing of wolves as part of a management strategy, which only perpetuates human-wolf animosity and does not manage wolves based on scientific population goals. Allowance of use of dogs to track and kill wolves, which is inhumane to both dogs and wolves. Minimal reflection of tribal attitudes toward wolves as relatives and valued members of their ecosystem.	3	Although a resident of Washington state, I own family property in Wisconsin and spend significant time there every year and have for decades, so this issue is extremely important to me. I believe wolves are a critical part of the healthy ecosystem of Wisconsin and welcome their recovery, and hope for an attitude towards wolves that is collaborative and accommodatiing rather than one of conflict and adversity.
Gladys Simerl	Most of it	Yes	Protecting wildlife and enjoying nature - which I fervently do	No idea	10	I am a Christian and God commanded man at creation to take care of it - including the animals
Kim Kelley	Most of it	Yes	• Buffer Zones around tribal reservations • Social Survey • removal of goal of 350 wolves	•the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy • Wolves should not be killed unless in extremely rare circumstances of defense of life • the plan should require abatement measures as well as non-lethal conflict minimization techniques by domestic animal owners for the latter to receive compensation for confirmed predation. ● In general, all omissions of scientific literature, the arbitrary prioritization of policy objectives, the rhetoric of the plan and the dismissal of public values and concerns for wolves point towards a biased, unscientific and instrumental view of wolves that promotes values contrary to broad public perspectives on wolves.	5	'SOM' wolf estimation methodology – From a recent critique: "The new methods sacrifice precision, but are believed to retain adequate accuracy and sensitivity to changing conditions for reliable decision-making. We review evidence for the accuracy, precision, and sensitivity of the new 'scaled occupancy model' (SOM) applied in Wisconsin. We conclude that the Wisconsin method would systematically overestimate wolf abundance by large (but currently incalculable) margins. Because Wisconsin, similar to other states, not only changed to unverified methods but also implemented widespread wolf killing, shortcomings in their estimates of wolf abundance may have far-reaching consequences for population viability and confidence in state wildlife managers. We discuss findings from Wisconsin alongside similar findings for other states' occupancy models being insensitive to human causes of mortality that have recently increased. Overall, Wisconsin's proposed method for estimating wolf abundance shows significant departures from best practices in scientific measurement. Verification will require independent replication and unbiased tests at multiple scales in multiple habitats under different human-induced mortality rates, and peer review before the new methods are considered reliable." Michelle Jorgensen	Most of it	No	That killing of 350 wolves is not the major goal. That it includes the trend that more and more people care about their survival and well being and do not want the current methods of "culling". That there will be buffer zones near the tribal areas.	There is a great deal of science and studies that should be reviewed and incorporated into the plan especially about sentience, wolf hierachies, wolf social dynamics, etc. This is key to understanding how to keep the wolf population stable and healthy. There are studies that show legal killling encourages illegal killing. There are better methods than recreational killing and wolves should only be killed in rare instances (life threatening). There should be more wolf protections and other methods incorporated like abatement and deterrants for livestock owners. Killing often is not a long term solution. There is so much research that the public wants less lethal killing and more humane ways to resolve problems. Trapping is extraordinarily cruel and in general the research shows the MAJORITY of those surveyed who do not want hunting at all, feel it's unnecessary, it's culturally offensive to Native Americans and they don't like the methods. Please use this research in your plan and tailor it to provide more abatement methods. Indiscriminate killing is not the answer.	4	There are definitely some pluses in this plan but please refer to some of the research below. Adams, L. G., Stephenson, R. O., Dale, B. W., Ahgook, R. Seth Coffey	All of it	No	Nothing.	It is far from reflecting the best available science, ethics and broad public values that should guide wolf policy and coexistence.	0	t we don't like: ● The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on (see reference list below): ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution ● The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. ● The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ○ A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal, cruel killings. Hounding or hound training, which are akin to allowing legalized dogfighting, should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public. ● The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. ○ Despite Act 169, which mandates a wolf hunting season, the department can still restrict the implementation of lethal methods by setting minimal quotas, including a quota of '0' wolves, restricting timing and methods. ○ Several studies have proven a proactive non-lethal approach leads to better conflict mitigation. ○ Lethal management often fails to provide a long-term solution to wolf predation and has the least consistent success rates when compared to non-lethal practices. In addition, there is significant evidence showing that lethal wolf management may be less functionally effective at mitigating subsequent livestock losses than non-lethal deterrents. ● The plan should require the implementation of abatement measures as well as the use of non-lethal conflict minimization techniques by domestic animal owners for the latter to receive compensation for confirmed predation. ● The plan also runs contrary to public values towards wolves (and omits mention of such majority values from the plan), despite department surveys evidencing that the broad public cares about wolves as individuals (and not just for the viability of the population). Given the recent liberalization of killing wolves by the state, it would be incredibly informative to note majority support of the following reasons for opposing a regulated wolf hunting/trapping season (which are all omitted from the plan): opposition to specific methods of harvest like hounds (64%) or traps (70%), feelings that hunting wolves is unnecessary (62%) or culturally offensive to Native American tribes (57%). ○ All such reasons convey majority disagreement with practices currently promoted and endorsed by the legislature and the WDNR, and such a conflict between managers and the public should not only be acknowledged, but foregrounded and carefully considered in policy (instead of dismissed). ○ Such decisions to omit literature or downplay evidence (e.g., such as majority opposition to killing wolves and their reasons) are contrary to principles of scientific integrity (e.g., present all relevant scientific evidence to the public) as well as ethics (e.g., disguising ethical decisions, such as recreational wolf killing, as robustly supported by science). ● Conflicting agency objectives (e.g., optimizing public hunting and conflict mitigation) are not only not acknowledged, but even misunderstood as harmonious, against the body of scientific evidence. That culminates in the prioritization of consumptive values and policies; e.g., according to the body of scientific literature, use of lethal methods, and

Marcus Allsup	All of it	No	Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. Much greater recognition of the ecological role of wolves Recognition of the increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves Adoption of proposed buffer zones around tribal reservations	The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on (see reference list below): -wolf ethology, sentience, sapience, sociability, agency and wellbeing -effectiveness of non-lethal interventions, especially relative to lethal ones -the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings. Hounding or hound training, which are akin to allowing legalized dogfighting, should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public. The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. -Despite Act 169, which mandates a wolf hunting season, the department can still restrict the implementation of lethal methods by setting minimal quotas, including a quota of '0' wolves, restricting timing and methods. -Several studies have proven a proactive non-lethal approach leads to better conflict mitigation. -Lethal management often fails to provide a long-term solution to wolf predation and has the least consistent success rates when compared to non-lethal practices. In addition, there is significant evidence showing that lethal wolf management may be less functionally effective at mitigating subsequent livestock losses than non-lethal deterrents. -The plan should require the implementation of abatement measures as well as the use of non-lethal conflict minimization techniques by domestic animal owners for the latter to receive compensation for confirmed predation. -The plan also runs contrary to public values towards wolves (and omits mention of such majority values from the plan), despite department surveys evidencing that the broad public cares about wolves as individuals (and not just for the viability of the population). Given the recent liberalization of killing wolves by the state, it would be incredibly informative to note majority support of the following reasons for opposing a regulated wolf hunting/trapping season (which are all omitted from the plan): opposition to specific methods of harvest like hounds (64%) or traps (70%), feelings that hunting wolves is unnecessary (62%) or culturally offensive to Native American tribes (57%). -All such reasons convey majority disagreement with practices currently promoted and endorsed by the legislature and the WDNR, and such a conflict between managers and the public should not only be acknowledged, but foregrounded and carefully considered in policy (instead of dismissed). -Such decisions to omit literature or downplay evidence (e.g., such as majority opposition to killing wolves and their reasons) are contrary to principles of scientific integrity (e.g., present all relevant scientific evidence to the public) as well as ethics (e.g., disguising ethical decisions, such as recreational wolf killing, as robustly supported by science). -Conflicting agency objectives (e.g., optimizing public hunting and conflict mitigation) are not only not acknowledged, but even misunderstood as harmonious, against the body of scientific evidence. That culminates in the prioritization of consumptive values and policies; e.g., according to the body of scientific literature, use of lethal methods, and especially public hunts, are contrary to most objectives relevant to: harm mitigation, the wellbeing of wolves, their ecological roles, and their non-exploitative enjoyment (i.e., Objectives A, B, D and F). -There is a stark lack of consideration for individual wolves, wolf population health (including wellbeing), and measurable indicators for assessing any harms barring disease prevalence (e.g., accounting for cortisol levels or other stress hormones, measures of pair/pack persistence) -There is an inappropriate understanding and consideration of tribal worldviews about wolves. Tribal worldviews of wolves are misconstrued as 'cultural benefits' tribes receive from the existence of a wolf population, when in fact tribal worldviews consider each individual wolf as a person and relative. Cultural respect and sensitivity towards such views, shared by many non-tribal members, demand the strict mitigation of lethal measures, especially recreational killing, as opposed to their current promotion in the plan. -In general, all omissions of scientific literature, the arbitrary prioritization of policy objectives, the rhetoric of the plan and the dismissal of public values and concerns for wolves point towards a biased, unscientific and	5

				instrumental view of wolves that promotes values contrary to broad public perspectives on wolves. -'SOM' wolf estimation methodology – From a recent critique: "The new methods sacrifice precision, but are believed to retain adequate accuracy and sensitivity to changing conditions for reliable decision-making. We review evidence for the accuracy, precision, and sensitivity of the new 'scaled occupancy model' (SOM) applied in Wisconsin. We conclude that the Wisconsin method would systematically overestimate wolf abundance by large (but currently incalculable) margins. Because Wisconsin, similar to other states, not only changed to unverified methods but also implemented widespread wolf killing, shortcomings in their estimates of wolf abundance may have far-reaching consequences for population viability and confidence in state wildlife managers. We discuss findings from Wisconsin alongside similar findings for other states' occupancy models being insensitive to human causes of mortality that have recently increased. Overall, Wisconsin's proposed method for estimating wolf abundance shows significant departures from best practices in scientific measurement. Verification will require independent replication and unbiased tests at multiple scales in multiple habitats under different human-induced mortality rates, and peer review before the new methods are considered reliable."		
D H	Just the parts I am interested in	No		Killing wolves.	1	Please protect wildlife and wilderness.
Aleasha K	All of it	No	We appreciate the efforts of all WDNR staff involved in updating the state's wolf management plan. Although we believe the current plan needs significant updating (see next section), we recognize the efforts and improvements made to the previous plan, including: ● Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. ● There is much greater recognition of the ecological role of wolves ● The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves ● The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed)	● The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on (see reference list below): ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution ● The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. ● The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ○ A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings. ○ Hounding or hound training, which are akin to allowing legalized dogfighting, should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public. ● The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. ○ Despite Act 169, which mandates a wolf hunting season, the department can still restrict the implementation of lethal methods by setting minimal quotas, including a quota of '0' wolves, restricting timing and methods. ○ Several studies have proven a proactive non-lethal approach leads to better conflict mitigation. ○ Lethal management often fails to provide a long-term solution to wolf predation and has the least consistent success rates when compared to non-lethal practices. In addition, there is significant evidence showing that lethal wolf management may be less functionally effective at mitigating subsequent livestock losses than non-lethal deterrents. ● The plan should require the implementation of abatement measures as well as the use of non-lethal conflict minimization techniques by domestic animal owners for the latter to receive compensation for confirmed predation. ● The plan also runs contrary to public values towards wolves (and omits mention of such majority values from the plan), despite department surveys evidencing that the broad public cares about wolves as individuals (and not just for the viability of the population). Virgene Link-New	Just the parts I am interested in	No	Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. ● There is much greater recognition of the ecological role of wolves ● The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves ● The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed)	The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on (see reference list below): ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution ● The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. ● The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ○ A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings.	4	Thank you.
Leonid Volovnik	Just the parts I am interested in	No	We appreciate the efforts of all WDNR staff involved in updating the state's wolf management plan. Although we believe the current plan needs significant updating (see next section), we recognize the efforts and improvements made to the previous plan, including: ● Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. ● There is much greater recognition of the ecological role of wolves ● The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves ● The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed)	The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on (see reference list below): ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution ● The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. ● The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ○ A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings. ○ Hounding or hound training, which are akin to allowing legalized dogfighting, should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public. ● The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. ○ Despite Act 169, which mandates a wolf hunting season, the department can still restrict the implementation of lethal methods by setting minimal quotas, including a quota of '0' wolves, restricting timing and methods. ○ Several studies have proven a proactive non-lethal approach leads to better conflict mitigation. ○ Lethal management often fails to provide a long-term solution to wolf predation and has the least consistent success rates when compared to non-lethal practices. In addition, there is significant evidence showing that lethal wolf management may be less functionally effective at mitigating subsequent livestock losses than non-lethal deterrents. ● The plan should require the implementation of abatement measures as well as the use of non-lethal conflict minimization techniques by domestic animal owners for the latter to receive compensation for confirmed predation. ● The plan also runs contrary to public values towards wolves (and omits mention of such majority values from the plan), despite department surveys evidencing that the broad public cares about wolves as individuals (and not just for the viability of the population). Given the recent liberalization of killing wolves by the state, it would be incredibly informative to note majority support of the following reasons for opposing a regulated wolf hunting/trapping season (which are all omitted from the plan): opposition to specific methods of harvest like hounds (64%) or traps (70%), feelings that hunting wolves is unnecessary (62%) or culturally offensive to Native American tribes (57%). ○ All such reasons convey majority disagreement with practices currently promoted and	4	

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
				endorsed by the legislature and the WDNR, and such a conflict between managers and the public should not only be acknowledged, but foregrounded and carefully considered in policy (instead of dismissed). ○ Such decisions to omit literature or downplay evidence (e.g., such as majority opposition to killing wolves and their reasons) are contrary to principles of scientific integrity (e.g., present all relevant scientific evidence to the public) as well as ethics (e.g., disguising ethical decisions, such as recreational wolf killing, as robustly supported by science). ● Conflicting agency objectives (e.g., optimizing public hunting and conflict mitigation) are not only not acknowledged, but even misunderstood as harmonious, against the body of scientific evidence. That culminates in the prioritization of consumptive values and policies; e.g., according to the body of scientific literature, use of lethal methods, and 2 especially public hunts, are contrary to most objectives relevant to: harm mitigation, the wellbeing of wolves, their ecological roles, and their non-exploitative enjoyment (i.e., Objectives A, B, D and F). ● There is a stark lack of consideration for individual wolves, wolf population health (including wellbeing), and measurable indicators for assessing any harms barring disease prevalence (e.g., accounting for cortisol levels or other stress hormones, measures of pair/pack persistence) ● There is an inappropriate understanding and consideration of tribal worldviews about wolves. Tribal worldviews of wolves are misconstrued as 'cultural benefits' tribes receive from the existence of a wolf population, when in fact tribal worldviews consider each individual wolf as a person and relative. Cultural respect and sensitivity towards such views, shared by many non-tribal members, demand the strict mitigation of lethal measures, especially recreational killing, as opposed to their current promotion in the plan. ● In general, all omissions of scientific literature, the arbitrary prioritization of policy objectives, the rhetoric of the plan and the dismissal of public values and concerns for wolves point towards a biased, unscientific and instrumental view of wolves that promotes values contrary to broad public perspectives on wolves. ● 'SOM' wolf estimation methodology – From a recent critique: "The new methods sacrifice precision, but are believed to retain adequate accuracy and sensitivity to changing conditions for reliable decision-making. We review evidence for the accuracy, precision, and sensitivity of the new 'scaled occupancy model' (SOM) applied in Wisconsin. We conclude that the Wisconsin method would systematically overestimate wolf abundance by large (but currently incalculable) margins. Because Wisconsin, similar to other states, not only changed to unverified methods but also implemented widespread wolf killing, shortcomings in their estimates of wolf abundance may have far-reaching consequences for population viability and confidence in state wildlife managers. We discuss findings from Wisconsin alongside similar findings for other states' occupancy models being insensitive to human causes of mortality that have recently increased. Overall, Wisconsin's proposed method for estimating wolf abundance shows significant departures from best practices in scientific measurement. Verification will require independent replication and unbiased tests at multiple scales in multiple habitats under different human-induced mortality rates, and peer review before the new methods are considered reliable." (Treves & Santiago-Ávila, 2023)		
Sandra Mallmann	Just the parts I am interested in	Yes	liked the ideas for helping to keep livestock safe.	trophy hunting,foothold traps, cable restraints, and the use of dogs, you don't use any of those methods for deer and don't think bear hunting either. Not sure if I read anything about killing pups and mom's in their dens' but should never happen.	4	
Vince	All of it	No	Any part of it that does not let wolves live in peace and tries to "manage" them, aka murder them is not anything I like.	Any part of it that allows the murders of wolves. They will call it "management".	1	Wolves do not need management and should be left alone!

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Katie O'Halloran	Most of it	Yes	We appreciate the efforts of all WDNR staff involved in updating the state's wolf management plan. Although we believe the current plan needs significant updating (see next section), we recognize the efforts and improvements made to the previous plan, including: ● Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. ● There is much greater recognition of the ecological role of wolves ● The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves ● The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed)	● The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on (see reference list below): ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution ● The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. ● The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ○ A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings. ○ Hounding or hound training, which are akin to allowing legalized dogfighting, should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public. ● The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. ○ Despite Act 169, which mandates a wolf hunting season, the department can still restrict the implementation of lethal methods by setting minimal quotas, including a quota of '0' wolves, restricting timing and methods. ○ Several studies have proven a proactive non-lethal approach leads to better conflict mitigation. ○ Lethal management often fails to provide a long-term solution to wolf predation and has the least consistent success rates when compared to non-lethal practices. In addition, there is significant evidence showing that lethal wolf management may be less functionally effective at mitigating subsequent livestock losses than non-lethal deterrents. ● The plan should require the implementation of abatement measures as well as the use of non-lethal conflict minimization techniques by domestic animal owners for the latter to receive compensation for confirmed predation. ● The plan also runs contrary to public values towards wolves (and omits mention of such majority values from the plan), despite department surveys evidencing that the broad public cares about wolves as individuals (and not just for the viability of the population). Given the recent liberalization of killing wolves by the state, it would be incredibly informative to note majority support of the following reasons for opposing a regulated wolf hunting/trapping season (which are all omitted from the plan): opposition to specific methods of harvest like hounds (64%) or traps (70%), feelings that hunting wolves is unnecessary (62%) or culturally offensive to Native American tribes (57%). ○ All such reasons convey majority disagreement with practices currently promoted and endorsed by the legislature and the WDNR, and such a conflict between managers and the public should not only be acknowledged, but foregrounded and carefully considered in policy (instead of dismissed). ○ Such decisions to omit literature or downplay evidence (e.g., such as majority opposition to killing wolves and their reasons) are contrary to principles of scientific integrity (e.g., present all relevant scientific evidence to the public) as well as ethics (e.g., disguising ethical decisions, such as recreational wolf killing, as robustly supported by science). ● Conflicting agency objectives (e.g., optimizing public hunting and conflict mitigation) are not only not acknowledged, but even misunderstood as harmonious, against the body of scientific evidence. That culminates in the prioritization of consumptive values and policies; e.g., according to the body of scientific literature, use of lethal methods, and 2 especially public hunts, are contrary to most objectives relevant to: harm mitigation, the wellbeing of wolves, their ecological roles, and their non-exploitative enjoyment (i.e., Objectives A, B, D and F). ● There is a stark lack of consideration for individual wolves, wolf population health (including wellbeing), and measurable indicators for assessing any harms barring disease prevalence (e.g., accounting for cortisol levels or other stress hormones, measures of pair/pack persistence) ● There is an inappropriate understanding and consideration of tribal worldviews about wolves. Tribal worldviews of wolves are misconstrued as 'cultural benefits' tribes receive from the existence of a wolf population, when in fact tribal worldviews consider each individual wolf as a person and relative. Cultural respect and sensitivity towards such views, shared by many non-tribal members, demand the strict mitigation of lethal measures, especially recreational killing, as opposed to their current promotion in the plan. ● In general, all omissions of scientific literature, the arbitrary prioritization of policy objectives, the rhetoric of the plan and the dismissal of public values and concerns for wolves point	4

				towards a biased, unscientific and instrumental view of wolves that promotes values contrary to broad public perspectives on wolves. ● 'SOM' wolf estimation methodology – From a recent critique: "The new methods sacrifice precision, but are believed to retain adequate accuracy and sensitivity to changing conditions for reliable decision-making. We review evidence for the accuracy, precision, and sensitivity of the new 'scaled occupancy model' (SOM) applied in Wisconsin. We conclude that the Wisconsin method would systematically overestimate wolf abundance by large (but currently incalculable) margins. Because Wisconsin, similar to other states, not only changed to unverified methods but also implemented widespread wolf killing, shortcomings in their estimates of wolf abundance may have far-reaching consequences for population viability and confidence in state wildlife managers. We discuss findings from Wisconsin alongside similar findings for other states' occupancy models being insensitive to human causes of mortality that have recently increased. Overall, Wisconsin's proposed method for estimating wolf abundance shows significant departures from best practices in scientific measurement. Verification will require independent replication and unbiased tests at multiple scales in multiple habitats under different human-induced mortality rates, and peer review before the new methods are considered reliable." (Treves & Santiago-Ávila, 2023)		
Theresa Cosmano	All of it	No	Not using old goal Of 350; inclusion of social survey; implementation of buffer zones.	Does not curtail lethal management; still allows hounding which is equivalent of DOGFIGHTING; hounding should be made illegal; ban the use of traps; plan not consistent with public values towards wolves.	5	Please consider more scientific information and please consider more humane avenues.
	Most of it	No	Some of the improvements to the horrible present plan!	Stop killing the wolves! Implement mandatory coexistence strategies!	5	
	Most of it	Yes	Nothing really. Trying to relocate them would be great.	I don't like hunting and trapping.	10	Wolves were here first. We infringe on them. Your only worried that there would be less deer for hunters. Who cares about them.
	Most of it	No	Just feel you need more scientific knowledge and help.	Same as 4.	5	Found it rather difficult to really understand, but just have to say PLEASE Stop the hunting and slaughter of these wonderful animals and PLEASE ACCEPT how much more worthwhile they are (this is so true especially regarding other wildlife, wild lands, climate, etc. They balance nature while man destroys it. I'm grateful you are working on a plan, but you must find a way to keep MAN from SLAUGHTERING the beneficial animals. Thank you for caring enough to try to get a plan together.
	Most of it	Yes	Removing an arbitrary wolf population goal is important to make sure the best-available science is centered in wolf management The low quota zones are an important and welcome addition to the plan The plan is rightly focused on the ecological benefits of wolves		10	
Donna Selquist	Most of it	Yes	You do have the ability to set a quota, and you should make that quota ZERO.	Hunting is still allowed. Trapping is especially horrific, and should NEVER be allowed/	6	
Alesander Romero	Most of it	Yes	I appreciate the wolf conflict mitigation plans to allow for non-lethal methods to avoid the rare occasions where there are conflicts with livestock in farms. I believe that science led practices are a step in the right direction. I also agree that increasing education for the public on the implementation of non lethal deterrent techniques is a MUST to help protect all animals and treat them in a humane way.	The idea of having a set season to train hounds on wolf trophy hunting is the equivalent to dog fighting and should be sanctioned. Trophy hunting and trapping wolves is only in the interest of a VERY SMALL population, and the focus should be more in the facts that wolves provide many benefits to the ecosystem, as well as reducing diseases and preventing accidents caused by deer. Studies have shown that killing a single wolf destabilizes the pack and causes chaos, leading to more issues with humans around. Overall, this plan focuses on the perception that wolves threaten human life or livestock, which is not true, and uses it as justification for killing them. Instead of it, the plan should focus more on EDUCATING the population to avoid such misinformation.	7	This plan should be updated to remove the mandate for trophy hunting and hunting seasons, provide more education on non-lethal deterrents as well as ending the misinformation about wolves being a threat to humans and livestock, and include a section to review the plan for potential changes in a short to medium time frame (every 10 years)
Jeffrey Ballou	All of it	Yes	Like the provisions to support farmers and others if wolves harm	Trophy hunting, use of dogs, etc	5	
Geraldine A Frigge	Most of it	Yes	It is imperative that these animals that were reintroduced into our State be protected, but managed.	Any uncontained wolf hunts.	4	Use common sense! Destroying animals in any sense must be controlled, not decided without REAL consequences.
	Just the parts I am interested in	No	Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves.	In general, all omissions of scientific literature, the arbitrary prioritization of policy objectives, the rhetoric of the plan and the dismissal of public values and concerns for wolves point towards a biased, unscientific and instrumental view of wolves that promotes values contrary to broad public perspectives on wolves.	4	It just boggles my mind how quick you are to bow down to the cattle industry. Time to wise-up guys . . .
Jean Purser Cameron	All of it	No	The buffer zones between native American tribes & wolves	"SLAUGHTERING" wolves is NOT the same as "MANAGING" them.	2	Trapping, poisoning, and allowing public hunts are all INHUMANE methods of managing them and, besides the ETHICAL reasons for not using these methods...you are hastening the EXTERMINATION of another "endangered species"!

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
william schultheis	Just the parts I am interested in	Yes	mgt. based in science		8	
Taylor Neff	Most of it	Yes	A science-based wolf management plan that takes into consideration local tribal input.	Plan presentation is so long that it is difficult to finish reading the whole thing.	10	I support a plan that allows the wolf to be treated as a native animal species that deserves it's rightful place as a wild animal in the state without excessive hunting pressure.
William Zwicky	All of it	Yes	1. Removing an arbitrary wolf population goal 2. The low quota zones are important 3. Focus on ecological benefits of wolves.		9	
Mary	All of it	No	Emphasis on maintaining or increasing the wolf population. The benefits they have are endless and the only complaint people have can be handled if they just kept their livestock safe and away from being accessed.	Predation shouldn't have any lethal response ever. Compensating for animal loss is fine, but teaching farmers how to put up a fence and keep their animals safe is much more important.	8	Do not kill wolves just because humans are too lazy to secure their property or watch their animals, or cause they're insecure a wolf will kill the buck they've been tracking.
	Most of it	Yes	1 - I like the removal of an arbitrary wolf population goal to that the best-available science is applied to wolf management. 2 - The low quota zones are an important and welcome addition to the plan. 3 - The plan is rightly focused on the ecological benefits of wolves.		10	
	All of it	No	the new one doesn't rely on population numbers.	it doesn't specifically provide for non-lethal interventions.	6	could be better by acknowledging the ecological role wolves play- how necessary to a sound wild life ecology, and providing for their permanent inclusion in all of the state's planning efforts.
Bridget Palecek	Most of it	Yes	I like the fact that they are considering buffer zones around the reservations and the fact that they finally realize the ecological plus to having wolves in our state. They are beautiful animals and are faithful to their pac (family) which is a beautiful thing to see. Randomly killing one of the pac affects the whole pac, so we want to keep killing wolves at a minimum so recreational killing of wolves needs to be banned. It's horrid seeing pictures of wolves killed by happy, smiling hunters.	If you implement the above, our wolf pacs in Wisconsin will benefit greatly.	7	A plan is only as good as the implementation of it.
Barbara Hegedus	Just the parts I am interested in	No		The slaughter of wolves is not only offensive, but I believe it's immoral and goes against nature. Let hunters shoot at tin cans!	2	Traps and guns - the only way too many agencies know how to "manage" wildlife! Let nature manage itself. Nature does it so much better!!!

Shannon Hunter	Just the parts I am interested in	No	I appreciate the efforts of all WDNR staff involved in updating the state's wolf management plan. Although I believe the current plan needs significant updating (see next section), I recognize the efforts and improvements made to the previous plan, including: ● Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. ● There is much greater recognition of the ecological role of wolves ● The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves ● The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed)	● The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on (see reference list below): ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution ● The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan hat runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. ● The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ○ A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings. ○ Hounding or hound training, which are akin to allowing legalized dogfighting, should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public. ● The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. ○ Despite Act 169, which mandates a wolf hunting season, the department can still restrict the implementation of lethal methods by setting minimal quotas, including a quota of '0' wolves, restricting timing and methods. ○ Several studies have proven a proactive non-lethal approach leads to better conflict mitigation. ○ Lethal management often fails to provide a long-term solution to wolf predation and has the least consistent success rates when compared to non-lethal practices. In addition, there is significant evidence showing that lethal wolf management may be less functionally effective at mitigating subsequent livestock losses than non-lethal deterrents. ● The plan should require the implementation of abatement measures as well as the use of non-lethal conflict minimization techniques by domestic animal owners for the latter to receive compensation for confirmed predation. ● The plan also runs contrary to public values towards wolves (and omits mention of such majority values from the plan), despite department surveys evidencing that the broad public cares about wolves as individuals (and not just for the viability of the population). Given the recent liberalization of killing wolves by the state, it would be incredibly informative to note majority support of the following reasons for opposing a regulated wolf hunting/trapping season (which are all omitted from the plan): opposition to specific methods of harvest like hounds (64%) or traps (70%), feelings that hunting wolves is unnecessary (62%) or culturally offensive to Native American tribes (57%). ○ All such reasons convey majority disagreement with practices currently promoted and endorsed by the legislature and the WDNR, and such a conflict between managers and the public should not only be acknowledged but foregrounded and carefully considered in policy (instead of dismissed). ○ Such decisions to omit literature or downplay evidence (e.g., such as majority opposition to killing wolves and their reasons) are contrary to principles of scientific integrity (e.g., present all relevant scientific evidence to the public) as well as ethics (e.g., disguising ethical decisions, such as recreational wolf killing, as robustly supported by science). ● Conflicting agency objectives (e.g., optimizing public hunting and conflict mitigation) are not only not acknowledged, but even misunderstood as harmonious, against the body of scientific evidence. That culminates in the prioritization of consumptive values and policies; e.g., according to the body of scientific literature, use of lethal methods, and especially public hunts, are contrary to most objectives relevant to: harm mitigation, the wellbeing of wolves, their ecological roles, and their non-exploitative enjoyment (i.e., Objectives A, B, D and F). ● There is a stark lack of consideration for individual wolves, wolf population health (including wellbeing), and measurable indicators for assessing any harms barring disease prevalence (e.g., accounting for cortisol levels or other stress hormones, measures of pair/pack persistence) ● There is an inappropriate understanding and consideration of tribal worldviews about wolves. Tribal worldviews of wolves are misconstrued as 'cultural benefits' tribes receive from the existence of a wolf population, when in fact tribal worldviews consider each individual wolf as a person and relative. Cultural respect and sensitivity towards such views, shared by many non-tribal members, demand the strict mitigation of lethal measures, especially recreational killing, as opposed to their current promotion in the plan. ● In general, all omissions of scientific literature, the arbitrary prioritization of policy objectives, the rhetoric of the plan and the dismissal of public values and concerns for wolves point towards a biased, unscientific and	3

				instrumental view of wolves that promotes values contrary to broad public perspectives on wolves. ● 'SOM' wolf estimation methodology – From a recent critique: "The new methods sacrifice precision, but are believed to retain adequate accuracy and sensitivity to changing conditions for reliable decision-making. We review evidence for the accuracy, precision, and sensitivity of the new 'scaled occupancy model' (SOM) applied in Wisconsin. We conclude that the Wisconsin method would systematically overestimate wolf abundance by large (but currently incalculable) margins. Because Wisconsin, similar to other states, not only changed to unverified methods but also implemented widespread wolf killing, shortcomings in their estimates of wolf abundance may have far-reaching consequences for population viability and confidence in state wildlife managers. We discuss findings from Wisconsin alongside similar findings for other states' occupancy models being insensitive to human causes of mortality that have recently increased. Overall, Wisconsin's proposed method for estimating wolf abundance shows significant departures from best practices in scientific measurement. Verification will require independent replication and unbiased tests at multiple scales in multiple habitats under different human-induced mortality rates, and peer review before the new methods are considered reliable."

We review evidence for the accuracy, precision, and sensitivity of the new 'scaled occupancy model' (SOM) applied in Wisconsin. We conclude that the Wisconsin method would systematically overestimate wolf abundance by large (but currently incalculable) margins. Because Wisconsin, similar to other states, not only changed to unverified methods but also implemented widespread wolf killing, shortcomings in their estimates of wolf abundance may have far-reaching consequences for population viability and confidence in state wildlife managers. We discuss findings from Wisconsin alongside similar findings for other states' occupancy models being insensitive to human causes of mortality that have recently increased. Overall, Wisconsin's proposed method for estimating wolf abundance shows significant departures from best practices in scientific measurement. Verification will require independent replication and unbiased tests at multiple scales in multiple habitats under different human-induced mortality rates, and peer review before the new methods are considered reliable." Donna Mulvey	Most of it	No	Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. ● There is much greater recognition of the ecological role of wolves ● The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves ● The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed) ●	The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on (see reference list below): ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution ● The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. ● The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ○ A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings.	5	Thank you.
	I have not read any of the draft plan	No	nothing	killing and murdering wolves who are only trying to exist and they are part of the ecological spectrum	0	made by sick people who can only kill and murder to solve situations. power grab by hunters and farmers in state fish and game agency does not represent the general public
Deborah Boots	I have not read any of the draft plan	No		You may be trying to stabalize the problem. but wolves need pro- tection, not overmanagement. Please dispense with all recreational and abusive cruelty measures to placate private residents.	2	please upgrade department courage to stand for ethical treatment of wildlife.
Laura Lane	Most of it	Yes	Removing an arbitrary wolf population goal, the plan rightly focuses on the ecological benefits of wolves, and the plan creates low quota zones around Tribal lands where the Tribe requested it.		9	Please protect Wisconsin's wolves!
Susan Welsford	Most of it	No	It is somewhat of an improvement ovr.the original plan.	It does not go far enough to protect the species. Animals are NOT on this planet for human convenience.	2	Please take any actions necessary to protect wolves and to stop legislation for wolf hunts in Wisconsin. I am desperately seeking protection for this severely threatened species and its return to the Endangered Species List. Loss of these two things will push the species to extinction. WI DNR is well aware of the importance of this predator in nature's biological ecosystem from the Isle Royale (MI) events. The wolf recovery system is deeply flawed, i.e. erroneous and poorly calculated population estimates, influence and dishonesty of farmers, greed of the hunting/trapping and firearms industries, climate change, urban sprawl, and the abject failure of state DNR organizations. In 1989, there were only three gray wolves left in the Michigan's U.P. Hunting, trapping and human/corporate greed nearly drove the species to extinction before, and (like Michigan's wolves) are on the brink of extinction again. We must allow them the required protections and acreage to live to expand their genetic pool. Without a valid, scientific and robust wolf protection plan, this vital species will be destined for extinction. Provide more protections for WI wolves.
Laurie Tabor	All of it	No	I appreciate the efforts of all WDNR staff involved in updating the state's wolf management plan. Although I believe the current plan needs significant updating (see next section), I recognize the efforts and improvements made to the previous plan, including: ● Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. ● There is much greater recognition of the ecological role of wolves ● The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves ● The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed)	Wolves are essential for a balanced ecosystem. ● The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on (see reference list below): ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution ● The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. ● The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ○ A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings. ○ Hounding or hound training, which are akin to allowing legalized dogfighting, should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public. ● The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. ○ Despite Act 169, which mandates a wolf hunting season, the department can still restrict the implementation of	3	New research out yesterday from the Voyageurs Wolf Project: Humans are a substantial source of mortality for wolves that live predominantly in national parks with legal hunting and trapping of wolves outside of national park boundaries accounting for 53% of all human-caused mortality for wolves from national parks. And human-caused mortality triggers instability in wolf packs in national parks. This conclusion is based on a huge collaborative effort that included data and researchers from five national parks—Yellowstone, Denali, Yukon Charley, Grand Teton, and Voyageurs. This research was different than previous work because it looked at how humans impact individual wolf packs (i.e., the social unit) as opposed to the larger wolf population. To do so, we contrasted what happened to wolf packs after at least one pack member was killed by human-causes with packs where no members died of human-causes. We figured out that the chance a pack stayed together to the end of the year decreased by 27% when a pack member died of human causes, and whether or not that pack reproduced the next year decreased by 22%. When a pack leader died, the impact was even larger, with the chance of the pack making it to the end of the year decreasing by 73% and reproduction by 49%. Although we did not examine whether human-caused mortality alters the size of wolf populations in national parks, this work shows that people are clearly altering certain aspects of wolf ecology in national parks even if they are not impacting overall population size. And why exactly is this? Turns out, humans are a disproportionate cause of mortality for wolves that live predominantly in national parks. In other words, wolves die more often of human-causes

				lethal methods by setting minimal quotas, including a quota of '0' wolves, restricting timing and methods. ○ Several studies have proven a proactive non-lethal approach leads to better conflict mitigation. ○ Lethal management often fails to provide a long-term solution to wolf predation and has the least consistent success rates when compared to non-lethal practices. In addition, there is significant evidence showing that lethal wolf management may be less functionally effective at mitigating subsequent livestock losses than non-lethal deterrents. ● The plan should require the implementation of abatement measures as well as the use of non-lethal conflict minimization techniques by domestic animal owners for the latter to receive compensation for confirmed predation. ● The plan also runs contrary to public values towards wolves (and omits mention of such majority values from the plan), despite department surveys evidencing that the broad public cares about wolves as individuals (and not just for the viability of the population). Given the recent liberalization of killing wolves by the state, it would be incredibly informative to note majority support of the following reasons for opposing a regulated wolf hunting/trapping season (which are all omitted from the plan): opposition to specific methods of harvest like hounds (64%) or traps (70%), feelings that hunting wolves is unnecessary (62%) or culturally offensive to Native American tribes (57%). ○ All such reasons convey majority disagreement with practices currently promoted and endorsed by the legislature and the WDNR, and such a conflict between managers and the public should not only be acknowledged, but foregrounded and carefully considered in policy (instead of dismissed). ○ Such decisions to omit literature or downplay evidence (e.g., such as majority opposition to killing wolves and their reasons) are contrary to principles of scientific integrity (e.g., present all relevant scientific evidence to the public) as well as ethics (e.g., disguising ethical decisions, such as recreational wolf killing, as robustly supported by science). ● Conflicting agency objectives (e.g., optimizing public hunting and conflict mitigation) are not only not acknowledged, but even misunderstood as harmonious, against the body of scientific evidence. That culminates in the prioritization of consumptive values and policies; e.g., according to the body of scientific literature, use of lethal methods, and especially public hunts, are contrary to most objectives relevant to: harm mitigation, the wellbeing of wolves, their ecological roles, and their non-exploitative enjoyment (i.e., Objectives A, B, D and F). ● There is a stark lack of consideration for individual wolves, wolf population health (including wellbeing), and measurable indicators for assessing any harms barring disease prevalence (e.g., accounting for cortisol levels or other stress hormones, measures of pair/pack persistence) ● There is an inappropriate understanding and consideration of tribal worldviews about wolves. Tribal worldviews of wolves are misconstrued as 'cultural benefits' tribes receive from the existence of a wolf population, when in fact tribal worldviews consider each individual wolf as a person and relative. Cultural respect and sensitivity towards such views, shared by many non-tribal members, demand the strict mitigation of lethal measures, especially recreational killing, as opposed to their current promotion in the plan. ● In general, all omissions of scientific literature, the arbitrary prioritization of policy objectives, the rhetoric of the plan and the dismissal of public values and concerns for wolves point towards a biased, unscientific and instrumental view of wolves that promotes values contrary to broad public perspectives on wolves. ● 'SOM' wolf estimation methodology – From a recent critique: "The new methods sacrifice precision, but are believed to retain adequate accuracy and sensitivity to changing conditions for reliable decision-making. We review evidence for the accuracy, precision, and sensitivity of the new 'scaled occupancy model' (SOM) applied in Wisconsin. We conclude that the Wisconsin method would systematically overestimate wolf abundance by large (but currently incalculable) margins. Because Wisconsin, similar to other states, not only changed to unverified methods but also implemented widespread wolf killing, shortcomings in their estimates of wolf abundance may have far-reaching consequences for population viability and confidence in state wildlife managers. We discuss findings from Wisconsin alongside similar findings for other states' occupancy models being insensitive to human causes of mortality that have recently increased. Overall, Wisconsin's proposed method for estimating wolf abundance shows significant departures from best practices in scientific measurement. Verification will require independent replication and unbiased tests at multiple scales in multiple habitats under different human-induced mortality rates, and peer review before the new methods are considered reliable." (Treves & Santiago-Ávila, 2023)		than would be expected for the amount of time wolves spend outside of park boundaries. All of this just shows how the conservation and management of wolves (and other wildlife) that routinely go in and out of protected areas such as national parks is challenging and why we think collaboration between different state and federal agencies is key when it comes to managing and conserving wolves and other wildlife.

Nicholas Kovalcik	All of it	No	I am very happy to hear that there will not be a bare minimum population number that the state would be attempting to achieve. I'm also very glad to hear that the use of dogs to track wolves during a potential hunting season will not be allowed.	I'm disappointed that there is a strong possibility for another wolf hunting and trapping season. Based on what we know about wolves, there doesn't appear to be a good reason to allow people to kill them for sport. I'm especially concerned that in the event of a wolf hunting and trapping season, recreational hunters and trappers will not take the individual wolves welfare into account and many animals will suffer needlessly. I would like to see a complete ban on the general public being able to kill wolves for sport. I would also like to see a more definite guarantee in the draft plan that non-lethal wolf/livestock conflict tools will be used first before lethal action is considered.	7	
Hannah Lemke	All of it	No	I truly appreciate all the efforts of all WDNR staff involved in updating the state's wolf management plan. Although I believe the current plan needs significant updating (see next section), I recognize the efforts and improvements made to the previous plan, including: ● Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. ● There is much greater recognition of the ecological role of wolves ● The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves ● The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed)	● The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on (see reference list below): ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution ● The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. ● The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ○ A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings. Christopher Tumolo	All of it	No	Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. There is much greater recognition of the ecological role of wolves The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed)	The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on (see reference list below): wolf ethology, sentience, sapience, sociability, agency and wellbeing effectiveness of non-lethal interventions, especially relative to lethal ones the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings Hounding or hound training, which are akin to allowing legalized dogfighting, should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public. The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. Despite Act 169, which mandates a wolf hunting season, the department can still restrict the implementation of lethal methods by setting minimal quotas, including a quota of '0' wolves, restricting timing and methods. Several studies have proven a proactive non-lethal approach leads to better conflict mitigation. Lethal management often fails to provide a long-term solution to wolf predation and has the least consistent success rates when compared to non-lethal practices. In addition, there is significant evidence showing that lethal wolf management may be less functionally effective at mitigating subsequent livestock losses than non-lethal deterrents. The plan should require the implementation of abatement measures as well as the use of non-lethal conflict minimization techniques by domestic animal owners for the latter to receive compensation for confirmed predation. The plan also runs contrary to public values towards wolves (and omits mention of such majority values from the plan), despite department surveys evidencing that the broad public cares about wolves as individuals (and not just for the viability of the population). Given the recent liberalization of killing wolves by the state, it would be incredibly informative to note majority support of the following reasons for opposing a regulated wolf hunting/trapping season (which are all omitted from the plan): opposition to specific methods of harvest like hounds (64%) or traps (70%), feelings that hunting wolves is unnecessary (62%) or culturally offensive to Native American tribes (57%). All such reasons convey majority disagreement with practices currently promoted and endorsed by the legislature and the WDNR, and such a conflict between managers and the public should not only be acknowledged, but foregrounded and carefully considered in policy (instead of dismissed). Such decisions to omit literature or downplay evidence (e.g., such as majority opposition to killing wolves and their reasons) are contrary to principles of scientific integrity (e.g., present all relevant scientific evidence to the public) as well as ethics (e.g., disguising ethical decisions, such as recreational wolf killing, as robustly supported by science). Conflicting agency objectives (e.g., optimizing public hunting and conflict mitigation) are not only not acknowledged, but even misunderstood as harmonious, against the body of scientific evidence. That culminates in the prioritization of consumptive values and policies; e.g., according to the body of scientific literature, use of lethal methods, and 2 especially public hunts, are contrary to most objectives relevant to: harm mitigation, the wellbeing of wolves, their ecological roles, and their non-exploitative enjoyment (i.e., Objectives A, B, D and F). There is a stark lack of consideration for individual wolves, wolf population health (including wellbeing), and measurable indicators for assessing any harms barring disease prevalence (e.g., accounting for cortisol levels or other stress hormones, measures of pair/pack persistence) There is an inappropriate understanding and consideration of tribal worldviews about wolves. Tribal worldviews of wolves are misconstrued as 'cultural benefits' tribes receive from the existence of a wolf population, when in fact tribal worldviews consider each individual wolf as a person and relative. Cultural respect and sensitivity towards such views, shared by many non-tribal members, demand the strict mitigation of lethal measures, especially recreational killing, as opposed to their current promotion in the plan. In general, all omissions of scientific literature, the arbitrary prioritization of policy objectives, the rhetoric of the plan and the dismissal of public	4	

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
				values and concerns for wolves point towards a biased, unscientific and instrumental view of wolves that promotes values contrary to broad public perspectives on wolves. 'SOM' wolf estimation methodology – From a recent critique: "The new methods sacrifice precision, but are believed to retain adequate accuracy and sensitivity to changing conditions for reliable decision-making. We review evidence for the accuracy, precision, and sensitivity of the new 'scaled occupancy model' (SOM) applied in Wisconsin. We conclude that the Wisconsin method would systematically overestimate wolf abundance by large (but currently incalculable) margins. Because Wisconsin, similar to other states, not only changed to unverified methods but also implemented widespread wolf killing, shortcomings in their estimates of wolf abundance may have far-reaching consequences for population viability and confidence in state wildlife managers. We discuss findings from Wisconsin alongside similar findings for other states' occupancy models being insensitive to human causes of mortality that have recently increased. Overall, Wisconsin's proposed method for estimating wolf abundance shows significant departures from best practices in scientific measurement. Verification will require independent replication and unbiased tests at multiple scales in multiple habitats under different human-induced mortality rates, and peer review before the new methods are considered reliable." (Treves & Santiago-Ávila, 2023)		
Patrick Pergolski	All of it	Yes	Keeping the wolf population up		10	Saving our Wolfs
Nicole	All of it	No	● Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. ● There is much greater recognition of the ecological role of wolves ● The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves ● The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed)	● The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on (see reference list below): ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution ● The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. ● The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ○ A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings. ○ Hounding or hound training, which are akin to allowing legalized dogfighting, should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public. ● The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. ○ Despite Act 169, which mandates a wolf hunting season, the department can still restrict the implementation of lethal methods by setting minimal quotas, including a quota of '0' wolves, restricting timing and methods. ○ Several studies have proven a proactive non-lethal approach leads to better conflict mitigation. ○ Lethal management often fails to provide a long-term solution to wolf predation and has the least consistent success rates when compared to non-lethal practices. 				provide a long-term solution to wolf predation and has the least consistent success rates when compared to non-lethal practices. In addition, there is significant evidence showing that lethal wolf management may be less functionally effective at mitigating subsequent livestock losses than non-lethal deterrents. ● The plan should require the implementation of abatement measures as well as the use of non-lethal conflict minimization techniques by domestic animal owners for the latter to receive compensation for confirmed predation. ● The plan also runs contrary to public values towards wolves (and omits mention of such majority values from the plan), despite department surveys evidencing that the broad public cares about wolves as individuals (and not just for the viability of the population). Given the recent liberalization of killing wolves by the state, it would be incredibly informative to note majority support of the following reasons for opposing a regulated wolf hunting/trapping season (which are all omitted from the plan): opposition to specific methods of harvest like hounds (64%) or traps (70%), feelings that hunting wolves is unnecessary (62%) or culturally offensive to Native American tribes (57%). ○ All such reasons convey majority disagreement with practices currently promoted and endorsed by the legislature and the WDNR, and such a conflict between managers and the public should not only be acknowledged, but foregrounded and carefully considered in policy (instead of dismissed). ○ Such decisions to omit literature or downplay evidence (e.g., such as majority opposition to killing wolves and their reasons) are contrary to principles of scientific integrity (e.g., present all relevant scientific evidence to the public) as well as ethics (e.g., disguising ethical decisions, such as recreational wolf killing, as robustly supported by science). ● Conflicting agency objectives (e.g., optimizing public hunting and conflict mitigation) are not only not acknowledged, but even misunderstood as harmonious, against the body of scientific evidence. That culminates in the prioritization of consumptive values and policies; e.g., according to the body of scientific literature, use of lethal methods, and 2 especially public hunts, are contrary to most objectives relevant to: harm mitigation, the wellbeing of wolves, their ecological roles, and their non-exploitative enjoyment (i.e., Objectives A, B, D and F). ● There is a stark lack of consideration for individual wolves, wolf population health (including wellbeing), and measurable indicators for assessing any harms barring disease prevalence (e.g., accounting for cortisol levels or other stress hormones, measures of pair/pack persistence) ● There is an inappropriate understanding and consideration of tribal worldviews about wolves. Tribal worldviews of wolves are misconstrued as 'cultural benefits' tribes receive from the existence of a wolf population, when in fact tribal worldviews consider each individual wolf as a person and relative. Cultural respect and sensitivity towards such views, shared by many non-tribal members, demand the strict mitigation of lethal measures, especially recreational killing, as opposed to their current promotion in the plan. ● In general, all omissions of scientific literature, the arbitrary prioritization of policy objectives, the rhetoric of the plan and the dismissal of public values and concerns for wolves point towards a biased, unscientific and instrumental view of wolves that promotes values contrary to broad public perspectives on wolves. ● 'SOM' wolf estimation methodology – From a recent critique: "The new methods sacrifice precision, but are believed to retain adequate accuracy and sensitivity to changing conditions for reliable decision-making. We review evidence for the accuracy, precision, and sensitivity of the new 'scaled occupancy model' (SOM) applied in Wisconsin. We conclude that the Wisconsin method would systematically overestimate wolf abundance by large (but currently incalculable) margins. Because Wisconsin, similar to other states, not only changed to unverified methods but also implemented widespread wolf killing, shortcomings in their estimates of wolf abundance may have far-reaching consequences for population viability and confidence in state wildlife managers. We discuss findings from Wisconsin alongside similar findings for other states' occupancy models being insensitive to human causes of mortality that have recently increased. Overall, Wisconsin's proposed method for estimating wolf abundance shows significant departures from best practices in scientific measurement. Verification will require independent replication and unbiased tests at multiple scales in multiple habitats under different human-induced mortality rates, and peer review before the new methods are considered reliable." (Treves & Santiago-Ávila, 2023)

Drew Holloway	I have not read any of the draft plan	Yes	The plan removes a numeric population goal: Removing an arbitrary wolf population goal is important to make sure the numbers of wolves are adaptable, so they can be based on best-available science and ecological changes. The plan creates low quota zones around Tribal lands where the Tribes requested it: These lands are treaty-protected with documented wolf packs. Making this update is an important and welcome addition to the plan. Ideally, the plan would expand these zones beyond just the few that are listed. The plan is rightly focused on the ecological benefits of wolves The plan is reflective of the public opinions survey that was released along with the plan and finds that opinions toward wolves have grown significantly more favorable There is expressed commitment to science and continued research with partners and acknowledges that "keystone species such as wolves are an important component of a healthy ecosystem"	The DNR should better regulate hound training on wolves. The DNR should limit wolf-focused hound training activities to only when wolf hunting is allowed in each zone. There is currently no guidance in plan for next review or update – there should be a plan for regularly updating the plan (so we don't have another plan that is used for decades) and there should be permanent, ongoing stakeholder AND science committees to oversee wolf management in Wisconsin – this oversight is critical. The plan acknowledges that there are responsible farming practices and other non-lethal options to reduce wolf and livestock conflicts, but doesn't recommend that these opportunities are prioritized.	9	I really appreciate you gathering public comments on this plan. I feel like wolves are an important component of Wisconsin history and tribal history and as I've learned more about their role as a keystone species, I've realized just how important they are to a functional ecosystem in Wisconsin. Visiting the wolves in the Green Bay wildlife sanctuary was a truly magical experience for me as well.
Dianne G Croft	Most of it	No	All positive aspects of the plan to preserve wolves.	Negatives such as hunting, culling and other "managed" control.	6	It could use more rules for protecting wolves and their pups.
Gerald Bowman	All of it	No	I encourage maintaining and supporting wolves. I like the idea of compensating farmers and ranchers for loss.	I do not like trapping or killing of wolves. There should be no trapping unless it involves a cage or something where the wolf is not injured. Killing of wolves should not be allowed unless under extreme cases	4	See above
	Just the parts I am interested in	No			7	
Elisabeth Ritter	Most of it	No				Anyway, it is so important that wolves go on living in those areas!
Jodi Weiskott	Most of it	No	We appreciate the efforts of all WDNR staff involved in updating the state's wolf management plan. Although we believe the current plan needs significant updating (see next section), we recognize the efforts and improvements made to the previous plan, including: ● Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. ● There is much greater recognition of the ecological role of wolves ● The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves ● The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed)	The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on (see reference list below): ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. ● The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ○ A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings. ○ Hounding or hound training, which are akin to allowing legalized dogfighting, should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public. ● The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. ○ Despite Act 169, which mandates a wolf hunting season, the department can still restrict the implementation of lethal methods by setting minimal quotas, including a quota of '0' wolves, restricting timing and methods. ○ Several studies have proven a proactive non-lethal approach leads to better conflict mitigation. ○ Lethal management often fails to provide a long-term solution to wolf predation and has the least consistent success rates when compared to non-lethal practices. In addition, there is significant evidence showing that lethal wolf management may be less functionally effective at mitigating subsequent livestock losses than non-lethal deterrents. ● The plan should require the implementation of abatement measures as well as the use of non-lethal conflict minimization techniques by domestic animal owners for the latter to receive compensation for confirmed predation. ● The plan also runs contrary to public values towards wolves (and omits mention of such majority values from the plan), despite department surveys evidencing that the broad public cares about wolves as individuals (and not just for the viability of the population). Given the recent liberalization of killing wolves by the state, it would be	4

(Treves & Santiago-Ávila, 2023).		
julia knaz	I have not read any of the draft plan	No	if it saves the lives of wolves good if not plan better	you need a plan that will continue to save the lives of all wolves, and not have a quota of how many should live	5	save all the wolves lives. do not fall to the hunters request for a hunt. save them and forget about the money made from hunting
Rachel D	All of it	Yes	I like that input from indigenous tribal leaders, and strong scientific information and research, were included in this plan.	I dislike the fact that many WI residents surveyed did not want wolves to occupy most / all of WI, and many residents did not know how to answer that question.	9	We cannot have another catastrophic wolf hunt as we recently did, before federal protections were reinstated. Wolves are important keystone predators, and they make Wisconsin's natural environment healthier.
G. Paxton	Just the parts I am interested in	No	Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. There is much greater recognition of the ecological role of wolves. The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves. The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed).	The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on (see reference list below): ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution. ● The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. ● The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ○ A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal.	2	Please provide a Draft Wolf Management Plan focused on wolf protections.
Yvette Tapptico	Just the parts I am interested in	No	Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves ● The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed)	The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life.	5	Cattle and dairy are destroying life and causing mass extinctions, water loss, deforestation, habitat loss. The ranchers are given priority ver indignous wild natural beings who lived here far longer than the imported invasive, land -thievng bovines and the ranchers. No killing of indeiegnous beings or restriction of the roaming ranges should ever be allowed. Removed th cattle, restrict the rights of the ranchers to take over our lands, waters, natural atmospheric balance. This is insane,, the perspective of the relative newcomers to the Americas! LET NATURE RULE. Grow organic crops to feed people,.
Philip Ratcliff	Just the parts I am interested in	No	Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. There is much greater recognition of the ecological role of wolves.	Scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances.	3	Last year your state went on a frenzy of wolf killing, just like the redneck states of Idaho, Wyoming, and Montana. I thought that your state was more civilized. The current draft plan is a slight improvement.

Liz Waters	Most of it	Yes	I appreciate the efforts of all WDNR staff involved in updating the state's wolf management plan. Although I believe the current plan needs significant updating (see next section), I recognize the efforts and improvements made to the previous plan, including: ● Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. ● There is much greater recognition of the ecological role of wolves ● The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves ● The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed)	● The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on (see reference list below): ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution ● The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. ● The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ○ A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings. ○ Hounding or hound training, which are akin to allowing legalized dogfighting, should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public. ● The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. ○ Despite Act 169, which mandates a wolf hunting season, the department can still restrict the implementation of lethal methods by setting minimal quotas, including a quota of '0' wolves, restricting timing and methods. ○ Several studies have proven a proactive non-lethal approach leads to better conflict mitigation. ○ Lethal management often fails to provide a long-term solution to wolf predation and has the least consistent success rates when compared to non-lethal practices. In addition, there is significant evidence showing that lethal wolf management may be less functionally effective at mitigating subsequent livestock losses than non-lethal deterrents. ● The plan should require the implementation of abatement measures as well as the use of non-lethal conflict minimization techniques by domestic animal owners for the latter to receive compensation for confirmed predation. ● The plan also runs contrary to public values towards wolves (and omits mention of such majority values from the plan), despite department surveys evidencing that the broad public cares about wolves as individuals (and not just for the viability of the population). Given the recent liberalization of killing wolves by the state, it would be incredibly informative to note majority support of the following reasons for opposing a regulated wolf hunting/trapping season (which are all omitted from the plan): opposition to specific methods of harvest like hounds (64%) or traps (70%), feelings that hunting wolves is unnecessary (62%) or culturally offensive to Native American tribes (57%). ○ All such reasons convey majority disagreement with practices currently promoted and endorsed by the legislature and the WDNR, and such a conflict between managers and the public should not only be acknowledged, but foregrounded and carefully considered in policy (instead of dismissed). ○ Such decisions to omit literature or downplay evidence (e.g., such as majority opposition to killing wolves and their reasons) are contrary to principles of scientific integrity (e.g., present all relevant scientific evidence to the public) as well as ethics (e.g., disguising ethical decisions, such as recreational wolf killing, as robustly supported by science). ● Conflicting agency objectives (e.g., optimizing public hunting and conflict mitigation) are not only not acknowledged, but even misunderstood as harmonious, against the body of scientific evidence. That culminates in the prioritization of consumptive values and policies; e.g., according to the body of scientific literature, use of lethal methods, and 2 especially public hunts, are contrary to most objectives relevant to: harm mitigation, the wellbeing of wolves, their ecological roles, and their non-exploitative enjoyment (i.e., Objectives A, B, D and F). ● There is a stark lack of consideration for individual wolves, wolf population health (including wellbeing), and measurable indicators for assessing any harms barring disease prevalence (e.g., accounting for cortisol levels or other stress hormones, measures of pair/pack persistence) ● There is an inappropriate understanding and consideration of tribal worldviews about wolves. Tribal worldviews of wolves are misconstrued as 'cultural benefits' tribes receive from the existence of a wolf population, when in fact tribal worldviews consider each individual wolf as a person and relative. Cultural respect and sensitivity towards such views, shared by many non-tribal members, demand the strict mitigation of lethal measures, especially recreational killing, as opposed to their current promotion in the plan. ● In general, all omissions of scientific literature, the arbitrary prioritization of policy objectives, the rhetoric of the plan and the dismissal of public	4	Thank you for taking in public comments and considering what is best for the wolf population.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
				values and concerns for wolves point towards a biased, unscientific and instrumental view of wolves that promotes values contrary to broad public perspectives on wolves. ● 'SOM' wolf estimation methodology – From a recent critique: "The new methods sacrifice precision, but are believed to retain adequate accuracy and sensitivity to changing conditions for reliable decision-making. We review evidence for the accuracy, precision, and sensitivity of the new 'scaled occupancy model' (SOM) applied in Wisconsin. We conclude that the Wisconsin method would systematically overestimate wolf abundance by large (but currently incalculable) margins. Because Wisconsin, similar to other states, not only changed to unverified methods but also implemented widespread wolf killing, shortcomings in their estimates of wolf abundance may have far-reaching consequences for population viability and confidence in state wildlife managers. We discuss findings from Wisconsin alongside similar findings for other states' occupancy models being insensitive to human causes of mortality that have recently increased. Overall, Wisconsin's proposed method for estimating wolf abundance shows significant departures from best practices in scientific measurement. Verification will require independent replication and unbiased tests at multiple scales in multiple habitats under different human-induced mortality rates, and peer review before the new methods are considered reliable." (Treves & Santiago-Ávila, 2023)		
	Just the parts I am interested in	Yes	Removing an arbitrary wolf population goal is important to make sure the best-available science is centered in wolf management The low quota zones are an important and welcome addition to the plan The plan is rightly focused on the ecological benefits of wolves		9	Thank you for basing this on science and taking public as well as tribal input.
Lori Erbs	Most of it	No	I appreciate the efforts of all WDNR staff involved in updating the state's wolf management plan. Although I believe the current plan needs significant updating I recognize the efforts and improvements made to the previous plan, including: ● Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. ● There is much greater recognition of the ecological role of wolves ● The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves ● The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed)	● The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on (see reference list below): ○ wolf ethology, sentience, sapience, sociability, agency and well-being ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, well-being, social dynamics, ecological relationships and evolution ● The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. ● The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ○ A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings	1	I am a former Wisconsin resident and realize that consciousness is the key to effective change in this and other issues. Please implement educational outreach to the citizens of WI to provide viable co-existence strategies and better understanding of apex predator role in maintaining healthy ecosystems.
Karin Lease	Just the parts I am interested in	No	Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. There is much greater recognition of the ecological role of wolves The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed)	The plan did not reflect the best management practices established by science. It ignores the sovereignty of individual wolves and their essential nature in local ecosystems. It does not take into account that overall public opinion is against killing them. Killing individual animals that are absolutely essential to the packs they are a part of is not a solution to anything. It is cruel, unethical and actually causes more of the problems problems it is supposed to solve. It is a huge factor on the illegal killings that are taking place all over their habitat. Using hounds presents more problems and it is horrifying on the suffering it causes. Thank you.	1	Please stop killing wolves. They are essential to a healthy ecosystem, other wildlife populations and the environment as a whole. They have a right to live just as we do.
PATRICK DELANEY	All of it	Yes			9	
	All of it	Yes			2	
Emily	Just the parts I am interested in	No	Increased recognition of the ecological role of wolves. Also the inclusion of a social survey, which notes increased positive views of wolves.	- The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. - The plan runs contrary to public values towards wolves. It omits mention of such majority values from the plan, despite department surveys evidencing that the broad public cares about wolves as individuals (and not just for the viability of the population). Given the recent liberalization of killing wolves by the state, it would be incredibly informative to note majority support of the following reasons for opposing a regulated wolf hunting/trapping season (which are all omitted from the plan): opposition to specific methods of harvest like hounds (64%) or traps (70%), feelings that hunting wolves is unnecessary (62%) or culturally offensive to Native American tribes (57%).	4

	Most of it	No	I appreciate the efforts of all WDNR staff involved in updating the state's wolf management plan. Although I believe the current plan needs significant updating (see next section), I recognize the efforts and improvements made to the previous plan, including: ● Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. ● There is much greater recognition of the ecological role of wolves ● The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves ● The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed)	The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on (see reference list below): ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution ● The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. ● The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ○ A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings.	4	The plan needs more focus on non-lethal resolutions and better protections for wolves
Lisa Ferguson	I have not read any of the draft plan	No				I support (i) increasing protections for wolves, (ii) requiring non-lethal conflict interventions, and (iii) the banning of recreational killing.
Juan Hernandez Garibay	All of it	No	None	I don't like everything about this draft plan !! Wolves like all animals restore ecosystems!!	0	WE NEED TO SAVE WOLVES FROM EXTINCTION!! WOLVES LIKE ALL ANIMALS RESTORE ECOSYSTEMS!! HUNTERS ARE THE INES THAT NEED TO BE MANAGED !! WE SAVE WILD ANIMALS WE SAVE ECOSYSTEMS!! WE SAVE EARTH
lynn hoang	Just the parts I am interested in	No	Wolves in WI will no longer be managed by reference to the old numerical goal of 350wolves.●There is much greater recognition of the ecological role of wolves●The inclusion of a social survey, which notes increased positive views of wolves,knowledge of their ecological roles and increased opposition to the motives and methodsfor killing wolves●The adoption of proposed buffer zones around tribal rereservations, whereas previously no buffer zones existed	The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on wolf ethology, sentience, sapience, sociability, agency and wellbeing; effectiveness of non-lethal interventions, especially relative to lethal ones; the impact of widespread killing on wolves' physiology, behavior, wellbeing,social dynamics The above scientific omissions, combined with the emphasis on and promotion ofsustainable recreational killing and consumptive users as a main management strategy,results in a biased plan that runs contrary to scientific evidence despite much of thisomitted scientific evidence being more recent, numerous and of stronger inference.●The plan should strictly curtail any lethal management of wolves except in extremely rarecircumstances of immediate defense of life.○A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowingliberalized killing of wolves result in a direct increase in the hazard and incidenceof illegal killings.	4	
Don Schaeffer	Just the parts I am interested in	Yes	No specific population goal	I would like to see the plan include a proposal to study the relationship between wolf density and the prevalence of CWD.	7	I don't believe dogs should be used hunting wolves.
	Most of it	No	I think all of the wolves should be respected and all of the animals should not be hunted. They are beautiful and especially the deer and elk should be respected.	na	10	I hope that the wolves will have protections in the future and not hunted down.
Miranda McCall	Just the parts I am interested in	Yes	Removing an arbitrary wolf population goal is important to make sure the best-available science is centered in wolf management The low quota zones are an important and welcome addition to the plan The plan is rightly focused on the ecological benefits of wolves		9

	Just the parts I am interested in	No	Appreciate the efforts of all WDNR staff involved in updating the state's wolf managementbplan. Believe the current plan needs significant updating while recognize the efforts and improvements made to the previous plan, including: ● Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. ● There is much greater recognition of the ecological role of wolves ● The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves ● The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed)	The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on (see reference list below): ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution ● The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. ● The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ○ A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings.Hounding or hound training, which are akin to allowing legalized dogfighting, should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public. ● The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. ○ Despite Act 169, which mandates a wolf hunting season, the department can still restrict the implementation of lethal methods by setting minimal quotas, including a quota of '0' wolves, restricting timing and methods. ○ Several studies have proven a proactive non-lethal approach leads to better conflict mitigation. ○ Lethal management often fails to provide a long-term solution to wolf predation and has the least consistent success rates when compared to non-lethal practices. In addition, there is significant evidence showing that lethal wolf management may be less functionally effective at mitigating subsequent livestock losses than non-lethal deterrents. ● The plan should require the implementation of abatement measures as well as the use of non-lethal conflict minimization techniques by domestic animal owners for the latter to receive compensation for confirmed predation. ● The plan also runs contrary to public values towards wolves (and omits mention of such majority values from the plan), despite department surveys evidencing that the broad public cares about wolves as individuals (and not just for the viability of the population). Given the recent liberalization of killing wolves by the state, it would be incredibly informative to note majority support of the following reasons for opposing a regulated wolf hunting/trapping season (which are all omitted from the plan): opposition to specific methods of harvest like hounds (64%) or traps (70%), feelings that hunting wolves is unnecessary (62%) or culturally offensive to Native American tribes (57%). ○ All such reasons convey majority disagreement with practices currently promoted and endorsed by the legislature and the WDNR, and such a conflict between managers and the public should not only be acknowledged, but foregrounded and carefully considered in policy (instead of dismissed). ○ Such decisions to omit literature or downplay evidence (e.g., such as majority opposition to killing wolves and their reasons) are contrary to principles of scientific integrity (e.g., present all relevant scientific evidence to the public) as well as ethics (e.g., disguising ethical decisions, such as recreational wolf killing,as robustly supported by science). ● Conflicting agency objectives (e.g., optimizing public hunting and conflict mitigation) are not only not acknowledged, but even misunderstood as harmonious, against the body of scientific evidence. That culminates in the prioritization of consumptive values and policies; e.g., according to the body of scientific literature, use of lethal methods, and especially public hunts, are contrary to most objectives relevant to: harm mitigation, the wellbeing of wolves, their ecological roles, and their non-exploitative enjoyment (i.e., Objectives A, B, D and F). ● There is a stark lack of consideration for individual wolves, wolf population health (including wellbeing), and measurable indicators for assessing any harms barring disease prevalence (e.g., accounting for cortisol levels or other stress hormones, measures of pair/pack persistence) ● There is an inappropriate understanding and consideration of tribal worldviews aboutwolves. Tribal worldviews of wolves are misconstrued as 'cultural benefits' tribes receive from the existence of a wolf population, when in fact tribal worldviews consider each individual wolf as a person and relative. Cultural respect and sensitivity towards such views, shared by many non-tribal members, demand the strict mitigation of lethal measures, especially recreational killing, as opposed to their current promotion in the plan. In general, all omissions of scientific literature, the arbitrary prioritization of policy objectives, the rhetoric of the plan and the dismissal of public values and concerns for	4

				wolves point towards a biased, unscientific and instrumental view of wolves that promotes values contrary to broad public perspectives on wolves. ● 'SOM' wolf estimation methodology – From a recent critique: "The new methods sacrifice precision, but are believed to retain adequate accuracy and sensitivity to changing conditions for reliable decision-making. We review evidence for the accuracy, precision, and sensitivity of the new 'scaled occupancy model' (SOM) applied in Wisconsin. We conclude that the Wisconsin method would systematically overestimate wolf abundance by large (but currently incalculable) margins. Because Wisconsin, similar to other states, not only changed to unverified methods but also implemented widespread wolf killing, shortcomings in their estimates of wolf abundance may have far-reaching consequences for population viability and confidence in state wildlife managers. We discuss findings from Wisconsin alongside similar findings for other states' occupancy models being insensitive to human causes of mortality that have recently increased. Overall, Wisconsin's proposed method for estimating wolf abundance shows significant departures from best practices in scientific measurement. Verification will require independent replication and unbiased tests at multiple scales in multiple habitats under different human-induced mortality rates, and peer review before the new methods are considered reliable." (Treves & Santiago-Ávila, 2023)		
Jason Linn	Just the parts I am interested in	No	I'm glad WDNR has allowed more than 350 wolves to live in Wisconsin. I'm glad the public opinion survey showed a clear majority valued wolves.	Hounding should be illegal because it's cruel. Too many hunters represented in public opinion survey. More scientific studies should be adduced. Wolves should not be killed. You should read Davidson-Nelson, S. J., & Gehring, T. M. (2010). Testing fladry as a nonlethal management tool for wolves and coyotes in Michigan. Human–Wildlife Interactions, 4, 87–94.	3	Non-lethal should be the default. I love wolves.
	Most of it	Yes	I appreciate that it is based on scientific consensus around the ecological benefit that wolves have in Wisconsin. I also am pleased with the consultation with tribes who have long lived in Wisconsin and have treaty rights that must be respected.	I think the plan needs to have clear guidance on how often this plan will be reviewed or updated. Many state plans such as DOT transportation plans have a regular cadence whereby they are reviewed and updated. Science and conditions change, so adding a regular cadence for review and update is essential.	9	Thank you for putting together such a thorough plan that reflects science and public engagement.
Suzanne Kirby	Most of it	No	Using scientific information to keep a healthy balance between nature and humans	The plan is missing some important scientific information and promoting recreational hunting as a management state-of-the-art even though this is not what the scientific literature suggest.	3	
Glen Anderson	I have not read any of the draft plan	No	Thanks for this opportunity. I'm glad so many WDNR staff have helped to update Wisconsin's wolf management plan. Thanks for these improvements over the status quo: ● The old numerical goal of 350 was stupid policy. ● I'm glad you recognize that wolves play legitimate roles in ecosystems. ● Your social survey is wise and smart. ● Thanks for setting up buffer zones around tribal reservations.	Although your draft plan improves upon the status quo, YOU MUST IMPROVE IT IN MANY WAYS: ● We need "BEST AVAILABLE SCIENCE" to guide everything. ● I am seriously disappointed that you support killing wolves for recreation instead of trusting nature to manage population. KILLING IS NOT ENTERTAINMENT!!! ● EXCLUDE lethal ways to manage wolves. ● FULLY INCLUDE AND EMPOWER indigenous people. They lived sustainably with wolves for thousands of years. They know best. ● PLEASE RELY ALSO ON THE "BEST AVAILABLE SCIENCE" instead of the biased, corrupt, typical ways states deal with wolves.	4	Thanks for this opportunity. I care about EVERY ecosystem, including those of locations elsewhere from where I live.
Andy Goretski	All of it	Yes	I like that we will have lethal means of management for wolves.	I support the 350 wolf threshold to begin management practices. I see no numbers proposed.	1	It is tragic what has happened to the deer population in historically strong Northwoods hunting forests. The whole balance has been crippled by Wisconsin DNR inaction to assert their responsibility to manage populations. DNR alliance with the Federal Goverment and special interests have been very discriminatory to Northwoods residents and wild game consumers. Get it right and get the balance back. I support 350 wolves so that we can experience some interactions with wolves, but not on almost every outing in wolf country.
myra	All of it	No		The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on (see reference list below): ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution ● The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. ● The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ○ A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings.	1

Virginia Watson	Just the parts I am interested in	No	Pleased to see an update of the wolf management plan. I like that 1) Wolves in WI will no longer be managed by the old numerical goal of 350 wolves. 2) The role of wolves in ecology will be considered. 3) A survey that shows increased positive views of wolves, knowledge of their ecological roles & especially increased opposition to killing wolves 4) The adoption of proposed buffer zones around tribal reservations.	don't like: 1) The current draft does not reflect the best available science a) wolf ethology, sentience, sapience, sociability, agency and wellbeing b) effectiveness of non-lethal interventions, especially relative to lethal ones c) the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships $ evolution 2) The emphasis on sustainable recreational killing & consumptive users which is contrary to scientific evidence 3) No lethal management of wolves except in immediate defense of life. 4) Wolf protections should be the priority, along with a concentration on non-lethal management relative to livestock conflicts. a) Set minimal hunting quotas relative to Act 169, mandating wolf hunting season, including zero quota. b) Studies have shown that non-lethal management produces better conflict management results. 5) Surveys indicate public cares about wolves as individuals & for maintaining biodiversity. The plan should heed public opinion & avoid the liberal killing of our wolves. 6) As it stands the plan fails to consider the majority public opinion in forming policy. 7) Decisions to omit literature or downplay evidence (such as majority opposition to killing wolves) are contrary to the principles of scientific integrity. 8) There is a stark lack of consideration for individual wolves, wolf population health & well-being. There are no measurable indicators for assessing any harms barring disease prevalence (e.g., accounting for cortisol levels or other stress hormones, measures of pair/pack persistence). 9) Tribal worldviews of wolves are misconstrued as 'cultural benefits' tribes receive from the existence of a wolf population. In contrast to the notion presented in the plan, tribes consider each individual wolf as a person and relative. Cultural respect and sensitivity towards these ideas are shared by many non-tribal members & demand the strict mitigation of lethal measures, especially recreational killing, as opposed to their current promotion in the plan. 10) In general, omissions of scientific evidence, & the dismissal of public values & concerns for wolves indicate a biased & unscientific perception of wolves promoting values contrary to majority public opinions.	4	
Kathryn Watkins	I have not read any of the draft plan	No	The wolf protection draft addresses the need to protect wolves and action is being taken to do so.	The protections don't go quite far enough, i.e., ways to coexist w/wolves using non-lethal methods, putting an end to "recreational" killing.	5	The following need to be included in the draft: There needs to be more protections for the wolves and the protections in the plan should be increased. People have to learn to coexist w/wolves which means non-lethal conflict interventions must be practiced. Lastly, recreational killing must be banned. No animal deserves to die just for our "entertainment". It is cruel, inhumane and an animal basically dies for nothing. We need wolves to balance the ecosystem. It is unconscionable to me that wolves are again being hunted and killed after coming back from near extinction. We must protect them as much & as soon as possible.
Heide Coppotelli	Most of it	No	We appreciate the efforts of all WDNR staff involved in updating the state's wolf management plan. Although we believe the current plan needs significant updating (see next section), we recognize the efforts and improvements made to the previous plan, including: ● Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. ● There is much greater recognition of the ecological role of wolves ● The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves ● The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed)	● The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on (see reference list below): ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution ● The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. ● The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ○ A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings. ○ Hounding or hound training, which are akin to allowing legalized dogfighting, should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public. The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. ○ Despite Act 169, which mandates a wolf hunting season, the department can still restrict the implementation of lethal methods by setting minimal quotas, including a quota of '0' wolves, restricting timing and methods. ○ Several studies have proven a proactive non-lethal approach leads to better conflict mitigation. ○ Lethal management often fails to provide a long-term solution to wolf predation and has the least consistent success rates when compared to non-lethal practices. In addition, there is significant evidence showing that lethal wolf management may be less functionally effective at mitigating subsequent livestock losses than non-lethal deterrents. ● The plan should require the implementation of abatement measures as well as the use of non-lethal conflict minimization techniques	5	I have chosen to use the comments on the wolf management plan that were compiled by experts in wolf conservation and management rather than write my own, because I agree with their statements and couldn't begin to articulate their cogent points nearly as well. Please know that I stand behind what I have entered and hope that you will take the input to heart. You can make a very important difference for not only this incredibly vital species, the wolf, but also for the ecosystems of which they are a critical part. Please, for all our grandchildren, we must be truly outstanding stewards.

				by domestic animal owners for the latter to receive compensation for confirmed predation. ● The plan also runs contrary to public values towards wolves (and omits mention of such majority values from the plan), despite department surveys evidencing that the broad public cares about wolves as individuals (and not just for the viability of the population). Given the recent liberalization of killing wolves by the state, it would be incredibly informative to note majority support of the following reasons for opposing a regulated wolf hunting/trapping season (which are all omitted from the plan): opposition to specific methods of harvest like hounds (64%) or traps (70%), feelings that hunting wolves is unnecessary (62%) or culturally offensive to Native American tribes (57%). ○ All such reasons convey majority disagreement with practices currently promoted and endorsed by the legislature and the WDNR, and such a conflict between managers and the public should not only be acknowledged, but foregrounded and carefully considered in policy (instead of dismissed). ○ Such decisions to omit literature or downplay evidence (e.g., such as majority opposition to killing wolves and their reasons) are contrary to principles of scientific integrity (e.g., present all relevant scientific evidence to the public) as well as ethics (e.g., disguising ethical decisions, such as recreational wolf killing, as robustly supported by science). ● Conflicting agency objectives (e.g., optimizing public hunting and conflict mitigation) are not only not acknowledged, but even misunderstood as harmonious, against the body of scientific evidence. That culminates in the prioritization of consumptive values and policies; e.g., according to the body of scientific literature, use of lethal methods, and 2 especially public hunts, are contrary to most objectives relevant to: harm mitigation, the wellbeing of wolves, their ecological roles, and their non-exploitative enjoyment (i.e., Objectives A, B, D and F). ● There is a stark lack of consideration for individual wolves, wolf population health (including wellbeing), and measurable indicators for assessing any harms barring disease prevalence (e.g., accounting for cortisol levels or other stress hormones, measures of pair/pack persistence) ● There is an inappropriate understanding and consideration of tribal worldviews about wolves. Tribal worldviews of wolves are misconstrued as 'cultural benefits' tribes receive from the existence of a wolf population, when in fact tribal worldviews consider each individual wolf as a person and relative. Cultural respect and sensitivity towards such views, shared by many non-tribal members, demand the strict mitigation of lethal measures, especially recreational killing, as opposed to their current promotion in the plan. ● In general, all omissions of scientific literature, the arbitrary prioritization of policy objectives, the rhetoric of the plan and the dismissal of public values and concerns for wolves point towards a biased, unscientific and instrumental view of wolves that promotes values contrary to broad public perspectives on wolves. ● 'SOM' wolf estimation methodology – From a recent critique: "The new methods sacrifice precision, but are believed to retain adequate accuracy and sensitivity to changing conditions for reliable decision-making. We review evidence for the accuracy, precision, and sensitivity of the new 'scaled occupancy model' (SOM) applied in Wisconsin. We conclude that the Wisconsin method would systematically overestimate wolf abundance by large (but currently incalculable) margins. Because Wisconsin, similar to other states, not only changed to unverified methods but also implemented widespread wolf killing, shortcomings in their estimates of wolf abundance may have far-reaching consequences for population viability and confidence in state wildlife managers. We discuss findings from Wisconsin alongside similar findings for other states' occupancy models being insensitive to human causes of mortality that have recently increased. Overall, Wisconsin's proposed method for estimating wolf abundance shows significant departures from best practices in scientific measurement. Verification will require independent replication and unbiased tests at multiple scales in multiple habitats under different human-induced mortality rates, and peer review before the new methods are considered reliable." (Treves & Santiago-Ávila, 2023)		
Diane Young	I have not read any of the draft plan	No	I like everything that will help wolves remain in the balance of ecology.	I don't know enough about what led to the plan to comment or criticize that hard work that went into its creation.	10	I wish success to all those involved in this mission to support a healthy wolf population in Montana. We don't have many wolves in Maine, but I'm glad to help.

(Treves & Santiago-Ávila, 2023)
	Just the parts I am interested in	Yes	First, the plan emphasizes the benefits that wolves provide to the environment. Second, the plan eliminates having an arbitrary wolf population goal. Finally, the plan creates low quota zones around Tribal lands where the Tribes have requested such zones.		9

Verification will require independent replication and unbiased tests at multiple scales in multiple habitats under different human-induced mortality rates, and peer review before the new methods are considered reliable." (Treves & Santiago-Ávila, 2023)
Lance Kammerud	I have not read any of the draft plan	Yes	STOP ANY PLAN OF KILLING WOLVES!!!	ANY WOLVES BEING KILLED IS TO MANY!!!	0	STOP THE PLAN TO KILL, HARM WOLVES IN ANY WAY OR ANY MEASURES OF HUMAN GREED THAT AFFECTS ANY WOLVES!!
	Just the parts I am interested in	No	Increased recognition of the ecological role of wolves.	The plan should emphasize no lethal management of wolves and eliminate hunting, trapping, and hounding of wolves.	2	
Chris Pedone	All of it	No	That this issue is being discussed	Sport hunting should NOT be considered. Non-lethal solutions need to be implemented.	4	
John Richardson	Most of it	No	I like the fact that you have done a lot of work and are addressing the status of wolves in WI.	I believe it needs to include the more science based research that's available on wolf ethology, sentience, sapience, sociability, agency and well-being as well as the effectiveness of non-lethal interventions	6	Can the plan "prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence"?

Lydia Garvey	I have not read any of the draft plan	No				It's vital to protect our wolf predators- they are vital to ecosystem balance. WI Draft WMP Talking Points What we like: We appreciate the efforts of all WDNR staff involved in updating the state's wolf management plan. Although we believe the current plan needs significant updating (see next section), we recognize the efforts and improvements made to the previous plan, including: ● Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. ● There is much greater recognition of the ecological role of wolves ● The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves ● The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed) What we don't like: ● The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on (see reference list below): ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution ● The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. ● The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ○ A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings. ○ Hounding or hound training, which are akin to allowing legalized dogfighting, should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public. ● The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. ○ Despite Act 169, which mandates a wolf hunting season, the department can still restrict the implementation of lethal methods by setting minimal quotas, including a quota of '0' wolves, restricting timing and methods. ○ Several studies have proven a proactive non-lethal approach leads to better conflict mitigation. ○ Lethal management often fails to provide a long-term solution to wolf predation and has the least consistent success rates when compared to non-lethal practices. In addition, there is significant evidence showing that lethal wolf management may be less functionally effective at mitigating subsequent livestock losses than non-lethal deterrents. ● The plan should require the implementation of abatement measures as well as the use of non-lethal conflict minimization techniques by domestic animal owners for the latter to receive compensation for confirmed predation. ● The plan also runs contrary to public values towards wolves (and omits mention of such majority values from the plan), despite department surveys evidencing that the broad public cares about wolves as individuals (and not just for the viability of the population). Given the recent liberalization of killing wolves by the state, it would be incredibly informative to note majority support of the following reasons for opposing a regulated wolf hunting/trapping season (which are all omitted from the plan): opposition to specific methods of harvest like hounds (64%) or traps (70%), feelings that hunting wolves is unnecessary (62%) or culturally offensive to Native American tribes (57%). ○ All such reasons convey majority disagreement with practices currently promoted and endorsed by the legislature and the WDNR, and such a conflict between managers and the public should not only be acknowledged, but foregrounded and carefully considered in policy (instead of dismissed). ○ Such decisions to omit literature or downplay evidence (e.g., such as majority opposition to killing wolves and their reasons) are contrary to principles of scientific integrity (e.g., present all relevant scientific evidence to the public) as well as ethics (e.g., disguising ethical decisions, such as recreational wolf killing, as robustly supported by science). ● Conflicting agency objectives (e.g., optimizing public hunting and conflict mitigation) are not only not acknowledged, but even misunderstood as harmonious, against the body of scientific evidence. That culminates in the prioritization of consumptive values and policies; e.g., according to the body of scientific literature, use of lethal methods, and 2 especially public hunts, are contrary to most objectives relevant to: harm mitigation, the wellbeing of wolves, their ecological roles, and their non-exploitative enjoyment (i.e., Objectives A, B, D and F). ● There is a stark lack of consideration for individual wolves, wolf population health (including wellbeing), and measurable indicators for assessing any harms barring disease prevalence

						(e.g., accounting for cortisol levels or other stress hormones, measures of pair/pack persistence) ● There is an inappropriate understanding and consideration of tribal worldviews about wolves. Tribal worldviews of wolves are misconstrued as 'cultural benefits' tribes receive from the existence of a wolf population, when in fact tribal worldviews consider each individual wolf as a person and relative. Cultural respect and sensitivity towards such views, shared by many non-tribal members, demand the strict mitigation of lethal measures, especially recreational killing, as opposed to their current promotion in the plan. ● In general, all omissions of scientific literature, the arbitrary prioritization of policy objectives, the rhetoric of the plan and the dismissal of public values and concerns for wolves point towards a biased, unscientific and instrumental view of wolves that promotes values contrary to broad public perspectives on wolves. ● 'SOM' wolf estimation methodology – From a recent critique: "The new methods sacrifice precision, but are believed to retain adequate accuracy and sensitivity to changing conditions for reliable decision-making. We review evidence for the accuracy, precision, and sensitivity of the new 'scaled occupancy model' (SOM) applied in Wisconsin. We conclude that the Wisconsin method would systematically overestimate wolf abundance by large (but currently incalculable) margins. Because Wisconsin, similar to other states, not only changed to unverified methods but also implemented widespread wolf killing, shortcomings in their estimates of wolf abundance may have far-reaching consequences for population viability and confidence in state wildlife managers. We discuss findings from Wisconsin alongside similar findings for other states' occupancy models being insensitive to human causes of mortality that have recently increased. Overall, Wisconsin's proposed method for estimating wolf abundance shows significant departures from best practices in scientific measurement. Verification will require independent replication and unbiased tests at multiple scales in multiple habitats under different human-induced mortality rates, and peer review before the new methods are considered reliable." (Treves & Santiago-Ávila, 2023 Your assistance in this most urgent matter would be much appreciated by all present & future generations of all species. Thank you Lydia Garvey Public Health Nurse [redacted] [redacted]Clinton OK 73601
Alice	Just the parts I am interested in	No	A Few changes	Not enough Protections for Wolves. No more killing of wolves ever!!	1	I Want the WDNR to know that I support increasing protections for wolves, requiring Non-lethal Conflict Interventions and Banning Recreational Killing.

Recognition of familiarity on the basis of howls: A playback experiment in a captive group of wolves. Behaviour, 152(5), 593–614. https://doi.org/10.1163/1568539
	All of it	No	What we like: We appreciate the efforts of all WDNR staff involved in updating the state's wolf management plan. Although we believe the current plan needs significant updating (see next section), we recognize the efforts and improvements made to the previous plan, including: ● Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. ● There is much greater recognition of the ecological role of wolves ● The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves ● The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed)	What we don't like: ● The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on (see reference list below): ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution ● The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. ● The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ○ A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings. ○ Hounding or hound training, which are akin to allowing legalized dogfighting, should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public. ● The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. ○ Despite Act 169, which mandates a wolf hunting season, the department can still restrict the implementation of lethal methods by setting minimal quotas, including a quota of '0' wolves, restricting timing and methods. ○ Several studies have proven a proactive non-lethal approach leads to better conflict mitigation. ○ Lethal management often fails to provide a long-term solution to wolf predation and has the least consistent success rates when compared to non-lethal	2	

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
				practices. In addition, there is significant evidence showing that lethal wolf management may be less functionally effective at mitigating subsequent livestock losses than non-lethal deterrents. ● The plan should require the implementation of abatement measures as well as the use of non-lethal conflict minimization techniques by domestic animal owners for the latter to receive compensation for confirmed predation. ● The plan also runs contrary to public values towards wolves (and omits mention of such majority values from the plan), despite department surveys evidencing that the broad public cares about wolves as individuals (and not just for the viability of the population). Given the recent liberalization of killing wolves by the state, it would be incredibly informative to note majority support of the following reasons for opposing a regulated wolf hunting/trapping season (which are all omitted from the plan): opposition to specific methods of harvest like hounds (64%) or traps (70%), feelings that hunting wolves is unnecessary (62%) or culturally offensive to Native American tribes (57%). ○ All such reasons convey majority disagreement with practices currently promoted and endorsed by the legislature and the WDNR, and such a conflict between managers and the public should not only be acknowledged, but foregrounded and carefully considered in policy (instead of dismissed). ○ Such decisions to omit literature or downplay evidence (e.g., such as majority opposition to killing wolves and their reasons) are contrary to principles of scientific integrity (e.g., present all relevant scientific evidence to the public) as well as ethics (e.g., disguising ethical decisions, such as recreational wolf killing, as robustly supported by science). ● Conflicting agency objectives (e.g., optimizing public hunting and conflict mitigation) are not only not acknowledged, but even misunderstood as harmonious, against the body of scientific evidence. That culminates in the prioritization of consumptive values and policies; e.g., according to the body of scientific literature, use of lethal methods, and 2 especially public hunts, are contrary to most objectives relevant to: harm mitigation, the wellbeing of wolves, their ecological roles, and their non-exploitative enjoyment (i.e., Objectives A, B, D and F). ● There is a stark lack of consideration for individual wolves, wolf population health (including wellbeing), and measurable indicators for assessing any harms barring disease prevalence (e.g., accounting for cortisol levels or other stress hormones, measures of pair/pack persistence) ● There is an inappropriate understanding and consideration of tribal worldviews about wolves. Tribal worldviews of wolves are misconstrued as 'cultural benefits' tribes receive from the existence of a wolf population, when in fact tribal worldviews consider each individual wolf as a person and relative. Cultural respect and sensitivity towards such views, shared by many non-tribal members, demand the strict mitigation of lethal measures, especially recreational killing, as opposed to their current promotion in the plan. ● In general, all omissions of scientific literature, the arbitrary prioritization of policy objectives, the rhetoric of the plan and the dismissal of public values and concerns for wolves point towards a biased, unscientific and instrumental view of wolves that promotes values contrary to broad public perspectives on wolves. ● 'SOM' wolf estimation methodology – From a recent critique: "The new methods sacrifice precision, but are believed to retain adequate accuracy and sensitivity to changing conditions for reliable decision-making. We review evidence for the accuracy, precision, and sensitivity of the new 'scaled occupancy model' (SOM) applied in Wisconsin. We conclude that the Wisconsin method would systematically overestimate wolf abundance by large (but currently incalculable) margins. Because Wisconsin, similar to other states, not only changed to unverified methods but also implemented widespread wolf killing, shortcomings in their estimates of wolf abundance may have far-reaching consequences for population viability and confidence in state wildlife managers. We discuss findings from Wisconsin alongside similar findings for other states' occupancy models being insensitive to human causes of mortality that have recently increased. Overall, Wisconsin's proposed method for estimating wolf abundance shows significant departures from best practices in scientific measurement. Verification will require independent replication and unbiased tests at multiple scales in multiple habitats under different human-induced mortality rates, and peer review before the new methods are considered reliable."

				regulated wolf hunting/trapping season (which are all omitted from the plan): opposition to specific methods of harvest like hounds (64%) or traps (70%), feelings that hunting wolves is unnecessary (62%) or culturally offensive to Native American tribes (57%). ○ All such reasons convey majority disagreement with practices currently promoted and endorsed by the legislature and the WDNR, and such a conflict between managers and the public should not only be acknowledged, but foregrounded and carefully considered in policy (instead of dismissed). ○ Such decisions to omit literature or downplay evidence (e.g., such as majority opposition to killing wolves and their reasons) are contrary to principles of scientific integrity (e.g., present all relevant scientific evidence to the public) as well as ethics (e.g., disguising ethical decisions, such as recreational wolf killing, as robustly supported by science). ● Conflicting agency objectives (e.g., optimizing public hunting and conflict mitigation) are not only not acknowledged, but even misunderstood as harmonious, against the body of scientific evidence. That culminates in the prioritization of consumptive values and policies; e.g., according to the body of scientific literature, use of lethal methods, and 2 especially public hunts, are contrary to most objectives relevant to: harm mitigation, the wellbeing of wolves, their ecological roles, and their non-exploitative enjoyment (i.e., Objectives A, B, D and F). ● There is a stark lack of consideration for individual wolves, wolf population health (including wellbeing), and measurable indicators for assessing any harms barring disease prevalence (e.g., accounting for cortisol levels or other stress hormones, measures of pair/pack persistence) ● There is an inappropriate understanding and consideration of tribal worldviews about wolves. Tribal worldviews of wolves are misconstrued as 'cultural benefits' tribes receive from the existence of a wolf population, when in fact tribal worldviews consider each individual wolf as a person and relative. Cultural respect and sensitivity towards such views, shared by many non-tribal members, demand the strict mitigation of lethal measures, especially recreational killing, as opposed to their current promotion in the plan. ● In general, all omissions of scientific literature, the arbitrary prioritization of policy objectives, the rhetoric of the plan and the dismissal of public values and concerns for wolves point towards a biased, unscientific and instrumental view of wolves that promotes values contrary to broad public perspectives on wolves. ● 'SOM' wolf estimation methodology – From a recent critique: "The new methods sacrifice precision, but are believed to retain adequate accuracy and sensitivity to changing conditions for reliable decision-making. We review evidence for the accuracy, precision, and sensitivity of the new 'scaled occupancy model' (SOM) applied in Wisconsin. We conclude that the Wisconsin method would systematically overestimate wolf abundance by large (but currently incalculable) margins. Because Wisconsin, similar to other states, not only changed to unverified methods but also implemented widespread wolf killing, shortcomings in their estimates of wolf abundance may have far-reaching consequences for population viability and confidence in state wildlife managers. We discuss findings from Wisconsin alongside similar findings for other states' occupancy models being insensitive to human causes of mortality that have recently increased. Overall, Wisconsin's proposed method for estimating wolf abundance shows significant departures from best practices in scientific measurement. Verification will require independent replication and unbiased tests at multiple scales in multiple habitats under different human-induced mortality rates, and peer review before the new methods are considered reliable." (Treves & Santiago-Ávila, 2023)		
	I have not read any of the draft plan	Yes	Just that there is a plan.	The counting population is 50 to 100% low.	1	The wolfe has decimated the northern deer heard on public property without a residentual area within 1/4 of a mile. People see deer only because the deer need to exist where there are lights on in a residence to survive. MI is worse. Thanks for wrecking tha hunt for whitetail deer in the north.

	All of it	No	Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. ● There is much greater recognition of the ecological role of wolves ● The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves ● The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed)	The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on (see reference list below): ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution ● The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. ● The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ○ A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings. ○ Hounding or hound training, which are akin to allowing legalized dogfighting, should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public. ● The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. ○ Despite Act 169, which mandates a wolf hunting season, the department can still restrict the implementation of lethal methods by setting minimal quotas, including a quota of '0' wolves, restricting timing and methods. ○ Several studies have proven a proactive non-lethal approach leads to better conflict mitigation. ○ Lethal management often fails to provide a long-term solution to wolf predation and has the least consistent success rates when compared to non-lethal practices. In addition, there is significant evidence showing that lethal wolf management may be less functionally effective at mitigating subsequent livestock losses than non-lethal deterrents. ● The plan should require the implementation of abatement measures as well as the use of non-lethal conflict minimization techniques by domestic animal owners for the latter to receive compensation for confirmed predation. ● The plan also runs contrary to public values towards wolves (and omits mention of such majority values from the plan), despite department surveys evidencing that the broad public cares about wolves as individuals (and not just for the viability of the population). Given the recent liberalization of killing wolves by the state, it would be incredibly informative to note majority support of the following reasons for opposing a regulated wolf hunting/trapping season (which are all omitted from the plan): opposition to specific methods of harvest like hounds (64%) or traps (70%), feelings that hunting wolves is unnecessary (62%) or culturally offensive to Native American tribes (57%). ○ All such reasons convey majority disagreement with practices currently promoted and endorsed by the legislature and the WDNR, and such a conflict between managers and the public should not only be acknowledged, but foregrounded and carefully considered in policy (instead of dismissed). ○ Such decisions to omit literature or downplay evidence (e.g., such as majority opposition to killing wolves and their reasons) are contrary to principles of scientific integrity (e.g., present all relevant scientific evidence to the public) as well as ethics (e.g., disguising ethical decisions, such as recreational wolf killing, as robustly supported by science). ● Conflicting agency objectives (e.g., optimizing public hunting and conflict mitigation) are not only not acknowledged, but even misunderstood as harmonious, against the body of scientific evidence. That culminates in the prioritization of consumptive values and policies; e.g., according to the body of scientific literature, use of lethal methods, and 2 especially public hunts, are contrary to most objectives relevant to: harm mitigation, the wellbeing of wolves, their ecological roles, and their non-exploitative enjoyment (i.e., Objectives A, B, D and F). ● There is a stark lack of consideration for individual wolves, wolf population health (including wellbeing), and measurable indicators for assessing any harms barring disease prevalence (e.g., accounting for cortisol levels or other stress hormones, measures of pair/pack persistence) ● There is an inappropriate understanding and consideration of tribal worldviews about wolves. Tribal worldviews of wolves are misconstrued as 'cultural benefits' tribes receive from the existence of a wolf population, when in fact tribal worldviews consider each individual wolf as a person and relative. Cultural respect and sensitivity towards such views, shared by many non-tribal members, demand the strict mitigation of lethal measures, especially recreational killing, as opposed to their current promotion in the plan. ● In general, all omissions of scientific literature, the arbitrary prioritization of policy objectives, the rhetoric of the plan and the dismissal of public	2

				values and concerns for wolves point towards a biased, unscientific and instrumental view of wolves that promotes values contrary to broad public perspectives on wolves. ● 'SOM' wolf estimation methodology – From a recent critique: "The new methods sacrifice precision, but are believed to retain adequate accuracy and sensitivity to changing conditions for reliable decision-making. We review evidence for the accuracy, precision, and sensitivity of the new 'scaled occupancy model' (SOM) applied in Wisconsin. We conclude that the Wisconsin method would systematically overestimate wolf abundance by large (but currently incalculable) margins. Because Wisconsin, similar to other states, not only changed to unverified methods but also implemented widespread wolf killing, shortcomings in their estimates of wolf abundance may have far-reaching consequences for population viability and confidence in state wildlife managers. We discuss findings from Wisconsin alongside similar findings for other states' occupancy models being insensitive to human causes of mortality that have recently increased. 	Most of it	No	Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. ● There is much greater recognition of the ecological role of wolves ● The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves ● The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed)	The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on (see reference list below): ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution ● The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. ● The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ○ A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings. ○ Hounding or hound training, which are akin to allowing legalized dogfighting, should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public. ● The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. ○ Despite Act 169, which mandates a wolf hunting season, the department can still restrict the implementation of lethal methods by setting minimal quotas, including a quota of '0' wolves, restricting timing and methods. ○ Several studies have proven a proactive non-lethal approach leads to better conflict mitigation. ○ Lethal management often fails to provide a long-term solution to wolf predation and has the least consistent success rates when compared to non-lethal practices. In addition, there is significant evidence showing that lethal wolf management may be less functionally effective at mitigating subsequent livestock losses than non-lethal deterrents. ● The plan should require the implementation of abatement measures as well as the use of non-lethal conflict minimization techniques by domestic animal owners for the latter to receive compensation for confirmed predation. ● The plan also runs contrary to public values towards wolves (and omits mention of such majority values from the plan), despite department surveys evidencing that the broad public cares about wolves as individuals (and not just for the viability of the population). Given the recent liberalization of killing wolves by the state, it would be incredibly informative to note majority support of the following reasons for opposing a regulated wolf hunting/trapping season (which are all omitted from the plan): opposition to specific methods of harvest like hounds (64%) or traps (70%), feelings that hunting wolves is unnecessary (62%) or culturally offensive to Native American tribes (57%). ○ All such reasons convey majority disagreement with practices currently promoted and endorsed by the legislature and the WDNR, and such a conflict between managers and the public should not only be acknowledged, but foregrounded and carefully considered in policy (instead of dismissed). ○ Such decisions to omit literature or downplay evidence (e.g., such as majority opposition to killing wolves and their reasons) are contrary to principles of scientific integrity (e.g., present all relevant scientific evidence to the public) as well as ethics (e.g., disguising ethical decisions, such as recreational wolf killing, as robustly supported by science). ● Conflicting agency objectives (e.g., optimizing public hunting and conflict mitigation) are not only not acknowledged, but even misunderstood as harmonious, against the body of scientific evidence. That culminates in the prioritization of consumptive values and policies; e.g., according to the body of scientific literature, use of lethal methods, and 2 especially public hunts, are contrary to most objectives relevant to: harm mitigation, the wellbeing of wolves, their ecological roles, and their non-exploitative enjoyment (i.e., Objectives A, B, D and F). ● There is a stark lack of consideration for individual wolves, wolf population health (including wellbeing), and measurable indicators for assessing any harms barring disease prevalence (e.g., accounting for cortisol levels or other stress hormones, measures of pair/pack persistence) ● There is an inappropriate understanding and consideration of tribal worldviews about wolves. Tribal worldviews of wolves are misconstrued as 'cultural benefits' tribes receive from the existence of a wolf population, when in fact tribal worldviews consider each individual wolf as a person and relative. Cultural respect and sensitivity towards such views, shared by many non-tribal members, demand the strict mitigation of lethal measures, especially recreational killing, as opposed to their current promotion in the plan. ● In general, all omissions of scientific literature, the arbitrary prioritization of policy objectives, the rhetoric of the plan and the dismissal of public values and concerns for wolves point	5	I support increasing protections for wolves, requiring non-lethal conflict interventions and banning recreational killing.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
				towards a biased, unscientific and instrumental view of wolves that promotes values contrary to broad public perspectives on wolves. ● 'SOM' wolf estimation methodology – From a recent critique: "The new methods sacrifice precision, but are believed to retain adequate accuracy and sensitivity to changing conditions for reliable decision-making. We review evidence for the accuracy, precision, and sensitivity of the new 'scaled occupancy model' (SOM) applied in Wisconsin. We conclude that the Wisconsin method would systematically overestimate wolf abundance by large (but currently incalculable) margins. Because Wisconsin, similar to other states, not only changed to unverified methods but also implemented widespread wolf killing, shortcomings in their estimates of wolf abundance may have far-reaching consequences for population viability and confidence in state wildlife managers. We discuss findings from Wisconsin alongside similar findings for other states' occupancy models being insensitive to human causes of mortality that have recently increased. Overall, Wisconsin's proposed method for estimating wolf abundance shows significant departures from best practices in scientific measurement. Verification will require independent replication and unbiased tests at multiple scales in multiple habitats under different human-induced mortality rates, and peer review before the new methods are considered reliable." (Treves & Santiago-Ávila, 2023)		
Jamila Viandier	Most of it	No	I like that WDNR really took the time to gather evidence of the public's opinion on wolf management, including tribal opinions. It was very in-depth, with important elements (such as insightful probing questions, how attitudes have changed, why attitudes have changed--including the role of social media in this) and really took into account a vast array of public stratum. I liked the education part, the way WDNR is actively trying to educate the public on wolf interactions.	It seems as though there is more scientific literature available that was not taken into account, such as literature on wolf packs, their needs, wants and prosperity. There also wasn't enough on why people oppose a wolf hunting season.	7	I strongly applaud Wisconsin's Department of Natural Resources for updating the state's wolf management plan and for seeking out public comments regarding it. The wolf management plan should emphasize and promote only non-lethal methods to deter livestock-wolf conflicts. WDNR should work with livestock owners to teach them how to non-lethally manage any wolves that they may think pose a threat to their livestock. WDNR should only compensate livestock owners if they have shown that they only use non-lethal deterrent methods. I am opposed to WDNR using recreational killing of wolves as a primary management strategy. Wolves are essential to any ecosystem and provide all sorts of benefits to nature and humanity. They keep deer populations in check (unlike humans that take the biggest and best deer, wolves know to take the weakest and sickest ones, ensuring better survival for the deer populations in the long run), which in turn keeps everything else in balance by controlling the prey animals.They are essential to any sort of biodiversity. While there is a mandated wolf hunting season (Act 169) WDNR can get around this by setting quota limits on wolves to "zero," thereby producing no fatalities. Hounding should also not be allowed, as this is dangerous to the hounds and promotes violent killing of the wolves. It is also very unsportsmanlike. Wolves are individual beings who deserve respect and should be allowed to live as intended; focusing on and persecuting wolves is unethical and antithetical to the natural order. It violates deeply held beliefs in Native American tribes as well as anyone who cares profoundly about the environment. Thank you, Jamila Viandier
carol pirkle	Most of it	No	The draft plan considers the recognition of the ecological role of wolves. In this day and age, inclusions of this sort are more important to our environment than ever. There is some opposition to motives and methods that presently exist for the killing of wolves.	Although the plan includes some opposition to methods of killing wolves, they need to go further and include the consideration that lethal management should be limited to the immediate threat of life. There is also a lack of scientific literature regarding the effectiveness of non-lethal interventions. More needs to be mentioned about studies done on wolf sociability, etc. This includes the impact that widespread killing of wolves has on the social dynamics and well being of wolf packs. I live very close to the county where OR 59 was shot and killed. This is also an area where coyote killing contests were held for years. This is a clear example of how the liberal killing of coyotes and wolves results in a direct increase in illegal killings.	7

Stephanie	Most of it	No	I appreciate the improvements made to the previous plan, including that wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves and the fact that wolves are now recognized for the important ecological role and benefit they play.	The current draft does not reflect the best available science and is missing a substantial amount of scientific literature on the following: ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution ● The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. ● The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ○ A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings. ○ Hounding or hound training, which are akin to allowing legalized dogfighting, should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public.	3	This plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. The plan fails to consider wolves as individuals. The opportunity exists to do better.
Katherine Wright	Most of it	No	* Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. * There is much greater recognition of the ecological role of wolves * The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves * The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed)	The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on (see reference list below): ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution ● The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. ● The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ○ A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings. ○ Hounding or hound training, which are akin to allowing legalized dogfighting, should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public. ● The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. ○ Despite Act 169, which mandates a wolf hunting season, the department can still restrict the implementation of lethal methods by setting minimal quotas, including a quota of '0' wolves, restricting timing and methods. ○ Several studies have proven a proactive non-lethal approach leads to better conflict mitigation. ○ Lethal management often fails to provide a long-term solution to wolf predation and has the least consistent success rates when compared to non-lethal practices. 				significant evidence showing that lethal wolf management may be less functionally effective at mitigating subsequent livestock losses than non-lethal deterrents. ● The plan should *require* the implementation of abatement measures as well as the use of non-lethal conflict minimization techniques by domestic animal owners for the latter to receive compensation for confirmed predation. ● The plan also runs contrary to public values towards wolves (and omits mention of such majority values from the plan), despite department surveys evidencing that the broad public cares about wolves as individuals (and not just for the viability of the population). Given the recent liberalization of killing wolves by the state, it would be incredibly informative to note majority support of the following reasons for opposing a regulated wolf hunting/trapping season (which are all omitted from the plan): opposition to specificmethods of harvest like hounds (64%) or traps (70%), feelings that hunting wolves is unnecessary (62%) or culturally offensive to Native American tribes (57%). ○ All such reasons convey majority disagreement with practices currently promoted and endorsed by the legislature and the WDNR, and such a conflict between managers and the public should not only be acknowledged, but foregrounded and carefully considered in policy (instead of dismissed). ○ Such decisions to omit literature or downplay evidence (e.g., such as majority opposition to killing wolves and their reasons) are contrary to principles of scientific integrity (e.g., present all relevant scientific evidence to the public) as well as ethics (e.g., disguising ethical decisions, such as recreational wolf killing, as robustly supported by science). ● Conflicting agency objectives (e.g., optimizing public hunting and conflict mitigation) are not only not acknowledged, but even misunderstood as harmonious, against the body of scientific evidence. That culminates in the prioritization of consumptive values and policies; e.g., according to the body of scientific literature, use of lethal methods, and especially public hunts, are contrary to most objectives relevant to: harm mitigation, the wellbeing of wolves, their ecological roles, and their non-exploitative enjoyment (i.e., Objectives A, B, D and F). ● There is a stark lack of consideration for individual wolves, wolf population health (including wellbeing), and measurable indicators for assessing any harms barring disease prevalence (e.g., accounting for cortisol levels or other stress hormones, measures of pair/pack persistence) ● There is an inappropriate understanding and consideration of tribal worldviews about wolves. Tribal worldviews of wolves are misconstrued as 'cultural benefits' tribes receive from the existence of a wolf population, when, in fact, tribal worldviews consider each individual wolf as a person and relative. Cultural respect and sensitivity towards such views, shared by many non-tribal members, demand the strict mitigation of lethal measures, especially recreational killing, as opposed to their current promotion in the plan. ● In general, all omissions of scientific literature, the arbitrary prioritization of policy objectives, the rhetoric of the plan and the dismissal of public values and concerns for wolves point to a biased, unscientific and instrumental view of wolves that promotes values contrary to broad public perspectives on wolves. ● "SOM" wolf estimation methodology – From a recent critique: "The new methods sacrifice precision, but are believed to retain adequate accuracy and sensitivity to changing conditions for reliable decision-making. We review evidence for the accuracy, precision, and sensitivity of the new 'scaled occupancy model' (SOM) applied in Wisconsin. We conclude that the Wisconsin method would systematically overestimate wolf abundance by large (but currently incalculable) margins. Because Wisconsin, similar to other states, not only changed to unverified methods but also implemented widespread wolf killing, shortcomings in their estimates of wolf abundance may have far-reaching consequences for population viability and confidence in state wildlife managers. We discuss findings from Wisconsin alongside similar findings for other states' occupancy models being insensitive to human causes of mortality that have recently increased. Overall, Wisconsin's proposed method for estimating wolf abundance shows significant departures from best practices in scientific measurement. Verification will require independent replication and unbiased tests at multiple scales in multiple habitats under different human-induced mortality rates, and peer review before the new methods are considered reliable." (Treves & Santiago-Ávila, 2023)

snigdhodeep mukherjee	All of it	No	Adoption of proposed buffer zones, recognition of the importance of wolves in the context of ecology, inclusion of social surveys focusing on positive views on wolves	1. The draft is missing significant amount of scientific literature on - wolf ethology, sentience, sapience, sociability, agency and wellbeing - effectiveness of non-lethal interventions, especially relative to lethal ones - the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution 2. The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. 3. The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. 4. The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. 5. The plan should require the implementation of abatement measures as well as the use of non-lethal conflict minimization techniques by domestic animal owners for the latter to receive compensation for confirmed predation.	4	
Jean Lindgren	Most of it	No	Consultation with local Native Tribes.	The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ○ A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings.	4	I'm originally from Wisconsin though I don't live there now. I appreciate your effort to treat wolves fairly but there's more to be done. Wolves are extremely important in keeping the eco-system in balance which must play an important role in your decisions. Wolves first, people second. Thanks for your consideration.
	I have not read any of the draft plan	No	We appreciate the efforts of all WDNR staff involved in updating the state's wolf management plan. Although we believe the current plan needs significant updating (see next section), we recognize the efforts and improvements made to the previous plan, including: ● Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. ● There is much greater recognition of the ecological role of wolves ● The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves ● The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed)	The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. ○ Despite Act 169, which mandates a wolf hunting season, the department can still restrict the implementation of lethal methods by setting minimal quotas, including a quota of '0' wolves, restricting timing and methods. ○ Several studies have proven a proactive non-lethal approach leads to better conflict mitigation. ○ Lethal management often fails to provide a long-term solution to wolf predation and has the least consistent success rates when compared to non-lethal practices. In addition, there is significant evidence showing that lethal wolf management may be less functionally effective at mitigating subsequent livestock losses than non-lethal deterrents. ● The plan should require the implementation of abatement measures as well as the use of non-lethal conflict minimization techniques by domestic animal owners for the latter to receive compensation for confirmed predation	3	
Laura Lyons	Most of it	No	●The efforts of all WDNR staff involved in updating the state's wolf management plan. ● Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. ● Greater recognition of the ecological role of wolves ● The social survey, which notes increased positive views of wolves,knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves ● The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed)	●A substantial amount of scientific research and literature is missing on wolf population assessment, wolf behavior, their relationship to the environment, and non-lethal management. ●The obvious bias in the plan, that ignores science and favors recreational killing. ● The dismissal of public values and concerns for wolves.	4	
	All of it	No	We appreciate the efforts of all WDNR staff involved in updating the state's wolf management plan. (Treves & Santiago-Ávila, 2023)		
Wendy mercier	Just the parts I am interested in	No			1	Wolves are very important and necessary. They need protection
Virginia Levith	All of it	No	It's a start, but we need more protection for the wolves. Increasing protections for wolves, requiring non-lethal conflict interventions and banning recreational killing!	Recreational killing needs to be banned. Any shooting or blowing up wolf dens, etc. for any reason needs to be banned. Ranchers can use guard dogs is an example of a responsible, non-lethal way to protect their herds. There are many more modern non-lethal methods. This is the 21st century.	3	Although the plan contains improvements compared to previous versions, it is far from reflecting the best available science, ethics and broad public values that should guide wolf policy and coexistence.
Sharon Olson	Just the parts I am interested in	No	Proposed buffer zones around tribal reservations Social survey notes increasingly positive views of wolves and their ecological roles - also increasing horror of wolf killings Removal of arbitrary limit of 350 wolf population	Does not consider science reports showing that non-lethal methods by livestock owners and wildlife officials lead to less livestock losses. Migration more effective than violence..	6	
Jayne	All of it	Yes	Greater recognition of the ecological role of wolves	The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. Hounding or hound training should be illegal	0	I support increasing protections for wolves, requiring non-lethal conflict interventions and banning recreational killing!
KD	All of it	No	I appreciate the efforts of all WDNR staff involved in updating the state's wolf management plan. Although I believe the current plan needs significant updating (see next section), I recognize the efforts and improvements made to the previous plan, including: ● Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves; ● There is much greater recognition of wolves' ecological roles; ● The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles, and increased opposition to the motives and methods for killing wolves; and ● The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed.)	The current draft does not reflect the best available science and is missing a substantial amount of scientific literature on: ○ wolf ethology, sentience, sapience, sociability, agency, and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships, and evolution ● The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous, and of stronger inference. The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ○ A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings. ○ Hounding or hound training, which are akin to allowing legalized dogfighting, should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public. Charles Fox	Most of it	No	The Draft Plan appears to be a comprehensive, good-faith effort on the part of the WDNR to manage Gray wolves in Wisconsin. I appreciate the background material on Gray wolf biology and ecology. Understanding these animals is one key to helping them survive in a dangerous human-dominated world. The human dimension is arguably the most important, contentious, and problematic aspect of wolf management. I appreciated the inclusion of the human social dynamics and attitudes towards wolves. The widespread use of non-lethal depredation tools for livestock producers will continue to be critical to wolf management in WI and is wisely included as well. As referenced above, public education and outreach will continue to be critically important components of wolf management. I liked some of the products of the draft plan including the Strategy C3: Encourage non-consumptive recreational and cultural opportunities associated with wolves, and Strategy D1: Foster public education and understanding of wolves by ensuring information is accurate and readily available to the public. I encourage the department to vigorously pursue these strategies.	It seems predetermined that wolves must be killed, that an abusive relationship between humans and wildlife must be maintained. That's a dangerous assumption. Wolves should not be classified as a "game" species. No one eats wolf and killing them is not a "harvest". Wolves and other native carnivores limit their own population based on the availability of prey and territory. Reducing the number of wolves on the landscape through recreational killing is a cruel, senseless waste. Shooting wolves is unjustifiable except for immediate threats to humans or their domestic animals. Pursuing wolves with packs of GPS collared dogs is unethical. Trapping wolves is extreme animal cruelty. The term "trapper ethics" is incoherent. No ethical person would torture animals for any reason. So-called "Best Management Practices" are fraudulent and have nothing to do with animal welfare. None of this can be justified ecologically, economically, or ethically. WDNR should not rely on killing wolves to meet management objectives. Research by Treves, et. al. strongly suggests that legally sanctioned killing of wolves increases illegal killings. The legally sanctioned killing of wolves signals that these animals are worthless and should be killed because they are of no value. Recreational killing of wolves is a very dangerous policy that should be reconsidered before any more killing "seasons" are authorized. The continued treatment of bear hounding as some kind of legitimate activity is highly problematic. Bear hounding is an intense source of conflict for wolves and should be abolished. This activity is abusive to bears, wolves, human residents, and the dogs themselves. WDNR never really knows how many wolves are living in the state so it is impossible to know how many wolves can be killed and still maintain a sustainable population. In an age of mass extinctions and mass shootings it's difficult to sanction still more killing. Despite its long history, the recreational killing of wildlife is highly problematic should not be used as the primary "management" tool for wildlife in Wisconsin.	5	The political environment around wolf management - and many other issues of modern life - is incredibly, insanely toxic. This draft plan does not adequately address this reality. Despite all your work this plan could be completely ignored and your state wildlife management hijacked like it was before, leaving wolves and other wildlife to be slaughtered.
Sandy White	Most of it	No	I appreciate the efforts of all WDNR staff involved in updating the state's wolf management plan. Although I believe the current plan needs significant updating (see next section), I recognize the efforts and improvements made to the previous plan, including:●Wolves in WI will no longer be managed by reference to the old numerical goal of 350wolves.●There is much greater recognition of the ecological role of wolves●The inclusion of a social survey, which notes increased positive views of wolves,knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves●The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed)	●The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on: ○wolf ethology, sentience, sapience, sociability, agency and well beingoeffectiveness of non-lethal interventions, especially relative to lethal oneso○the impact of widespread killing on wolves' physiology, behavior, well being,social dynamics,ecological relationships and evolution●The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy,results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference.●The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life.○A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings.	5	n/a
Katie Warner	Most of it	No	I like the recognition of wolves' ecological importance, something that should go without saying but often does not. I like the inclusion of buffer zones around tribal land. I especially appreciate the scrapping of a numerical quota, a fairly useless measure in a changing environment.	I dislike the absence of some very critical information, like the impacts of hunts on the health of packs and informed supported information on proven non-lethal methods. I dislike that lethal management is considered appropriate for anything but the most extreme cases, as it is not usually necessary. There is very little value put on the actual familial relationship of wolves and tribes, or recognition of the importance of each wolf/family unit.	5	Western wolves are under extreme attack, globally many species, especially carnivores are on the brink of extinction. The us has already made the mistake of management of wolves by extermination, only now we absolutely know better. Not to mention wolves balance your ecosystems, I know Wisconsin is a beautiful state, so I know you recognize the importance of that balance. Enough bloodshed, I'm begging you.
Laura Arias	Just the parts I am interested in	No	I support increasing protections for wolves, requiring NON-lethal conflict interventions and banning recreational killing!	I support increasing protections for wolves, requiring NON-lethal conflict interventions and banning recreational killing!	1	I support increasing protections for wolves, requiring NON-lethal conflict interventions and banning recreational killing!
	I have not read any of the draft plan	No	Leave the wolves alone!	Leave the wolves alone!	0	Leave the wolves alone

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Amy Martin	All of it	Yes	Examples of non-lethal wolf depredation abatement tools.	I dislike the use of hunting dogs and lethal traps to hunt wolves. This poses dangers to those dogs, and traps such as snares and the like are unethical as animals try to release themselves by gnawing their own limbs. I definitely despise the killing of wolves younger than 2 years of age! They haven't really been given the chance to live their lives as they should or to engage with a pack. What happens to the animal once it is killed? Sure, they can be skinned for their hide, but what of the rest of the animals? Humans do not nor should they consume wolf "meat," and excuse me for this but all I see is just another form of entertainment for testosterone-fueled egos. The great white hunter! And I am white and definitely do NOT identify with hunting what we cannot consume for the sheer sport of it. That IS what this is-- all bout a sport. They can try to paint it any way they like, but it's just a bloodsport. There are way too many aspects of the Wolf Management Plan that are disheartening--too many to discuss in a mere survey. There are other ways to maintain the population of wolves in Wisconsin--we do not have to kill them. This was their land before it was ours. We must respect and nurture all wildlife. It is our duty as humane beings. Done.	0	There are several other states that are trying to re-introduce wolves to bring back balance to their ecosystems: Idaho, Montana, Wyoming, and Colorado in the recent past. Why can we not round up the "quota" of wolves and send them to those states to aid in their reintroduction? WHY must we KILL one of our greatest majestic natural predators? Assisting those states with their re-introductions will also build closer relationships between them and Wisconsin. We are, after all, the UNITED States of America.
Sonja Mills	All of it	No	Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. ● There is much greater recognition of the ecological role of wolves ● The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves ● The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed)	In general, all omissions of scientific literature, the arbitrary prioritization of policy objectives, the rhetoric of the plan and the dismissal of public values and concerns for wolves point towards a biased, unscientific and instrumental view of wolves that promotes values contrary to broad public perspectives on wolves. ● 'SOM' wolf estimation methodology – From a recent critique: "The new methods sacrifice precision, but are believed to retain adequate accuracy and sensitivity to changing conditions for reliable decision-making. We review evidence for the accuracy, precision, and sensitivity of the new 'scaled occupancy model' (SOM) applied in Wisconsin. We conclude that the Wisconsin method would systematically overestimate wolf abundance by large (but currently incalculable) margins. Because Wisconsin, similar to other states, not only changed to unverified methods but also implemented widespread wolf killing, shortcomings in their estimates of wolf abundance may have far-reaching consequences for population viability and confidence in state wildlife managers. We discuss findings from Wisconsin alongside similar findings for other states' occupancy models being insensitive to human causes of mortality that have recently increased. Overall, Wisconsin's proposed method for estimating wolf abundance shows significant departures from best practices in scientific measurement. Verification will require independent replication and unbiased tests at multiple scales in multiple habitats under different human-induced mortality rates, and peer review before the new methods are considered reliable." (Treves & Santiago-Ávila, 2023)	2	None
	Just the parts I am interested in	No	We appreciate the efforts of all WDNR staff involved in updating the state's wolf management plan. Although we believe the current plan needs significant updating (see next section), we recognize the efforts and improvements made to the previous plan, including: ● Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. ● There is much greater recognition of the ecological role of wolves ● The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves ● The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed)	● The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on (see reference list below): ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution ● The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. ● The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ○ A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings. ○ Hounding or hound training, which are akin to allowing legalized dogfighting, should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public. ● The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. ○ Despite Act 169, which mandates a wolf hunting season, the department can still restrict the implementation of lethal methods by setting minimal quotas, including a quota of '0' wolves, restricting timing and methods. ○ Several studies have proven a proactive non-lethal approach leads to better conflict mitigation. ○ Lethal management often fails to provide a long-term solution to wolf predation and has the least consistent success rates when compared to non-lethal practices. In addition, there is significant evidence showing that lethal wolf management may be less functionally effective at mitigating subsequent livestock losses than non-lethal deterrents. ● The plan should require the implementation	4	

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
				of abatement measures as well as the use of non-lethal conflict minimization techniques by domestic animal owners for the latter to receive compensation for confirmed predation. ● The plan also runs contrary to public values towards wolves (and omits mention of such majority values from the plan), despite department surveys evidencing that the broad public cares about wolves as individuals (and not just for the viability of the population). Given the recent liberalization of killing wolves by the state, it would be incredibly informative to note majority support of the following reasons for opposing a regulated wolf hunting/trapping season (which are all omitted from the plan): opposition to specific methods of harvest like hounds (64%) or traps (70%), feelings that hunting wolves is unnecessary (62%) or culturally offensive to Native American tribes (57%). ○ All such reasons convey majority disagreement with practices currently promoted and endorsed by the legislature and the WDNR, and such a conflict between managers and the public should not only be acknowledged, but foregrounded and carefully considered in policy (instead of dismissed). ○ Such decisions to omit literature or downplay evidence (e.g., such as majority opposition to killing wolves and their reasons) are contrary to principles of scientific integrity (e.g., present all relevant scientific evidence to the public) as well as ethics (e.g., disguising ethical decisions, such as recreational wolf killing, as robustly supported by science). ● Conflicting agency objectives (e.g., optimizing public hunting and conflict mitigation) are not only not acknowledged, but even misunderstood as harmonious, against the body of scientific evidence. That culminates in the prioritization of consumptive values and policies; e.g., according to the body of scientific literature, use of lethal methods, and especially public hunts, are contrary to most objectives relevant to: harm mitigation, the wellbeing of wolves, their ecological roles, and their non-exploitative enjoyment (i.e., Objectives A, B, D and F). ● There is a stark lack of consideration for individual wolves, wolf population health (including wellbeing), and measurable indicators for assessing any harms barring disease prevalence (e.g., accounting for cortisol levels or other stress hormones, measures of pair/pack persistence) ● There is an inappropriate understanding and consideration of tribal worldviews about wolves. Tribal worldviews of wolves are misconstrued as 'cultural benefits' tribes receive from the existence of a wolf population, when in fact tribal worldviews consider each individual wolf as a person and relative. Cultural respect and sensitivity towards such views, shared by many non-tribal members, demand the strict mitigation of lethal measures, especially recreational killing, as opposed to their current promotion in the plan. ● In general, all omissions of scientific literature, the arbitrary prioritization of policy objectives, the rhetoric of the plan and the dismissal of public values and concerns for wolves point towards a biased, unscientific and instrumental view of wolves that promotes values contrary to broad public perspectives on wolves. ● 'SOM' wolf estimation methodology – From a recent critique: "The new methods sacrifice precision, but are believed to retain adequate accuracy and sensitivity to changing conditions for reliable decision-making. We review evidence for the accuracy, precision, and sensitivity of the new 'scaled occupancy model' (SOM) applied in Wisconsin. We conclude that the Wisconsin method would systematically overestimate wolf abundance by large (but currently incalculable) margins. Because Wisconsin, similar to other states, not only changed to unverified methods but also implemented widespread wolf killing, shortcomings in their estimates of wolf abundance may have far-reaching consequences for population viability and confidence in state wildlife managers. We discuss findings from Wisconsin alongside similar findings for other states' occupancy models being insensitive to human causes of mortality that have recently increased. Overall, Wisconsin's proposed method for estimating wolf abundance shows significant departures from best practices in scientific measurement. Verification will require independent replication and unbiased tests at multiple scales in multiple habitats under different human-induced mortality rates, and peer review before the new methods are considered reliable." (Treves & Santiago-Ávila, 2023)

TRACY STAEDTER	Just the parts I am interested in	Yes	I appreciated the inclusion of Tribal Perspectives from Wisconsin indigenous communities and as well details from a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves. I appreciate the adoption of proposed buffer zones around tribal reservations.	Scientists who concern themselves with studying wolves have shown the effectiveness of non-lethal interventions to prevent livestock predation. This is not talked about in the report. The emphasis on recreational killing and consumptive users as a main management strategy is a biased plan. The influence on this is plan is clearly from an ag/hunting viewpoint and runs contrary to scientific evidence. How can any one look at the map of where wolves lived compared to where the roamed hundreds of years ago and think that continued killing of them is a good thing? It is also well known that wolves are social animals, who live in families and interact with other packs in specific ways. The impact of random deaths in a pack negatively affects their behavior, wellbeing, and social dynamics. There is a lack of consideration for wolf population health and measurable indicators for assessing stress. The report also doesn't touch on the financial opportunities that could be available to Wisconsin from wolf-watching tourism. Ten years after the wolves were brought back the Yellowstone, the University of Montana conducted a Regional Economic Impact Analyses and estimated that more than $35.5 million (confidence interval of $22.4 to $48.6 million) are generated via wolf-centered ecotourism in the park's surrounding gateway communities. Source: https://www.nathab.com/blog/economic-benefits-of-wolves-in-yellowstone/	5	It's depressing to see the map of the historic range of wolves in the US compared to what they are today. Wisconsin has an opportunity. I also think that the plan should recommend that Wisconsin strictly curtail any lethal management of wolves, especially that which uses hounds. The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. I was shocked to see the number of illegal killings of wolves compared to those harvested legally. Humans seem to want to kill or hold captive what they cannot control. It's sickening. I appreciate the public commentary but I actually don't think anything I say will matter. I strongly believe that lives of wolves are at the mercy of Big Ag and Hunting. It saddens me greatly to read this report and to even comment on it.
Andrew J Luk	I have not read any of the draft plan	No	I appreciate the efforts of all WDNR staff involved in updating the state's wolf management plan. Although I believe the current plan needs significant updating (see next section), I recognize the efforts and improvements made to the previous plan, including: ● Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. ● There is much greater recognition of the ecological role of wolves ● The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves ● The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed)	The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on (see reference list below): ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution ● The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. ● The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ○ A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings.circumstances of immediate defense of life. ○ A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings. ○ Hounding or hound training, which are akin to allowing legalized dogfighting, should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public. ● The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. ○ Despite Act 169, which mandates a wolf hunting season, the department can still restrict the implementation of lethal methods by setting minimal quotas, including a quota of '0' wolves, restricting timing and methods. ○ Several studies have proven a proactive non-lethal approach leads to better conflict mitigation. ○ Lethal management often fails to provide a long-term solution to wolf predation and has the least consistent success rates when compared to non-lethal practices. Diane M. Kastel	I have not read any of the draft plan	Yes	We appreciate the efforts of all "WDNR" staff involved in updating our state's, wolf, management plan. Although we believe the, current, plan needs, significant, updating, we recognize the efforts, and, improvements made to the, previous, plan, including: ● Wolves, in WI, will no longer be managed by reference to the, old, numerical, goal of 350 wolves! ● There is, much, greater recognition of the, ecological, role of wolves! ● The inclusion of a, social, survey, which notes, increased, positive views of wolves! knowledge of their, ecological, roles, and, increased, opposition to the motives, and, methods, for killing wolves! ● The adoption of, proposed, buffer zones around, tribal, reservations (i.e., previously, no buffer zones existed)	● The current, draft does NOT reflect the, best, available science, and, is missing a, substantial, amount of, scientific, literature on, wolf, ethology, sentience, sapience, sociability, agency, and, wellbeing! ○ effectiveness of, non-lethal, interventions, especially, relative to lethal, ones! ○ the impact of, widespread, killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological, relationships, and, evolution! ● The, above, scientific, omissions, combined with the emphasis on, and, promotion of, sustainable, recreational, killing, and, consumptive, users as a, main, management strategy results in a, biased, plan that runs contrary to, scientific, evidence despite much of this, omitted scientific, evidence being more recent, numerous, and, of stronger, inference! ● The plan MUST, strictly, curtail, any, lethal management of wolves except in, extremely, rare circumstances of immediate, defense of life! ○ A, substantial, body of research documenting, human-caused, mortality in, North American, wolves, including, Wisconsin, wolves, has found that policies allowing, liberalized, killing of wolves result in a, direct, increase in the hazard, and, incidence, of, illegal, killings! ○ Hounding, or, hound, training, which are akin to allowing, legalized, dogfighting, MUST be illegal, or, severely, restricted as this practice is, extremely, cruel to wolves, and, hounds, alike, and, is NOT supported by the majority of hunters, or, the, broad public! ● The plan MUST prioritize, wolf, protections, and, concentrate, solely, on, non-lethal, management of wolves in response to, livestock, conflicts to ensure, ethical, coexistence! ○ Despite "Act 169", which mandates a, wolf, hunting season, the Department can, still, restrict the implementation of, lethal, methods by setting, minimal, quotas, including a quota of '0' wolves, restricting timing, and, methods! ○ Several studies have proven a, proactive, non-lethal approach leads to, better, conflict, mitigation! ○ Lethal management fails to provide a, long-term, solution to, wolf, predation, and, has the, least, consistent success rates when compared to, non-lethal, practices! In addition, there is, significant, evidence showing that, lethal, wolf management may be, less, functionally effective at mitigating, subsequent, livestock losses than, non-lethal, deterrents! ● The plan MUST require the implementation of, abatement, measures as well as the use of, non-lethal, conflict minimization techniques by, domestic, animal owners for the latter to receive compensation for, confirmed, predation! ● The plan, also, runs contrary to, public, values towards wolves (and, omits mention of, such, majority values from the plan), despite, Department, surveys evidencing that the, broad, public cares about wolves, as individuals, (and, not just for the viability of the population)! Given the, recent, liberalization of killing wolves by the state, it would be, demonstrably, informative to note, majority, support of the, following, reasons for opposing a, regulated, wolf hunting/trapping season (which are, all, omitted from the plan): Opposition to, specific, methods of harvest, like hounds (64%), or, traps, (70%), feelings that hunting wolves is unnecessary (62%), or, culturally, offensive to Native American tribes (57%)! ○ All, such, reasons convey, majority, disagreement with practices, currently, promoted, and, endorsed, by the legislature, and, the "WDNR", and, such a conflict between managers, and, the public, MUST, not only be acknowledged, but, foregrounded, and, carefully, considered in policy (instead of dismissed)! ○ Such decisions to omit literature, or, downplay evidence (e.g., such as, majority, opposition to killing wolves, and, their reasons) are contrary to principles of, scientific, integrity (e.g., present, all, relevant, scientific, evidence to the public) as well as ethics (e.g., disguising, ethical, decisions, such as, recreational, wolf killing, as, robustly, supported by science)! ● Conflicting Agency objectives (e.g., optimizing, public, hunting, and, conflict, mitigation) are NOT only NOT acknowledged, but, even, misunderstood as harmonious, against the body of, scientific, evidence! That culminates in the prioritization of, consumptive, values, and, policies; e.g., according to the body of, scientific, literature, use of, lethal, methods, and, especially, public, hunts, are contrary to, most, objectives relevant to: harm mitigation, the wellbeing of wolves, their, ecological, roles, and, their, non-exploitative, enjoyment (i.e., Objectives A, B, D and F)! ● There is a, stark, lack of consideration for, individual, wolves, wolf, population health (including wellbeing), and, measurable, indicators for assessing, any, harms, barring, disease, prevalence (e.g., accounting for, cortisol, levels or, other, stress hormones, measures of pair/pack existence)! ● There is an, inappropriate, understanding, and, consideration of, tribal, worldviews about wolves! Tribal worldviews of wolves are misconstrued as 'cultural benefits' tribes receive from the existence of a, wolf, population, when, in fact, tribal, worldviews consider, each, individual wolf as a person, and, relative. Cultural respect, and, sensitivity, towards, such, views, shared by, many, non-tribal members, demand the, strict, mitigation of, lethal, measures, especially, recreational, killing, as opposed to their, current, promotion in the plan! ● In	4

				general, all, omissions of, scientific, literature, the, arbitrary, prioritization of, policy, objectives, the rhetoric of the plan, and, the dismissal of, public, values, and, concerns for wolves, point towards a, biased, unscientific and, instrumental, view of wolves that promotes values contrary to, broad, public perspectives on wolves! ● 'SOM', wolf, estimation methodology – From a, recent, critique: "The, new, methods sacrifice precision, but, are believed to retain, adequate, accuracy, and, sensitivity, to, changing, conditions for, reliable, decision-making. We review evidence for the accuracy, precision, and, sensitivity of the, new, 'scaled occupancy model' ("SOM") applied in Wisconsin. We conclude that the, Wisconsin, method would, systematically, overestimate, wolf, abundance by large (but, currently, incalculable) margins! Because Wisconsin, similar to other states, not only changed to, unverified, methods but, also, implemented widespread, wolf killing, shortcomings in their estimates of, wolf, abundance may have, far-reaching, consequences for, population, viability, and, confidence in, state, wildlife managers! We discuss findings from Wisconsin, alongside, similar, findings for, other, states', occupancy, models being insensitive to, human, causes of mortality that have, recently, increased! Overall, Wisconsin's, proposed, method for estimating, wolf, abundance shows, significant, departures from, best, practices in, scientific, measurement! Verification will require, independent, replication, and, unbiased, tests at, multiple, scales in, multiple, habitats under, different, human-induced, mortality rates, and, peer, review before the, new, methods are considered reliable." (Treves & Santiago-Ávila, 2023)		
Rene Ruston	All of it	No	The plan contains improvements compared to previous versions (which, if we are honest is not a high bar). Wolves in Wisconsin will no longer be managed by reference to the old numerical goal of 350 Greater recognition of the ecological role of wolves. Nature created a perfect ecological system where EVERY creature plays a part and when we, humans, disturb this balance is when we run into trouble. A social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves The addition of proposed buffer zones around tribal reservations. Previously no buffer zones existed	This draft does not reflect the best available science, and is missing a substantial amount of scientific literature (I am aware of at least 79 references) on: A. wolf ethology, sentience, sapience, sociability, agency and wellbeing. B. Effectiveness of NON-LETHAL measures, especially relative to lethal ones C. the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution These 79 scientific omissions, combined with the emphasis on and promotion of "sustainable recreational killing" and "consumptive users" as a main management strategy, results in a BIASED plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. The plan should strictly curtail ANY lethal management of wolves except in extremely rare circumstances of immediate defense of life. This is what "management" is. Killing is not "managing". It is up to us to adapt to nature. Not the other way around. A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings. Hounding or hound training, which is a form of legalized dogfighting should be illegal or severely restricted as this practice is extremely cruel to wolves AND the hounds. It is not supported by the majority of hunters or the broad public and reminiscent of the hideous practice of Galgo dogs in Spain. The plan should prioritize wolf PROTECTIONS and concentrate SOLEY ON NON-LETHAL MANAGEMENT of wolves in response to livestock conflicts to ensure ethical coexistence. Despite Act 169, which mandates a wolf hunting season, the department can still support the public majority in calling for restricting the implementation of lethal methods by setting minimal quotas, including a quota of '0' wolves, restricting timing and methods. Use creative methods to "protect" not destroy.	2	In general, ALL omissions of scientific literature, the prioritization of policy objectives over conservation, the rhetoric of the plan and the alarming dismissal of public support and concern for wolves can only be construed as biased, unscientific and an instrumental view of wolves that promotes values contrary to broad public perception of wolves. 'SOM' wolf estimation methodology – From a recent critique: "The new methods sacrifice precision, but are believed to retain adequate accuracy and sensitivity to changing conditions for reliable decision-making. After reviewing the evidence for the accuracy, precision, and sensitivity of the new 'scaled occupancy model' (SOM) applied in Wisconsin, the obvious conclusion is that the Wisconsin method would systematically overestimate wolf abundance by large (but currently incalculable) margins. Because Wisconsin, similar to other states, not only changed to unverified methods but also implemented widespread wolf killing, shortcomings in their estimates of wolf abundance may have far-reaching consequences for population viability and confidence in state wildlife managers. The findings from Wisconsin alongside similar findings for other states' occupancy models ignore human causes of mortality that have recently increased. Overall, Wisconsin's proposed method for estimating wolf abundance significantly ignores best practices in scientific measurement. Verification will require independent replication and unbiased tests at multiple scales in multiple habitats under different human-induced mortality rates, and peer review before the new methods

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
				Several studies have proven a proactive non-lethal approach leads to better conflict mitigation. Lethal management often fails to provide a long-term solution to wolf predation and has the least consistent success rates when compared to non-lethal practices. There is significant evidence showing that lethal wolf management may be less functionally effective at mitigating subsequent livestock losses than non-lethal deterrents. Include requiring the implementation of abatement measures as well as the use of non-lethal conflict minimization techniques by domestic animal owners for the latter to receive compensation for confirmed predation. The plan also runs contrary to public values towards wolves and, quite obviously, omits mention of such majority values from the plan, despite department surveys confirming that the broad public cares about wolves as individuals and not just for the viability of the population. Some of these wolves have names! Given the recent liberalization of killing wolves by the state, it would be incredibly informative to note majority support of the following reasons for opposing a regulated wolf hunting/trapping season (which are all omitted from the plan): opposition to specific methods of harvest like hounds (64%) or traps (70%), feelings that hunting wolves is unnecessary (62%) or CULTURALLY OFFENSIVE to Native American tribes (57%). All such reasons convey majority disagreement with practices currently promoted and endorsed by the legislature and the WDNR, and such a conflict between managers and the public should not only be acknowledged, but prioritized and carefully considered in policy (instead of dismissed). Such decisions to omit literature or downplay evidence (e.g., such as majority opposition to killing wolves and their reasons) are contrary to principles of scientific integrity. Present ALL relevant scientific evidence to the public. as well as ETHICS (e.g., disguising ethical decisions, such as recreational wolf killing, as robustly supported by science). Conflicting agency objectives (e.g., optimizing public hunting and conflict mitigation) are not only not acknowledged, but even misleading as harmonious, against the body of scientific evidence. That culminates in the prioritization of consumptive values and policies; e.g., according to the body of scientific literature, use of lethal methods, and two especially public hunts, are contrary to most objectives relevant to: harm mitigation, the wellbeing of wolves, their ecological roles, and their non-exploitative enjoyment (i.e., Objectives A, B, D and F). There is a stark lack of consideration for individual wolves, wolf population health (including wellbeing), and measurable indicators for assessing any harms barring disease prevalence (e.g., accounting for cortisol levels or other stress hormones, measures of pair/pack persistence) There is an inappropriate understanding and consideration of tribal worldviews about wolves. Tribal worldviews of wolves are misconstrued as 'cultural benefits' tribes receive from the existence of a wolf population, when in fact tribal worldviews consider EACH INDIVIDUAL WOLF as a person and relative. Cultural respect and sensitivity towards such views, shared by many non-tribal members, demand the strict mitigation of lethal measures, especially recreational killing, as opposed to the current promotion in the plan.		
Cherri Farren	Just the parts I am interested in	No		Wolf management does not mean interfere with packs, research shows this causes more numbers and problems than leaving them to naturally roam.	6	I have worked on ISRO wolf moose longest ongoing research project. Wolves are shy, and do not bother people. Only times I was capable of interacting with wolves is when radio collars were applied. Otherwise, they are scared of humans and keep away. Not a problematic creature at all. Hunting wolves will cause instability in packs, unstable behaviour and more issues with human wolf interactions. Only 20 years ago did the UP reintroduce wolf packs. Wolves keep coyotes population in-line.
Brenda Frey	Most of it	No	I like anything that is for the wolves because hunters think they are competition, trappers just love catching them for wolf haters and ranchers go into land that should be the wolves.	I do not want them killed.	5	We have been at war with them for too many years and it has to stop. We have to learn to live with them and make sure they do not become extinct. Cannot make laws like okay to murder pups and everything else that is cruel.
Pam Bacon	All of it	No		I don't think that hunters/trappers and agriculture/ranching vs wolf advocacy/education is fair..	1	
Traci Moreno	All of it	No	proposed buffer zones, gathering public opinion, recognizing the benefits to wolves role in the ecosystem.	Prohibit killing wolves except if there's imminent danger. Make hound trading illegal.	1	
	Just the parts I am interested in	No	Not sure what bear baiting has to do with KILLING wolves, let's stop sugar coating what you really want. "Harvesting" is what is done with corn and wheat. KILLING is what is done to living animals.	Stop ambiguous language which allows hunters to "think that a wolf MIGHT cause a problem". These are family groups that need ALL there members to survive, all year long. You worry about livestock and pets but make no mention about how wolves maintain the health of wild herds- elk and deer- by removing old and sick members and carrion in the winter. If they have more natural food to hunt, they generally will not bother domestic animals. Get the cattle OUT of natural wolf areas.	2	Many hunters don't care what they hunt, just so they can go out and kill animals. Hunting should be confined to those animals that are used for food. TROPHIES are not a reason to kill.

Nelson B	All of it	No	I am glad of the efforts of all WDNR staff involved in updating the state's wolf management plan. However I think the current plan needs significant updating (see next section), I acknowledge the efforts and improvements made to the previous plan, including: Wolves in Wisconsin will no longer be managed by reference to the old numerical goal of 350 wolves. There is much greater recognition of the ecological role of wolves. The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves. Also, the addition of proposed buffer zones around tribal reservations where previously no buffer zones existed.	The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings. Hounding or hound training, which are akin to allowing legalized dogfighting, should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public. The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. Despite Act 169, which mandates a wolf hunting season, the department can still restrict the implementation of lethal methods by setting minimal quotas, including a quota of '0' wolves, restricting timing and methods. Several studies have proven a proactive non-lethal approach leads to better conflict mitigation. Lethal management often fails to provide a long-term solution to wolf predation and has the least consistent success rates when compared to non-lethal practices. In addition, there is significant evidence showing that lethal wolf management may be less functionally effective at mitigating subsequent livestock losses than non-lethal deterrents. The plan also runs contrary to public values towards wolves (and omits mention of such majority values from the plan), despite department surveys evidencing that the broad public cares about wolves as individuals (and not just for the viability of the population). Given the recent liberalization of killing wolves by the state, it would be incredibly informative to note majority support of the following reasons for opposing a regulated wolf hunting/trapping season (which are all omitted from the plan): opposition to specific methods of harvest like hounds (64%) or traps (70%), feelings that hunting wolves is unnecessary (62%) or culturally offensive to Native American tribes (57%). All such reasons convey majority disagreement with practices currently promoted and endorsed by the legislature and the WDNR, and such a conflict between managers and the public should not only be acknowledged, but foregrounded and carefully considered in policy (instead of dismissed). Such decisions to omit literature or downplay evidence (e.g., such as majority opposition to killing wolves and their reasons) are contrary to principles of scientific integrity (e.g., present all relevant scientific evidence to the public) as well as ethics (e.g., disguising ethical decisions, such as recreational wolf killing, as robustly supported by science).	3	Please stop the unwarranted slaughter of these beautiful creatures!
Paul	Just the parts I am interested in	No	Recognition of the importance of wolves.	That you have altered your plan by omitting scientific data to support your agenda. Wolves do NOT need to be managed. They self-manage.	5	Support wildlife for the sake of preservation NOT for hunting, agriculture or farm animal grazing.
David Lauder	Most of it	No	The majority of Wisconsin residents support increasing the number of wolves living there.	That DNR wants to limit their numbers. 350 doesn't sound like a sustainable population.	8	I live in Illinois, so I'm not sure I should be commenting on what Wisconsin does about this. I think wolves are beautiful, misunderstood animals that can and should be a part of a healthy ecosystem.
Julia	All of it	No	Nothing	Not protection for wolves	1

Candace Rocha	Most of it	No	● Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. ● There is much greater recognition of the ecological role of wolves. ● The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves. ● The adoption of proposed buffer zones around tribal reservations.	● The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on (see reference list below): ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution ● The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. ● The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life.	5	
cathy elizabeth levin	All of it	No	What we like: We appreciate the efforts of all WDNR staff involved in updating the state's wolf management plan. Although we believe the current plan needs significant updating (see next section), we recognize the efforts and improvements made to the previous plan, including: ● Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. ● There is much greater recognition of the ecological role of wolves ● The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves ● The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed)	What we don't like: ● The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on (see reference list below): ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution ● The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. ● The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ○ A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings. ○ Hounding or hound training, which are akin to allowing legalized dogfighting, should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public. ●The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. ○ Despite Act 169, which mandates a wolf hunting season, the department can still restrict the implementation of lethal methods by setting minimal quotas, including a quota of '0' wolves, restricting timing and methods. ○ Several studies have proven a proactive non-lethal approach leads to better conflict mitigation. ○ Lethal management often fails to provide a long-term solution to wolf predation and has the least consistent success rates when compared to non-lethal practices. In addition, there is significant evidence showing that lethal wolf management may be less functionally effective at mitigating subsequent livestock losses than non-lethal deterrents. ● The plan should require the implementation of abatement measures as well as the use of non-lethal conflict minimization techniques by domestic animal owners for the latter to receive compensation for confirmed predation. ● The plan also runs contrary to public values towards wolves (and omits mention of such majority values from the plan), despite department surveys evidencing that the broad public cares about wolves as individuals (and not just for the viability of the population). Given the recent liberalization of killing wolves by the state, it would be incredibly informative to note majority support of the following reasons for opposing a regulated wolf hunting/trapping season (which are all omitted from the plan): opposition to specific methods of harvest like hounds (64%) or traps (70%), feelings that hunting wolves is unnecessary (62%) or culturally offensive to Native American tribes (57%). ○ All such reasons convey majority disagreement with practices currently promoted and endorsed by the legislature and the WDNR, and such a conflict between managers and the public should not only be acknowledged, but foregrounded and carefully considered in policy (instead of dismissed). ○ Such decisions to omit literature or downplay evidence (e.g., such as majority opposition to killing wolves and their reasons) are contrary to principles of scientific integrity (e.g., present all relevant scientific evidence to the public) as well as ethics (e.g., disguising ethical decisions, such as recreational wolf killing, as robustly supported by science). ● Conflicting agency objectives (e.g., optimizing public hunting and conflict mitigation) are not only not acknowledged, but even misunderstood as harmonious, against the body of scientific evidence. That culminates in the prioritization of consumptive values and policies; e.g., according to the body of scientific literature, use of lethal methods, and especially public hunts, are contrary to most objectives relevant to: harm mitigation, the wellbeing of wolves, their ecological roles, and their non-exploitative enjoyment (i.e., Objectives A, B, D	1	

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
				and F). ● There is a stark lack of consideration for individual wolves, wolf population health (including wellbeing), and measurable indicators for assessing any harms barring disease prevalence (e.g., accounting for cortisol levels or other stress hormones, measures of pair/pack persistence) ● There is an inappropriate understanding and consideration of tribal worldviews about wolves. Tribal worldviews of wolves are misconstrued as 'cultural benefits' tribes receive from the existence of a wolf population, when in fact tribal worldviews consider each individual wolf as a person and relative. Cultural respect and sensitivity towards such views, shared by many non-tribal members, demand the strict mitigation of lethal measures, especially recreational killing, as opposed to their current promotion in the plan. ● In general, all omissions of scientific literature, the arbitrary prioritization of policy objectives, the rhetoric of the plan and the dismissal of public values and concerns for wolves point towards a biased, unscientific and instrumental view of wolves that promotes values contrary to broad public perspectives on wolves. ● 'SOM' wolf estimation methodology – From a recent critique: "The new methods sacrifice precision, but are believed to retain adequate accuracy and sensitivity to changing conditions for reliable decision-making. We review evidence for the accuracy, precision, and sensitivity of the new 'scaled occupancy model' (SOM) applied in Wisconsin. We conclude that the Wisconsin method would systematically overestimate wolf abundance by large (but currently incalculable) margins. Because Wisconsin, similar to other states, not only changed to unverified methods but also implemented widespread wolf killing, shortcomings in their estimates of wolf abundance may have far-reaching consequences for population viability and confidence in state wildlife managers. We discuss findings from Wisconsin alongside similar findings for other states' occupancy models being insensitive to human causes of mortality that have recently increased. Overall, Wisconsin's proposed method for estimating wolf abundance shows significant departures from best practices in scientific measurement. Verification will require independent replication and unbiased tests at multiple scales in multiple habitats under different human-induced mortality rates, and peer review before the new methods are considered reliable." (Treves & Santiago-Ávila, 2023)		
Alexander Hughes	Just the parts I am interested in	No	The recognition of the ecological benefits of wolves	Permitting training/using hounds to hunt wolves	6	
	All of it	No	Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. There is much greater recognition of the ecological role of wolves ● The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves ● The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed	The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on (see reference list below): ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution ● The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. ● The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ○ A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings.	0	The plan also runs contrary to public values towards wolves (and omits mention of such majority values from the plan), despite department surveys evidencing that the broad public cares about wolves as individuals (and not just for the viability of the population). Wendy Jean Honold	All of it	Yes	The wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves, there is much greater recognition of the ecological role of wolves, the inclusion of a social survey (which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves, and the adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed).	The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution. The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings. Hounding or hound training, which are akin to allowing legalized dogfighting, should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public. The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. Despite Act 169, which mandates a wolf hunting season, the department can still restrict the implementation of lethal methods by setting minimal quotas, including a quota of '0' wolves, restricting timing and methods. Several studies have proven a proactive non-lethal approach leads to better conflict mitigation. Lethal management often fails to provide a long-term solution	4	It would be nice if wolf killing would become illegal.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
				to wolf predation and has the least consistent success rates when compared to non-lethal practices. In addition, there is significant evidence showing that lethal wolf management may be less functionally effective at mitigating subsequent livestock losses than non-lethal deterrents. The plan should require the implementation of abatement measures as well as the use of non-lethal conflict minimization techniques by domestic animal owners for the latter to receive compensation for confirmed predation. The plan also runs contrary to public values towards wolves (and omits mention of such majority values from the plan), despite department surveys evidencing that the broad public cares about wolves as individuals (and not just for the viability of the population). Given the recent liberalization of killing wolves by the state, it would be incredibly informative to note majority support of the following reasons for opposing a regulated wolf hunting/trapping season (which are all omitted from the plan): opposition to specific methods of harvest like hounds (64%) or traps (70%), feelings that hunting wolves is unnecessary (62%) or culturally offensive to Native American tribes (57%). All such reasons convey majority disagreement with practices currently promoted and endorsed by the legislature and the WDNR, and such a conflict between managers and the public should not only be acknowledged, but foregrounded and carefully considered in policy (instead of dismissed). Such decisions to omit literature or downplay evidence (e.g., such as majority opposition to killing wolves and their reasons) are contrary to principles of scientific integrity (e.g., present all relevant scientific evidence to the public) as well as ethics (e.g., disguising ethical decisions, such as recreational wolf killing, as robustly supported by science). Conflicting agency objectives (e.g., optimizing public hunting and conflict mitigation) are not only not acknowledged, but even misunderstood as harmonious, against the body of scientific evidence. That culminates in the prioritization of consumptive values and policies; e.g., according to the body of scientific literature, use of lethal methods, and 2 especially public hunts, are contrary to most objectives relevant to: harm mitigation, the wellbeing of wolves, their ecological roles, and their non-exploitative enjoyment (i.e., Objectives A, B, D and F). There is a stark lack of consideration for individual wolves, wolf population health (including wellbeing), and measurable indicators for assessing any harms barring disease prevalence (e.g., accounting for cortisol levels or other stress hormones, measures of pair/pack persistence). There is an inappropriate understanding and consideration of tribal worldviews about wolves. Tribal worldviews of wolves are misconstrued as 'cultural benefits' tribes receive from the existence of a wolf population, when in fact tribal worldviews consider each individual wolf as a person and relative. Cultural respect and sensitivity towards such views, shared by many non-tribal members, demand the strict mitigation of lethal measures, especially recreational killing, as opposed to their current promotion in the plan. In general, all omissions of scientific literature, the arbitrary prioritization of policy objectives, the rhetoric of the plan and the dismissal of public values and concerns for wolves point towards a biased, unscientific and instrumental view of wolves that promotes values contrary to broad public perspectives on wolves. 'SOM' wolf estimation methodology – From a recent critique: "The new methods sacrifice precision, but are believed to retain adequate accuracy and sensitivity to changing conditions for reliable decision-making. We review evidence for the accuracy, precision, and sensitivity of the new 'scaled occupancy model' (SOM) applied in Wisconsin. I conclude that the Wisconsin method would systematically overestimate wolf abundance by large (but currently incalculable) margins. Because Wisconsin, similar to other states, not only changed to unverified methods but also implemented widespread wolf killing, shortcomings in their estimates of wolf abundance may have far-reaching consequences for population viability and confidence in state wildlife managers. Please prove the findings from Wisconsin alongside similar findings for other states' occupancy models being insensitive to human causes of mortality that have recently increased. Overall, Wisconsin's proposed method for estimating wolf abundance shows significant departures from best practices in scientific measurement. Verification will require independent replication and unbiased tests at multiple scales in multiple habitats under different human-induced mortality rates, and peer review before the new methods are considered reliable." (Treves & Santiago-Ávila, 2023)		
G. Simmons	Most of it	No	You have good intentions but it needs to be more pro animal and environment.	I dislike the presentation of preservation when your plan actually means killing animals. Oh and 34% is very low maybe humans should be scales back to 34% And many people are kept fearful of animals so the human reaction is...KILL IT. Unacceptable and despicable.		Syop murdering animals to appease people and educate people on how to coexist without murdering animals that also have a right to thrive.

				of lethal methods, and 2 especially public hunts, are contrary to most objectives relevant to: harm mitigation, the wellbeing of wolves, their ecological roles, and their non-exploitative enjoyment (i.e., Objectives A, B, D and F). ● There is a stark lack of consideration for individual wolves, wolf population health (including wellbeing), and measurable indicators for assessing any harms barring disease prevalence (e.g., accounting for cortisol levels or other stress hormones, measures of pair/pack persistence) ● There is an inappropriate understanding and consideration of tribal worldviews about wolves. Tribal worldviews of wolves are misconstrued as 'cultural benefits' tribes receive from the existence of a wolf population, when in fact tribal worldviews consider each individual wolf as a person and relative. Cultural respect and sensitivity towards such views, shared by many non-tribal members, demand the strict mitigation of lethal measures, especially recreational killing, as opposed to their current promotion in the plan. ● In general, all omissions of scientific literature, the arbitrary prioritization of policy objectives, the rhetoric of the plan and the dismissal of public values and concerns for wolves point towards a biased, unscientific and instrumental view of wolves that promotes values contrary to broad public perspectives on wolves. ● 'SOM' wolf estimation methodology – From a recent critique: "The new methods sacrifice precision, but are believed to retain adequate accuracy and sensitivity to changing conditions for reliable decision-making. We review evidence for the accuracy, precision, and sensitivity of the new 'scaled occupancy model' (SOM) applied in Wisconsin. We conclude that the Wisconsin method would systematically overestimate wolf abundance by large (but currently incalculable) margins. Because Wisconsin, similar to other states, not only changed to unverified methods but also implemented widespread wolf killing, shortcomings in their estimates of wolf abundance may have far-reaching consequences for population viability and confidence in state wildlife managers. We discuss findings from Wisconsin alongside similar findings for other states' occupancy models being insensitive to human causes of mortality that have recently increased. Overall, Wisconsin's proposed method for estimating wolf abundance shows significant departures from best practices in scientific measurement. Verification will require independent replication and unbiased tests at multiple scales in multiple habitats under different human-induced mortality rates, and peer review before the new methods are considered reliable." Lisa D. Urness	Most of it	No	I appreciate the fact that WDNR recognizes that wolves have the right to LIVE at all.	It is critical to implement conflict management plans with the community and educate the public as to options other than MURDERING these animals who have every bit as much right to exist as holier-than-thou humans. Continuing the use of HOUNDS to torture wolves (and, in turn, all too often be injured themselves) is UNCONSCIONABLE. "Recreational killing". Really? Will humans EVER grow a conscience?	2	Please place substantial emphasis on EDUCATING and working with the ranchers to minimize conflict. It seems to be working to some extent in Wyoming and Montana.
Lisa Schoenbachler	Just the parts I am interested in	No	Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. ● There is much greater recognition of the ecological role of wolves ● The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves ● The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed)	The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on (see reference list below): ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution ● The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. ● The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ○ A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings. Hounding or hound training, which are akin to allowing legalized dogfighting, should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public. ● The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. ○ Despite Act 169, which mandates a wolf hunting season, the department can still restrict the implementation of lethal methods by setting minimal quotas, including a quota of '0' wolves, restricting timing and methods. ○ Several studies have proven a proactive non-lethal approach leads to better conflict mitigation. ○ Lethal management often fails to provide a long-term solution to wolf predation and has the least consistent success rates when compared to non-lethal practices. In addition, there is significant evidence showing that lethal wolf management may be less functionally effective at mitigating subsequent livestock losses than non-lethal deterrents. ● The plan should require the implementation of abatement measures as well as the use of non-lethal conflict minimization techniques by domestic animal owners for the latter to receive compensation for confirmed predation. ● The plan also runs contrary to public values towards wolves (and omits mention of such majority values from the plan), despite department surveys evidencing that the broad public cares about wolves as individuals (and not just for the viability of the population). Given the recent liberalization of killing wolves by the state, it would be incredibly informative to note majority support of the following reasons for opposing a regulated wolf hunting/trapping season (which are all omitted from the plan): opposition to specific methods of harvest like hounds (64%) or traps (70%), feelings that hunting wolves is unnecessary (62%) or culturally offensive to Native American tribes (57%). ○ All such reasons convey majority disagreement with practices currently promoted and endorsed by the legislature and the WDNR, and such a conflict between managers and the public should not only be acknowledged, but foregrounded and carefully considered in policy (instead of dismissed). ○ Such decisions to omit literature or downplay evidence (e.g., such as majority opposition to killing wolves and their reasons) are contrary to principles of scientific integrity (e.g., present all relevant scientific evidence to the public) as well as ethics (e.g., disguising ethical decisions, such as recreational wolf killing, as robustly supported by science). ● Conflicting agency objectives (e.g., optimizing public hunting and conflict mitigation) are not only not acknowledged, but even misunderstood as harmonious, against the body of scientific evidence. That culminates in the prioritization of consumptive values and policies; e.g., according to the body of scientific literature, use of lethal methods, and especially public hunts, are contrary to most objectives relevant to: harm mitigation, the wellbeing of wolves, their ecological roles, and their non-exploitative enjoyment (i.e., Objectives A, B, D and F). ● There is a stark lack of consideration for individual wolves, wolf population health (including wellbeing), and measurable indicators for assessing any harms barring disease prevalence (e.g., accounting for cortisol levels or other stress hormones, measures of pair/pack persistence) ● There is an inappropriate understanding and consideration of tribal worldviews about wolves. Tribal worldviews of wolves are misconstrued as 'cultural benefits' tribes receive from the existence of a wolf population, when in fact tribal	3	Wolves are an important part of the ecosystem and deserve to live as close to their nature as is possible with as little interference from man as possible.

				worldviews consider each individual wolf as a person and relative. Cultural respect and sensitivity towards such views, shared by many non-tribal members, demand the strict mitigation of lethal measures, especially recreational killing, as opposed to their current promotion in the plan. ● In general, all omissions of scientific literature, the arbitrary prioritization of policy objectives, the rhetoric of the plan and the dismissal of public values and concerns for wolves point towards a biased, unscientific and instrumental view of wolves that promotes values contrary to broad public perspectives on wolves. ● 'SOM' wolf estimation methodology – From a recent critique: "The new methods sacrifice precision, but are believed to retain adequate accuracy and sensitivity to changing conditions for reliable decision-making. We review evidence for the accuracy, precision, and sensitivity of the new 'scaled occupancy model' (SOM) applied in Wisconsin. We conclude that the Wisconsin method would systematically overestimate wolf abundance by large (but currently incalculable) margins. Because Wisconsin, similar to other states, not only changed to unverified methods but also implemented widespread wolf killing, shortcomings in their estimates of wolf abundance may have far-reaching consequences for population viability and confidence in state wildlife managers. We discuss findings from Wisconsin alongside similar findings for other states' occupancy models being insensitive to human causes of mortality that have recently increased. Overall, Wisconsin's proposed method for estimating wolf abundance shows significant departures from best practices in scientific measurement. Verification will require independent replication and unbiased tests at multiple scales in multiple habitats under different human-induced mortality rates, and peer review before the new methods are considered reliable." (Treves & Santiago-Ávila, 2023)		
	Most of it	No	The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves		1	The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life.
Carol Ohlendorf	All of it	No	What we like: We appreciate the efforts of all WDNR staff involved in updating the state's wolf management plan. Although we believe the current plan needs significant updating (see next section), we recognize the efforts and improvements made to the previous plan, including: ● Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. ● There is much greater recognition of the ecological role of wolves ● The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves ● The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed) What we don't like: ● The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on (see reference list below): ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution ● The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. ● The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ○ A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing	What we don't like: ● The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on (see reference list below): ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution ● The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. ● The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ○ A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings.	0	I am so sick and tired with all the killing of our wildlife especially the wolves...this is a political issue not a wildlife issue...the ranchers have powerful lobbyists that continue to help pass legislation and laws that will kill our wolves...we have co-existed with our wildlife for centuries but in the last 8 yrs..all I read about is trophy hunters allowed to kill anything for a trophy. This is horrific and needs to be stopped...when are we going to take care of our wildlife and not eradicate them...

Paul Palla	All of it	No	What we like:We appreciate the efforts of all WDNR staff involved in updating the state's wolf managementplan. Although we believe the current plan needs significant updating (see next section), werecognize the efforts and improvements made to the previous plan, including:●Wolves in WI will no longer be managed by reference to the old numerical goal of 350wolves.●There is much greater recognition of the ecological role of wolves●The inclusion of a social survey, which notes increased positive views of wolves,knowledge of their ecological roles and increased opposition to the motives and methodsfor killing wolves●The adoption of proposed buffer zones around tribal reservations (i.e., previously nobuffer zones existed).	The current draft does not reflect the best available science, and is missing a substantialamount of scientific literature on (see reference list below):○wolf ethology, sentience, sapience, sociability, agency and wellbeing○effectiveness of non-lethal interventions, especially relative to lethal ones○the impact of widespread killing on wolves' physiology, behavior, wellbeing,social dynamics,ecological relationships and evolution●The above scientific omissions, combined with the emphasis on and promotion ofsustainable recreational killing and consumptive users as a main management strategy,results in a biased plan that runs contrary to scientific evidence despite much of thisomitted scientific evidence being more recent, numerous and of stronger inference.●The plan should strictly curtail any lethal management of wolves except in extremely rarecircumstances of immediate defense of life.○A substantial body of research documenting human-caused mortality in NorthAmerican wolves, includingWisconsin wolves,has found that policies allowingliberalized killing of wolves result in a direct increase in the hazard and incidenceof illegal killings.○Hounding or hound training, which are akin to allowing legalized dogfighting,should be illegal or severely restricted as this practice is extremely cruel to wolvesand hounds alike and is not supported by the majority of hunters or the broadpublic.●The plan should prioritize wolf protections and concentrate solely on non-lethalmanagement of wolves in response to livestock conflicts to ensure ethical coexistence.○DespiteAct 169,which mandates a wolf hunting season, the department can stillrestrict the implementation of lethal methods by setting minimal quotas, includinga quota of '0' wolves, restricting timing and methods.○Several studieshave proven a proactive non-lethal approach leads to betterconflict mitigation.○Lethal management often fails to provide a long-term solution to wolf predationand has theleast consistent success rateswhen compared to non-lethal practices.In addition, there is significant evidence showing thatlethal wolf managementmay be less functionally effective at mitigating subsequent livestock losses thannon-lethal deterrents.●The plan shouldrequirethe implementation of abatement measures as well as the use ofnon-lethal conflict minimization techniques by domestic animal owners for the latter toreceive compensation for confirmed predation.●The plan also runs contrary topublic values towards wolves(and omits mention of suchmajority values from the plan), despite department surveys evidencing that the broadpublic cares about wolves as individuals (and not just for the viability of the population).Given the recent liberalization of killing wolves by the state, it would be incrediblyinformative to note majority support of the following reasons for opposing a regulatedwolf hunting/trapping season (which are all omitted from the plan): opposition to specificmethods of harvest like hounds (64%) or traps (70%), feelings that hunting wolves isunnecessary (62%) or culturally offensive to Native American tribes (57%).○All such reasons convey majority disagreement with practices currently promotedand endorsed by the legislature and the WDNR, and such a conflict betweenmanagers and the public should not only be acknowledged, but foregrounded andcarefully considered in policy (instead of dismissed).○Such decisions to omit literature or downplay evidence (e.g., such as majorityopposition to killing wolves and their reasons) are contrary to principles ofscientific integrity (e.g., present all relevant scientific evidence to the public) aswell as ethics (e.g., disguising ethical decisions, such as recreational wolf killing,as robustly supported by science).●Conflicting agency objectives (e.g., optimizing public hunting and conflict mitigation)are not only not acknowledged, but even misunderstood as harmonious, against the bodyof scientific evidence. That culminates in the prioritization of consumptive values andpolicies; e.g., according to the body of scientific literature,use of lethal methods, and2especially public hunts, are contrary to most objectives relevant to: harm mitigation, thewellbeing of wolves, their ecological roles, and their non-exploitative enjoyment (i.e.,Objectives A, B, D and F).●There is a starklack of consideration for individual wolves,wolf population health(including wellbeing), and measurable indicators for assessing any harms barring diseaseprevalence (e.g.,accounting for cortisol levels or other stress hormones, measures ofpair/pack persistence)●There is aninappropriate understanding and consideration of tribal worldviews aboutwolves.Tribal worldviews of wolves are misconstrued as 'cultural benefits' tribes receivefrom the existence of a wolf population, when in fact tribal worldviews considereachindividual wolfas apersonandrelative. Cultural respect and sensitivity towards suchviews, shared by many non-tribal members, demand the strict mitigation of lethalmeasures, especially recreational killing, as opposed to their current promotion in theplan.●In general, all omissions of scientific literature, the arbitrary prioritization of policyobjectives, the	2	WE NEED TO SAVE THE WOLVES!

				rhetoric of the plan and the dismissal of public values and concernsforwolvespoint towards a biased, unscientific and instrumental view of wolves thatpromotes values contrary to broad public perspectives on wolves.●'SOM' wolf estimation methodology – From a recentcritique:"The new methodssacrifice precision, but are believed to retain adequate accuracy and sensitivity tochanging conditions for reliable decision-making. We review evidence for the accuracy,precision, and sensitivity of the new 'scaled occupancy model' (SOM) applied inWisconsin. We conclude that the Wisconsin method would systematically overestimatewolf abundance by large (but currently incalculable) margins. Because Wisconsin, similarto other states, not only changed to unverified methods but also implemented widespreadwolf killing, shortcomings in their estimates of wolf abundance may have far-reachingconsequences for population viability and confidence in state wildlife managers. Wediscuss findings from Wisconsin alongside similar findings for other states' occupancymodels being insensitive to human causes of mortality that have recently increased.Overall, Wisconsin's proposed method for estimating wolf abundance shows significantdepartures from best practices in scientific measurement. Verification will requireindependent replication and unbiased tests at multiple scales in multiple habitats underdifferent human-induced mortality rates, and peer review before the new methods areconsidered reliable." (Treves & Santiago-Ávila, 2023)Rating:4-5Reference list (studies not integrated into the current draft wolf plan)3Adams, L. G., Stephenson, R. O., Dale, B. W., Ahgook, R. T., & Demma, D. J. Dr. Robert Williamson	Just the parts I am interested in	No	Monitoring	none	10	
Tim Midboe	All of it	No	We appreciate the efforts of all WDNR staff involved in updating the state's wolf management plan. Although we believe the current plan needs significant updating (see next section), we recognize the efforts and improvements made to the previous plan, including: ● Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. ● There is much greater recognition of the ecological role of wolves ● The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves ● The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed)	The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on (see reference list below): ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution ● The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. ● The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ○ A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings. ○ Hounding or hound training, which are akin to allowing legalized dogfighting, should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public. ● The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. ○ Despite Act 169, which mandates a wolf hunting season, the department can still restrict the implementation of lethal methods by setting minimal quotas, including a quota of '0' wolves, restricting timing and methods. ○ Several studies have proven a proactive non-lethal approach leads to better conflict mitigation. ○ Lethal management often fails to provide a long-term solution to wolf predation and has the least consistent success rates when compared to non-lethal practices. In addition, there is significant evidence showing that lethal wolf management may be less functionally effective at mitigating subsequent livestock losses than non-lethal deterrents. ● The plan should require the implementation of abatement measures as well as the use of non-lethal conflict minimization techniques by domestic animal owners for the latter to receive compensation for confirmed predation. ● The plan also runs contrary to public values towards wolves (and omits mention of such majority values from the plan), despite department surveys evidencing that the broad public cares about wolves as individuals (and not just for the viability of the population). Given the recent liberalization of killing wolves by the state, it would be incredibly informative to note majority support of the following reasons for opposing a regulated wolf hunting/trapping season (which are all omitted from the plan): opposition to specific methods of harvest like hounds (64%) or traps (70%), feelings that hunting wolves is unnecessary (62%) or culturally offensive to Native American tribes (57%). ○ All such reasons convey majority disagreement with practices currently promoted and endorsed by the legislature and the WDNR, and such a conflict between managers and the public should not only be acknowledged, but foregrounded and carefully considered in policy (instead of dismissed). ○ Such decisions to omit literature or downplay evidence (e.g., such as majority opposition to killing wolves and their reasons) are contrary to principles of scientific integrity (e.g., present all relevant scientific evidence to the public) as well as ethics (e.g., disguising ethical decisions, such as recreational wolf killing, as robustly supported by science). ● Conflicting agency objectives (e.g., optimizing public hunting and conflict mitigation) are not only not acknowledged, but even misunderstood as harmonious, against the body of scientific evidence. That culminates in the prioritization of consumptive values and policies; e.g., according to the body of scientific literature, use of lethal methods, and 2 especially public hunts, are contrary to most objectives relevant to: harm mitigation, the wellbeing of wolves, their ecological roles, and their non-exploitative enjoyment (i.e., Objectives A, B, D and F). ● There is a stark lack of consideration for individual wolves, wolf population health (including wellbeing), and measurable indicators for assessing any harms barring disease prevalence (e.g., accounting for cortisol levels or other stress hormones, measures of pair/pack persistence) ● There is an inappropriate understanding and consideration of tribal worldviews about wolves. Tribal worldviews of wolves are misconstrued as 'cultural benefits' tribes receive from the existence of a wolf population, when in fact tribal	6	

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
				worldviews consider each individual wolf as a person and relative. Cultural respect and sensitivity towards such views, shared by many non-tribal members, demand the strict mitigation of lethal measures, especially recreational killing, as opposed to their current promotion in the plan. ● In general, all omissions of scientific literature, the arbitrary prioritization of policy objectives, the rhetoric of the plan and the dismissal of public values and concerns for wolves point towards a biased, unscientific and instrumental view of wolves that promotes values contrary to broad public perspectives on wolves. ● 'SOM' wolf estimation methodology – From a recent critique: "The new methods sacrifice precision, but are believed to retain adequate accuracy and sensitivity to changing conditions for reliable decision-making. We review evidence for the accuracy, precision, and sensitivity of the new 'scaled occupancy model' (SOM) applied in Wisconsin. We conclude that the Wisconsin method would systematically overestimate wolf abundance by large (but currently incalculable) margins. Because Wisconsin, similar to other states, not only changed to unverified methods but also implemented widespread wolf killing, shortcomings in their estimates of wolf abundance may have far-reaching consequences for population viability and confidence in state wildlife managers. We discuss findings from Wisconsin alongside similar findings for other states' occupancy models being insensitive to human causes of mortality that have recently increased. Overall, Wisconsin's proposed method for estimating wolf abundance shows significant departures from best practices in scientific measurement. Verification will require independent replication and unbiased tests at multiple scales in multiple habitats under different human-induced mortality rates, and peer review before the new methods are considered reliable." (Treves & Santiago-Ávila, 2023)

Our wild ones maintain the balance. It is humans who have and continue to ruin and descimate our wild ones from wolves, bears, horses…
Elsa Katrine	All of it	Yes	We appreciate the efforts of all WDNR staff involved in updating the state's wolf management plan. Although we believe the current plan needs significant updating (see next section), we recognize the efforts and improvements made to the previous plan, including: ● Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. ● There is much greater recognition of the ecological role of wolves ● The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves ● The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed	The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on (see reference list below): ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution ● The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. ● The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ○ A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings. ○ Hounding or hound training, which are akin to allowing legalized dogfighting, should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public. ● The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. ○ Despite Act 169, which mandates a wolf hunting season, the department can still restrict the implementation of lethal methods by setting minimal quotas, including a quota of '0' wolves, restricting timing and methods. ○ Several studies have proven a proactive non-lethal approach leads to better conflict mitigation. ○ Lethal management often fails to provide a long-term solution to wolf predation and has the least consistent success rates when compared to non-lethal practices. In addition, there is significant evidence showing that lethal wolf management may be less functionally effective at mitigating subsequent livestock losses than non-lethal deterrents. ● The plan should require the implementation of abatement measures as well as the use of non-lethal conflict minimization techniques by domestic animal owners for the latter to receive compensation for confirmed predation. ● The plan also runs contrary to public values towards wolves (and omits mention of such majority values from the plan), despite department surveys evidencing that the broad public cares about wolves as individuals (and not just for the viability of the population). Given the recent liberalization of killing wolves by the state, it would be incredibly informative to note majority support of the following reasons for opposing a regulated wolf hunting/trapping season (which are all omitted from the plan): opposition to specific methods of harvest like hounds (64%) or traps (70%), feelings that hunting wolves is unnecessary (62%) or culturally offensive to Native American tribes (57%). ○ All such reasons convey majority disagreement with practices currently promoted and endorsed by the legislature and the WDNR, and such a conflict between managers and the public should not only be acknowledged, but foregrounded and carefully considered in policy (instead of dismissed). ○ Such decisions to omit literature or downplay evidence (e.g., such as majority opposition to killing wolves and their reasons) are contrary to principles of scientific integrity (e.g., present all relevant scientific evidence to the public) as well as ethics (e.g., disguising ethical decisions, such as recreational wolf killing, as	2	PROTECT our ESSENTIAL WILDLIFE ESPECIALLY WOLVES at all costs! No more hunting or trapping wolves in Wisconsin. Period.

				robustly supported by science). ● Conflicting agency objectives (e.g., optimizing public hunting and conflict mitigation) are not only not acknowledged, but even misunderstood as harmonious, against the body of scientific evidence. That culminates in the prioritization of consumptive values and policies; e.g., according to the body of scientific literature, use of lethal methods, and 2 especially public hunts, are contrary to most objectives relevant to: harm mitigation, the wellbeing of wolves, their ecological roles, and their non-exploitative enjoyment (i.e., Objectives A, B, D and F). ● There is a stark lack of consideration for individual wolves, wolf population health (including wellbeing), and measurable indicators for assessing any harms barring disease prevalence (e.g., accounting for cortisol levels or other stress hormones, measures of pair/pack persistence) ● There is an inappropriate understanding and consideration of tribal worldviews about wolves. Tribal worldviews of wolves are misconstrued as 'cultural benefits' tribes receive from the existence of a wolf population, when in fact tribal worldviews consider each individual wolf as a person and relative. Cultural respect and sensitivity towards such views, shared by many non-tribal members, demand the strict mitigation of lethal measures, especially recreational killing, as opposed to their current promotion in the plan. ● In general, all omissions of scientific literature, the arbitrary prioritization of policy objectives, the rhetoric of the plan and the dismissal of public values and concerns for wolves point towards a biased, unscientific and instrumental view of wolves that promotes values contrary to broad public perspectives on wolves. ● 'SOM' wolf estimation methodology – From a recent critique: "The new methods sacrifice precision, but are believed to retain adequate accuracy and sensitivity to changing conditions for reliable decision-making. We review evidence for the accuracy, precision, and sensitivity of the new 'scaled occupancy model' (SOM) applied in Wisconsin. We conclude that the Wisconsin method would systematically overestimate wolf abundance by large (but currently incalculable) margins. Because Wisconsin, similar to other states, not only changed to unverified methods but also implemented widespread wolf killing, shortcomings in their estimates of wolf abundance may have far-reaching consequences for population viability and confidence in state wildlife managers. We discuss findings from Wisconsin alongside similar findings for other states' occupancy models being insensitive to human causes of mortality that have recently increased. Overall, Wisconsin's proposed method for estimating wolf abundance shows significant departures from best practices in scientific measurement. Verification will require independent replication and unbiased tests at multiple scales in multiple habitats under different human-induced mortality rates, and peer review before the new methods are considered reliable." (Treves & Santiago-Ávila, 2023)		
Jennifer Spirakis	All of it	No	None	I support increasing protections for wolves, requiring non-lethal conflict interventions and banning recreational killing!	0	I support increasing protections for wolves, requiring non-lethal conflict interventions and banning recreational killing!
Cristy Murray	Just the parts I am interested in	No	Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves There is much greater recognition of the ecological role of wolves The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed)	In general, all omissions of scientific literature, the arbitrary prioritization of policy objectives, the rhetoric of the plan and the dismissal of public values and concerns for wolves point towards a biased, unscientific and instrumental view of wolves that promotes values contrary to broad public perspectives on wolves.	2	I object to the term wolf harvesting. Wolf killing is more authentic, though just as objectionable.

Ashley	All of it	Yes	● Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. ● There is much greater recognition of the ecological role of wolves ● The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves ● The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed)	● The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on (see reference list below): ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution ● The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. ● The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ○ A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings. ○ Hounding or hound training, which are akin to allowing legalized dogfighting, should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public. ● The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. ○ Despite Act 169, which mandates a wolf hunting season, the department can still restrict the implementation of lethal methods by setting minimal quotas, including a quota of '0' wolves, restricting timing and methods. ○ Several studies have proven a proactive non-lethal approach leads to better conflict mitigation. ○ Lethal management often fails to provide a long-term solution to wolf predation and has the least consistent success rates when compared to non-lethal practices. In addition, there is significant evidence showing that lethal wolf management may be less functionally effective at mitigating subsequent livestock losses than non-lethal deterrents. ● The plan should require the implementation of abatement measures as well as the use of non-lethal conflict minimization techniques by domestic animal owners for the latter to receive compensation for confirmed predation. ● The plan also runs contrary to public values towards wolves (and omits mention of such majority values from the plan), despite department surveys evidencing that the broad public cares about wolves as individuals (and not just for the viability of the population). Given the recent liberalization of killing wolves by the state, it would be incredibly informative to note majority support of the following reasons for opposing a regulated wolf hunting/trapping season (which are all omitted from the plan): opposition to specific methods of harvest like hounds (64%) or traps (70%), feelings that hunting wolves is unnecessary (62%) or culturally offensive to Native American tribes (57%). ○ All such reasons convey majority disagreement with practices currently promoted and endorsed by the legislature and the WDNR, and such a conflict between managers and the public should not only be acknowledged, but foregrounded and carefully considered in policy (instead of dismissed). ○ Such decisions to omit literature or downplay evidence (e.g., such as majority opposition to killing wolves and their reasons) are contrary to principles of scientific integrity (e.g., present all relevant scientific evidence to the public) as well as ethics (e.g., disguising ethical decisions, such as recreational wolf killing, as robustly supported by science). ● Conflicting agency objectives (e.g., optimizing public hunting and conflict mitigation) are not only not acknowledged, but even misunderstood as harmonious, against the body of scientific evidence. That culminates in the prioritization of consumptive values and policies; e.g., according to the body of scientific literature, use of lethal methods, and especially public hunts, are contrary to most objectives relevant to: harm mitigation, the wellbeing of wolves, their ecological roles, and their non-exploitative enjoyment (i.e., Objectives A, B, D and F). ● There is a stark lack of consideration for individual wolves, wolf population health (including wellbeing), and measurable indicators for assessing any harms barring disease prevalence (e.g., accounting for cortisol levels or other stress hormones, measures of pair/pack persistence) ● There is an inappropriate understanding and consideration of tribal worldviews about wolves. Tribal worldviews of wolves are misconstrued as 'cultural benefits' tribes receive from the existence of a wolf population, when in fact tribal worldviews consider each individual wolf as a person and relative. Cultural respect and sensitivity towards such views, shared by many non-tribal members, demand the strict mitigation of lethal measures, especially recreational killing, as opposed to their current promotion in the plan. ● In general, all omissions of scientific literature, the arbitrary prioritization of policy objectives, the rhetoric of the plan and the dismissal of public values and concerns for wolves point towards a biased, unscientific and	4

				instrumental view of wolves that promotes values contrary to broad public perspectives on wolves. ● 'SOM' wolf estimation methodology – From a recent critique: "The new methods sacrifice precision, but are believed to retain adequate accuracy and sensitivity to changing conditions for reliable decision-making. We review evidence for the accuracy, precision, and sensitivity of the new 'scaled occupancy model' (SOM) applied in Wisconsin. We conclude that the Wisconsin method would systematically overestimate wolf abundance by large (but currently incalculable) margins. Because Wisconsin, similar to other states, not only changed to unverified methods but also implemented widespread wolf killing, shortcomings in their estimates of wolf abundance may have far-reaching consequences for population viability and confidence in state wildlife managers. We discuss findings from Wisconsin alongside similar findings for other states' occupancy models being insensitive to human causes of mortality that have recently increased. Overall, Wisconsin's proposed method for estimating wolf abundance shows significant departures from best practices in scientific measurement. Verification will require independent replication and unbiased tests at multiple scales in multiple habitats under different human-induced mortality rates, and peer review before the new methods are considered reliable." (Treves & Santiago-Ávila, 2023)

Aimee Miller	Just the parts I am interested in	No	We appreciate the efforts of all WDNR staff involved in updating the state's wolf management plan. Although we believe the current plan needs significant updating (see next section), we recognize the efforts and improvements made to the previous plan, including: ● Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. ● There is much greater recognition of the ecological role of wolves ● The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves ● The adoption of proposed buffer zones around tribal reservations (i.e., previously no buffer zones existed)	The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on (see reference list below): ○ wolf ethology, sentience, sapience, sociability, agency and wellbeing ○ effectiveness of non-lethal interventions, especially relative to lethal ones ○ the impact of widespread killing on wolves' physiology, behavior, wellbeing, social dynamics, ecological relationships and evolution ● The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. ● The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. ○ A substantial body of research documenting human-caused mortality in North American wolves, including Wisconsin wolves, has found that policies allowing liberalized killing of wolves result in a direct increase in the hazard and incidence of illegal killings. ○ Hounding or hound training, which are akin to allowing legalized dogfighting, should be illegal or severely restricted as this practice is extremely cruel to wolves and hounds alike and is not supported by the majority of hunters or the broad public. ● The plan should prioritize wolf protections and concentrate solely on non-lethal management of wolves in response to livestock conflicts to ensure ethical coexistence. ○ Despite Act 169, which mandates a wolf hunting season, the department can still restrict the implementation of lethal methods by setting minimal quotas, including a quota of '0' wolves, restricting timing and methods. ○ Several studies have proven a proactive non-lethal approach leads to better conflict mitigation. ○ Lethal management often fails to provide a long-term solution to wolf predation and has the least consistent success rates when compared to non-lethal practices. In addition, there is significant evidence showing that lethal wolf management may be less functionally effective at mitigating subsequent livestock losses than non-lethal deterrents. ● The plan should require the implementation of abatement measures as well as the use of non-lethal conflict minimization techniques by domestic animal owners for the latter to receive compensation for confirmed predation. ● The plan also runs contrary to public values towards wolves (and omits mention of such majority values from the plan), despite department surveys evidencing that the broad public cares about wolves as individuals (and not just for the viability of the population). Given the recent liberalization of killing wolves by the state, it would be incredibly informative to note majority support of the following reasons for opposing a regulated wolf hunting/trapping season (which are all omitted from the plan): opposition to specific methods of harvest like hounds (64%) or traps (70%), feelings that hunting wolves is unnecessary (62%) or culturally offensive to Native American tribes (57%). ○ All such reasons convey majority disagreement with practices currently promoted and endorsed by the legislature and the WDNR, and such a conflict between managers and the public should not only be acknowledged, but foregrounded and carefully considered in policy (instead of dismissed). ○ Such decisions to omit literature or downplay evidence (e.g., such as majority opposition to killing wolves and their reasons) are contrary to principles of scientific integrity (e.g., present all relevant scientific evidence to the public) as well as ethics (e.g., disguising ethical decisions, such as recreational wolf killing, as robustly supported by science). ● Conflicting agency objectives (e.g., optimizing public hunting and conflict mitigation) are not only not acknowledged, but even misunderstood as harmonious, against the body of scientific evidence. That culminates in the prioritization of consumptive values and policies; e.g., according to the body of scientific literature, use of lethal methods, and 2 especially public hunts, are contrary to most objectives relevant to: harm mitigation, the wellbeing of wolves, their ecological roles, and their non-exploitative enjoyment (i.e., Objectives A, B, D and F). ● There is a stark lack of consideration for individual wolves, wolf population health (including wellbeing), and measurable indicators for assessing any harms barring disease prevalence (e.g., accounting for cortisol levels or other stress hormones, measures of pair/pack persistence) ● There is an inappropriate understanding and consideration of tribal worldviews about wolves. Tribal worldviews of wolves are misconstrued as 'cultural benefits' tribes receive from the existence of a wolf population, when in fact tribal worldviews consider each individual wolf as a person and relative. Cultural respect and sensitivity towards such views, shared by many non-tribal members, demand the strict mitigation of lethal measures, especially recreational killing, as opposed to their current promotion in the plan. ● In general, all omissions of scientific literature, the arbitrary prioritization of policy objectives, the rhetoric of the plan and the dismissal of public	4	

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
				values and concerns for wolves point towards a biased, unscientific and instrumental view of wolves that promotes values contrary to broad public perspectives on wolves. ● 'SOM' wolf estimation methodology – From a recent critique: "The new methods sacrifice precision, but are believed to retain adequate accuracy and sensitivity to changing conditions for reliable decision-making. We review evidence for the accuracy, precision, and sensitivity of the new 'scaled occupancy model' (SOM) applied in Wisconsin. We conclude that the Wisconsin method would systematically overestimate wolf abundance by large (but currently incalculable) margins. Because Wisconsin, similar to other states, not only changed to unverified methods but also implemented widespread wolf killing, shortcomings in their estimates of wolf abundance may have far-reaching consequences for population viability and confidence in state wildlife managers. We discuss findings from Wisconsin alongside similar findings for other states' occupancy models being insensitive to human causes of mortality that have recently increased. Overall, Wisconsin's proposed method for estimating wolf abundance shows significant departures from best practices in scientific measurement. Verification will require independent replication and unbiased tests at multiple scales in multiple habitats under different human-induced mortality rates, and peer review before the new methods are considered reliable." (Treves & Santiago-Ávila, 2023		
Lisa Neste	Most of it	No				I support increasing protections for wolves, requiring non-lethal conflict interventions and banning recreational killing!
Tasha	All of it	No	I pray I'm a pastor that all animals are save the majestic creatures. I pray that all your plans in your mind or given to you by God and that you're able to save every wolf every baby cub in the name of Jesus it will all work he will be rejuvenate, restored and refresh, and you will have clarity on how to do this and many people from everywhere will come to help you I'm in.	Anything you were trying to do to save the wolves it's all good nothing is bad at least some people are coming to go to save the wolves that are voiceless	10	I believe we need to find people in Congress attorneys judges, people that have power, and know how to word things so that they understand that we are not gonna stand for the animals being killed. Remember, the animals are majestic creatures that belong to God if you protect them, God will protect you and your family. If you do not protect his animals, then don't cry to him to protect your kids so I believe that you were doing the right thing there's nothing wrong with your plan if I think of anything else I will let you know, but at least y'all are trying to say the poor wolfs.
Daniel Aquino	Most of it	No	Wolves in WI will no longer be managed by reference to the old numerical goal of 350 wolves. There is much greater recognition of the ecological role of wolves. The inclusion of a social survey, which notes increased positive views of wolves, knowledge of their ecological roles and increased opposition to the motives and methods for killing wolves. The adoption of proposed buffer zones around tribal reservations.	The current draft does not reflect the best available science, and is missing a substantial amount of scientific literature on such as wolf ethology, sentience, sapience, sociability, agency and wellbeing. The above scientific omissions, combined with the emphasis on and promotion of sustainable recreational killing and consumptive users as a main management strategy, results in a biased plan that runs contrary to scientific evidence despite much of this omitted scientific evidence being more recent, numerous and of stronger inference. The plan should strictly curtail any lethal management of wolves except in extremely rare circumstances of immediate defense of life. The plan should require the implementation of abatement measures as well as the use of non-lethal conflict minimization techniques by domestic animal owners for the latter to receive compensation for confirmed predation.	4	
Rick Barber	Most of it	Yes	It is a very thorough and comprehensive plan covering all aspects of wolf ecology and history. I can see that a diverse group of wolf interest groups provided input to the plan.	There should not be buffer zones around reservations. Even the northern zone of WI is not "wilderness". A balance needs to be maintained between predator and prey. Collapsing the deer herd in favor of wolves is not sustainable or responsible. Allowing numerous wolf packs to disperse into second and third tier areas with more roads and agriculture is not sustainable or responsible. The wolf population has exploded well above previously accepted, scientifically determined population goals. Specific management tools must be added to this management plan.	3	This management plan provided very little in the management area but provides much in the area of monitoring, studying and maintaining the unacceptable status quo.
Steve Arduser	Most of it	Yes	Lots of graphs and charts with specific information.	No population goals.	6	I think the population should be 350. And I'm not concerned about hunting near reservations.
Daniel Rambo	Most of it	Yes	The completeness of the plan, addressing supporting wolf populations, continued monitoring/research, and education outreach to the public. The DNR consulting with an established board of various interested partiesi s a very good idea as is the establishment of different management zones that address particular concerns or characteristics of that area of the state is a valuable method of gaining support from state residents and interest groups. Overall, I think the plan is well thought out.	No objections	10	As stated in the plan, the idea of wolves being part of our state ecology brings much debate. Unfortunately, wolves have not had the support or acceptance from human populations that other wild animals have. Hopefully the proposed plan can help increase understanding of the place of wolves in ecology of our state. The plan is a reasonable approach to addressing the variety of opinions held by we humans.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
	Just the parts I am interested in	Yes		population goal was not set. Should be set at 350	1	
Anne Edwardson	All of it	Yes	I like the very thorough and detailed presentation of the history of WI wolves, the historical changes in the relationship between people and wolves, the cultural importance of wolves to our First Nations, and public attitudes toward our wolf population. I like the attention given to the values held by members of the public of animal equality; i.e. the right of wolves to exist and live here; the moral and ethical considerations of how wolves are managed and hunted; the value of stewardship vs. dominance. I like the description of how the department has managed wolves in the past, what has worked well with recommendations for continuation and what might be different in the future with recommendations for change. Much of what I am concerned about, concerning the hunting of wolves, was addressed. I would encourage the target hardening of farms and livestock: the plan addresses this, yet I would increase emphasis on it, expanding possible options.	I did not see anything that would prevent a repeat of the infamous hunt of 2021. The elephant in the room is WI Statute 29.185 that mandates a wolf hunt whenever wolves are not federally protected. I understand that as an agency, you must work within statutory authority, yet that statute seems to totally contradict the fundamental premises of this plan. I am opposed to the wolf being a "game species", and it seems that public sentiment and the cultural values of WI tribes share that value. Somewhere or somehow there must be a check to a simply mandated hunt. This plan calls for a "well-regulated public wolf hunting and trapping season" in Strategy C1a. If for whatever reason, a hunt cannot be well regulated, then a hunt should not be held. Somehow, this plan should provide for that possibility. I would also include a recommendation for monitoring hunting dog depredation to assure that the dogs are the victims of wolves and not of irresponsible human companions who are training them in wolf caution areas, known rendezvous sites, or bear bait locations. I would support a return to funding wolf depredation through the sale of endangered species license plates (if I understood that change correctly). Also, I would recommend not allowing dogs to be used to hunt wolves. I understand from TWA that the road system and logging trails in northern WI are so pervasive that wolf dens are dangerously accessible increasing their vulnerability and leading to heightened mortality. I would suggest adding citizen groups who monitor wolf hunting activities to the post-season hunting survey for their input on what they observed during the hunt. There are not enough wardens, and concerned citizens should be encouraged to observe in the civil fashion in which, for example, the Wolf Patrol does. ( ) The Animal Legal Defense Fund has a bill of rights for animals, one of which is: The Right of animals in the wild to self-determination and an environment that allows them to engage in behavior natural to their species. That might be included in this plan.	8	I am in the almost "opposed to all hunting" category, yet I consider tolerating hunting as the price to pay for living in a state with the gift of natural resources that we have in WI. I have had many co-workers and some family members who hunt so I understand the desire to hunt. Yet I do not want to experience the trauma of flagrant, unregulated hunting, and I emphasize support for the balance of stakeholder interests that I read in this draft plan. In the just wondering category, is the loss of farms in the northern part of the state having any effect on wolf management needs or strategies? Do farms attract wolves for other than their livestock? The grain and other feed sources may attract or support rodents and other small animals that the wolves also eat. And, are increasingly isolated farms more vulnerable to wolf predation than farms located in a robust farming community? (Just wondering.)
Steve Gevaert	All of it	Yes	I don't know that I like any elements. Even in your preface you make false statments, "Since the DNR manages wolves according to this plan and following state and federal laws, the DNR takes this revision process very seriously" You don't take "YOUR" plan, or State Law seriously or you would been ready to hold a required hunting and trapping season I January.	That you don't abide by your own scientific research that WI only has quality habitat for a limited population of 350 wolves. It's a total sham and cruel to subject people in the northern part of the state to such a high populations which I'm sure numbers much higher than you propose. We could never hunt and trap 1/4 to 1/3 of the overall wolves in 3 or 4 days. Stick to your own research (not the national organizations) and place the 350 population goal in the plan and activiely hunt and trap to accomplish it. I have cabin on the Forest/Florence boarder and the deer herd is almost non-existent.	1	Having large buffer zones around tribal lands is just another way of increasing the overall population. Remove those.
Bill Perrotti	Most of it	Yes	Nothing comes to mind	Buffer zone around Reservation land. Increase in population.	1	
	All of it	Yes	I understand you think by killing them is to help them with climate change and so forth . But it's not a good idea . Keep them alive . The planet needs them. We have to learn how to live with them .	Do not kill them .	4	Stop trapping them and killing them for fur .
Jonathan Walter	All of it	Yes	N/A	1. We need a numerical goal for the state. This is the basis for using science to use data to accomplish a goal. Be specific and manage to the plan. 2. Buffers around Reservations. US Landowners have property rights in the USA. 3. Not counting lone wolves in population estimates. They have no less of an impact on people and wildlife than those counted. Estimates are 10-15% of the population are Lone Wolves 4. Managing the hunting harvest while factoring in Native American harvest tags. If they are not going to use them, we need to increase the available amount for state hunters.	1	For me, the most obvious sign of concern is the lack of understanding of how people who actually live on the ground in wolf country feel about the population. All indicators at the local and county level where the populations are highest are asking for a 350 population goal and reducing the numbers. As an avid Bayfield County Hunter from SE WI, the impact is not felt in the southern state anywhere near what it is in Bayfield County. There is not a day you hunt during the gun season where you don't see Wolf Tracks, see Wolves, or hear Packs Howling. They have decimated the deer herd and destroyed the hunting camp traditions of the north. And for what?
Bruce J Olson	All of it	Yes	All of it	Non of it	10	About time we have a balanced plan.
Angela Payseur	All of it	Yes	The harvest zones and limitations set forth within most of them. Trying to listen to hunters, but also taking into account the importance of Wolves.	The zones of 1B and 2B not included in the reservation no-harvest zone. There should be a no hunting perimeter around the tribal lands. The approval of using baiting and dogs to hunt wolf (and bear). It is inhumane and the cause of most of the depredation. Although controversial, remove the hunting dogs and you remove most of the depredation and payments for losses- indicated by your research in the plan.	4	Please reconsider allowing baiting and the use of dogs. Also, including zones 1B and 2B in the tribal no hunting zones. The thought that tourism to see wolves etc, while enticing, isn't very realistic for our area and probably won't have any impact. The plan is well researched and thought out. But, personally, I hope they remain listed, so no hunting is allowed. People need to be aware educated and respectful of wildlife and we can co-exist.
Rick Mack	Most of it	Yes	The zones	The lack of a population goal	1	

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Jeffrey F Kenkel	Most of it	Yes		I took way too long to present. No Population Goal: The 'holistic approach" is wrong. There was a numerical goal of 350when wolves were first re-introduced, and that should remain. It was the DNR's number then and no reason has been given for it not being retained. Population Estimates: Plain and simple, there are too many wolves. You are trying so hard to deny that, but given our human population, how it is spread across the state, and the many conflicts that deer hunters, bear hunters, and dog owners have every year wolves are far more prevalent and create far more human conflicts than reasonable. The population needs to be reduced and not having the original 350 population as a goal furthers these conflicts. Tribal Zones: It is WRONG to increase the tribal zines beyond the reservation lands boundaries. Farmers and hunters in these areas are being unduly punished by no reducing wolf populations and therefore conflicts. Hunting Quotas: It is no secret that the tribes do not want to harvest any wolves, so why even include them in the quota?? That's just silly. Just go a head and create harvest numbers to aim us back the the originally accepted number of 350. Delisting: The plan must insist the DNR help the State delist wolves so that we can resume lethal conflict control and population management.	1	Plummeting deer numbers in wolf overpopulated areas have affected our economy negatively by A) Reducing deer hunter enthusiasm and therefore hunting participation, B) Decreasing recreational (hunting) land prices, C) Severely depressing deer hunting as a tradition and significant source of tourism dollars across at least the northern one-third of the state. Please stop your veiled ani-deer hunting attraction to wolves.
James F Koth	Just the parts I am interested in	Yes	None of what I read	No actual number of wolves goal.	1	The DNR wolf management has ruined deer hunting on public land in the northern 1/3 of Wisconsin. There are way to many wolves and no management plan.
Don DeMotts	Most of it	Yes		No population goal, no hearing in heavily wolf populated areas, local governments should have input, the plan implies that hunting conflicts are hunters fault and have no recourse, buffer zones for reservations gives management to tribes, no form of population control in the plan,	0	It appears to me that our DNR is solidly in the camp of wolf protectionists and is anti hunter, anti dogs and is not for the management of the wolf population, rather management of humans to accept wolves where ever they are located.
Deborah Dakich	Most of it	Yes	I'm happy to see that the plan calls for using scientific research instead of instituting a plan that is based on bias information influenced by a small minority of Wisconsin residents and outside influences, such as, Hunter Nation.	The first item is the recreational hunting of the wolves to reduce conflicts. There isn't any scientific basis for this. In fact studies have shown that by removing a pack member, especially an alpha male or female, increases conflicts. Also, the model used for determining the population, is skeptical. We should try to accumulate more data on the population throughout the state. This should include the input of biologists and professionals.	5	One other item is the use of hounds for hunting wolves. This practice encourages unsactioned dog fighting. It also disrupts other animals within that environment. Allowing hounds to run wild on public lands, is a nuisance and annoying practice for other residents using public lands. Wolves should not be hunted in national forests and areas of prime habitat.
Dianne Yeske	All of it	Yes	I am very pleased to see the elimination of a numeric population goal and ensures that the ecological effects of a hunt are taken more into account. I am also pleased to see that the treaty rights of the tribes (which have been sorely ignored in the past) are taken into consideration, with the establishment of the low quota zones.	I would like to see better regulation of hound training, where rather than keeping it open through the entire state during wolf hunting season, it be closed as each zone is closed. I would also like to see more emphasis onn non-lethal options to reduce wolf and livestock conflicts. And, as with any good adaptive wildlife plan, there should be something in place that spells out when the plan will be up for review again and updated as needed, as well as a committee specifically created to oversee this management.	9	Overall, I think the proposed plan is significantly better than what Wisconsin currently has, and commend you for considering the science and the tribes in this new plan.
Anne B	Most of it	No	Input from multiple partners & not just hunting groups (tribes, state/tribal agencies, nature/conservation groups, etc.); science-based information used as basis for information (not preconceived outdated ideas like 'kill all the predators' etc. as in the past); depth of information and research	No specific elements; maybe that it doesn't include information on immediate effect of bordering populations as in the UP of MI and MN - I live just over the northern WI border in the UP and we have wolf populations that might interact with the WI populations	8	Make sure hunting season is better regulated/methods in place so the debacle of the last one isn't repeated and the quota isn't vastly overreached
Leslie Paynter	Most of it	Yes	1) Getting rid of a numerical target population goal 2) The adoption of buffer zones around tribal lands 3) The importance of wolves' ecological benefits 4) The inclusion of tribal knowledge and values in the document	1) I would like to see the DNR work with the state legislature to overturn PA 169 2) Hunting with hounds and hound training be banned in the state 3) At minimum I'd like to see a ban on the use of hounds to hunt wolves in National Forests 4) I'd really like to see a zero hunting quota to protect wolves	7	I appreciate the time and effort that went into drafting this plan and overall I feel it is good. I think the hunting organizations hold too much sway in this state and there seemed to be a lot of emphasis on the killing of wolves rather than meaningful steps towards co-existence.
Barb Voigtman	All of it	Yes	The plan removes a numeric population goal and instead focuses on the science of what it will take to maintain a healthy wolf population within a healthy ecosystem. Love that the plan focuses on the ecological benefits of wolves, commitment to science and research, focus on public education and the importance of non-lethal methods in promoting co-existence of farmers with wolves.	Recommend calling out the challenge ACT 169 has on the DNR's ability to foster true stewardship of wolves and in maintaining a healthy ecosystem, not to mention the impact this could have on a potential increase in livestock attacks by pack disruptions. If hound training on wolves must be allowed, recommend stopping training in the zones that are closed. Recommend putting in date for future review of plan such as in 5 years versus "valid until replaced". Recommend prioritizing non-lethal methods to prevent wolf attacks versus paying for wolf attacks after the fact. Put prime emphasis on public education to dismiss myths about wolves. Living in a county that has wolves I have heard many falsehood about wolves. We desperately need education to counter this misinformation. Recommend more emphasis on honoring tribal beliefs and culture through more tribal involvement and policies that reflect the tribes beliefs. The tribes have hundreds of years of experience in living in harmony with wolves and hold the wolf in high regard. We should tap into this experience more and put more weight on honoring tribal beliefs.	9	Thank to the DNR for using comprehensive methods to include key stakeholders and public input along with an extensive literature review of current and applicable research/benchmarks as well as a review of historical and current DNR data to write this plan. This plan was well written and a great reference. Great job!

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Dave Krause	Most of it	Yes	Management level of 500 animals	Not keeps the 500 animals	1	Your poor wolf management has come close to wiping out low deer populations, especially after hard winters. Low to no raw production. Our future of deer and deer hunters are being left in the hands of people who let this get out of control. I would like to see my license money to be spent on something better then a 70 page report on wolf plan. A animal that had no reason to be reintroduced in the state of Wis.
Lisha Doucet	Just the parts I am interested in	No	• The elimination of a numerical target population • The importance of the ecological benefits of wolves and inclusion of tribal values and knowledge. • The attempt to minimize the impacts of a recreational hunt by adopting buffer zones around tribal lands, shortening reporting requirements and making hunting licenses zone specific. • Emphasizes the use of non-lethal methods to reduce conflicts.	• Absent is a commitment by DNR to work with the legislature to overturn PA 169 and remove payments for hunting hounds, killed by wolves. • Hound training must be stopped. • The plan should establish a zero hunting quota to protect wolves in our national forests and other areas prime habitat. • The recreational hunting/trapping to reduce conflicts has no scientific basis. • At a minimum, DNR should ban the use of dogs to hunt wolves in our national forests. • There is considerable uncertainty in estimating wolf populations based on the occupancy model and should not be used solely to determine population. • The plan should include an oversight committee which is comprised of biologists and professionals.	5	Overall, the plan is good; however, the Committee was overrepresented by hunting organizations even though they represent the minority opinion of Wisconsinites. Too much emphasis was placed on the killing of wolves rather than co-existence.
	Most of it	Yes	Protecting the wolves	No dogs for anything training or otherwise	10	We need to balance our ecosystem and that includes wolves
Bob R	Most of it	Yes	Hunting remains an option	No goal. Should be 350. Can't hold department accounts without a number goal. Should not have buffer zones that includes private lands where wolves might be a problem.	1	Need to hold public hearings.
John Barton	All of it	Yes	Not much, no mention of numbers or hunting.	No number on how many wolfs Wisconsin we limit. We need a control on wolf's north of highway 29	1	Wolf's have caused millions if not billions of lost revenue in Northern Wisconsin. We are losing hunters in the north and land ownership because of the wolf. We need two separate plans, one north of Highway 29, and one south.
Matt Amend	Just the parts I am interested in	Yes	I like the fact that you are taking comments on the plan, and that you will use the comments to improve it.	I do not like the fact that there is not a population goal. Seems the agency took the easy way. If the current form comes to pass, it will open up a can of worms for all. Also, I don't understand what the large buffer areas around the tribal reservations has to do with good management. I don't own property in these areas, but I would be mad as heck being restricted from using it……i.e. hunting. Please get back to managing the population through hunting and trapping this year. It is a shame that the whole situation has become somewhat of a political football these days.	3	We need to have a population numbers. The current idea is too vague. Hunting and trapping is a must. Also take into account that the tribes will have a harvest of zero. Big boy decision time…….please!
Anne-Marie Hewitt	All of it	No	The elimination of a numerical target population. The importance of the ecological benefits of wolves and inclusion of tribal values and knowledge. The attempt to minimize the impacts of a recreational hunt by adopting buffer zones around tribal lands, shortening reporting requirements and making hunting licenses zone specific. Emphasizing the use of non-lethal methods to reduce conflicts.	No commitment by DNR to work with the legislature to overturn PA 169 and remove payments for hunting hounds, killed by wolves. Hound training must be stopped. The plan should establish a zero hunting quota to protect wolves in our national forests and other areas prime habitat. The recreational hunting/trapping to reduce conflicts has no scientific basis. As a minimum, DNR should ban the use of dogs to hunt wolves in our national forests. There is considerable uncertainty in estimating wolf populations based on the occupancy model and should not be used solely to determine population. The plan should include an oversight committee which is comprised of biologists and professionals.	7	Overall, the plan is good. However, the Committee was overrepresented by hunting organizations, even though they represent the minority of Wisconsinites. Too much emphasis is placed on the killing of wolves rather than co-existence.
Barry Benson	Most of it	Yes	Like the use of sub zones to address livestock depredations. I also like the integrated approach to dealing with livestock depredations and health and human safety issues.	Population numbers not being used in management goals. This isn't logical based on the fact that DNR has solid info on every breeding pack in the state. Aren't overall numbers relevant when it comes to Federal listing or delisting? Seems like it's being avoided because of public disagreement with other wildlife populations(deer). Overall wolf population numbers do not have to be the sole basis of wolf management, but it should definitely be a part. The non hunting/trapping public opinions are based on overall population of any species . If the deer population is high, then hunting isn't viewed negatively. Same thing if the wolf population is growing or stable. Of course, the opposite happens if populations are low. Numbers ARE important and have to be included in any management plan, especially since the DNR has solid evidence to back those numbers up. Also I'm confused why the concentration of livestock depredations in northern Portage and Wood counties are not included in zone 4a. It would make sense to extend the northern boundary of 4a to the Portage/Marathon county line to include those farms that have had past depredations.	7	Probably caught this error already, but the language states that zone 4a includes parts of Wood, Portage, Clark, and Adams. The map actually shows that Adams is NOT in zone 4a, but a small portion of Waushara county is.
Bruce Coleman DNR # 96826	All of it	Yes	NONE	NO wolf numbers goal but DNR has lied to about the plan from the start so why should I believe you any way.	1	I don't believe anything you say about the plan. I voted for the very first plan and DNR lied about it all. I love to see wolves but you lied that numbers would be in check and I will not believe anything you say or write once you lie to me you will NEVER get me to believe you until you live up to your first broken promis
Michael Wipfli	Just the parts I am interested in	Yes		Not using numerical population estimates to base management and harvest proposals upon. A population goal of 350 was established to insure perpetuation of the species. Harvest quotas will be applied to tribal areas but If those quotas are not filled other methods must be applied to fill those quotas.	4	The Wolf is a wildlife species which requires the basics of food, water, and cover. You Natural Resource Professionals must get back to these basics and regulate this species to ensure that it stays in Wisconsin but is managed to population densities where prey specie populations are not affected, and human-wolf interactions are minimal.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Frank A Scherkenbach	All of it	Yes			10	When we spoke on the phone yesterday, I mentioned that I had a passing interest in commenting during the still open public comment period preceding the DNR's long anticipated publication of its updated wolf management plan. While in the process of entering the website to forward my comments, I noticed that participants are specifically asked whether they have read the proposed plan in whole or in part. This triggered me to take a good look at the entire plan. Once having done it, I've become so fascinated by the comprehensiveness of the study, including the exhaustive data gathering, and state history on which the plan is based, that I thought I would send it along for your recommended leisure reading. I found it both an informative and entertaining read. In fact, this is great read for anyone interested in Wisconsin's historic wildlife and cultural history, forming the basis on which we are now asked to consider regulating the wolf impact in appropriate wildlife areas still to be found here. In any event, I was impressed by the amount of effort the DNR has put into this highly controversial wolf management plan - and have a new appreciation for the people who are trying to serve the larger public interest, by bridging the gap between divergent and varied interests impacted by this DNR decision.
	Most of it	Yes		You write a plan that a majority of people will not read because it's too lengthy and confusing. It is clearly biased to favor the wolf.	1	You hide the cost chart of payments being paid for farm animals, pets, and other payments because of the wolf population. People are more interested in the cost and safety that is being caused by the increase in the wolf population. There is clearly a big increase in the payments to people from wolves killing their animals. People don't trust the dnr, and reports like this with no action of controlling the population only make people trust you less. KEEP IT SIMPLE STUPID
Paul Martin Griepentrog	All of it	Yes	None	Failure to address diseases transferred from wolves to livestock and people. example neopsorosis. Failure to address landowners concerns within the extended reservation boundaries.	0	Will USDA APHIS employ the tactic now being used in other abatement programs that violate civil rights? Example; farmers being denied access to programs because they refused to implement abatement protacals without just compensation for labor involved with implementation and maintenance.
Chuck	Most of it	Yes	Not much. We have 2000-3000 wolves in the state given the 20-21 survey. This doesn't include roaming wolves or sections of the state that aren't surveyed yet. For years we were told the population is around 824 wolves. Why should we believe anything from you now?	I'm not seeing any wolf management plan as far as reduction goes. There are far too many wolves in our state. I have zero faith in the dnr or any other government body to reduce the wolf population. Wolves have decimated the deer population in our state. And the UP as far as that goes. Same with northern Minnesota. They're as far south as Columbia county and most likely into Dane county as well. So their habitat is not restricted to northern forest zones. Also, Wolves not only kill weakened prey, they also kill healthy prey. It's not like they hang around starving till some deer gets weak. I've personally seen and followed them in bloody snow as they allowed young wolves to practice chasing and killing a healthy deer that an adult wolf hamstrunged so they couldn't run full tilt. As they wolves decimated the northern deer herd, they followed the food source south. I'm sure they'll be welcome in Madison and Milwaukee so city folks can see them. Just imagine gofling your favorite course as a pack of wolves chase a deer down the 13th fairway and kill a deer while you play through. Awesome!	0	End the elk program in Wisconsin. We were promised and elk hunt starting in 2000. Wolves killing elk delayed that for years until herds increased. Now we get a WHOLE 5 ELK A YEAR to hunt!!!! Oh Boy!! Eliminate all the staff and money that goes along with it. You want to hunt elk? Go west. And one more thing. Shut down all the deer farms aka cwd factories in the state. Just like Montana did in 2000 to protect their elk. Apple Creek in Cecil has over 300 deer per square mile. They have cwd within their fences resulting in surrounding counties not able to bait or feed. Yet Apple Creek still feeds artificially within their cwd factory fences. Total BS.
Jason Thomas	All of it	Yes	not much.	There should be more specific language about targeting the wolf harvest as resource management effort. It could be targeted more to avoid livestock predation damages. It could be targeted more as a way to increase Elk populations. It could be targeted more as a way to increase deer populations in certain areas. These things need wording that allows change over time. For example if the deer herd in wolf unit 1 experiences an extreme winter die off in 2022, then the wolf harvest in 2023 should be adjusted upward accordingly to improve deer population in wolf unit 1. If the deer population is strong in the accepted wolf range, then the wolf harvest should be targeted to the zones where the elk herds exist. Wisconsin has spent a ton of money on the elk reintroduction, and each elk has an extremely high cost association. There is no reason NOT to target wolf harvest to the elk zones, however limiting the method of harvest in these areas needs consideration. In Summary, The plan needs specific language to target wolf harvest and adjust wolf harvest Annually to manage the populations of deer, elk, and wolves looking at the current population estimates of all 3 species. The plan also needs specific language limiting the population estimate to 350 wolves and language stating that we will target harvest to achieve that population goal with in 3 years.	3	
Robert Tocco	Most of it	Yes	I like that the first "rule" is to maintain a viable population to fulfull the ecological role that wolve's play.	Too much control and allowing hunting groups too much say.	7	I am a long time hunter but I do not kill things I don't eat and I oppose predator hunting. In my opinion, the people that engage in wolf hunting lack ethics and do not care about or understand general ecology.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Marie Baker	Just the parts I am interested in	Yes	Removing an arbitrary wolf population goal is important to make sure the best-available science is centered in wolf management The low quota zones are an important and welcome addition to the plan The plan is rightly focused on the ecological benefits of wolves	The DNR should better regulate hound training on wolves.There is currently no guidance in plan for next review or update.The plan acknowledges that there are responsible farming practices and other non-lethal options to reduce wolf and livestock conflicts, but stops short of recommending that the DNR prioritizes these opportunities.	9	
Wende Zinda	Most of it	Yes	Science based approach. Tribal input. Involving volunteers to monitor the wolf packs.	I question the accuracy of wolf attacks on domestic animals. I think the information provided on this topic should be of less importance.	6	I don't want wolves to be hunted during mating season and when they have cubs. I don't want them to be hunted on snowmobiles or with dogs. I want regular reviews of how the new management plan is working.
Steven Davis	Most of it	Yes	It respects the principle of biodiversity and the place of wolves in Wisconsin's ecological systems. It also respects the tribes of Wisconsin instead of ignoring their views and preferences as has been the case for so long. Finally it rids the state of an outdated and obsolete population target that doesn't reflect reality or science and going forward would cause nothing but continued trouble and controversy.	I'd prefer it take stronger action on hunting with dogs. I am not opposed to hunting, but wolf hunting should be something hard to do as a sporting challenge, and not a frenzied showdown cruel to both dogs and wolves.	9	I thank the DNR for undertaking this new plan and seeing the need for it and taking seriously all sorts of different voices.
patrick j koehler	All of it	Yes	The reasons wolves should be maintained in Wisconsin's environment.	No quota.	4	Why does the DNR not want to abide by the original goal of 350 wolves as set by professional wildlife managers? It appears the DNR is bending to the whims of a very small segment of Wisconsin's citizens, and special interest groups, who base their stance on unscientific and emotional reasons only.
John Unger	All of it	Yes	None, as it is a smoke screen to the ignorant	The program was brought to the public using 350 as the number to be the goal, the goal now is 3 to 4 times that.	1	This is why the outdoorsman of this state do not trust our DNR, we were lied to and misled again.
Cory A. Masiak	Most of it	Yes	I like that the draft plan includes a focus on the ecological benefits of wolves; that Wisconsin's Native tribes were consulted in this process; that the tribes' responses (letters) were included verbatim in the body of the plan; and that "non-consumptive recreational opportunities associated with wolves" and wolf-related ecotourism were taken into account.	I feel that the plan does not take adequate account of the illegal harvesting of wolves in Wisconsin, which I suspect is much higher than we are aware of. I also think that the DNR should prioritize nonlethal options to reduce wolf-livestock conflicts. Finally, the use of hounds and other dogs in the wolf hunt needs to be better regulated.	8	Overall, I feel that this plan is science-based, which is a positive. But as someone who is totally opposed to the hunting of wolves, except in the case of serious livestock predation, I do not like its emphasis on providing a "sustainable harvest opportunity." As noted, we should aim for a form of "mutualism": the coexistence of wildlife and humans. I especially appreciated the statement by the Potawatomi that it is not the tribe's stance to "manage" their brother but to instead provide stewardship or nonlethal coexistence. If only white people (and I speak as a white person) exhibited as much wisdom as our Native neighbors.
Scott G Hrovat	Most of it	Yes	I like extra time for public to read and give comment! I do believe all groups need to work together on this and come up with a number all can agree on.	Need to be more accurate on population. Need a population goal for state.	3	I believe your population estimates are low, and you will need them to be accurate to establish quotas in specific management areas.
Linda Brunner	Just the parts I am interested in	No	Objective A: Ensure a healthy and sustainable wolf population to fulfill it's ecological goal.	Allowing any trapping (immense suffering often for the animal) and any use of dogs for hunting.	6	Those human beings in the areas focused on for wolf/animal predation concerns must be fully responsible on their end for the protection of livestock and pet animals.
THOMAS FECK	Most of it	Yes			10	I appreciate the vast amount of work and research that went into this plan. The educational sections are worthy. The actual management strategies are measured, fair and reasonable. Personally, I am opposed to killing wolves under almost all circumstances but I realize that this is not possible. Good job on the plan, I hope that it is implemented as written.
Matt Dettlaff	Most of it	Yes	I like the inclusion of many stakeholders in the process and the consideration of both the resource and social impact of trying to manage wolves in Wisconsin.	I am very disappointed that a numerical target population is not part of the plan. You cannot manage what you do not measure. Although we are measuring the wolf population, the plan has nothing solid to compare how effective future management efforts are in meeting a population goal. I live in the "secondary" wolf habitat of Adams County and I think it is very cool to have them in the area. Never would have thought wolves (or bears or bobcats) would inhabit the area when I was a kid first starting to hunt the area in 1980's. I think they add a very unique thread in the fabric of the ecosystem, habitat management and outdoor experience. I just think we need to manage them with specific population # goals in mind. And let the wildlife experts set the appropriate harvest quota's to keep the whole ecosystem healthy...and not the special interests on either end of spectrum manipulate the science.	6	Thank you for your efforts to balance the science and social pressures of this resource.
	Most of it	Yes		NO QUOTA OF 350 ANIMALS; YES ITS THAT SIMPLE!	1	I own land that is in the reservation boundary in Sawyer Co. The wolves have devastated the deer herd here and even members of the tribe are upset that there is no control set in place. WI. residents were on board with reintroduction of wolves as long as the 350 count was used. There is NO reason as to why the state would need more. Thank you.
Daryl	Most of it	Yes	not a lot	not having a wolf count. we have 3x as many wolves as we should have.	2	we need to help the northern counties to control the wolf numbers.there will be few deer if we dont.
	All of it	Yes			1	
	Most of it	Yes	There is a place for the wolf in Wi, at a managed level.	Underestimated population	2	

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
ken vanden heuvel	Just the parts I am interested in	Yes	i like that there will hopefully be a limit to the number of wolfs allowed and will be maintained		3	
	Most of it	Yes	Very little to like!	This is such a boring read. I wish that I was getting paid to read this because it took up so much of MY time!	2	Don't be listening so much to the people that live only in Milwaukee & Madison. And don't be censoring the comments. the DNR is not so believable so much anymore!!! Not everything can have a positive outlook all the time. That is not reality. Also you should be listening to the WWF board members more especially on there Objections numbers # 7-9-10 and 11. I own properties in Price and Juneau counties for meny years. And YES YOU NEED TO SET A NUMERIC POPULATION GOAL,
	Just the parts I am interested in	Yes			0	Looked like a huge data dump without the most important summary of population goal and annual harvest goals.
Cranberry River herbster	All of it	Yes	Not believe your graphs are accurate And I am a hunter Who spends 10 months in the woods along the Cranberry Sand and Raspberry river bottoms	Too much information for Most people is putting it mildly rather scientific data is wonderful for those of us that have dealt with it for 50 years But a more simplified Version for most people would make this more useful	4	I fear dealing with conservation Since childhood That recommendations should have been spelled out Precisely.
jim gibson	Most of it	Yes	Not much.	Not being very realistic on holding to the original number (350) of wolves. It's only a matter of time that someone will be severely injured by a wolf as they become more accustomed to humans. ie; When the old alpha male gets kicked out of the pack and has to fend for himself nothing's easier than a kid, older person or for that matter any person to become prey.	1	Sticking to the original goal of 350 wolves statewide.
Kyle Bartelt	Just the parts I am interested in	Yes	The plan removes a numeric population goal: Removing an arbitrary wolf population goal is important to make sure the numbers of wolves are adaptable, so they can be based on best-available science and ecological changes. The plan creates low quota zones around Tribal lands where the Tribes requested it: These lands are treaty-protected with documented wolf packs. Making this update is an important and welcome addition to the plan. Ideally, the plan would expand these zones beyond just the few that are listed. The plan is rightly focused on the ecological benefits of wolves The plan is reflective of the public opinions survey that was released along with the plan and finds that opinions toward wolves have grown significantly more favorable towards wolves There is expressed commitment to science and continued research with partners and acknowledges that “keystone species such as wolves are an important component of a healthy ecosystem”	The DNR should better regulate hound training on wolves. The DNR should close wolf-focused hound training activities as each wolf hunting zone closes.The plan currently would allow hounds to chase wolves for training purposes during the wolf hunting season, across the entire state, until the very last wolf zone is closed. This could go on for months and would interfere with the wolf breeding season in late winter. There is currently no guidance in plan for next review or update – there should be a plan for regularly updating the plan (so we don’t have another plan that is used for decades) and there should be permanent, ongoing stakeholder AND science committees to oversee wolf management in Wisconsin – The scientific oversight is critical. The plan acknowledges that there are responsible farming practices and other non-lethal options to reduce wolf and livestock conflicts, but stops short of recommending that the DNR prioritizes these opportunities.	9	
Carol Myers	Most of it	Yes	I like that it relies on tribal input and science, valuing wolves as an important component of environmental balance		10	
RUSSELL MATTICE	Most of it	Yes	MAPS showing distribution of Wolves on p48, etc	There is NO population maximum of Wolves listed. The subzones should be eliminated. The tribes already have harvest rights in the Ceded territory, per treaty. The US negotiated them a long time ago. Are there treaty rights just now discovered by the DNR that were not previously addressed in those treaties, that provide for more rights around the reservations? The survey in '22 sent out is suspect. I would like to see more imput from communities in Wolf populated zones. They PAY the REAL price. 500 WOLVES MAXIMUM IN THE CEDED TERRITORY A MUST! The DNR can set a goal for more Wolves in Zone 6 to reach any unproclaimed number.	3	The number of wolves to be harvested by tribes in ceded territories should be listed, and adjusted for non-tribal harvest opportunities based on actual tribal harvest totals. The adjustments to non-tribal harvest should be similar to the methodology used in tribal SPRING Walleye harvests on lakes in the ceded territory. The non-tribal harvest in the ceded territory would follow behind the tribal harvest season. I would like to see wolves managed for population increases in the southwestern counties in Wisconsin that have high CWD infection rates. I find this plan to favor tribal and the non-hunting urban communities to a large degree. I would encourage the DNR to promote the southern urban communities to take "Fluffy" for a walk in a Wolf populated zone, and follow up with periodic surveys also.
Judith Siettmann	Most of it	Yes	Removing an arbitrary wolf population goal. The focus of the plan on the ecological benefits of wolves. Planning for low quota zones around tribal lands.		9	

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Jason K Duehring	Most of it	Yes	I like the fact that there is a wolf management plan particularly data relating to historical wolf population and prey abundance in other areas of the country.	I dislike the lack of a proposed population goal based on prey abundance, human interactions, and livestock depredation.	4	What good is a wolf management plan that draws no conclusions on a wolf population density. Without a set population goal, how can you manage licenses and harvest?
Daniel Rhode	All of it	Yes	The plan needs critical review. There is very little to like.	The plan moves away from the wolf management 350 count that was previously promised to the residents of Wisconsin.	0	Initially the DNR stated that when population reached 350 wolves hunting and trapping would be allowed to control the population. This plan does not maintain that DNR promise to manage the wolves. Also the number of wolves the DNR states as the current population is grossly underestimated. Efforts should be made to accurately represent the current wolf population, and real management efforts begin to reduce that number to 350 or less. Its a shame that as an avid bird hundred for over 50 years I am afraid to take my dog hunting due to the actual number of wolves in the woods.
	Just the parts I am interested in	Yes	Setting up management zones to better manage the wolf population	I think the original population goal of 350 wolfs was spot on. We have now exceeded the carrying capacity, without conflict in certain areas of the state.	3	The only comment I have is the only people that should be listened too about wolves are those who live with them. No liberal from Madison or Milwaukee should have any input at all. They are not directly affected by wolves and should have no say, especially out of staters.
	Most of it	Yes	I like that the DNR claims to want to protect and enhance our natural resources.	Protecting wolfs does not protect and enhance our natural resources, if you go into a wolf pack territory you see and hear very little quantity of other animals because they kill virtually everything else. They do this with farm animals and animals which are hunted for food also.	0	You see on page 52 nothing major kills wolves except for people, however you can see on page 9 wolves are the largest killer of the elk herd (people can eat elk). The draft does not document the same information for the deer population however on page 14 it says in areas of high wolf usage the overall deer density was reduced by 62%. What are they benefiting in the environment? The only thing I see is lower deer heard will help reduce CWD, but so would a longer hunting season and that would avoid any risk to farmers heards.
	Just the parts I am interested in	Yes		Should be only 250 wolf like we where told years ago. And no buffering zone .These people pay tax's and bought land to hunt on .Who come up with these ideas not fair to landowners.	4	
[redacted]	Most of it	Yes	The historical components were very helpful . Understanding of public opinion is important as well. I live in a populated wolf area and can corroborate the opinions. Wolf population growth through the years was also very helpful.	Not sure that there is much to dislike. However, there is more background than plan.	6	
	All of it	Yes	I like the idea to spread wolf statistics and information with the public. I think there is a huge misconception in non-range that wolves are BeLOW population goals, while that simply is not true. I like the idea of a harvest season for population control.	I dont like objective A where the plan wants population goals above predetermined levels. There isnt a goal listed while the previous goal was 250 wolves in Wis and UP. Need more specific goals on this. The plan seems like it will be expensive to execute. Do we need all of these population and herd analytics when our population is substantially higher than goals!? This doesnt make sense.	7	
Tom Duffey	Most of it	Yes	Overarching goal, i.e. the species role in the overall scheme of things.	Nothing stood out, as I think necessary compromises have been incorporated.	10	Me viewpoint relates to forestry, forest health, and especially, the ability of certain tree and understory species to regenerate under our unnaturally high deer population. I support allowing the natural relationship between predator/prey to at least somewhat be reestablished.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Megan Fitzgerald	Just the parts I am interested in	Yes	I like the thought of dividing up zones to narrowly focus on certain wolf management and conflicts within that area. Also collaborating and collecting scientific data from different reports collected.	N/A	10	Hello, I am a current student at UW-Stevens Point majoring in Conservation Law Enforcement with a minor in Criminal Justice. In my past college career I have taken Conservation Law Enforcement Theory and Principles were our class studied the current issue of wolf management and collaborated on how to come up with a management plan and how to implement it in Wisconsin. Also, I attended a Fish, Forest and Wildlife Resources course where for our end of semester project we were required to create a scientific report and I chose to do wolf management with livestock conflicts. My outline was very similar to your plan draft, so I am making some suggestions as to what I accumulated over my courses. My approach to possible management techniques was to divide the state of Wisconsin in 6 divisions such as : NW, NE, CW, CE, SW, SE. Several wolf packs could have tracking devices put on to track their movements and collecting data from farmers as an online submission form reporting encounters or fatalities of livestock. Reporting could also be implemented for hunters with tracking dogs. A recommendation could be made as far as offering a grant program for farmers to apply for funding on installing deterrent methods on their properties such as fencing, install corrals closer to residence/barn, spot lights and making recommendations for their livestock to be locked up at night. There could be quarterly reporting done from the DNR with the farmers to monitor improvement or challenges. Another recommendation that may be more challenging to keep track of would be decipher the deer population and deciding on an appropriate range of wolf population that can be healthy and sustain both populations. Although it is hard to determine how many deer are within the population of Wisconsin, compiling reports of fatalities, motor vehicle fatalities and tag submissions from gun/bow hunting season can help get an idea of the impact on the deer population and the potential of wolf-conflicts. By compiling all these reports could help monitor an appropriate population for wolves and deer. Of course this will be a trial and error and numbers may be adjusted, but it is to be expected since it is impossible to know the exact numbers for populations. Another issue that influences the wolf management plan is bias and opinions from the public. By implementing more information and education programs can help people get an understanding of the importance of healthy population balance. This could be mailing surveys, targeting algorithms on social medias, maybe creating creative and fun videos since social media is a huge part of society (maybe getting involved in TikTok), getting student bodies more actively involved by having DNR individuals visit the schools for a visitor day or hold after school meetings for the public. I feel like there is a lack of education and a disconnect between the public where people are just concerned of how they were endangered and are "animal lovers" so to speak which can significantly alter their viewpoints.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Danielle Pahlisch	All of it	Yes	I appreciate the increased investment in public outreach, education, and opportunities for engagement through community science efforts. I also prefer the updated plan's management goals moving towards a social and biological carrying capacity, which I feel is more effective and legitimate than setting a number that is often used to justify population reductions whereas the science suggests otherwise.	I firmly believe that more regulatory oversight and methods to ensure regulatory enforcement need to be considered. The results of the 2021 wolf harvest should never be able to occur again, and methods that led to such a rapid over-harvest need must be reconsidered such as the coordinated use of multiple groups of hunting dogs.	7	I am a graduate student enrolled in the Masters of Natural Resources program at the University of Wisconsin – Steven's Point. In addition to maintaining a research focus on the intersection of predator species and human cultures, I have been an active participant in community science projects, professional trainings, and research conferences that emphasize wolf biology and ecology in the state of Wisconsin. I hope to someday serve communities in Wisconsin as a wildlife educator by improving community and wildlife coexistence methods through the utilization of engaging, science-based methods. Therefore, I have a vested interest in the successful implementation and evaluation of an updated Wolf Management Plan for the state of Wisconsin which is guided by the best available science. There are many improvements and additions to the objectives in the draft management plan that, I feel, will be beneficial in supporting a balance between a healthy and viable wolf population as well as stakeholder interests. However, I urge the Department to reassess and reconsider some of the proposals listed under Objective C, particularly the goals highlighted in Strategy C: Evaluate wolf harvest season structure and implementation. I strongly disagree with the use of hunting dogs as a legal method of wolf harvesting and encourage that the Department reconsiders the inclusion of this practice in the final version of this management plan. Wisconsin is the sole state in which this practice is legal, and the ramifications of its use has already been revealed in the results of the 2021 Wisconsin Wolf Harvest. Harvest totals were more than double the Department's set quota limit and were reached at an unprecedented speed of just 72 hours. Among verified occurrences of delayed harvest reporting and improved tracking capabilities due to snowfall, the one variable that contributed most significantly to the over-harvest was the use of hunting dogs. Official evaluations of the hunt show that 86% of wolf harvests were done so by the use of dogs, up significantly from the 35% of dog-assisted harvest totals from the 2013-2014 harvest. The ease at which some hunters can coordinate their respective groups of dogs to chase, tire, and trap wolves has led to the success rate of this method. Further information that is highly troubling was revealed by necropsies performed on harvested wolves, which were the wounds and lacerations consistent with canine-inflicted injuries. This suggests that hunting dogs are engaging physically with wolves. This is not the legacy or hunting tradition that Wisconsin's Department of Natural Resources should embrace; instead, I encourage the Department to install only those hunting methods that encourage fairness and dignity for wild and domesticated animals alike. Thank you for considering this input, and I look forward to following the development and implementation of this newest management plan.
Brett Widmar	Most of it	Yes	I liked how the statistics of depredation are clearly laid out as well as the statistics that show the Wisconsin wolf population is clearly increasing throughout time.	I disliked how the plan doesn't have a clear (+/-) deviation on the wolf population. The numbers seem to be skewed in a direction that encourages the idea of a slowly growing wolf population.	6	Future management plans should be left up to citizens and representatives that reside NORTH of hwy 29. It is these people who deal with the wolves, but it is policies created south of hwy 29 that dictate how we are able to manage this population. The wolves have their place in the ecosystem, but their population can not continue to grow un-checked.
michael goessl	Most of it		NONE	there is no numeric goal. We need to have a total number of wolves limit.	0	None of this seams to be science based. It appears to be mostly driven by emotions.
AnnMarie Preecd	Most of it	Yes	Removing an arbitrary wolf population goal is important to make sure the best-available science is centered in wolf management The low quota zones are an important and welcome addition to the plan The plan is rightly focused on the ecological benefits of wolves	Hound training!	9	
Dave Breuer	All of it	Yes	Just writing a plan	Anything having to do with having more than 350 wolves in this state	0	science and the people affected should be considered and not politics or the whim of tree huggers!!!!! We do not protect rats so why protect wolves!!!!
	All of it	Yes	ADD THESE POINTS I like the fact that the plan is based on good science and is not impose. Any mandatory population cut offs.	I think the plan could be a little more clear about the economic and tourism benefits of being one of the only states in the country that has a thriving wolf population and complete ecosystems	9	
Larry B	All of it	Yes	It appears like a lot of time has been spent on this.	But with all the time spent on the plan. It appears to be biased towards the wolf. It seems like the plan wants to increase the population or at the very least maintain the current numbers. Which are not very believable.	2	By not putting a population goal on the plan it means nothing. And by allowing the tribes to claim tags when there is a season is a joke. The DNR already knows they will not use them.
Cameron Beatty	All of it	Yes	Removing an arbitrary wolf population goal • The plan is rightly focused on the ecological benefits of wolves • The plan creates low quota zones around Tribal lands where the Tribes requested it	Overall none	9	Please do whatever it takes to correct last years tragic occurrence.
Chuck Matoush	All of it	Yes	The use of Science based management. Wolves should be left alone as much as possible except for human/livestock interaction.	The plan should be connected more to the deer population than human desires. A pop of 350 seems arbitrary. Dog hunting and Reimbursement are ridiculous. The benefits of a healthy wolf population are not really explored.	5	I am curious to know how much bears, coyotes, and dogs actually do wolf interaction. Comparisons to other carnivore interactions with Deer, Elk, and Livestock, are not even mentioned. Comparisons of bear and deer hunting to car accidents. Viability of disease and overpopulation of deer control compared to wolf predation.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
John Hollis	All of it	Yes	Increasing the numeric wolf numbers. Respecting the tribes cultural values concerning wolves.	Make sure wolf counts are very accurate by counting the population as opposed to territory modeling. Hunting does not solve depredation conflicts.	5	The use of hounds on wolves should not be allowed.
Jeremy Reichl	All of it	No	I do like to see in the wolf plan the DNR consider the wolf a game species.	The research on the elk predation seemed a little weak due to COVID restrictions and funding issues.	10	The wolf plan seemed to be appropriate for the numbers and time and left room for federal or state restriction on harvesting.
Kimberly Hollis	All of it	Yes	Thanks for removing cap on wolf population and acknowledging the tribal values of wolves.	I do not care for hunting as a conflict tool, hunting increases conflict as young inexperienced pack members are left to fend for themselves with the loss of older pack members. I do not care for the occupancy model currently being used. I think this model overestimates the number of wolves on the landscape.	5	I think that there should be a buffer zone around tribal lands and ban hunting in prime wolf habitat. Bear hound training needs to be drastically reduced as well as baiting. Baiting brings conflict between hounds and wolves. Chocolate should not be allowed in bait as it is poison to candid's. There should be no compensation for hounds lost to wolves. Hounds should not be allowed to train on wolves or used during any wolf hunting. The majority of Wisconsin residents believe people and wolves can coexist. The trophy hunting of wolves is only to appease a small, vocal minority and not the majority. I oppose recreational hunting and trapping.
Jim Johannes	All of it	Yes	Only the idea that we have a plan.	I sent in detailed comments before so I will not repeat those. I forgot to add this comment, however, and want to do it now. There should be no buffer zone around reservations. That infringes on rights of private land owners. It shouldn't have to go beyond that but if you insist on a buffer, you have it backwards! I draw an analogy to the Vietnam War and Cambodia. Where did the Vietcong and the NVA go to hide? Cambodia. The only way to stop that was to go into Cambodia. To the extent wolves can retreat onto reservations after predation on private livestock you need to allow them to be pursued onto reservations. So the buffer should be onto the reservations not onto private land. The common sense solution is to simply agree there can be no buffer zone for any buffer creates problems we do not need.	2	Please do not be so transparently biased in creating these committees. It is embarrassing.
debbie	Most of it	Yes				i think wolf should still be protected and Dnr should regulate them and last time open hunting they took a lot mor then they should of.
	All of it	Yes	Educating the public on the benefits of wolves to our eco system.	disagree with regulating population of wolves, specifically hunting, apparently we still have not learned from the mistakes of the past wiping out species for sport, recreation, misunderstanding of species. We live in their environment and need to learn to coexist with them vs. hunting them down, Even reducing the number of licenses to hunt still significantly effects their population. Let them live man is more of a trhreat to their survival than nature.	5	please reconsider plan to hunt wolves and study outcome of population every couple of years.
David Unger	Most of it	Yes	Mitigation of human/wolf issues, the idea of keeping wolves as a game species, the existence of wolves in our state	Lack of numerical management goal, apparent lack of concern for lowering wolf population	2	The original delisting population goal of 350 should be the standard still. There should be a timeline as to when to reach that goal. The tribes should not be allocated tags for something they have no intention of using. The reality is that when hunting and trapping begins in Wisconsin it will quickly become difficult to lower their numbers as is seen in Weatern states. This is something that needs to be addressed with tag allocation.
	All of it	Yes	Confirmed number of wolfs per zone	Need to low the number of wolves	1	
	Most of it	No			1	
Gary Giannunzio	All of it	Yes	leave the wolves alone; hunt the hunters	leave the wolves alone	5	leave the wolves 100% alone; get rid of hunting
	Just the parts I am interested in	Yes	The plan removes a numeric population goal: Removing an arbitrary wolf population goal is important to make sure the numbers of wolves are adaptable, so they can be based on best-available science and ecological changes. The plan creates low quota zones around Tribal lands where the Tribes requested it: These lands are treaty-protected with documented wolf packs. Making this update is an important and welcome addition to the plan. Ideally, the plan would expand these zones beyond just the few that are listed. The plan is rightly focused on the ecological benefits of wolves. The plan is reflective of the public opinions survey that was released along with the plan and finds that opinions toward wolves have grown significantly more favorable towards wolves. There is expressed commitment to science and continued research with partners and acknowledges that “keystone species such as wolves are an important component of a healthy ecosystem”.	The DNR should better regulate hound training on wolves. The DNR should close wolf-focused hound training activities as each wolf hunting zone closes.The plan currently would allow hounds to chase wolves for training purposes during the wolf hunting season, across the entire state, until the very last wolf zone is closed. This could go on for months and would interfere with the wolf breeding season in late winter. There is currently no guidance in place for next review or update – there should be a plan for regularly updating the plan (so we don’t have another plan that is used for decades) and there should be permanent, ongoing stakeholder AND science committees to oversee wolf management in Wisconsin – The scientific oversight is critical. The plan acknowledges that there are responsible farming practices and other non-lethal options to reduce wolf and livestock conflicts, but stops short of recommending that the DNR prioritize these opportunities.	9	

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
	I have not read any of the draft plan	Yes				To many wolfs ask the old timers why they got rid of them years ago it wasn't because they were so great. Get rid of them agian. Devastating the deer up north & the economy. Lots of people went to northern wis to deer hunt but nobody wants to go up there there are so few deer left it ain't even a huntable population. Most people are giving up on hunting wis just fo out of state there is a hell of a lot beter hunting& don't have to deal with the stupidity
	All of it	Yes	Nothing. Way too many wolves.	Pretty pathetic when we hunt 3 counties up north & run over 40 trail cameras between all of group & it's not uncommon to find multiple wolves when we check their trail cameras every week. Or when we go to the cabin in winter to snowmobile in Ashland county the only tracks on our 1 mile long road are wolf tracks. Doesn't take a genius to figure that out. It ain't no stray dog running wild in January.	1	Why don't you ask the public for their input on the wolf population. Not some city slicker that never leaves their cushy office to venture into nature and doesn't even know what a wolf track even looks like.
Joe Goltz	Just the parts I am interested in	Yes	Removing the cull number and basing the plan on populations and the science of the moment. I also like how tribal input was considered in the plan and there was focus put on the benefits of wolves in our ecosystem.		9	
	Just the parts I am interested in	Yes	Nothing reduce wolf numbers simple as that.	The wolf's devastated the deer herd in northernwis & the tax payers have to foot the bill for all livestock& hunting dog that get killed because of way to many wolf's.	1	The population. Estimates are so far of it ain't even funny all them educated idiots that think that they know the population are so far off. That's all they have to do is talk to all the people that spend time in the woods instead of sitting in there office that's never been in the woods.
	Just the parts I am interested in	Yes			10	Wolves are an integral part of our ecosystems. They help keep deer population in check, which benefits drivers, many plant, and other animal species. Less dear means less deer in our yards and on our roads and eating plants. That means plants can grow more. More plant growth means more food for other animals and less animals coming into town to look for food. The carcasses of their prey also help to add nutrients back into our soil and provide food for scavengers. Whuch means healthier soil for more diverse plant life and less scavengers in our trashcans. Want less highway accidents caused by deer? Less rabbits in your garden? A more diverse and healthier ecosystem? Keep the wolves around.
L Endicott	Most of it	Yes	That it is a science based plan and that you have included the Tribal communities.	I still believe quotas are too high for the wolves.	9	Humans do not need wolves for meat to feed their families. The wolves do not need to be hunted in huge numbers. Hunters in Wisconsin have many other species to hunt and even to fish. We need to leave these beautiful animals roaming in Wisconsin. When we remove the wolf at the apex of a food chain, the other animals in the chain are all affected. We should not risk damage to the interconnected chains that make our delicate food web. Please limit the wolf hunt in Wisconsin NOW!
Carol Mickelsen	I have not read any of the draft plan	Yes				-Tired'!!!-of-'Spending'!!-'Decades'!!-Trying to 'Bring Back'!!-'Endangered Species'!??---Only to Have the-'DNR'!!-End up Selling-'Licenses- To-'Kill Them'-!!!-!!-??////((-!!!-('Is-'Anyone-'Safe' -!!???-From-'$$$-'Engendered from-'Selling-'Licenses'-!!!-???-???-//-((((-!!!--('Ultimately'!!!?? -'Only Making:-'Lical'!??/-Orrr:-'Out of State-'Hunters'!??-'Happy'!???-Is-'Alll'---We have-to-'Offer'!!???-As a-'State'!!-??-??////--('Or'!??-'Alll -We -"Have'!!??-to-'Wake Up For'-!!!???-?!-//-;(((-???-?!'-??-((((-!!-!!!!
Amanda Coleman	All of it	Yes	- Removing an arbitrary wolf population goal is important to make sure the best-available science is centered in wolf management - The low quota zones are an important and welcome addition to the plan - The plan is rightly focused on the ecological benefits of wolves - Tribal community has been involved in the process	- The DNR should better regulate hound training on wolves. The DNR should limit wolf-focused hound training activities to only when wolf hunting is allowed in each zone. - There is currently no guidance in plan for next review or update – there should be a plan for regularly updating the plan (so we don't have another plan that is used for decades) and there should be permanent, ongoing stakeholder AND science committees to oversee wolf management in Wisconsin – this oversight is critical. - The plan acknowledges that there are responsible farming practices and other non-lethal options to reduce wolf and livestock conflicts, but doesn't recommend that these opportunities are prioritized	9	
	All of it	Yes	The only comment would be that there is a place for the Grey Wolf in Wisconsin but needs more management that stated in new plan.	Need total Wolf count of 350 or less. Buffer around reservations redicious. Comments related to hunting dog problems being the dog iwnets problem is wrong. Breaking the Wolf zones into small areas nor acceptable. Hound hunting for Wolves needs to take place. I believe the current Wolf population is way off on the extreme low side. The whole plan appears slanted towards the Wolf protectionist groups. Time for Wolves to be delisted and a hunting/trapping season to drastically reduce the state population.	2	This plan is unacceptable and needs to be redone with realistic conservation methods not bending to protectionist groups.
Erin Spoehr	Most of it	Yes	-removal of wolf population goal -consideration of the benefits wolves contribute to the ecology -creation of low quota areas around tribal lands		9	

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
jean publiee	Just the parts I am interested in	No	none. i want to point out there is no science involved. this is a political polemic. biologists are trained at land grant colleges where they learn to kill animals for humans. bad training	the killing and murder of a species that is part of the ecological spectrum that deserves respect and protection from humans, not to let fat sloppy guys with guns make a new trophy	0	wolves are never "resources" they are living breathing creatures that kil for food. no science at all in plan, just moneymaking as usual.license money is the goal. fat slob hunters killing an animal to have a trophy doesnt make me happy. reduce conflict humanely.killing wolves does not in any way help to "understand" wolves. stop the hunting and trapping. stop the venality of moneymad humans for license money
	Most of it	Yes	Overall analysis.	Lacking numerical wolf goals. Those in favor of increasing the number of wolves primarily live in large urban areas that have no wolves and more than likely are not hunters. Their support impacts the state plan overall, however, it hurts the areas with wolves. Business are closing due to lack of hunters because of low deer populations directly related to wolves. Also forces hunters to relocate to where there is a somewhat sustainable population.	4	
	Most of it	Yes	*There is connection to Tribal management. *It acknowledges the ecological benefit of wolves.	*It would be great to get specific about review and evaluation for the future.	9	
	Most of it	Yes	Removing an arbitrary wolf population goal is important to make sure the best-available science is centered in wolf management The low quota zones are an important and welcome addition to the plan The plan is rightly focused on the ecological benefits of wolves	there should be a plan for regularly updating the plan (so we don't have another plan that is used for decades) and there should be permanent, ongoing stakeholder AND science committees to oversee wolf management in Wisconsin – The scientific oversight is critical.	7	I like that the plan creates low quota zones around Tribal lands where the Tribes requested it.
Marvin Thorell	All of it	Yes	Numbers, of total wolves, projected and actual kill numbers.	WAY too long.	7	I own 80 acres of mostly wooded land in Lincoln County with 7 elevated (tree) stands. In 2022, I hunted 3 straight months from those stands. I also put out 8 trail cams throughout the 80 acres. In those 3 months of hunting I saw only one deer, a small doe, which I killed with my crossbow. I estimate that I put in over 80 hours in my elevated stands. I am 76 years old and have hunted this land for the last 64 years of my life and have never seen the deer population this low. I see as many wolf tracks as deer tracks in the woods. PLEASE kill more wolves. I felt bad about killing the single young doe because that is the seed for the future of deer hunting on my land. Will I see 0 deer on my land in fuure years. The thought distresses me.
	Most of it	Yes	The overall data provided from a range of different issues related to wolves	No population goal, buffer zones around reservations impeding land owners and users of public land in those areas, no plan to work with the federal government to delist wolves and bring management back into the states control	3	
	Most of it	Yes			3	
	Just the parts I am interested in	Yes	NONE	Most of all it, the WI DNR has no interest in actually fixing the issue of massive over population in the state. You are only doing this to waste money. We have no season, its not allowed by Federal Law, and there is a Democrat Governor in office. Do you honestly believe you're going to create a season on your own? LOL....stop it. When a season was available, YOU lied about numbers, as always, creating a far, FAR lower quota for the hunters of this state. Its absolutely sickening. As a hunter, who puts far more money into the economy of this state, than any hiker can dream too, i have no doubt the DNR will make a mockery of it all, again. I'm just happy that the Northwoods hunters of this state take things into their own hands, as well they should. Shoot em all!	0	Complete trash, like most DNR ran operations.
	Most of it	Yes		There is no population goal. We need to have a way to keep the population under control when protections are removed. WI should be active in trying to get wolves from the federial protect species list.	1	
Karen	All of it	No	• The elimination of a particular number as a target population • The importance of the ecological benefits of wolves and inclusion of tribal values and knowledge. • The attempt to minimize the impacts of a recreational hunt by adopting buffer zones around tribal lands, shortening reporting requirements and making hunting licenses zone specific. • Emphasizes the use of non-lethal methods to reduce conflicts.	Absent is a commitment by DNR to work with the legislature to overturn PA 169 and remove payments for hunting hounds, killed by wolves. • Hound training MUST be stopped. • The plan should establish a zero hunting quota to protect wolves in our national forests and other areas prime habitat. • The recreational hunting/trapping to reduce conflicts has absolutely no scientific basis. • At a minimum, DNR must ban the use of dogs to hunt wolves in our national forests. • There is huge uncertainty in estimating wolf populations based on the occupancy model and should absolutely not be used solely to determine population. • The plan should include an oversight committee which is comprised dominantly of biologists and non-hunter, non-trapper professionals.	7	
	Most of it	Yes	Nothing. Waste of time and money. I used to hunt deer, hardly see any since the wolves were brought in.	After seeing the wolf with the fawn in its mouth going back to feed the little ones we saw on camera, I don't want wolves eating our deer.	0	Plan a wolf hunt.
Anne C	All of it	Yes			0	Wolves should be on the protected species list and not hunted for any reason.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Anna Brewer	Just the parts I am interested in	No	The elimination of a numerical target population The importance of the ecological benefits of wolves and inclusion of tribal values and knowledge. The attempt to minimize the impacts of a recreational hunt by adopting buffer zones around tribal lands, shortening reporting requirements and making hunting licenses zone specific. Emphasizes the use of non-lethal methods to reduce conflicts.	Absent is a commitment by DNR to work with the legislature to overturn PA 169 and remove payments for hunting hounds, killed by wolves. Hound training must be stopped. The plan should establish a zero hunting quota to protect wolves in our national forests and other areas prime habitat. The recreational hunting/trapping to reduce conflicts has no scientific basis. At a minimum, DNR should ban the use of dogs to hunt wolves in our national forests. There is considerable uncertainty in estimating wolf populations based on the occupancy model and should not be used solely to determine population. The plan should include an oversight committee which is comprised of biologists and professionals.	7	Please provide any other comments related to the current draft wolf management plan: Overall, the plan is good; however, the Committee was overrepresented by hunting organizations even though they represent the minority opinion of Wisconsinites. Too much emphasis was placed on the killing of wolves rather than co-existence.
	All of it	No	The elimination of a numerical target population • The importance of the ecological benefits of wolves and inclusion of tribal values and knowledge. • The attempt to minimize the impacts of a recreational hunt by adopting buffer zones around tribal lands, shortening reporting requirements and making hunting licenses zone specific. • Emphasizes the use of non-lethal methods to reduce conflicts. Too much emphasis was placed on the killing of wolves rather than co-existence.
RFH	All of it	Yes	A sustainable population, but at very reduced numbers.	Creation of Wolf Advisory Commitee, another inefficient, politically motivated government bureaucracy, Don't believe that wolf populations can be self-regulating without human intervention. There is a reason wolves were hunted to near extinction. Plan is too wordy and long and contains much "weird" science vs real science. Was the draft peer reviewed by anyone?	2	I believe wolf populations should be kept low, not near extinction levels, but a number where depradations are the exception and not the rule.
	Just the parts I am interested in	Yes			4	I think you should do more research on how many wolf's there actually are. You should thin the herd by 50%
Joy Perry	All of it	Yes	Recognition of ecological roles of wolves as well as acknowledgement of the importance of wolves to WI tribes. The draft is voluminously referenced and very well supported with respect to the underlying science (too much to be specific here) You seem to have accomplished good balances among competing interests, while making clear that the plan will be based primarily on the science. Recognition of importance of sub zones such the 1B is a great addition. The scientific literature review is impressive and insightful. Similarly, data collected from so many researchers, organizations and even the public help to ground this plan.	The draft has to address hunting, but here's where some of it goes too far. First, allowing the use of dogs is absolutely nonsporting. The bear season has vividly shown me that hunters track their radio collared dogs from their vehicles and put fresh dogs onto the trail when initial dogs tire, and so on. There's nothing whatsoever "sporting" about that - electronic tracking needs to be prohibited. I view baiting and trapping/snares/legholds the same way - there's no 'fair chase" in that, not to mention increased risks of other species (including domestic dogs) being caught. If we have to allow wolf hunting, structure it to ensure that it be ethical and strictly targeted to wolves.	6	I'd be interested in knowing just how many people actually read all 170+ pages… Good job overall; or reflects a lot of hard work by many people.
	Most of it	Yes			5	Protect the wolves. Don't listen to all of the redneck bar talk.
Campsie Grothendieck	Just the parts I am interested in	Yes	I like a minimal effort to recognize the need to protect our natural resources in Wisconsin. I appreciated the map, disturbing as it is, showing the teeny area left of the historical ranging area of the wolf. Let's protect what little of this beautiful eco system we have left.	I dislike the heavy influence of ranchers and hunters who only care about their own profits or their own personal entertainment to the detriment of our precious wildlife.	5	We must protect the dwindling natural world and stand up to self-serving profiteers who would destroy every last living being to make a buck. Enough
	All of it	Yes	The 2022 draft plan eliminates an arbitrary and unscientific numerical target population which is consistent with other states, such as Michigan. The plan stresses the ecological benefits of wolves and the importance of tribal values and knowledge. The plan does attempt to minimize the impacts of a recreational hunt by adopting buffer zones around tribal lands, shortening reporting requirements and making hunting licenses zone specific. The plan emphasizes the use of non-lethal methods to reduce conflicts.	The DNR should make a commitment to work with the legislature to overturn PA 169 and remove payments for hunting hounds, killed by wolves. Hound training must be stopped. Hound training is ongoing even though wolves are currently federally protected. The plan should establish a zero hunting quota to protect wolves in our national forests and other areas prime habitat. There is no scientific support for the use of recreational hunting/trapping to reduce conflicts. At a minimum, DNR should ban the use of dogs to hunt wolves in our national forests. There is considerable uncertainty in estimating wolf populations based on the occupancy model and should not be used solely to determine population. The plan should include an oversight committee which is comprised of biologists and professionals.	8	I was disappointed that the committee was over-represented by hunting organizations who based their opinions on hearsay, myths and not scientific data. The DNR should promote co-existence rather than pandering to the hunting/trapping community (and in particular the Bear Hunting organizations)
Cindy Walters	Just the parts I am interested in	Yes	I really appreciate the way you included input from all different parties including tribal. I really support a science based approach. I think the hunt a few years ago was a total mess as so many more wolves were killed than the goal.	Don't support a hunt vs non lethal means for wolf control. It seems an unnecessary concession to deer hunters. Generated by ginning up fear and hate for wolves.	8	Thank you for extending your time for public input. I live up north and often see wolf scat on our trails and wolves in our trail cams. I feel they are an important piece of our ecosystem up here.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
	Most of it	Yes	the management zones seem fairly logical, the plan to educate the public seems reasonable	could not find anything specific for what the carrying capacity is for each zone, no plan to petition the Federal Government to finalize remove from endangered species list and make it more difficult for single judges to put wolves back on the endangered species list in this state	5	seems to be very biased toward no actual management of wolves to allow them to expand their population as much as with as little harvesting, control or human interference as possible
Nathan Socha	Most of it	Yes	I like that it uses more current scientific research.	I do not like that no actual number or number range has been set for a goal. By not doing that it allows the state to do what they want. Also the majority of the public imput from surveys should come from the areas where wolf reside.	2	I feel like considering marquette and green lake counties unsuitable for wolves is just false. There are plenty of wolves in that area. The fact that 8 of them were harvested from marquette alone should show that.
mary	Just the parts I am interested in	Yes	that you are taking a holistic approach to managing the wolf in WI		10	
Gerard Deprez	Just the parts I am interested in	Yes	I thought the plan went into a lot of historical information pertaining to the adaption of the wolf on the ecosystem.	I thought the plan could have been done in more of an executive summary and less pages and less detail. You cited a reference to a 2014 survey that was done. I think you can refute a lot of the findings of that study. It comes down to the fact that there are too many wolves on the landscape and we need to reduce the population by at least 20%. This will not harm the wolf population based on the study.	1	I believe the residents in the state have spoken. They would like a wolf hunting season to reduce the wolf population. We need to set a numerical target for the desired population. If this population continues to grow, there will be more and more payments to citizens that have been harmed, a more dangerous environment for northern residents and visitors, and fewer animals to be hunted where wolves exist.
John Marchwick	All of it	No	I REALLY think this is one of the best wolf plans I have read yet. It's informative, you use hard facts, scientific data, you got statement's and teach the reader about the cultural significance of wolves and their meanings among Native Americans. I love how you're honest about wolf livestock conflicts as nothing is 100% effective which I love how you're honest about it. I love the elimination of the state population goal because as a sixth generation Montanan, the state population goal in Montana for wolves has been incredibly controversial as it's influenced how the anti wolf laws were made in 2021 that Montanas state legislature and governor passed. I love how you debunk myths about wolves within your wolf plan and it really seems like you used the best available science.	Well, I guess this part is more of an improvement but I would like to see if there's anyway the DNR can incorporate or promote tolerance of wolves in areas where people are living with them as I saw numbers in those areas that showed people there that didn't like wolves rather than they did. I do NOT support a wolf trapping/hunting season but I also know by law you are required to in Wisconsin however it seems like you're more prepared if one were to occur versus from the February wolf hunt of 2021. But again and overall, I really like the draft wolf plan you guys created and I hope you adopt it.	10	If there's anyway to like increase tolerance of wolves with people in areas where wolves are living in could be quite beneficial but from what I read you guys have a solid wolf plan.
Steven Gerrish	Most of it	Yes	Did I miss the part on the number of deer and the impact wolves has on it? Let's be real, the elk is is being decimated by wolves too. Your unknown mortality, bring the elk kill loss over 50% by wolves.	We have spend $16,000,000+ on an animal reintroduction for what? Where is the ROI? Should have never happened and your populations counts are Not accurate. There is way more wolves than you can count.	5	We need a let hunters harvest more wolves. Deer hunting and hunting license generate revenues. Revenues that should be used for greater outdoor engagement, not spent on wolves that nobody has an interest in
K N	Just the parts I am interested in	Yes	Removing an arbitrary wolf population goal is important to make sure the best-available science is centered in wolf management The low quota zones are an important and welcome addition to the plan The plan is rightly focused on the ecological benefits of wolves		10	The DNR should better regulate hound training on wolves. The DNR should limit wolf-focused hound training activities to only when wolf hunting is allowed in each zone. There is currently no guidance in plan for next review or update – there should be a plan for regularly updating the plan (so we don't have another plan that is used for decades) and there should be permanent, ongoing stakeholder AND science committees to oversee wolf management in Wisconsin – The scientific oversight is critical. The plan acknowledges that there are responsible farming practices and other non-lethal options to reduce wolf and livestock conflicts, but stops short of recommending that the DNR prioritizes these opportunities.
	Just the parts I am interested in	Yes			1	I ask that are wolves protected, not gunned down for sport or cruelly trapped for their pelts. Please eliminate wolf-hunting adjacent to Tribal reservations. I demand to disallow hunters from training dogs to chase down wolves. I want to thank the state of Wisconsin for removing a cap on the wolf population.
	All of it	Yes	I appreciate the removal of the cap on the wolf population	It allows hunting with dogs How can you insure effective law enforcement on future wolf hunts? The Wolf Advisory Committee needs term limits.	7	How often will the plan be reviewed? Why are wolf den and rendezvous sights public knowledge?
	All of it	Yes	EDUCATING THE PUBLIC ON WOLVES. THE FACTS ABOUT THE REAL DANGER TO PETS AND LIVESTOCK.	PAYING FOR HUNTING DOGS KILLED WITH TAXPAYER DOLLARS! ALSO, THE DISEASES IN WOLVES ARE CARRIED BY DOGS ALL OVER.	3	Paid Safari Companies do not belong in WI. HOLD OVER FROM A PREVIOUS ADMINISTRATION. The land in WI is being eaten up by developers, creating a loss of habitat. When will the DNR pay to buy more land for Parks as did our forefathers? Funding wolf hunts is not something I support. We could do something better with the money.
Michael ballmann	Most of it	Yes	You attempted to involve people from across all demographics. But some were under represented.	No population goal- it should remain at 350. Did not get a fair representation of residents living in prime wold habitat. Giving the tribes the right to manage properties 6 miles surrounding their reservations. Taking away the rights of those who hunt w/ dogs. Too many zones to micromanage an animal that roams over large tracts of land that intersect	2	Hunters support conservation in this country, it's our money supporting state DNR's. With crashing big game populations in wolf territory, you are losing hunters who are paying the fees. The wolf lovers are not going to fund these agencies.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
				many of the proposed zone. A disregard for deer population numbers. It's all about wolf #'s.		
	Most of it	Yes		No population goal	1	Set a population goal and a plan to achieve it within two years. if permits are allotted for the tribes, an equal number should be allotted for the general population above and beyond the amount allotted for the general
John Welhoefer	All of it	Yes	It is obvious if we kept the numbers around 5-700 we would have less problems with the farmers. It does state that numbers could go as low as 200 before the federal government would feel it was endangering the possibility of a recovery.	Page 124 you talked about wolves on the reservations, it seems like you're really caving into the Indians on this. I don't own land on the perimeter of the res. But if I did I would be upset about the extended boundary.	8	It is a tough choice but the wolf numbers will need to be reduced to half or less in order for people up north to live with them. Everyone should be able to protect their livelihood.
	Most of it	Yes			1	Being a Wisconsin land owner in the north and seeing the lose of deer in my area , finding numbers of wolf killed deer on my property through out the years , and watching the lose of hunters in the aera ,makes me think that our DNR only cares about keeping their jobs or to justify the thought of them as the keepers of our state wildlife. They need to remember that if not for the men and women that hunt in this state they would not even be needed. I am not going to say that wolves should not be part of the eco system , the DNR uses the hunter as a tool to control the population of wildlife in this state. I think it's time for the DNR to set limits on how many wolves we need in this state. I spent 1/4 of my life in the north and have only seen 3 wolves in their natural habitat , most people in this state will never see a wolf in the wild only in a zoo, (and i think that wolves should not be in a zoo) talking to the hunters this fall most saw more wolvers then deer, the only thing I see coming is a uprising on the wolves and there will be no more and I think they do belong but need to be limited to a manageable number
Susan Michaud	Most of it	Yes	I am encouraged by the fact that no overall quota will be established - I think some local control is good but oversight by the DNR will be crucial. (see next question). It is not clear to me at what point and how the DNR will step in on the wolf hunt - and say enough!	The fact that wolf hunting seasons may well be longer is of concern -there may well be an impact on wolf packs and any hunting close to breeeding season and wolf pup birthing is not appropriate. I am also not clear on who will be allowed to serve on the state wolf advisory committee. It seems that an advisory commitee made up of scientist/biologists should be separate from committees that include wolf hunters. Why not have different committees that could have some inclusive meetings. Lastly, although the DNR's hands are apparently tied in regards to the use of dogs for wolf hunting is there a reason that the DNR can't give an opinion on that and at least point to the cruelty of that for both dogs and wolves?-	7	I found much of the plan comprehensive and thoughtful. However, because of its length (and detail) I am concerned that the number of people that will read it is very limited thus diluting its impact.
Diana Jonen	Just the parts I am interested in	Yes	The legitimacy and importance of wolves in an ecological system; low hunt quota zones; the removal of arbitrary wolf population goals	I don't know	9	I am glad to see changes are being made that will prevent another debacle like last year's.
A. Lewandowski	All of it	Yes	None of it.	The idea of allowing the wolf to spread throughout the state. Wolves need to be where people aren't. The sad thing is someone will have to die in order to get the point across.	0	The wolf is back so do your part to get it de-listed.Set a number , 350 and stick to it no matter what the antis in the south say. They don't live with them!
Russ Bloom	Just the parts I am interested in	Yes		Lack of a management number and a clear plan to control wolf numbers	1	I have been a life long hunter, and have purchased land in Lincoln county to great financial hardship. My grown children hunt with high hopes of passing this tradition down to my grandkids. We have had some wolfs move through in the past, but within the last year we have had a pack make our area there home- the results have been devastating. I would not have believed how bad it could be. How we going to keep young hunters, our future, interested in deer hunting when they sit on stand for days not seeing anything? I'm very disappointed in the department for letting wolf management get out of control. Wolf management going forward needs a clear population goal(350, which is still to many) and a harvest season. Very disappointed.
Dawn Williams	All of it	Yes	1. Removal of max. population number/goal. 2. Recognizing the important role wolves play in providing ecosystem services. 3. A more balanced plan that recognizes Tribal beliefs and the interconnectedness between wolves, as a part of nature, and human well-being. 4. Commitment to science and continued research, including the recognition that current regulations for hunting other species, e.g., bears for which baiting and	1. Greater oversight/regulation is needed regarding hound training on wolves. The DNR should limit wolf-focused hound training activities to only when wolf hunting is allowed in each zone. 2. That prioritization wasn't given to responsible farming practices and other non-lethal options to reduce conflicts with wolves. 3. The plan lacks a defined review/update schedule. 4. The plan does not include permanent, ongoing stakeholder and science committee(s) involvement in overseeing wolf management in the state.	9	Thank you

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
			hunting dogs are allowed, contribute to wolf/hunting dog conflicts.			
Jennifer butler	I have not read any of the draft plan	Yes	Couldn't download anything. Your site is difficult which is probably your plan.	Make it easy to answer, which you didnt		You are VERY deceptive with this and the answers. Shame on you.
Meghan Pierce	Most of it	Yes	The plan removes a numeric population goal: Removing an arbitrary wolf population goal is important to make sure the numbers of wolves are adaptable, so they can be based on best-available science and ecological changes. The plan creates low quota zones around Tribal lands where the Tribes requested it: These lands are treaty-protected with documented wolf packs. Making this update is an important and welcome addition to the plan. Ideally, the plan would expand these zones beyond just the few that are listed. The plan is rightly focused on the ecological benefits of wolves The plan is reflective of the public opinions survey that was released along with the plan and finds that opinions toward wolves have grown significantly more favorable towards wolves There is expressed commitment to science and continued research with partners and acknowledges that "keystone species such as wolves are an important component of a healthy ecosystem"	The DNR should better regulate hound training on wolves. The DNR should close wolf-focused hound training activities as each wolf hunting zone closes.The plan currently would allow hounds to chase wolves for training purposes during the wolf hunting season, across the entire state, until the very last wolf zone is closed. This could go on for months and would interfere with the wolf breeding season in late winter. There is currently no guidance in plan for next review or update – there should be a plan for regularly updating the plan (so we don't have another plan that is used for decades) and there should be permanent, ongoing stakeholder AND science committees to oversee wolf management in Wisconsin – The scientific oversight is critical. The plan acknowledges that there are responsible farming practices and other non-lethal options to reduce wolf and livestock conflicts, but stops short of recommending that the DNR prioritizes these opportunities.	9	I like that the plan centers science, public input, and Tribal engagement- the core tenets of the best way to protect, conserve, and sustain natural resources.
Loren Voss	Most of it	Yes	Information	Sway towards wolves being any modern day use.	1	Wisconsin has very little habitat for wolves. Wolves will NOT stay in the habitat that Wisconsin has for them. i am a life long resident and hunter of Wisconsin. I have never saw a wolf in the wild. Now do I want to!
	All of it	No	It is the start to a real plan, better than nothing at all.	There is no numerical goal for the wolf population.	1	In order to properly manage the wolf population in WI, you must provide a reasonable and achievable number of wolves as the population goal. ie. 350!
Christopher Baker	Most of it	Yes	Ensuring a healthy and viable wolf population.	Allowing a wolf hunt.	7	
Larry Steen	Most of it	Yes	I give credit to this product of much research and contemplation. The authors, I think, did their very best to present and discuss all sides/views to the question of whether wolves should be allowed to exist in Wisconsin. However, the authors are human beings, only expressing what is "best" for the humans, but not for the wolves. Thankfully, there are many people who are looking out for the very best interests of the wolves, and hence the production of this Draft Review.	The sad, but true, history of humans slowly but surely destroying our earth is a reality that most admit, but few put forth any effort or remedy, at any level. I see this Draft Review as an effort. However, the bottom line with this Draft Review is that wolves come second place to the human interest. Of course, this is always a conclusion when humans and nature conflict. Thus, in this Draft Review, consideration for the wolves come secondary. Why should human beings determine/dictate that only so many wolves should be allowed to live in Wisconsin, and that certain human beings, who love to kill, be allowed to "harvest" the wolves? (The word "harvest" reminds me of picking apples or squash.) If truth be told, in theory, the human race should be examined as to how many of us are allowed to live, in Wisconsin or elsewhere. Any one wolf, in Wisconsin or elsewhere, is of more importance and significance than a human being. Although I hunted when young and stupid, today I can only view hunters as people who, quite simply, love to kill another being; hunters have a thirst only to be satiated by killing. My view is that there should be no hunting season for wolves. This majestic animal should be allowed to thrive as nature dictates. Man controlling nature, has over and again resulted in disaster. And, importantly, the wolves were here first.	4	I am well aware that my thoughts and comments will be ignored. Thank you for allowing me the forum to express me feelings. Larry Steen, [redacted] Elkhorn, WI 53121-1338. [redacted]
John Marchewka	Most of it	Yes		the composition of your wolf management team consists of more protectionist groups than those interested in an active hunter/trapper harvest plan.	2	The DNR is making little effort to manage wolves (even remotely close) to the established population goal of 350 animals. There is a poor accounting of lone wolfs and dispersed groups. There is a 4-5x multiplier of wolves in this state over said population goal. Protectionist groups now have more influence on DNR management plans than does the long-standing relationship between the DNR and hunters/ trappers (and there respective organizations).
mike thompson	Most of it	Yes	The graphs showing percentages of wolf/prey kills	The percentage of kills labeled unknown it looks like the dnr is hiding facts	7	always keep in mind the ability of wolf to reproduce if populations are low. overhunting is not bad aand helps the population in the long run

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Michael Delvoye	Most of it	Yes	Let the wolf be a wolf. Cattle and sheep are invasive species. Reimburse farmers for their losses without so much red tape.	Hunting the wolf makes no sense.	0	Listen to the indigenous people, they know what they are talking about regarding the wolf.
John Meagher	Most of it	Yes	The public forum for using citizens input	I don't like increasing the number of wolves killed via licensing	3	It is my belief, that if we are trying to combat CWD, we would want to increase the total amount of wolves in the state. Not only are there EFFECTIVE measures to prevent predation of domestic animals (dogs...), a lot of those kills are by coyotes, etc. Peoples fear(?) of these beautiful animals of God's creation, is and has been used as an excuse for destroying the animals that are not used for food. People need to stop fearing our wildlife, which is a very precious resource that balances the circle of life. The more 'natural' our environment here in Wisconsin is, the more tourism we will keep having.
Russell Ryczkowski	All of it	Yes	None of it!	No quota. Buffer around reservations. Population estimates. Lone wolves not counted while other states do count them. This whole process is upsetting all sportsmen and landowners who have been dealing with high predator numbers for year.	0	
	All of it	Yes				I don't think wolves should be hunted at all
Steve Nagel	All of it	Yes				If you're going to allow wolf hunting in Wisconsin, please kill all of the wolves so that we never have to go through this barbaric, psychopathic, inhumane cruelty ever again.
Fred Hubley	Most of it	Yes	Endeavoring to keep a sustainable level of wolf population, while reducing conflicts with human activities like livestock and pet predation	No target number for the wolf population. Few specifics on management goals/numbers, which will require hunting of wolves since their numbers are already well above any and all goals the DNR has ever set. Clear bias toward larger than sustainable wolf numbers, which will increase human issues; and against wolf hunting. Lip service at best toward hunting as a management technique	4	The wolf population is extremely healthy in Wisconsin, Minnesota, and the UP of Michigan. Deer numbers in northern WI are suffering because of this (and a couple other factors). We risk losing a generation of deer hunters if wolf numbers are not controlled to their sustainable levels. Any reading of a "pack map" in Wisconsin would allow for a meager harvest each year to keep their number in check. I want both deer and wolves in Wisconsin. The Plan ensures there will be few deer in northern Wisconsin for years to come. Please agree on a management number of wolves.
Dane Miller	Just the parts I am interested in	Yes	I like that the goal of the plan is to promote a healthy and sustainable wolf population. I think they are a valuable and important part of the Wisconsin landscape and I am happy that their long term presence is valued by the state. I also like that a sustainable harvest is part of the plan. I believe that if the population can sustain with a managed harvest that it is the right of the people to utilize the resource.	I believe any deer or turkey hunter should be given a wolf tag for bow,crossbow,shotgun,or rifle harvest. My understanding is that most wolves harvested in Wisconsin have been with the aid of dogs or trapped. The most vocal anti-wolf hunters tend to insist that wolves are ruining their deer hunting. If that is the case then they must be seeing more wolves than deer. Put a tag in there pocket for a wolf harvest WITHOUT dogs and WITHOUT trapping. If they have a point then they will have harvested wolves to prove their point! I also hunt in the UP of Michigan where the deer population is low and the wolf population is stable or growing. I saw many deer this year and no wolves. However, if I was sitting in my stand next year and saw wolves come through and no deer I would wish to have a wolf tag in my pocket.	8	Really great work. My take is that WDNR is spending more resources than necessary on this issue due to the sensitive public nature of wolves and it is taking resources away from other species that are not as popular. How about a pine marten or coaster brook trout plan this intensive? But I also respect that the WDNR has risen to the challenge and I am encouraged that the wolf population will be managed.
LAWRENCE PAPLHAM	All of it	Yes	Large cross section of represented parties, albeit incomplete. Importance of having Native American input, especially given cultural significance. Section 1 / Background information very good Wolf zones and sub-zones.	Removal of numerical goal (350). Reinstitute this. Plan late: missed International Wolf Center Conference on October 15 -16. Question release right after elections Included HSUS but downplayed those who want no wolves. May have been able to learn something from the "no wolves" persons. Not weighted enough for those who live in wolf county. Inadequate reimbursement for depredation. Ignore indirect costs of wolf depredation. Wolves as a solution toward CWD. Really? Implicit bias. Some models and estimates need to be more robust and defendable.	6	If there is no way for people to control wolves, they will (and have) taken it upon themselves. The question is do you want to have a mechanism in place that allows for the control of wolves or do you want citizens to take it upon themselves to control the population. I can appreciate the limitations on a complete plan as the Feds continue to prevent lethal methods of control. But the framework could be in place, as noted by your draft. Thanks for an opportunity to comment upon the plan.
Mary	Just the parts I am interested in	Yes	Overall, I think providing specific data is good.	Not having information on reported wolf incidents involving pet attacks, livestock and other wolf concerns reported and on record	2	I am not in favor of the “adaptive management process” vs. a count. What are the specific “mechanisms” to address local concerns.
Curtis Andersen	I have not read any of the draft plan	Yes	I am very interested in having Wisconsin's natural resources being brought back to the way they were when the white man first arrived. Wolves are part of that.	Specifically, wolf "hunters" are not about eating the wolves, just about shooting, and most real hunters HATE shooters, who just blast away at everything.	5	The people that shoot wolves tend to be other than ranchers or dairy farmers, so they are just shooters, and should have no say in what the limits are on wolf hunting.
DOROTHY CROCKETT	Most of it	Yes	Objectives B, C and D. Product C1d. Strategy C3. Product D3b.	Anything promoting a wolf "harvest." Nature should control the numbers. Lethal means for mitigating wolf conflicts should used as a last resort, or for imminent threat.	6	I am not in favor of a wolf hunt, especially trapping. If a hunt is approved, please at least BAN trapping. There is no humane way to trap. BMPs will not eliminate the torture. California has banned trapping of furbearing animals. WI should do the same. The use of dogs for wolf and bear hunting should also be banned. The draft is well-written and very thorough. I agree with all of it except promotion of legal "harvest," i.e. hunting and trapping.
	Most of it	Yes		Leave the wolves alone. Let nature take care of itself for once. Humans don’t need to have their hands in everything.		We really do need to let the wolf population thrive. When wolves thrive, so does the entire ecosystem. They okay a vital role in keeping the ecosystem healthy. We meddle in enough things with nature. Let’s not screw this one thing up. To meddle in this is to do ourselves a grave disservice in the long run.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Glenn Shong	All of it	Yes		No listed target number for wolf population. Ie the old 350 number. Does not take into account the input of the counties, local government and those that are facing the wolf predation from the wolves. Input should be limited to Wisconsin residents and property owners from the affected areas.	1	The DNR needs to study what the western states are showing for wolf data and take a long hard look at how Wisconsin can reduce its wolf numbers. There is a place for wolves but the population needs to be better managed... Just because they are a wild animal an people love the look and vote to keep them place, it's about time the DNR stepped up and controlled the PROBLEM
Jason Kleist	Most of it	Yes	With the proposed changes to harvest the tags would become unit/zone specific similar to bear tags. The research on wolves is good to see in the plan.	I dislike the 50/50 split between random and points for drawing tags. My preference would be to go all random to dissuade people from buying points with no plans of hunting the wolf.	2	If the tribes are able to claim half of the wolf tags but dont use them how is it expected to reach population goals?
ALLEN OLEARY	All of it	Yes	the effort was well done	tribal sub zones; lack of numeric population estimate methodology	5	too much input from anti hunters/preservationists
Sue Kinde	All of it	Yes	I prefer no arbitrary wolf population goal, but goals flexible and scientifically based. The zones seem carefully designed, with the low quotas around Tribal Lands helpful. I like the emphasis on the ecological benefits of wolves, especially as new knowledge is developed. I also thought your support for education of the public is very helpful. I thought the plan had detailed history and analysis, and was very thorough and well-written.	It wasn't clear who would be on the Committee, but I would like a strong presence of scientists. I am concerned about trapping, and also about dogs disturbing the wolf breeding season. Perhaps dog training could end as each zone is closed, and also hunting itself could be limited to one zone and end for that individual as the zone is closed. I would like additional encouragement of non-lethal agricultural practices. I knew about dogs and fences, but fladry is new to me!	10	I was impressed with the detailed history and recommendations.
	Most of it	Yes	The data tables are graphs are well done and show a clear picture of our current status in regards to wolves. Information on almost every aspect of managing wolves was clear to see,	The draft plan is enormous. There is a lot of information, but hard to find specifics because of its sheer volume. I had a hard time finding information on how wolves are affected deer herds per county.	7	
angie cope	Just the parts I am interested in	Yes	Incredible amount of research went into creating this report.	I would like to see a cooperative effort between Wisconsin and neighboring states. Surely wolves travel between Michigan, Minnesota and Wisconsin.	8	I didn't get to vote on how I feel about wolves - but I would like to see them treated fairly and well in our state. Farmers and ranchers that suffer losses can be encouraged to have livestock guardian dogs (LGD) to protect their herds. Thanks for you hard work on this and continuted protection of the wolf.
	All of it	Yes	I like that you consulted with the Ojibwa and the HSUS.	That you consulted with the bear hunters and trappers. Two hunting groups that should never be.	1	First of all I do not believe in the hunting of wolves. There are many other ways you can manage the wolf. I know from being a lifelong member of Defenders of Wildlife that ranchers are compensated for all proven wolf attacks that result in loss of cattle, sheep. There are dogs that are bred for guarding livestock and fencing. Many options for protection against predators. If a wolf hunt does take place please remember the order of the wolf pack. No alphas should ever be shot, they should all be collared. I just pray this does not happen.
	Most of it	Yes	I was surprised to learn of the significant impact wolves have on the northern elk herd. The wolf hunting exclusion zone around native peoples seems workable.	I was surprised that there was not more information on how wolves impact the white tail deer herd. As written it seems that little thought has been given to the sustainability of the northern elk herd? It seems that we are trying to grow the northern elk herd so the wolves have a varied diet. The draft plan talks about challenges to the white herd quantity and health but does not include any information about the decline of whitetail harvest rates generally for over 20 years and the impact declining deer hunting has on the northern economy.	3	The wolf population and regions impacted can't be managed without consideration of the larger considerations once the wolf is no longer endangered.
Pat Witter	All of it	Yes	Use of scientific data	Use of lethal means to control the wolf, in particular trapping	7	I would like to see more regard given to our Native Americans viewpoints. DNR should always keep in mind that the greatest majority of Wisconsinites are NOT hunters and trappers, but they seem to receive the least amount of consideration when the DNR sets regulations and rules. What we do to another we do to ourselves.
Bruce Herwig	All of it	Yes	I dont understand the reason why we even would think about bringing the wolf back.	I think it needs to be a ongoing season to get them off this planet. They are killers and when you have to deal with people loosing their dog from the wolves we should have never gotten to this population level but until some kid gets hurt we protect the wolf??	1	Get a firm plan on a yearly basses to get the population under control because everyone that has taken it in their own hands, no animal should die that way !!! You have one pissed off public in all counties and loosing your support.
	All of it	Yes	Not much.	No numeric population goal. The writers were obviously influenced by partisan politics. Once again the masses of people living in urban surroundings with very little or no contact with the northern forest areas are dictating our policy.	1	This opportunity to provide comments is a disgrace to our state and the people living here. I have no faith in our government and our system. This response mechanism is tailored to provide the answers desired by the system. A complete embarrassment.
Michael Kiekhafer	All of it	Yes	I would like to start by saying I was impressed with the detailed information provided. I think the proposed management elements are solid and well thought out.	My biggest concern is the lack of target population numbers. Without the ability to control the population by hunting at this time, there is no control of the population ceiling for these animals. In my opinion, this will ultimately stress the forest ecology (primarily the food sources present) where these animals exist.	5	A concern of mine has always been input from those not directly dealing with wolf encounters or having them present in the locations they live. It is easy to ask people if they would like to see numbers expand when those people only have exposure to wolves via the media.
Mark Krueger	All of it	Yes	none	moving forward carelessly without any accountability to a specific numeric goal, giving your team full reign on how large the wolf population gets in years and decades to come. bad careless plan. really no plan at all!!!	1	lost our deer hunting spot in western forest county east of Howell lake due to wolves. two years in a row absolutely NO deer tracks two days before gun opener. Friend of mine on western forest oneida county line near backtracker will not snowshoe any more due to all the wolf tracks around our cabin on 7-Mile lake. we have too many wolves in WI right now

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
						and need a plan like Wydeven brags about in the beginning of the "transplant". 300 wolves max.
Eli Schulz	All of it	Yes	Clearly you have done no real world boots on the ground research at all. Most of this is lies and propaganda. But i'm not surprised as you are woefully inept at managing anything at all let alone an apex predator like a wolf.	Is a bunch of bureaucratic[redacted] I wouldn't expect anything less from a bunch of non elected socialist democrats. I can't believe it took you 178 pages to explain yourself. Everything from your data on the elk herd to wolf population estimates and depredation is completely inaccurate. Even the survey you used for people on where they would like to see the wolves range is a lie. Apparently you only surveyed leftist democrats from Madison.	0	I have hunted the Northern forests of this state for 35 years about 4 months of my year was spent in the National Forest. The whitetail deer population in the Chequamegon National Forest is almost non existent. It began a precipitous decline in 2005 and has gotten worse every single year to the point where there is now only 0-4 deer per mile square which makes it basically un-huntable. There have always been hard winters, there has always been hunting (all be it severely mismanaged with way to many antlerless deer harvested), the only variable that would contribute to this catastrophic extinction of the deer in the national forest is the explosion of the wolf population. There are WAY more wolves in this state than you think there are. I would have thought that would be evident the last time there was a hunt, when the quota was met in 24 hrs. The only way that could happen is if the wolf population was 3 to 4 times what you thought it was. This is also evident in the complete and total failure of the elk reintroduction program. By 2010 there was supposed to be over 3000 elk in the national forest. In 2023 there is less than 300, and left alone, they will be wiped out by the wolves as well. The only places were the hunting is still decent is on tracts of private property beyond the reach of the WI DNR and NRB where landowners can manage the land and wildlife themselves. The DNR has failed and betrayed the sportsman of this state for far too long. Weather it is fisheries management or big game management you have failed on all counts. We the people will manage the wolf population ourselves. We do not need your permission.
	Most of it	Yes	Hard to find something I like in such a one sided plan.	The plan is totally biased. Wolves are shown to populate the northern area of the state. However the central sands area, which is not prime habitat, holds a large number of wolves. As a grandparent I am concerned to allow my young grandchildren to wonder in the area I know holds a alpha predator.	1	The wolf population continues to grow past population goals set by the state. Conflicts are down played. IE loss of property or the fact they are having a negative impact on the elk reintroduction program. In conversation with many land owners, they DO NOT want wolves on the land scape in central Wisconsin. If wolves are leaving the prime habitat indicated in your report and moving to marginal habitat that must indicate a population that has reached the carrying capacity of the land. In such a situation the excess population needs to be harvested. It is very clear from what is stated in the report that this is not going to happen.
Craig Railton	All of it	Yes	Having an extension for public comment. Having a wolf plan - but reasonable and sensible!	Inclusion/Exclusion - exclusion of comments from county/local govts. Balanced committee to include impacted stakeholders Population estimates - c'mon man - be true to the numbers and learn from states that doing it right Conflict management is weak for non-agricultural domestic animals and us Zone restructure will cause landowners in buffer zones will largely go unprotected and inadequate protection of livestock and pets Population goals established in 1999 (24 years ago) what is this, how can you even begin to think this is appropriate. Right along with this is, being realistic with deer herd populations in northern Wi. (other areas also) and the depredation #s. Listen to and include representation of groups affected - landowners, hunters, and residents of areas - not "wolf expansionist groups" located in Milwaukee and Madison Do not take my public property rights away with zoning around reservations. Zones should be set smaller (ex..by county) as our deer her hunting is zoned/monitored More robust and up to date monitoring of wolves (herd/individuals/public reporting, etc....) Why are we not looking and working with Western States to learn and come up with better models Goals / Objectives - should be realistic / appropriate and not filled with narratives, but with science/data/stakeholders in areas impacted,	1	The DNR lack of or appearance of - non inclusion of input with: city/county govts, stakeholders/landowners in units impacted, limiting public comment times, holding public hearings, utilizing real data and leveraging other states with robust plans ----- shows an incredible inadequacy of our representatives or an obvious kowtowing to other groups, which is "serving the people"
	All of it	Yes	whole thing is pretty over whelming		8	they should be managed , problem wolves should be taken out
Gary K	All of it	Yes	I applaud the effort to create a plan, but it is very vague and contains no measurement tools.	I've read the WWF's 32 point suggestions for change and I agree with them all. Buffer zones around reservations ?? No way.	2	You can't manage what you can't measure and you aren't measuring the wolf population. Put some hard numbers in your plan and then resubmit for public comment.
Kim Wasilewski	Most of it	Yes		Halt the wolf hunt and let their numbers rebound. Last year's hunt was a mistake and to many were harvested.		Please seriously consider letting the wolf population grow. Last year far to many were harvested. Their population has plummeted, they are being pushed out of their breeding areas and they're the natural selectors of managing the deer population. Let their numbers grow and HALT the hunt.
John Robson	All of it	Yes	I like the thought of regulating the population.	I don't support any future planting of wolf stock.	1	The wolves are ruining the woods for the true sportsman. They need to be regulated to a couple hundred in the entire state of Wisconsin.
	All of it	Yes	None of them	Need quota on how many our state can handle	1	Need to reduce the over all number of wolfs. They are killing everything they can. Way to many. 350 was the goal and the DNR don't know how many are running around. Listen to the people up north they know.
	Most of it	Yes	none	eliminate wolfs south of hwy 70	1	no wolves south of hwy 70 , to many dog hunters

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
EmilyMae	Just the parts I am interested in	Yes	The cultural role and impact, population and pack distribution.	It's a large article and I imagine general public isn't gathering the content.	7	I didn't find any plan for wolf ecology and education, a lot if misconception in certain populations. I think the key is getting this information out in a format that sheds light on this subject.
Tim Mitchell	Just the parts I am interested in	Yes	keeping human/wolf and animal /wolf conflicts down	should be a maximum carrying capacity for wolves ! The 350 that was originally provided by SCIENCE !	7	Native Americans should have no say except on reservations !
	All of it	Yes	the level of research, removal of numeric quotas, removal of hunting around reservations	dnr should better handle hound training to reduce conflicts with wolves	8	thanks for high level of research and public input and for caring about wolves
	Most of it	Yes	I like the management zones.	Nothing really.	10	
	Most of it	Yes	Input from Native American tribes is extremely important.	The use of dogs in hunting of wolves is barbaric and psychopathic... Example: Wolf hunters, John Wayne Gacy, Jeffrey Dahmer, and Ted Bundy are psychopaths.	2	1) The problem is not the wolf population... The problem is encroachment on wildlife by never ending development... the problem is too many people, not too may wolves. 2) Sterilize the wolf population... physical or chemical sterilization. 3) There's plenty of money available to sterilize wolves. 4) If the US Congress can flush $3 trillion taxpayer dollars down the toilet every year on war then they can spend at least $25 million every year to sterilize wolves in Wisconsin.
	I have not read any of the draft plan	Yes				I suggest a 30 day hunt of all genders of wolves here in WI.
	All of it	Yes	The plan is adaptive rather than managing to a number. An adaptive approach is the best way to manage ANY wildlife.	It is a little beyond the scope of the plan because it is legislative in nature, but hunting wolves with dogs should be eliminated (consistent with WCC feedback) and Act 169 should be repealed because it is not a good management tool.	9	The plan is extremely well thought out, science based (long overdue), and I very much appreciate the DNR considering not have a poplulation target. I would like to see no hunting in territory immediately adjacent to Native American land. I would like to see hunting wolves with dogs banned, consistent with feedback provided by residents to the Wisconsin Conservation Congress and Act 169 repealed - mandatory hunting is no way to manage ANY wildlife species.
Susan Smith	Just the parts I am interested in	Yes	Creating different zones of managment	Allowing hunting	7	
				where is the goal there is no numbers set ;every thing the dnr does is based on numbers; why are we counting prints in the snow when you could fly drones with camera over land and get a good count	1	
Nicholas Sprague	Just the parts I am interested in	Yes				I would like to see the wolf population increase in WI.
Flynn	I have not read any of the draft plan	Yes	None. Wolves are killers and take out livestock and peoples dogs	All of it. Wolves are dangerous	0	Wolves should not be repopulated in Wisconsin. They kill deer people dogs and livestock. The are dangerous
	All of it	Yes	There are a variety of both lethal and non-lethal abatement options available to help address wolf/livestock conflict. The primary non-lethal abatement methods implemented at conflict sites, particularly livestock depredation sites, include visual and auditory harassment tools, predator-proof and electric fencing, and alteration of animal husbandry practice.	Another critical step in the harvest season development process is to determine the number of wolf harvesting licenses to make available to achieve the state harvest quota.	4	Let their population grow, we don't need wolf hunts for at least another 10 years.
	Just the parts I am interested in	Yes	Trying to be accurate on the count and including elk predation	The length, make something people can read that doesn't take an afternoon, but include sources for your numbers, who counted what, where and when.	2	Keep a hunting season and issue extra tags near the elk population.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
	All of it	Yes	Continuing to allow a wolf hunting season and expand it.	Restrictions on hunting wolves in the state. There are WAY too many wolves. Remember, at the end of the day, they are just a vicious dog.	3	We do NOT need wolves in the State of Wisconsin. They were introduced by environmentalist interest groups in retaliation against deer hunters.
	All of it	Yes	Sustainment of the wolf pack Addressing and reduce human-wolf conflict Address public misunderstanding of wolves	Human - Wolf conflict address, my fear is that it will always play out with the wolves losing their lives over somebodies hole in the fence.	3	Wisconsin has a history of allowing killing of any animal group that has an increase to 3. As long as the Herons, egrets, wolves, etc have shown their population can become 3 or more it's open season on them. Why bring back a population of any animal to the state if killing them is the objective??
	Most of it	Yes			10	Why have the wolves around they kill our animals that we hunt for food and they are very dangerous to humans need to get rid of all of the wolves just like they did in the sixties and not let them back in the United States
	Most of it	Yes	its very inclusive	not enough consideration of direct affects wolves have on property owners in wolf core areas	6	deer populations need to be considered more as they are as important to the wolf population as they are to the deer hunting public
Melissa Smith	All of it	Yes	Numerical Goal: The previous plans referred to a 350 wolf recovery goal set when the population was much lower. The number proved contentious over the years, even though the original plan authors said it was never meant as a cap. The 2022 draft plan does away with that debate entirely. It's also reflective of a new direction for wolf management in the state Social Survey: Overall, most Wisconsinites somewhat or strongly agreed that predators like wolves keep nature in balance (77%), wolves are culturally important (71%), and wolves are special animals that deserve our admiration (75%). Similarly, a majority of Wisconsinites agreed that people and wolves should be able to coexist (75%) and that it is important to maintain a wolf population in Wisconsin (80%). Ecological Benefits: More than ever before, the DNR has taken consideration into the ecological benefits of wolves, including CWD, landscape of fear, etc. This should be priority one over all other goals increased acknowledgement of tribal values and goals: Wisconsin Tribal Perspectives and Cultural Significance As part of the development of this plan, the department formally requested that the federally recognized tribes in Wisconsin contribute a written narrative on the cultural significance of wolves to be included in the plan. Acknowledging that it is not possible to speak with one voice for all tribes in Wisconsin, the invitation was extended to all. The request was sent to the Tribal Natural Resource/Conservation Directors and Tribal Historic Preservation Officers of each of the eleven federally recognized tribes of Wisconsin. It was also sent to the Great Lakes Indian Fish and Wildlife Commission. While I stand firm against recreational hunting of wolves, I think the zone system and shortening of reporting is a step in the right direction. I support buffer zones. WE cannot allow what happened in 2021 to EVER occur again. While I also oppose lethal removal of wolves for depredation I am glad to see extensive talk about nonlethal abatement and increased scientific proof	I would first like to state that when the DNR stacked the committee with pro-wolf-hunting groups they continued an anti-democratic and failed policy of the Walker administration by dismissing the values of the true majority of the public that do not support killing wolves even in cases of livestock loss (Manfredo et al. 2020) and completely ignored the will of youths and future generations of Wisconsin residents. Therefore, any claim about a majority view or balanced committee in this report is inaccurate on its face. Using recreational hunting as a conflict resolution tool. Absolutely not. There is also plenty of scientific evidence documenting the harms that may come from wolf hunting. Wolves self-regulate their populations, without any need for human intervention. Given their internal regulation, an "overpopulation" of wolves is scientifically unheard of, and clearly a value judgment by humans who would rather have fewer wolves on the landscape. Wolves know what they need and live sustainably; it is a fallacy that their numbers need to be "maintained." The majority of Wisconsin citizens do not support wolf hunting. It is cruel especially with the use of dogs. Until that law is changed, a hunt being mandated is against the public trust, the DNR has the responsibility to set the wolf hunting quota at zero. As our lawsuit stated, Zero is a number Nor is there any evidence that wolf hunting decreases wolf-human conflicts. On the contrary, wolf hunting will likely create problems that did not exist in the first place. Wolf killing disrupts the social stability that allows for their cooperation and self-regulation. Hunting causes the break-up of wolf family groups necessary for taking down large wild prey, which in turns leads to some wolves shifting from wild to easier domestic prey. Hence, wolf hunting would increase harms to wolves, domestic animals and their guardians. Wolf conflict is highly exaggerated. The 2022 survey results showed that support (46%) for a regulated hunting and trapping of wolves is higher than opposition (29%); one-quarter of Wisconsinites were undecided. Support was higher among wolf-range residents (57%) than it was for residents outside wolf-range (43%). While modifications to question design between 2014 and 2022 limited statistical comparisons, informal comparisons suggest that statewide support for a wolf hunting and trapping season has declined over the last eight years. As was found in the 2014 survey, the top reason for opposition in 2022 was concern that wolves would become endangered again. The least selected reason for opposing a regulated wolf hunting and trapping season Occupancy model: The new model relies on estimated territory size and how likely wolves are to inhabit a certain area. This estimate is of the the entire population with much larger confidence intervals. The agency believe this estimates the entire population. Built in the framework of full protection and A lot of uncertainty without being conservative and not good for setting hunting quotas. Test this model while using the old Adams model for 5 years. The 14% decline you saw glosses over a wide confidence interval, There are weakness in territory size and observations per pack. It also doesn't account for a lot of wolf mortality or poaching Other concerns are that there is no oversight committee, The makeup of that very committee will have huge impacts on this plan In the plan you state that you will monitor expectations and outcomes. We have a hard time supporting that not knowing who this body is going forward? When will these assessments take place? We would like the committee formed before approval of the plan. There should be ZERO hound training. These people had no problem slaughtering wolves wtihout one. This is set up to cause major violations and interference to other hunters. There should be no reimbursement of hound hunters at any time for any reason	7	I think the DNR did a great job on the plan overall. I really appreciated the social survey being completed. I would like to see the wolf plan include those who want to move wildlife management towards an ethical, science-based, democratic vision of wildlife conservation that respects diversity and the intrinsic value of all life. I would also like to see outside scientists included in development, including Dr Adrian Treves etc. I believe in the need for wildlife stewardship to be reflective of democratic values and public interest, best available science and the U.S. public trust. We advocate for the change of processes within current wildlife stewardship, game agencies and the biases within these systems, including this wolf plan
Daniel E. Schmidt	All of it	Yes	None	Eliminating the population segment of the management plan. This was CRITICAL to our plan from the very start, and it has been modified several times and now trying to be eliminated. We were lied to. Management was never going to be an option. Original plan was for 250 wolves before management tool kicked in. That was revised several times after that.	0	Quote Aldo Leopold all you want, he is rolling in his grave over your handling of this natural resource. Wisconsin residents deserve better. Our wolves deserve better.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
	Most of it	Yes	All the data from the studies.	The data seems skewed.	1	In core areas where the wolf exists they seem to really have a lot of impact on that area.
Liz Meyer	I have not read any of the draft plan	Yes		I do not need to read 178 pages to express my opinion. I firmly disagree with any type of wolf hunting/trapping/killing. We are so quick to turn to killing because it is easy and less expensive. I know there are remote places in the United States where whole packs can be relocated. This is just another example why our world is turning against us. Earth will be a lot better off after the next mass extinction event, which will be the first man made one. So sad.	0	
Greg Fabel	Just the parts I am interested in	Yes		Failing to acknowledge the lack of economic and social benefits of wolves versus other other animal species (i.e.deer).	3	I see very little social benefit from the presence of wolves in Wisconsin. The vast majority of residents have never seen nor had any sort of interaction wolves. As an avid outdoors person for my entire life, I have never seen or encountered a wolf. So I see no value in their presence on the landscape. On the other hand, the vast majority of residents have seen and/or interacted with deer and other prey species of wolves. If the presence of wolves results in a decreased population of these other species, it results in negative social and economic impacts. Therefore I believe the wolf population should be managed to the lowest possible number.
Logan Szopinski	Just the parts I am interested in	Yes	The objective for science based wolf management. specifically strategy F1 that gives everyone a seat at the table.	I dislike how in the past that plans and objectives have been touted as "science based" and couldn't be further from it. Population objectives have been reached long ago and I am all for the science based approach to creating a plan if it is truly science based.	5	
	Most of it	Yes	not much	Not having a wolf number to manage to. this basically allows the wolf population to be controlled by the amount of deer, etc. that is available to eat.	1	The plan does not take a centered approach to management. It leans towards the environmental and native american groups. there is no consideration to the sportsman in the state that want a huntable population of deer in the northern forest area of wisconsin
THOMAS S BERENZ	All of it	Yes	Nothing, I found it to lack any representation for the hunters or the people who live in the wolf zones.	There needs to be a numeric population goal! The DNR must define what that goal is, and present a plan to reach that number.	1	Obviously, the Governor and his appointees waited until after the election was over to submit this plan to the public in order to prevent any backlash from the voters. Stop making this a political issue and start relying on the science!
Rachel Zentner	Just the parts I am interested in	Yes	The acknowledgement of tribal connections and understanding of the wolf and its history	The idea of "managing" a predator. The entire system is set up to manage itself. This plan is unnecessary.	1	Your science is flawed and skewed towards land and species management which again is unnecessary, and the funds could be used for protection of a natural system to "manage" itself. Consider allowing the world to exist without your "help".
	Just the parts I am interested in	Yes			0	I love wolves and why can you not just leave them alone!
Scot J Balsavich	Most of it	Yes	The history is beneficial	I own acreage in a wolf area. I have had to stop any idea of using a bird dog for grouse hunting and had to build a 6-foot fence to protect my pets from harm. I am not afraid of wolves, but am afraid if my wife walks the dogs, she may put herself or the dogs in harm's way. If hunting is ever allowed again for wolves, the goal should be reduced to 200 wolves in the state. The wolves are not needed to control deer or any other critter. We have not been overrun by mice or beaver or deer in the past, so leaving the wolf number low is better for the overall balance. Yes, having wolves does create jobs for the WDNR staff, but we can find other useful work for that staff.	1	Reduction in population is in my opinion the best overall approach for the future. Too many wolves will lead to more conflict, will lead to further division in beliefs, and lead ultimately to reduced WDNR revenues.
Daniel Schultz	Most of it	Yes	I like the zones as they are established right now.	I think the tribes should have much more legal say in the hunting & "culling" of resident wolf packs.	4	"Product C2c: Issue wolf harvesting licenses which are only valid in the specific zone(s) specified on the license." This needs to be done immediately. Also, Wisconsin's 2021 Wolf Harvest Season was an embarrassing example of the "sportsman" hunting industry to take advantage of a legal hiccup to slaughter lots of wolves. It made a mockery of your hard won policies toward efficient, sane management. Yes, I AM a hunter!
	Most of it	Yes	I like how the individual wolves and wolves on the reservations are not being counted so we can publish lower population numbers. Very clever.	No population target goal. How do you achieve a goal if you don't have a target? Safety zones around the reservations. I could not find the zones listed in the treaty.	4	Once a population goal is set. Why does it matter what tools you use to achieve it? The use of dogs is the most efficient way.
Doug Frankenstein	I have not read any of the draft plan	Yes				Hunting with dogs should be eliminated. That would make it easier to control quota numbers and provide more opportunities for trapping and calling. The number of permits could be increased allowing more people to participate.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Scott	All of it	Yes	I like that MAYBE you will finally have a plan that has some merit to it. This doesn't look like the plan though, what you have here is more political based than anything based in science or to the wishes of the residents of Wisconsin. Which, was expected.	First of all your "plan" is counterproductive to your very own mission statement. In every way, I could take it line by line but you've quit listening anyway. I am not advocating for the elimination of wolves, but their numbers (like all animals) need to be controlled. Under your plan their numbers will continue to grow with little oversight. It's fine that there are wolves, but their numbers need to be kept very low. You do that through active trapping and hunting seasons. If honest you would admit your own estimates of their numbers are kept low. Truth is if it wasn't for the unofficial hunting season their numbers would have exploded beyond what they are now.	2	Other than your own pet employees have you ever considered the opinions of other wolf experts? Start with Valerius Geist and go from there.
David D Worzalla	I have not read any of the draft plan	Yes	Thare just needs to be some kind of control on them.thay ant any better than cooties.	Anything is better than nothing		
Jim Seifert	Just the parts I am interested in	Yes	Elk/wolf mortality study and statistics. Wolves certainly play an important role in the rate of growth of the Clam Lake herd.	Wolf favorability study...academic sausage making. Survey the people in and around Mellen WI...the study/results would most certainly skew heavily toward unfavorable.	2	2023 buck board contest at Drop Tine Bar and Grill, Mellen WI: 162 entries, 19 bucks registered - 11% success rate. The wolf (and bear) population has decimated the deer population in Ashland and Iron Counties.
Cory Dellenbach	Most of it	Yes	I like it all. It leaves the decision in the hands of the DNR and the advisory committees, the experts in the fields and not anyone else, just the way it should be. Very well thought out plan. Great work by the DNR and especially the wolf experts there.	NA	10	The DNR is doing a great job managing the wolf populations and keeping the state citizens informed of what is going on.
Don Simon	Most of it	Yes		lack of a numeric management goal	4	I feel that a goal of around 350 wolves would allow a healthy population while minimizing the spread of wolves to less favorable habitat and reduce predation on livestock.
Susan e Thaller	All of it	Yes	-recognizing wolves as an essential part of our ecosystem -allowing special focus on Native American input and explanation of sacred role wolves play in several cultures -recognizing ways farmers/ranchers can decrease wolf interactions with livestock -not naming one kill quota for wolf hunts	-Focus on hunting, especially with use of dogs and traps -Almost no focus on responsibility farmers and ranchers have in initiating interventions to prevent wolf/livestock incidents	6	
Don	All of it	Yes	Nothing	Its a very typical bloated bureaucratic mess. I don't care for the surveys about what people who don't know jack care or feel about wolves. I want wolves in Wisconsin period. Your last hunt was a cluster XXXX of epic proportion where everyone knew it would blow through the limit because it wasn't set up correctly. I see nothing in this to correct any of that. Just let the wolves be. Nature takes care of itself.	1	It sucks and is WAY to long and very tedious to read through.
Mark Beeler	All of it	Yes	I like the fact that there is a plan for keeping the population in check and the managemnt units were divided up to have different objectives.	The plan was written up to try to keep everybody happy. there is no way all of the work mentioned in this plan can be accomplished. I can see there was a lot of work put into this plan. The big question everybody is waiting for is what is the total number of wolves the plan is going to maintain (science based is a cop out answer). If this was in the plan my answer to the next question would change a lot.	5	Wisconsin has a long history of deer camps, ranching/farming, hunting. I like the fact that we have wolves in Wisconsin. I feel that they fill a nitch that was missing for many years. With that said the populations have gotten way out of control (initally 350 was a good number). If you would just set a number of wolves that you are going to sustain, let the sparks fly between the special intrest groups and let the winners be winners. Currently there is a lot of upset people on both sides of the fence, unfortunatly, there are a lot of groups making this difficult that do not live in or spend time in "wolf country" that are weighing in on decisions. We have a very rich heritage in Wisconsin that dates way back. Lets keep it strong. As far as observing wildlife for tourism, Whitetails, elk and other small animals have been of major intrest in the northern and midstate forests for years, the plan thinking this will work for wolves don't have a clue how reclusive wolves are. To think we can view them like they do in Yellowstone is crazy. Lets keep this plan simple, it will have a much better sucess story. Thank you Mark Beeler

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
TIM STAINBROOK	Most of it	Yes	I enjoy seeing SOME wolves when I am driving around. There is a need for some. SOME.	I think that there should be a goal, as a number of wolves that are wanted in each area. In the Central Forest area, you do not express the number of wolves that you want. I trap beaver through out the Central Forest area, and I can honestly say that you see many more wolf tracks than you see deer tracks. I did a 8 mile walk last spring, 2 miles north up a ditch, 2 miles west to the next ditch, back 2 miles south to the road, and 2 miles back to my truck. In that walk, I saw where 1 deer had walked. But the whole area, there was wolf tracks the entire way. I seems to me, that the DNR is managing the deer herd, or lack of it, for the wolves. If the DNR is truely interested in managing the deer herd for deer hunting, they need to come up with the number of wolves they want in the area, and reduce the number of wolves in the Central Forest area. I used to deer hunt in Central Wisconsin public forest, and I gave it up. When I started deer hunting, in the 1980's, you would see 20 or so deer each day. When I gave it up 10 years ago, you could sit and you would be lucky to see 2 or 3 deer a day. Now, it is even more depressing. You could sit all day and see a few birds. No deer. In the 80's, there would be cars and trucks parked up and down the roads. Now there are only a fraction of people hunting the area that there used to be. If the DNR wants more people to hunt, and buy licenses, they need to manage the deer herd better, and that means removing alot more of the wolves.	3	Some wolves in the Central Forest area are good. Nice to observe. BUT, there are way too many in Central Wisconsin forested areas. They are eating way too many of the other animals in the area. You need to set a goal, (Lower) as to the number of wolves, in the Central Forested area, and allow hunting and trapping of the excess to get the number of wovles back in control. It is also nice to see deer, turkeys, coyotes, etc., not just wovles.
	All of it	Yes	Acknowledging wolves need to be managed.	No population goal for each management unit.	3	Please develop population management goals for each unit. Legal harvest methods should be used to maintain a reasonable population at those goals. I believe without those goals there will be to much room for interpretation as well as social and political bias.
Brysn	All of it	Yes	You admit we need a hunt	Pretty much everything the zones are to big and the are no real numbers	0	It's amazing how you say that there are not that many wolves but we can hear from a warden how there are way more than the dnr will actually tell you about. It's just a political joke like every thing these days.
Ben Grohn	All of it	Yes	None	All of it	1	I don't know how you can have a management plan without a numeric value for the population goal. Is there not a numeric population goal for other wildlife in WI such as deer, turkey, bear, etc? Why would you not have one for wolves? Also the zones are way too big. Need to be smaller and more focused. This seems like little effort was actually put into this so called "plan."
Art Gruner	All of it	Yes	The population goal of 350	The lack of true population numbers and the fact that we give natives tags and they don't participate	1	
	Just the parts I am interested in	Yes	Using a factor to determine a wolf population that is based on historical ecological landscaping Wisconsin is not appropriate…. with people living in rural areas, humans being involved in deer management and no other natural predators or competition makes this objective inappropriate. I think you should include a reasonable deer population in the northern half of Wisconsin as a consideration ….due to the reduction of value of hunting property, the lost hunting participation and outdoor experiences of many.	One of the elements should be how to keep the wolf population at a tolerable level based on deer population, hunter satisfaction and outdoor experiences of many. You are favoring the wolf population over many other species that they pray upon and many people by licenses support local communities and maintain valuable hunting properties. Wolves have no natural predators besides humans in Wisconsin anymore.	1	If you have any chance of increasing hunter numbers, outdoor revenues for the department and saving face…. I suggest you take a larger interest in maintaining deer populations in northern Wisconsin and not over emphasizing the importance of wolves in Wisconsin whose ecology is drastically different than it was 100 years ago.
	All of it	Yes			3	
Dan	Most of it	Yes	The implementation of a science-based wolf management plan.	I dislike the affirmation of using dogs to hunt wolves and other mammals as a rich Wisconsin tradition. It's cruel, and should be outlawed.	8	I would like to see the minimum threshold raised for what is considered a healthy wolf population. 250 seems low and meant to appease wolf hunters.
	Just the parts I am interested in	Yes	Most of it	Wolf management goal, and its implementation.	8	We need the wolf in Northern Wisconsin. There are to many deer. The wolf should be left alone. Only the problem ones should be harvested.
	All of it	Yes	There is nothing in the management plan I really truly like! This is not a fair plan to anybody but the people that don't want a season at all!	Not having a population goal is not a realistic goal! Mine as well not have a plan at all! Having such big buffer zones around reservations is ridiculous also! If they have buffer zones why can't other people hunt on the reservation?	1	This plan really needs to be looked at more fairly and not cater to the people that don't recreate in northern Wisconsin where there are many more problems! People that live in Southern counties and never seen the north woods or pay taxes in upper Wisconsin for that matter are basing things off of their beliefs and feelings not science at all!
Greg Graunke	All of it	Yes	NO! PART	No population goals are you kidding! You have one for everything else! Buffer zones, where did you come up with that one! Sounds like the tribes are running this and not the DNR, giving up management AGAIN? I was asked to fill out a survey along time ago and was told that 80 I repeat 80 was the population goal, what a outright lie that was! This whole thing sounds like a list of how the people that have no stake in the game get to run the show along with the tribes. The next question is 1 to 10 if there was a 0 or less that would be more on the mark!	0	How about letting the rest of us who have a direct stake in this have a say!!!!!!!!!! It is pretty obvious that this, I guess you can call it a plan, did not come out till after the election, just as predicted by just about everyone!

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
	Most of it	Yes	The cap on wolves available to be hunted. Thank you. Relying on scientific data to determine cap. During wolf hunting season, the requirement to require harvest registration time to no later than 8 hours after killing the wolf. (C 2a) During hunting season, the license issued in only valid in zones (more than one?) specified on the license.(C 2c) After closing gun deer season, the hunting of wolves with dogs would occur only during daylight hours…not during the last season when they ran they dogs constantly, bringing in fresh teams.	Hunting wolves with dogs period!! Shame! Wolf Advisory Committee seems to have a lot of power. Do these member represent a diverse group? Non hunters? How long of a term do they serve? The hunting zones are confusing. Why would there be an encouraged hunt in more populated areas? Den and rendezvous site designation should be eliminated. How can there be ensured number of increased law enforcement to aid future wolf recovery? Why can wolves not be rehabilitated?	8	I like the emphasis on wolf public education and understanding. There should be more of an emphasis on a wolf's value as it relates to tourism and bequest. More should be done to eliminate the inbred hate of hunters toward wolves.
	Most of it	Yes	The cap on wolves available to be hunted. Thank you. Relying on scientific data to determine cap. During wolf hunting season, the requirement to require harvest registration time to no later than 8 hours after killing the wolf. (C 2a) During hunting season, the license issued in only valid in zones (more than one?) specified on the license.(C 2c) After closing gun deer season, the hunting of wolves with dogs would occur only during daylight hours…not during the last season when they ran they dogs constantly, bringing in fresh teams. There should be more of an emphasis on a wolf's value as it relates to tourism and bequest. More should be done to eliminate the inbred hate of hunters toward wolves.
Paul neste	Most of it	No	Using science to determine wolf plan	Using peoples"feelings" and sacred native American objections. To formulate a wolf plan.	4	I would say one only has to look at northern Minnesota or northern Ontario where the balance of predator prey relationship is so out of whack because of wolves. I thought the dnr job is to help balance that relationship. Your plan will have peaks and valleys no prey ,wolves will die on there own. Much like happens in Canada. We can manage both but not if we continue to keep people's "feelings" into account instead of science.
Matt Mackenzie	Most of it	Yes	The amount of science involved is very nice to see involved in part of the plan	We need to place a number for quota purposes. I don't like that there is no number like previous plans	2	Please respect northern Wisconsin residents in drafting a plan that affects us the most. Wolves have a place, but they have taken over in areas and now deer are scarce or nonexistent. A pack of wolves moved all deer out of our section of hunting land and we saw 1 deer over a 2 mile area. No other tracks. Hunting in northern Wisc is getting harder and harder to show any enthusiasm for doing and it's worse because I live here.
Logan Seipel	Most of it	Yes		Lack of numeric population goal. Without a population goal that is numeric, the goal is very subjective and often times a "moving goalpost" that will never allow goals to be achieved. Lack of defining where wolves are appropriate. Where wolves can exist based on biological carrying capacity should not be the sole factor of determining suitable habitat. Maintaining a wolf population that that promotes little to no conflict should be the goal. The draft plan does not utilize any data from other states that harvest wolves in guiding their quotas. The state also no plans of working towards delisting the wolf in Wisconsin. Finally, the desires of Wisconsin residents who live in areas populated by and in close proximity to wolves should have a much larger say in the DNR's wolf management plan.	1	Wolves should continue to be on the landscape in Wisconsin, however, effective population management is vey important. Numeric goals and adherence to the goals must be part of the plan. Special interest groups and non-residents should not have their voices heard above residents, specifically those who live with in close proximity to wolves and must deal with the effects of their rising population.
	Just the parts I am interested in	Yes	Very thorough history review, designated zones, issues, problems, populations etc. Designation of 6 statewide zones, noting differing habitat, wolf populations as well as wolf/human/cattle problems.	The movement away from a population number in exchange for the adaptive mgt style similarly used in the new deer mgt. where words like increase-decrease or maintain the current population are used. It appears that many folks feel that a number such as 350 wolves is too low for a sustainable statewide population goal and healthy wolf population. With the use of a goal such as X it can be used in light of noting increases-decreases in numbers due to many reasons such as trapping, vehicle as well as natural mortality and lends itself to being useful to defend a population level. X - (minus) then can also be used to set a population goal for the future based on mortality - natural and man made, taking into consideration cattle and human interaction and depradation and mortality to make a more defendable and acceptable population goal. These numbers are also more useful to explain that a harvest of wolves at a certain permitted level has not and will not be of great concern or in some cases any concern in diminishing the zone specific or statewide population as some have commented. Wolves need to be managed as any other wildlife species does by DNR wildlife managers using the best available data, techniques taking into account a controlled wolf population sustainable, defendable and managable in light of todays opinions, reality based numbers, wolf depredation, realistic goals and wolf - human interactions and coexistence.	8	Wolf management should be done at the statewide level using DNR management not legislative mandates or emotional driven mgt. Due to the continuing wolf depredation of livestock, dogs, wolf/human interactions wolves need to be managed and in some areas reduced to allow for a sustainable, defendable and realistic wolf population number for the future.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
	Most of it	Yes	Nothing at this point	Do not believe population model is accurate. Does not have a goal of 350 wolves. Plan has no numeric population goal. Thus, there is no timeline to get to goal. Plan does not seem to address any population control Do not like buffer zones near tribal lands. Plan does not identify what suitable habitat is. Plan does not identify where suitable habitat is. Plan does not address the fact that wolves are not appropriate everywhere.	1	Wolf range needs to be reduced so that human - wolf interaction is low. This would necessitate a reduction in population. Need to go back to the drawing board.
	Just the parts I am interested in	Yes	Don't like any of it.	Not setting a number goal.	1	If we do not continue the harvest of Gray Wolves in WI the entire Northern WI hunting population will continue to diminish. No trophy bucks anymore thanks to the wolfs! It does not even pay for me to take my grandkids to Ashland County deer hunting because of the low deer population. Set the harvest goal back to 350 and we may get deer back on the Northern WI landscape. At this pace deer hunter numbers will go down 3% this year and 5% next year. Then who will pay your bills!
Todd Schultz	All of it	Yes	The fact that there is finally a base plan is encouraging.	There has to be a population goal. Every other species is managed with a population goal. The Native Americans have no intention of harvesting any wolf's so why give them harvest tags.	1	Talk to the people that are most affected by wolves, not liberal beaurocrats from Dane, Waukesha and Milwaukee counties.
	Just the parts I am interested in	Yes	that they finally came out with a plan	moving away from the single numeric population goal	1	if the dnr would of held to the original 350 wolves almost no one would have a problem with the wolf being here. As a dairy farmer in southeast WI we have lost calves to the coyotes and the wolves would be much more of a problem if they make it here.
Robert Knoll	Most of it	Yes	Data is easy to read and understand.	Appendix X. Delete the Ven Diagram and make public input the whole circle and switch the state and federal government take up the little quarter size piece of the puzzle. You all work for us and this management plan is for all Wisconsinites. Public input should be the main factor in this plan.	1	1.) Gray wolves are considerably larger than the Eastern Timberwolf, and as such they should be managed considerably more aggressively. 2.) I want a set population goal. 3.) Rural respondents input to surveys should hold a greater weight in the wolf management plan as they are more likely to encounter wolves. 4.) I am an avid outdoorsman and would much rather spend my time in the woods not worrying about a wolf stalking me. I can’t say I want wolves totally eradicated, but I think their population has exceeded initial goals and has no reason to expand. With the rapid harvest back in 2021 it’s clear there are a lot more wolves than what was originally thought.
Andy	Just the parts I am interested in	Yes	Delineating surveys between those in wolf areas and outside.	I had a hard time reading through everything. I wasn't sure if I was reading the management plan or everything ever written about wolves in Wisconsin.	4	I didn't read anything about why wolves live in certain places or if their distribution and management is planned in terms of habitat. I have observed a definite concentration of wolves certain areas that make the population seem higher than estimates.
	Most of it	Yes	Use of science based decision making.	The non number based goals. Without that it will be too easy to change how data is interpreted.	6	I have been a part time resident of Canada for 23 yrs and witnessed the devastating results of improper wolf management on other wildlife.(moose deer beaver) They are only starting to recover after changing wolf management back. Put the wolves back in urban areas and see how they like their dogs and cats disappearing. The wolves are showing up in small towns every winter. Without hunting the wolves lose most fear of humans. We have cabin in Price Co and a home in Wausau. We have wolves come close to our cabin in an open field in the middle of the afternoon. The wolves also killed a 3.5 yr old 8pt buck last yr on the field. So much for killing the sick and week.
kurt Alt	Most of it	Yes	The plan promises to be science based and decisions to be made collaboratively to maximize the wolf as a valuable resource	requires me to trust the Requires me to trust the DNR and NRB to be non political and treat the wolf with respect and maximize their numbers The plan does not provide specifics on herd numbers or hunter techniques (eg: I oppose hunting wolves with dogs). What you're offering is a is construct, an outline, a framework. The detail is yet to me determined and so the fate of the wolf	6	Maximize the states wolf carrying capacity. No baiting allowed. No hunting with dogs. No trapping. Local and regional quotas Tribal input om hunting quotas. Same day registration of a kill. Zone hunting on separate days
Daniel Bolan	Most of it	Yes	legally being able to harvest some wolves	There are way too many wolves . I would of assumed you would have realized that after how rapidly the quote was reached	1	I know some farmers in Marathon county that said they will shoot them on sight . When they kill a child it will be on you
	Most of it	Yes	Facts about wolves.	Lack of numerical population goal. Suggesting non lethal methods of control will increase tolerance.	1	Draft fails to detail a sound management plan to reduce numbers to tolerable levels of 350 wolves.
Randy O’Connell	Most of it	Yes	Removal of numeric population goal. The plan focuses more on the ecological benefits of wolves. The plan represents more of what the public opinion on wolves is. The plan is more in line with Tribal requests. Lastly, a greater commitment to scientific findings.	Better regulation of hound training is sorely needed. Actually , I would like to see the use of hounds for hunting both wolves and bears ended. The plan appears to lack continual oversight so that adjustments for unintended results can be addressed , such as wolf livestock conflicts.	9	You should be commended for taking into account the February hunt results and what a startling impact it had on our apex predator population. Thank you.
Richard schlee	All of it	Yes	That your looking at finding a balance between the needs of the wolves and that of peoples use of the land.	Not really sure harvest of wolves is best. What else can be done first? Educate say that people should not let their pets run loose or be outside unattended persay. With the age of wireless cameras for ranchers and farmers keep a better eye on livestock?	5	I would like to see alternatives to harvesting of wolves. Wildlife is one of the reasons tourists come up to areas up north not just fishing and hunting

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
	Just the parts I am interested in	Yes			0	
Abby Frucht	Just the parts I am interested in	Yes	I like that it is science based and that it is invested in protecting wildlife. I like that it removes an arbitrary wolf population number. I like too that it remains cognizant of people's fears and needs.	I don't really dislike any of it.	8	
Jacob Zimmerman	Most of it	Yes	I thought much of the explanation of wolf population dynamics, the food sources/debits on the landscaoe they create quantified, and examination of what a responsible harvest % is was intresting, and learned a lot by reading it. Section 1 was my favorite.	The lack of either a population goal or range/density goal or a concrete explanation of harvest objectives. I am fine with not having a population goal if we say that every year a hunt is allowed, enough permits are issued so that the projected successful harvest rate will be equal to or less than 30% between recreational and deperedation harvest. I.e success rate of issues tags is 50%, we have 1000 wolves, the number of depredation permits issued in the previous 365 days prior to drawing was 50, you then issue 500 tags. Resulting in 250 wolves harvested, within the 30% non population effecting range they can sustain. This would ensure wolves remain at their current population level. A numerical population goal would be nice and appreciated by some people, but i feel that itself is too vague as the carrying capacity of given landscapes is different, if we say we want 2000 wolves in WI, theres no saying what that looks like and allows unlimited range increasing human conflict likelyhood. A better solution may be density per range quota similiar to how the zones are managed and set up. We lay out a goal of 2.5 wolves per mile (ex only) in a given zone or 1 in another or 10 in another and manage accordingly following the above harvest procedure. When wolves are protected by the esa and allowed to go over a given density goal, either depredation on private livestock or excessive depredation of public trust wildlife must be liberally enforced to ensure ecosystems remain in a combination of biologic and social harmony. I felt the quota setting section was vague and non descript of how a number is actually reached. A systematic process laying out how either harvest quotas or population goals are decided upon is essential. Whatever it is so that in 10 years we can say either a particular administration is following it or not. Taking a hands off approach and saying things are out of an agencys hands because of other factors is not ok, a management goal must remain the goal regardless of outside political factors.	4	
Bruce Prentice	All of it	Yes	I like moving away from a single numeric goal and moving toward an adaptive process that is more zone/problem area/Tribal boundary specific. I have to imagine however that at times, numbers would have to be considered, considering the circumstances. Continuing research, reaching out to/with the public with the results. More educational opportunities at numerous forums.	Information, cooperation and collaboration will be a key factor. Stakeholder groups may not be able to get everything that they want but should be able to meet in the middle.	8	The plan, as in any plan, has to be able to adapt, sometimes in real time.
thomas martin	All of it	Yes	a very poor written document	what population is Wi desire - no # is a joke. I dislike the increased protection area near indian reserations	8	I live in Bayfield County and we have too many wolves. Wolves need to be controlled and the DNR has no set limits. People who live where the wolves are do not like them.
Daniel K.	Just the parts I am interested in	Yes				There should be a complete banning of the use of dogs to hunt wolves. Also the wolf population in Wisconsin is far from what the state can easily support, plenty of prey deer and other prey.A wolf is the only highly intelligent animal in Wisconsin that is also the member of a social structure or family in this case a pack. Wolves deserve are respect and appreciation for the vital role they play in the overall health of Wisconsin's natural areas.
Todd and Ellen Needham	Most of it	Yes	Focus on sustainable grey wolf populations especially in core wolf areas. Creation of protective buffer zones around native American lands. Emphatically support the commitment to science and continued research.	Strongly dislike the use of dogs for wolf hunting. as well as the amount of compensation for dog and livestock damage. Too much potential political influence; public policy should be science-based.	7	

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Daniel Trawicki	All of it	Yes	As part of the wold study committee I was happy that Safari club and other hunting organizations were able to provide input.	A number of things Safari club has gone on record opposing in the management of the State wolf. The biggest issue had to do with a lack of numerical population goal. As your aware for many years the established population goal was 350. Todays most recent population estimate is approx. 970 wolves, which is way over previously established numbers. As part of the population madel to establish the number of wolves it was explained that the average pack size has been determined to be 6 animals and that lone wolves are not counted at all which safari club very much opposes. This past season has shown that dog hunters released there dogs on single or pairs of animals only. The reason being is that any dogs released on a pack were endangered of being killed themselves. Those lone wolves not being counted has the potential to greatly increase the current population estimates. Safari club also feels that the average pack size number is under stated. In addition, its clear that while the DNR relies primarily on staff and volunteer ground tracking. We know from the reports returned that several of the units were "under tracked" or essentially not having a large portion of the unit tracked. In addition, several known wolf areas were not tracked by anyone.	3	Safari club remains committed to maintaining a healthy wolf population in our state. We are however opposed to a high popuation number that endangers our livestock and other domestic animals. We support hunting and trapping as a way of controlling the wolf population
Michael Glenetzke	Most of it	Yes	None	None	0	We do NOT need a wolf hunt PERIOD! Those wanting a wolf hunt are a very small minority that claim wolf conflicts and livestock and property damage. The deer overpopulation itself proves we need a predator animal as the wolf. Using archaic methods in any hunt is barbaric and needs to stop.
Mike Loveland	All of it	Yes	none of it	no numbers for maintaining population, don't like buffer zone idea	0	numbers need to be used as it is with other species hunted in this state
Craig Lincoln	All of it	Yes	-No specific numeric goal for the wolf population. This is the most important change that needs to be made. -A framework to manage wolves as part of ecological goals, but with caveats that public input could be improved. (See comments on parts I dislike). -Different management goals for different zones. -Recognition of wolf-human conflict and subzones to allow appropriate management where conflict is higher (specifically cattle farmers). -Recognition of tribal rights and delegation of management to them. -Better standards for hunting/trapping wolves; in particular, better reporting standards.	-I think we need more and better public input; perhaps something akin to regular meetings in town/towns to act as listening sessions. Part of what we're doing is similar to risk communications, and experience has shown that risk communications are improved when communicators start by listening to people. -We should start implementing something like the trappers' code of ethics with hound hunting. We have a long tradition of hound hunting here and in the country, but times change and all of us who use the outdoors have made changes to adjust to our culture and more users.	8	It can be difficult to find the people and money to do lots of listening sessions. Absent an appropriation from the state to pay for the expenses, perhaps the DNR can begin a volunteer program like its winter tracking surveys or educational volunteer network -- train volunteers to hold sessions, listen to input, and relay that input to the DNR and its management committee.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Steven Kelsey	Most of it	Yes	I do not like much of the plan. This appears to be heavily leaning toward making non-hunters and anti-hunting individuals and groups, that do not live in the wolf populated ares of our state happy! Get back to the biology, not the business of appeasing those that really do not have any real investment or existence with the wolf. Get back to the science, not the social bleeding heart management.	I am disappointed in the majority of this Word Salad/ Plan! I compliment everyone involved for the extensive effort, time and money spent in the creation of this is plan and information. However, it is my view the residents and sportsman that live in the Wolf Dominated Areas, that often own recreational land and have a high degree of passion for hunting, land management and overall recreation in Northwest Wisconsin, ultimately pay the price for adverse impacts of the wolf on species like whitetail deer and domestic animals. The vast majority of the individuals that are in favor of severely limited wolf harvests and controls do not reside in the areas where the wolf populations are located. The highest population that will never be directly impacted by the wolf population is not in the areas where the wolf exists! The local sportsmen and women with real investments in property ownership, year around wildlife interaction and an unappreciated understanding and passion for wolf population control or lack of control as the State of Wisconsin now reflects, are largely ignored in the final management of the wolf. The population in the State of Wisconsin that does not interact directly with the wolf situation will likely ultimately seize control of Wolf Management with almost no wolf population controls that are Biologically Based! In other words, it is my opinion that the final wolf management plan will ignore the local sportsman and women and residents that live directly in the wolf areas. The people in the metropolitan areas of the state that likely will never see a wolf or directly be impacted by a wolf, will garner the power to shove limited non-biologically based wolf management down the throats of the residents and sportsman of Northern Wisconsin. I have absolutely no confidence that the sportsman and residents that live in Northwest Wisconsin will see a solid biologically based final management plan. This whole process is very disappointing. I so badly wish that the science, not the BS emotions, would rule this ultimate plan. Given the track record of this whole process, the sportsman will end up screwed in the end! I am not for the elimination of the wolf! I have a strong desire to see biologically based management. The rights of sportsman, hunters, land owners and local residents should be highly respected and supported in the final management plan as in the end, we are the ones that ultimately end up directly impacted by the wolf or the lack of biologically based management of the wolf population. We desire logical biologically based management of the wolf only! Not Feel Good Anti-Management!	1	Unfortunately, in the end, I fear this is all a waste of time for people like me that have a strong passion and involvement for hunting and recreation along with land ownership and management in Northwest Wisconsin! Manage the wolf like all of the other wildlife in state. All wildlife is important! The wolf is really not any more special than any other wildlife. Cut the Crap and get the biology back front and center!
Mary Fries	Most of it	Yes	The hx of wolves in WI, the cultural significance to the Native Americans, the plan particularly as it relates to the interaction of species, most of those items that elicited an emotional response.	The statistical details. Although necessary, because I trust the judgement of the experts in the DNR, I tended to briefly peruse these.	9	
Ryan Schultz	Most of it	Yes	None of it.	No population goal.	1	Maintain the current 350 population goal and get the population down near that goal.
Mary Schultz	Most of it	Yes	None of it.	No numeric population goal.	0	Maintain the state population goal of 350. Work to push the federal government to delist. Tell the feds either delist or they can deal with the management of them. Once delisted, get the population down to 350.
Barry B. Phillips	All of it	Yes	Giving landowners and farmers the ability to use lethal force to protect their livestock and animals from wolf attacks if taken off the endangered protection list.	Giving out Indian tribal wolf hunting permits on tribal lands knowing they are not going to be used. I feel this is only done for political reasons to get leverage on Indian rights in our state. Not to protect brother wolf. All this will do is give problem wolves a save place that they can not be controlled by the state.	2	I own land and have hunted in northeast Wisconsin for over fifty years now. I no longer use a bird dog for fear of losing it or putting it in danger of a wolf attack. I hunted deer in the most remote forested areas I could find. In doing so I have enjoyed many good years hunting. I've seen the bad winter die offs of the deer herd in early 1970s and no doe seasons. Then as time went on the deer herd really took off, so did the coyotes and bear numbers. Still the herd could handle the pressure, lot of beaver, snow shoe rabbits and grouse. Then the first wolves started showing up in the mid 90's.After that every thing started to change first the rabbits disappeared, then the beaver, then the deer herd got smaller and harder to hunt now that the deer were hunted 365 days a year. I still hunt the remote big forest and have had a lot of experiences with the wolves in the area. So the wolf is a better hunter than I, my freezer has went empty many times lately. My big lesson here is if I want venison i need to hunt away from wolves, wolves don't really like being around humans. So i now hunt by our little settlement and my freezer is full. The other comment is if the gray wolf is ever delisted and farmers and land owns were allowed to drive off or use force to control wolf attacks on there property with a DNR follow up this is all we would need for a wolf management plan.
Mark McCune	All of it	Yes			1	Th wolf population is too great I. northern Wisconsin. It has had a dramatic impact on the adult deer heard in the Vilas and Oneida Counties
	Most of it	Yes	The ability to harvest wolves via trapping and hunting.	No items that I dislike.	9	The ability to harvest wolves should ONLY be available to RESIDENTS of Wisconsin.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
	Just the parts I am interested in	Yes	not much	catering to indians	1	where to you people get your credentials?
Concerned Citizen	Most of it	Yes		The lack of a population goal. The large tribal buffer zones	1	Do better. The wolf population in the north is out of control and we need to be able to properly manage it. This current plan doesnt allow that.
	Most of it	Yes			10	
John Wallendal	All of it	Yes	A less rigid plan to determine wolf Populations is desired. Biological communities are dynamic. Controlling populations via a static plan is less than desirable.	Development of a plan to include the hybrid coy-wolf should be considered	10	Our farm includes to den and rendezvous breeding site of the New Chester (zone 5) pack. We have had numerous encounters, including bird dog training, with these wolves. We view their presence favorably. The encounters, tempered with sane precaution, are part of our coexistence with the natural environment. Living on the terminal moraine of the glacier gives this region a patina rarely experienced!
Colleen Robson	Most of it	Yes	I appreciate that this plan is clearly based upon the most current scientific research. I especially like that it is focused on the ecological benefits of wolves and honors the Tribes requested low quota zones around their lands. I also think it wisely removes an arbitrary population goal for wolves in Wisconsin providing the needed flexibility to respond to changing needs from one year to the next.	I continue to question the use of hounds to chase wolves at anytime, but especially during the wolf breeding season. I also think a plan for regular updates should be clearly stated and a system for scientific oversight should be established.	9	Thank you to everyone for the hard work you have done to develop a responsible plan and for your commitment to implementing it.
Charles J. Larscheid	All of it	Yes	I found discussion of the Grey Wolf's relationship as a cornerstone species as most informative.		10	I looked but did not see discussion of protecting dispersal routes for the Grey Wolf. In particular, human highway upgrades that result in barriers to wildlife crossings due to fencing, etc. are increasing and could decrease Wolf and other large wildlife dispersal in the future.
Doug Aanes	Most of it	Yes	Comprehensive. I especially liked that a lot of the plan establishes context and the existing evidence and data. I appreciate the efforts to be inclusive of various perspectives and constituencies.	Not sure what I dislike at this time.	9	none at this time.
	All of it	Yes	None	It's basically a popularity contest for wolf lovers. While some facts are reported, most of it is biased justification for their existence.	2	Why would the state spend millions on improving the populations of elk, deer, grouse, & other desirable game only to now justify the wolves killing of them?
Simon Grahl	Most of it	Yes	Specificity & management approach.	A listing and geographical documentation of federal and state owned lands in Northern Wisconsin along with associated mortality, fertility and harvesting rates.	5	1.) Can the DNR specify the associated mortality, harvesting and fertility rates of wolf population on federal and state owned lands in northern wisconsin and has it any indication that wold populations on tribe-owned lands have indications of higher prey-predator interaction as a result of their geographical location? 2.) Has the DNR determined if in fact the wolf population (or for that matter predator - prey population) is unique for the geographical location compared to States such as Minnesota and/or Michigan? And does the DNR have any associated migration data for movement within the United States and/or into Canada?
	I have not read any of the draft plan	Yes	none	all	0	kill them all
Henry Fuller	Most of it	Yes	Starting the hunting season again, like any animal they need to be managed and there are too many wolfs currently.	Not sure why we need to continue using funds/resources to "study" wolfs.	6	I own property in Adams Co and manage for QDM with my neighbors. I have seen a decline in the number of deer and fawns particularly as the wolf population has increased in my area. I understand the place wolfs occupy in a healthy ecosystem, but there are too many. I spend a lot of time, money and effort for deer hunting and wolfs take away from that. They need to be hunted and managed.
	Most of it	Yes	none	the goal o 350 was where we should be	0	the dnr is supported by sportsmans registration and liscense fees. how about supporting your customers
Deer hunter	I have not read any of the draft plan	Yes			1	We were promised never more than 350 wolves in Wisconsin when you sold this wolf reintroduction program. So live up to your promise. Get it to or under 350. When I see it, I'll believe it. When you make a promise, keep it.
barry wallace	All of it	Yes		too much input from the wolf protectionists.	4	the current DNR has become way too much of a political organization and not enough emphasis on managing wildlife. The hunters and fishermen of WI fund you, not the tribes or the protectionists.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Matt Kufahl	Most of it	Yes	Since the plan calls for a healthy, sustainable population, there's nothing positive I can take from it.	There needs to be a number for the population goal (350). No buffers especially around the LCO reservation. Protecting the elk and encouraging their growth is way more important than protecting the wolves. Elk calf mortality is at unacceptable levels right now thanks to wolf mismanagement. Don't get me started on the deer herd too. The age class is also suffering in northern Wisconsin from a number of factors, which includes wolves.	1	Please get this sorted out as quick as possible so the judge can reinstate the wolf hunt. I see the plan right now kind of mirrors Minnesota's wolf plan which is anti hunting, which is unacceptable. Many hunters will not tolerate a plan like that.
	All of it	Yes		Hunting plans, put it permanently to rest	5	Need more study of beaver overpopulation and plant and tree degradation due to deer
Leslie Ison	Most of it	Yes	objective c1	No population goal. no explanation of why the original 350 population goal has been abandoned no explanation of who pays for wolf deterrent methods in agricultural area (expensive extra fencing)	4	this plan is overly complex & requires hours of study. It seems that urban populations with no impact from wolves have an oversized emphasis in this plam
Virginia Metzdorf	Most of it	Yes	the inclusion of the Native American perspective in their own words--public education efforts--encouraging public involvement and citizen science efforts	Some of the vocabulary is off-putting. Referring to the hunt as a harvest for example--I dislike the whole management concept and would prefer more emphasis on co-existence	5	There is more of a need to discuss the fiasco of the last hunt and what can be done to insure that that doesn't happen again. Also hunting with dogs needs to be addressed
Lesley McKee	Just the parts I am interested in	Yes	Just keep wolves safe to make their natural contribution to the Wisconsin ecosystem.	Nothing that I read.	10	I do not possess enough knowledge to offer any salient comments. Just keep up the good work.
	Just the parts I am interested in	Yes			7	I support the passage of this plan.
Norman Aulabaugh	Just the parts I am interested in	Yes	I like the input from groups with vestyed interests in this pln - especially Native Americans. I especially liked that the plan creates low quota zones around Native American lands.	I did not see any elements in the plan that I would be knowledgeable enough about to dislike.	9	I sincerely appreciate having the opportunity to comment on this plan draft.
Andrea Rodriguez	Most of it	Yes	It is generally felt that wolves themselves should be allowed to determine their numbers and distribution on the broader landscape, as opposed to having humans make this determination. In addition, taking a wolf's life is a serious consideration that requires substantial justification. Recreational harvest doedepredation necessitate that preventative actions and non-lethal approaches be pursued before consideration of lethal techniques. Wolf harvesting zones and designated zero quota areas in use since 2012 in Wisconsin. Overall as a Native American I like the plan	I completely disagree with the hunting of this species for sport. The unnatural killing of any animal simply for sport is not okay. The killing of animals to feed families is considered a way of life. I know of no one in my lifetime that kills wolves to consume them.	7	I like the amount of research provided in this draft. I grew up in very Rural Northern Wisconsin and spent 90% of my childhood living and playing in the deep unpopulated Northwoods. I only have one memory of all those years of seeing a grey wolf as a child. As one would appear daily at the edge of our yard and sit and watch us playing. It never entered our yard but it seemed curious as to our lives as human beings. I never felt threatened or afraid as my siblings and I often played alone on our 10 acres of land.
Nancy Pourciau	Just the parts I am interested in	Yes	1. No need to reduce to 350 wolves. 2. Buffer zones around Indian Reservations 3. Better education of residents about wolves. 4. REDUCE ILLEGAL wolf kills!	1. Don't want longer wolf hunting seasons. 2. Would like to see hunters using their own skills, and NOT those of the dogs. That is not hunting! 3. Make-up of state wolf advisory committee should be based on the science of wolf hunting, and not the desires of the hunters.	7	
Dave	All of it	Yes	Having a harvest goal	The only dogs I have are bird dogs, and the thought of losing them and only getting a possible $2500.00	1	Maybe find a way to get problem wolves placed south of hwy 10 which goes through the central part of the state then everyone has a chance to deal with them
Scott Schroepfer	All of it	Yes	The overall scope and structure	No wolf population target, not using lone wolf estimates in the population estimate, expansion of wolf buffer zones affecting private property.	5	Please emphasize the perspective of the persons that live in wolf territory (northern WI).

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Chuck Kolar	All of it	Yes	I like that the plan addresses the importance of encouraging forest practices that promote a healthy percentage of early successional forest.	I feel the expansion of primary wolf range and secondary wolf range doesn't serve the people who live in those areas well. Much of zone 4 is agricultural. Expanding it to secondary range will only create conflict between livestock and pet owners. Some of the buffer zones appear to be fairly wide. (Maps don't delineate scale or straight line distance) Since its an area of reduced harvest, seems like this may be onerous on agricultural producers and pet owners if conflicts arise in those areas. Fig 35 on Page 104 shows results for a question on the survey of desired public opinion. Yet the results should be considered invalid since the expanded wolf range into areas once not considered suitable wasn't data provided for the survey respondents. Pg 126 C2F. All trapping of wolves should be delayed until at least 12/1 if harvest is ever allowed again. Wolf fur is not in prime earlier than that so why would any harvest be sought - early harvest provides lower quality fur and taxidermy mounts. The animal deserves better if it is to be harvested. Its death should provide more than management control. There is also a high potential of resource user conflicts with wolf traps in public forest with hikers and their dogs, coon hunters, rabbit hunters, and upland game hunters. I have seen trappers hanging signs warning of wolf traps over large areas of prime upland bird and rabbit coverts as well as hiking trail areas. Warnings are nice, but I'm pretty sure that those hanging the signs were hoping to scare of other forest users to reduce human activity. I see no reason for traps or snares set for large canines in public forest during high usage periods for owners of hunting dogs and companion dogs for trail hiking prior to the end of Gun Deer Season. I also feel it would be more equitable for harvest tags to be issued specifically for trapping vs hunting. First season of harvest seemed to fill quotas before the dog hunters even had a chance and they are a stakeholder group that seems to have been saddled with a large portion of the conflict with wolves.	6	Plan draft provides a tremendous amount of information and clearly represents a tremendous amount of effort. If management authority doesn't return to the state within the next 12 months I feel the state may have to take a stand and provide livestock and pet owner with the ability to defend their animals. The reality is depredation occurs so quickly and unexpectedly that lethal defense would most likely never occur. But it would go a long way towards making those living in proximity to wolves to feel empowered instead of defenseless. It would also start to send a message to Washington that its time for management to be returned to the state and meaningful changes to the ESA to eliminate all the senseless litigation over an animal that has clearly recovered in the Great Lakes States. I also personally oppose national organization that provide no benefit to wolves whatsoever, are clearly just a PAC using wolves to raise funds, don't own any property suitable for wolf inhabitation to be on the wolf advisory committee. I specifically speaking to HSUS having a seat at the table. Disgraceful.
	Just the parts I am interested in	Yes		all of it. need to regulate population more severely	0	
Chad Geissler	All of it	Yes	I've read thru this so called plan twice,and there is nothing in it I like.	Having no population goal. When reintroduction plans were formed every group involved was satisfied and agreed to a population goal of 350. That's what the goal needs to be set at. Johnson has come up with a tactic, NOT a plan.	0	We don't need input from other states or people who will never see, hear or have to deal with these animals. There's to many people and organizations out there that feel no animals should be managed. We need our DNR to work with Wisconsin sports people to keep our wildlife healthy and in check. Not work for the animal rights groups and tribe's that feel the state should be saturated with wolves.
Sue Menter	Just the parts I am interested in	No	The removal of the arbitrary population goal. Having low quota zones. The importance of the ecological benefits of wolves.	Any kind of hounding on wolves. This, to me, is sanctioned dog fighting. No mention of a timeline for review of this plan on a regular basis. Climate change can greatly affect wildlife.	9	We have been lake home owners in Burnett County for 14 years. We WANT the wolves to live unharmed in our area. The white tail deer population is out of control here and any way CWD can be combatted should be left in place. Wolves are known to hunt sick deer. Wolves are a no-cost solution to help limit this terrible disease.
	Most of it	Yes	Increases wolf population.	Want more protection for wolves.	7	
	Most of it	Yes	Using more non-lethal methods of control and increased education to improve relationships between humans and wolves.	The fact that you will still support hound hunting. There is no way to justify hunting a canine with another canine. It is a barbaric way to hunt and you have no actual way to control that method. If you must have wolf hunting, at least keep it humane and only allow hunting in areas that have had depredations. Secondly, the tourist aspect sounds interesting, but in reality, wolf hunting and wolf tourism can not occur in the same area. Yellowstone has a strong wolf tourism following but they do not allow wolf hunting.	5	There is a very, very small percentage of the population that wants to hunt bear and wolves with hounds but they have a disproportionate voice in how our wildlife is managed. Maybe it's time to listen to the majority of residents and ban the hound hunting altogether. If you would provide more education to inform people about that practice, you would see an overwhelming turn against it. Another point is that the DNR promotes food plots for deer and when the deer numbers increase in a small area, wolves are going to be attracted to that food source. Then the landowner complains about the wolves and possibly get compensation for other depredation.
Eva Kuzmanich	Just the parts I am interested in	Yes	Taking out of arbitrary wolf population goal. Low quota zones are good idea. Management focuses more on ecological benefits of the wolf		9	
Brett Weir	Most of it	Yes	I like the inclusion and diversity of the stake holder groups represented by the committee. I like the inclusion of Science, Biology and History as it relates to wolf management.		10	

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Brian Bucki	All of it	Yes	Wolves being managed.	No reason for the lack of numbers in the new wolf plan. NONE.	2	SHAME ON THE DNR. I have always supported the DNR for the most part. I am a CDAC in the Northern Forest Zone and will be voting for zero antlerless on public land from here on out until the DNR does their job and straightens out the heavy toll predation is doing on our northern deer herd. You are turning the public on the DNR after years of improving your image. I will be encouraging other CDACs in all northern counties to follow suite if this wolf plan is not changed. If the DNR wants to over rule low antlerless tags on public land , so be it. will not be part of this and many other CDACs are coming on board. It will be embarrassing for the DNR at best. The CDACs have a responsibility. Hopefully the DNR will take their responsibility just as seriously.
Dennis jeffers	Most of it	Yes	None of it	All of it	1	Better start taking the people who have to live with them in to consideration and how they are affected not the special interests groups
	Most of it	Yes	I like that there is no exact population goal. I do worry though that the WDNR could be pressured under a Republican administration to pursue a high harvest goal. I like low quota zones around tribal lands	Hound hunting should not be allowed. I realize this requires a change in the law but at least the training window should be limited (1-2 months per year in the fall) not 365 days. Under Objective B (page 102) add: Non-lethal methods for wolf/livestock conflicts should be prioritized. Wolf subzones around tribal lands should be based on wolf home ranges. It doesn't meet the tribes goal if the wolves that occupy tribal lands are not protected. There should be a planned review every 5-10 years once you see how this is working and it should incorporate science and all stakeholder groups.	9	No hunting with dogs. This is inhumane for both.
Terence Noone	Most of it	Yes	nothing	I would like to see a population goal.	0	I feel that allowing only 2 months for public comment makes everything about this process look one sided. The plan looks very anti harvest.
	Just the parts I am interested in	Yes	Nothing. This is a non-scientific, emotion and religion driven document	Many many items, however you can bbegin with goals 1 and 3. As to goal 1: The wolf has no ecological role unless you are emotionally or religiously inclined to believe it does. There is no ecological role that a wolf can perform, that humans can't do better. Wolves would only have a needed ecological role if humans were removed from the equation. As to goal 3: there is no benefit to a wolf population unless you are emotionally or religiously inclined to believe there is. The wolf is no different than any other animal, plant or object. (Except for those needed to sustain life) The wolf is not necessary to sustain life.	0	The plan is a failure, created by emotionally and religiously driven people who have a pre-determined outcome for wolf management. That outcome is to the detriment of people.
	Just the parts I am interested in	Yes	NOTHING! This is a non-scientific, emotion driven, and religion driven document.			
	Most of it	Yes	I like that the plan will be science-based. Picking numbers for a harvest was arbitrary, and counter indicative to the health of the wolf population.	I don't like that "harvests" are not being TOTALLY eliminated. Wolves are not hunted as a food item. A top predator is NEVER a good choice or reason to put food on the table because the loss in energy at each trophic level makes it prohibitive as a good energy source. Rather this species is being hunted to provide one thing only: Trophies. That sends the wrong message. People should know that the state and the MAJORITY of its residents value the wolf for many reasons, among them it's niche as top predator, it's value as being emblematic of wilderness and wild land preservation, and it's long relationship to native peoples in the state. Rather than continuing the counter-indicative idea of having a harvest, the state should redouble its effort to compensate residents and farmers for the loss of pets and live stock. (By the way, I AM fully aware that the state legislature and the Natural Resources Board have historically set harvest numbers in years when the wolf is not listed as a species of concern. These numbers have been put forth as a type of quota, with no scientific underpinnings whatsoever. This practice/policy must be changed, and management of wolf populations must be returned to DNR, the only state agency that can apply a scientific approach to that management. The citizens of Wisconsin deserve no less.)	9	

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Mike MacKenzie	All of it	Yes	A lot to cover on likes. It was a well thought out plan. D2= excellent, specifically D2c,D1a,D1e (getting specimen items to the right educational folks will be a plus; E2b, E2c, The plan of partnering w/ UW and educational segments mentioned will make this a stronger and a powerful too to support science based managment and harvest quotas. Hopefully it will work out that way. F2e Getting CITES authority I think is a smart move for several reasons. For education purposes also having cites tags on education specimans will be more transparent to general public and prevent illegally taken specimans less profitable. Attending wildlife/wolf conferences, having educational (qualified/articulate staff) at events open to general and sporting public (Milw sport show, trapper convention, school forest/educational facility....)etc will build strenght over time. Eco tourism built around wolves can benefit local areas with stable wolf populations. examples Yellow stone, Thompson Manitoba area. Also B3b is good idea; I don't have number handy but making sure accurate info pro or con is distributed, and when that info is abused or biased, it needs to be corrected. B1 was all good; B1e livestock carcass disposal should be done properly or abatement payments shouldn't be allowed if warned before. I worked in areas where farmers disposed of livestock in slobby ways which created problems, and in some cases to draw wolves in to possibly get payments for cattle the farmer lost due to negligence on their own. Same true w/ some hound hunters. A1 and A5 very good as was most of plan. I'll leave it at that, there was so much to comment on but overall very good plan.	Only dislike I could articulate too is the concern over season structure, It mentioned (don't have # handy, think it was in F part. In regards to baiting, night hunting (not until after deer season). and season start. I didn't see information on length of season. I believe strongly that having a season extended into the breeding season would be a strong negative for me and many others. It was mentioned and don't have the number handy. problem wolves, and problem areas should be strongly targeted, quotas and this areas in a zone need to be specifically targeted thru the process of setting quotas. So that this hunt wil provide a good result for hunters/farmers and the wolf herd. If that is done in this plan which I believe was mentioned that is good/important to the social aspect of the plan. The last hunt was a cirus which hurt the image of hunting to the general public; being a hunter safety instructor is more difficult when that last hunt happened the way it did. It is so important that the hunts are based on strong science. I think this plan will actually help educate more people about wolves and possibly help hunters understand more about deer, and deer/predator relation. Socially I think this plan is good. as long as science can maintain a fair role in quotas. I did have minor concerns on quota setting in relation to primary prey populations A1definitions. no problems there, understand why that's mentioned, but in many areas we have too many prey (deer) although not always perceived correctly by general population. I hope their false perception on deer numbers don't increase wolf harvest while reducing deer harvest. Iif deer population is higher, and CWD is present what do you do? A healthy wolf population, from a science-based hunt would probably be a benefit either way. so maybe dislike? Dealing with this was mentioned in other parts of plan. A1b was was good, long term sustainable management is key and hopefully this plan when approved can remain solid to prevent too much political change on that. Also not sure if carcass collection was mentioned but once w/no specifics. Maybe it's covered under an NR code, but would be more comfortable if carcass collection was more specific (for data collection) hunters/trappers can end up w/ skulls/carcass as long as data is available when needed. I understand w/ the covid issue the last hunt but need to avoid lost data.	10	the time it took to get this plan together was reasonable in my opinion, it's a good plan. I'm impressed w/ the work that involved accomplishing this plan. Next steps I hope don't change the plan much. I would support a higher deer kill which would possible lower wolf numbers for the people who don't want as many wolves. Wolves are important part of our landscape in Northern Wisconsin. I've targeted my deer hunting to areas with healthy wolf populations, that's what I learned to do from over 50 years of deer hunting in WI (20+ in Canada) that's where the best deer hunting is. I see great benefit in stable wolf populations here, not just for healthier deer herds, but for benefitting plant and forest diversity. In my lifetime I've personally witnesses what the lack of predators and wolves have done to our landscape. I've also witnessed in a short term, what reducing wolf numbers to quickly have done to destroy top quality native plant and forest habitat which benefitted deer and diversity. I have also witnessed how quick a reduction of a healthy forest and native plant community can happen because of a poorly planned and rushed wolf hunt. I've witnesses how much negative impact there was as a result of hunters shooting (illegally) a breeding pair of wolves in an area I had hunted for several years in Canada. the deer in that area over concentrated in that area the following winter and grossly over browsed the deer habitat where we hunted. The deer hunting went to hell for ten years after that in this isolated area of NW Ontario. I see that happening here, I feel strongly that this wolf plan will help prevent damage to our ecosystem here. It will benefit so many things in the process; native plants, regenerating forests, birds and other animals as well as people and tourism. We need a healthy wolf population. Thank you for the opportunity to review this plan. Keep up the good work.
Nick Ninneman	Most of it	Yes	None it is vague in its terminology and seems to exclude any studies or actual management statistics. Nothing is mentioned for preferred quotas and a balanced population size.	It doesn't represent any past studies done. It doesn't provide statistics of the wolf population or a preferred population management. It was drafted in a short timeline and has for the most part been hidden from the public eye where only wolf enthusiasts would know of it. The majority of hunters and farmers in Wisconsin do not even know of this draft. The draft has catered to the anti wolf hunting groups and reservations with little input from hunters and farmers. All of which seems intentional.	1	Provide numbers for the current population and what the dnr believes is a managed population size. Something that is sustainable between hunters and conservation. Provide actual study information.
	All of it	Yes	the fact that you are recognizing a wolf problem.	should be state wide hunt, including the tribal areas.	4	The wolf cannot be protected. Northern Wisconsin is being overrun with the animals, need a season to eliminate many !
Steven Lutzke	Most of it	Yes	Zones, and zone specific sustainable wolf populations with harvest goals harvest goals		7	Appreciate the work that has been done. I feel that having specific sustainable population numbers with legal harvesting goals like is done with so many other animals is the most desirable plan for all involved. In my experience (only) and as a hunter, I have yet to meet a hunter who is totally against having wolves in the state. By having real number sustainable goals with real legal harvest goals I believe is the best way to placate and be respectful of everyone's views. The success of reintroduction of elk and wild turkeys are two examples, both which appear to have successful management plans. Coyotes are found statewide now and have been legally harvested for years. Again thank you for the effort extended and encouraging public comment.
Peter Cyganiak	Most of it	Yes	I like the science based approach referenced many times in the draft.	1. No population goal. Whoever has the largest voice wins population. 2. Subzones around Native American reservations. Separate zones around their land hurts the residents in that area. If Tribes do not want a goal that is their right. Don't push that to neighboring lands	1	See above
Kate	Most of it	Yes	Attempting to balance the needs of humans and wolves; zones; compensation for livestock loss	no specifics on nonlethal means of controlling problem wolves; the term "harvesting", they are not a crop	6	Details about nonlethal means of dealing with problem wolves i.e. livestock guard dogs. California has a newer plan on dealing with mountain lions that is excellent.
Zachary Krueger	All of it	Yes	That we will allow a sustainable wolf population.	Dislike that there is no set target number. This allows the DNR to not take anything seriously and just allow the wolf population to grow with no lethal management strategy.	2	DNR needs to reinstate a wolf hunt and lower the wolf numbers to the original agreed upon wolf population of 300-400 wolves. There needs to be a management number that takes deer hunters wishes of decent northwoods deer hunting into consideration. You are negatively affecting the tourism industry by having the deer hunting being poor and not having a serious management plan with serious management numbers. I am not anti-wolf by any means but they need to be managed like all other wildlife with sustainable numbers.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Nick Kufalk	All of it	Yes	Hunting be used as part of the management plan.	The subzones around the reservations. If they don't want to kill wolves on their reservations that's fine, but I don't think we should be limiting private property and public land users around the reservations that want to hunt wolves because the tribal groups don't want the wolves hunted.	6	I feel like the wolves should be harvested at a greater number to bring their population number closer to 350. Given that was the original management plan population number. I think that is a fair number for everyone involved because they are still on the landscape, but not at such a great number that they negatively impact people's livelihoods and personal enjoyment of other activities (Ex: Bear Hunting, Deer Hunting, Running my Dog). Majority of the people who complain about the wolf hunt are people who have never spent anytime in wolf country and have never had to deal with them.
Stephen Constantine	Just the parts I am interested in	Yes	None, it's an ambiguous action that skirts any wolf population management kowtows to uninformed non-rural folks and animal rights (antihunting) groups.	1. Lack of an actual population goal. Where is the science based management goals that The DNR longs for? 2. People in non-wolf areas carrying equal say on wolf management. The ones affected most by the wolves should carry more of a voice. 3. Areas not inhabited by wolves should not be deemed primary or secondary wolf range. 4. Expanded buffer zones, especially around reservations. 5. The 350 population goal was supported by many, many people and entities; and the will of the people was completely ignored.	0	The Feb. 2021 wolf hunt (considered a slaughter by the uninformed) had no impact on the wolf population. However, it's no coincidence that the 2022 deer kill was up in almost all areas, including most wolf zones. Obviously, the thinning of these critters, allowed deer populations to rebound quickly. A sensible science based wolf hunt is needed in the northern wolf zones in order to maintain acceptable deer numbers and also help out the hunting related economy up there.
Josh Kolasch	All of it	Yes	I like how the DNR is moving away from a specific numerical population goal, as this is old science and we have seen how special interest groups can use a number for whatever their goal is. Allowing for a population to fulfill their ecological role while still allowing for human harvest and lethal control is the most sustainable long term management solution. The buffer zones around reservations, increased harvest areas around high depredation zones and lower quotes in core wolf range all lead to sound science management that addresses multiple issues.	Some of the boundaries for zones follow highways and interstates, which can cut off some core wolf areas. Also, I think that emphasizing a lower wolf quota in zones 1-2 is important as these areas will likely see some loud disagreements from anti-wolf groups.	9	Having more tribal say and input over the total ceded territory will respect the tribes sovereignty as well as allow for a more resilient management plan, just like with walleye management from GLIFWC and the DNR partnership
Cindy Pope	Just the parts I am interested in	No	Education and stabilization	Conflict management- until the barbaric practice of harassing bears with dogs is outlawed, conflict will continue.	7	
	I have not read any of the draft plan	Yes				Eliminate wolf-hunting adjacent to Tribal reservations. Hunters should NOT be able to use dogs to chase down wolves. Thank you for removing a cap on the wolf population.
Jeff	All of it	Yes	I liked the concern for diversity and recognizing the importance of having a wolf population in Wisconsin.	I dislike not following the population goal that was originally set. I got the impression from reading the plan that the purpose of the group was to justify expanding the wolf population. I also did not like how the survey allows people who have never seen a wolf and will never set foot into their environment to weigh in on this subject. I also did not like the dismissal of what would happen if we continue to not curb the wolf population.	0	I hunted in Rusk, Iron, Vilas and Marinette counties this year. My hunt was disrupted by wolves in each of these counties. The hunters I know are all disgusted with the DNR lack of concern for the effect wolves are having on our hunting. No money for game wardens but enough to monitor atvs and study wolves, easy to see who the DNR prioritizes.
Rick Cassel	All of it	Yes	I like that you are taking a look at reporting on wolf hunting and limiting the time to report a killed wolf. I like the elimination of a specific number of wolves that will live.	I do not support any wolf hunting. I do not support hound hunting of wolves, and extended hound training. Baiting, and trapping of wolves is also a negative thing.	5	I would like someone to look at the imbalance of power on the Conservation Congress. This group is heavily stacked with bear hunters
	All of it	Yes			3	1) Lack of population goal. There should be a total population of 350 or less. 2) Citizens living in wolf country should have a greater voice than non-wolf areas. 3) Areas currently not inhabited by wolves should not be considered primary or secondary wolf range. 4) Spring hearings overwhelmingly support a goal of 350 or less wolves. Listen to there voice. There is a reason for their vote. 5) Buffer zones around reservations effectively allow tribes to manage private land outside of reservation boundaries. This is simply a bad idea and does not allow for overall proper management. 6) Wolf impact on deer and elk populations should be a major consideration; especially as it applies to hunting.
	Most of it	Yes	Removing an arbitrary wolf population goal is important to make sure the best-available science is centered in wolf management The low quota zones are an important and welcome addition to the plan The plan is rightly focused on the ecological benefits of wolves		9	Areas that should improve: The DNR should better regulate hound training on wolves. The DNR should limit wolf-focused hound training activities to only when wolf hunting is allowed in each zone. There is currently no guidance in plan for next review or update – there should be a plan for regularly updating the plan (so we don't have another plan that is used for decades) and there should be permanent, ongoing stakeholder AND science committees to oversee wolf management in Wisconsin – this oversight is critical. The plan acknowledges that there are responsible farming practices and other non-lethal options to reduce wolf and livestock conflicts, but doesn't recommend that these opportunities are prioritized.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
jerry adamovich	Just the parts I am interested in	Yes	the fact that dnr would continue to monitor populations	That a population number be determined. Extremely lower than our current population. In the plan it said it helps tourism, I disagree because in Northern Wis, I see less deer, causing less hunters to come north, and more dog kills so less hunters getting involved. I also know from experience that if wolves are where you hunt you are not finding deer. I encountered a wolf turkey hunting and they are not afraid of humans no matter how much you scream at them. Also because of over population in the north some irresponsible people put out poison and killed dogs that people were just taking for a walk. My point here is that if a reasonable number was met, some people would not try taking matter into their own hands.	2	
Michele Saridan	Most of it	Yes	The plan removes a numeric population goal. The plan creates low quota zones around Tribal lands where the Tribes requested it. The plan is rightly focused on the ecological benefits of wolves. There is expressed commitment to science and continued research with partners and acknowledges that “keystone species such as wolves are an important component of a healthy ecosystem”	The DNR should better regulate hound training on wolves. The DNR should limit wolf-focused hound training activities to only when wolf hunting is allowed in each zone. There is currently no guidance in plan for next review or update – there should be a plan for regularly updating the plan (so we don’t have another plan that is used for decades) and there should be permanent, ongoing stakeholder AND science committees to oversee wolf management in Wisconsin – this oversight is critical. The plan acknowledges that there are responsible farming practices and other non-lethal options to reduce wolf and livestock conflicts, but doesn’t recommend that these opportunities are prioritized.	9	I would like to thank the WDNR for writing a wolf management plan that centers science, public input, and Tribal engagement- the core tenets of the best way to protect, conserve, and sustain natural resources, especially gray wolves in Wisconsin.”
John Saridan	Most of it	Yes	The plan removes a numeric population goal. The plan creates low quota zones around Tribal lands where the Tribes requested it. The plan is rightly focused on the ecological benefits of wolves The plan is reflective of the public opinions survey. There is expressed commitment to science and continued research with partners.	The DNR should better regulate hound training on wolves. There is currently no guidance in plan for next review or update. There should be permanent, ongoing stakeholder AND science committees to oversee wolf management in Wisconsin. The plan acknowledges that there are responsible farming practices and other non-lethal options to reduce wolf and livestock conflicts, but doesn’t recommend that these opportunities are prioritized.	9	I would like to thank the DNR for writing a wolf management plan that centers science, public input, and Tribal engagement- the core tenets of the best way to protect, conserve, and sustain natural resources, especially gray wolves in Wisconsin.
ELizabeth Bolton	Most of it	Yes	Thank the state for removing a cap on the wolf population.	I urge the state to eliminate wolf-hunting adjacent to Tribal reservations. I demand that the plan disallow hunters from training dogs to chase down wolves.	4	
Sarah Aslakson	Most of it	Yes	Advice from multidiscplinary sources	management = hunting. Wolves are historically a historic part of the environment and should remain so		There is no control over hunters, as seen from the last hunt when they went crazy and killed every wolf in site. Without real management of the hunters it is all lip service
Janet Fischer	Most of it	Yes	Compensation for verified wolf attacks. Cattle, calves, and hunting dogs.		7	Very thorough plan. History provided for better understanding. Impact to native Indian lands protected. Impact on elk population most important
David Selby	Most of it	Yes	Regulated Hunting is still a consideration, pending state and federal approvals	The disregard of the significant reduction of mature bucks in zones 1 and 2 coincident with the introduction of wolves in the 1990's. The National Forests formerly offered a quality hunting opportunity to apply woodsmanship skills in large tracts of forest and the hope of encountering and harvesting a mature buck. Large rubs, large tracks and scrape lines have all but vanished in your wolf management zones 1 and 2 rendering 100's of thousands of acres of public land. This is not anecdotal evidence. Note the winners of buck pools at local bars in the north. Odds are that a 10 inch wide 6 or 8-pointer will collect the pot out of 75 or more entrants. If the mature bucks were still out there in huntable numbers, someone occasionally would stumble upon one. Deer have moved closer to towns and dwellings (as you noted in your report). If a rare mature buck sighting occurs, it is usually close to more "urban areas" where it has found safe bedding cover because of the presence of humans and dogs. The northwoods deer hunt is but a pale shadow of what it was in the early 90's and prior when newspapers were filled with photos of 18 inch wide 10 point bucks and larger. My "big woods" hunting partners and I are now travelling downstate for most of our deer hunting because the promise of taking a nice buck is an integral part of the hunt. I and my partners have logged hundreds of hours (possibly1000's) scouting and hunting wolf zones 1 and 2 over the last 35 years such that we longer believe its feasible to take a mature buck in the national forests. I understand test design and that correlation is not the same as causation but no one within DNR circles seems to be addressing what's happened to the mature bucks that used to roam the national forests prior to wolf introduction. Private property owners within zones 1 and 2 also have a re-occurring story. "We bought our 80 acres for hunting and planted a food plot. At first we attracted some deer but then wolves moved in because we inadvertently created an easily killing zone for them." The damage to "the great traditional northwoods public land hunt" cannot be over-emphasized and it deserves a strong voice in wold management discussion.		Wolf tourism is a bit of a joke as well. I spend well over 100 hours each fall skulking around the national forests in scent controlled clothing and sitting quietly on deer stands. I have NEVER observed a wolf while hunting even though the areas I hunt have a significant amount of wolf tracks. They will never be a tourist factor nor will they ever be at risk of having their population decline to below a sustainable number. The horses have left the barn so to speak. Its PC to study and protect wolves but I think they do just fine on their own!
Joyce Frohn	Just the parts I am interested in	Yes	The time people put in to the plan and the oppertunies people have to comment	Any increase in killing wolves. We need wolves to help fight wasting disease in deer.	2	

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Amy Rambow-Larsen	Most of it	Yes	Effects of wolves on their biome are considered, and effect of disruption of family units are considered in the introduction - although a large portion of the data seems to come from Spain rather than from studies of the Wisconsin wolf packs.	Despite surveys that indicate a preference for having the DNR perform any wolf killing, the proposal still calls for a wolf season. It is clear that most people do not consider wolves a true game species. Additionally, trapping is an especially cruel way to kill. I am surprised that the section on public perception of wolves failed to address the public view of methods of killing other than hunting.	1	The thought of murdering members of an intelligent family group such as a wolf pack for fun is abhorrent. Wolves should be regulated by the removal of problem individuals by affected farmers or the DNR. More data is clearly needed to determine the wolf population that can be supported in Wisconsin. The argument that wolves need to be slaughtered to protect the deer population runs counter to the oft made argument that deer hunting is required to control the deer population.
	Just the parts I am interested in	Yes	Mortality rates	Nothing	7	
	Most of it	Yes	I liked that there was a public survey, though it wasn't broad enough to cover public opinion. I feel the counties with higher wolf populations/depradations should have more input than counties with no wolves. If you don't feel the impact of the wolves, your opinion isn't based in fact.	There needs to be a set number of wolves for harvest in the plan. There needs to be a complete counting of the wolves - I don't feel that to date the count has been accurately reported. The Tribal buffer zone, in theory, is a good idea, but if you own the property adjacent to it, your voice is neutralized - that's not fair, not should it be part of the plan.	3	Those not impacted by the wolves should not have such loud voice in this plan. Perhaps the wolves in high problem areas could be transplanted to areas where there is high support for them - to balance the issue.
	Just the parts I am interested in	Yes	The use of scientific means to determine actionable quotes per zones.		7	
	Most of it	Yes	I like that you evaluating input from where people live in proximity to wolves.	There is no goal number	2	You are not managing to a defined goal
	I have not read any of the draft plan	Yes			10	
Kat Molitor	Most of it	Yes	The removal of the cap on the number of wolves in our state. Limit the hunting of wolves around our indigenous peoples reservations, the wolves are sacred to them.	I have always been totally against the use of trained dogs in hunting to run down wolves.	5	I live in southwest WI and would love to have wolves in my backyard. We struggle with too many deer on our farm. We need wolves to keep a check on the deer population, just like the wolves were needed in Yellowstone to keep the elk in check.
Glenn Beaudoin	All of it	Yes	I liked seeing comparison in population estimates between Fuller and Adams to ensure the newer methodology was statistically accurate.	I did not like seeing the two population methods not being compared using the same data year. Are the Fuller and Adams methods really comparable? It's like comparing apples and oranges. You should know better!! So, what is the goal for the number of wolves? Are you waiting to see what the ecological system will support and then use the same system as deer? Less, maintain, or more classification for each zone or go right to that once declassified? This is not clear to me.	7	The first part of the document is difficult to read since all references are cited in the text. Use an appendix to cite references for easier reading. The background should have been presented first, then the plan. I can also see why done the current ay, since many will not care about the background information. I felt as if I was reading the same information multiple times, just worded differently. Alot of what was provided could have been condensed. It's as if you had a minimum number of words to present to sound intelligent or you were trying to ensure no one would read the entire document.
Kathleen Knoeppel	All of it	Yes	I like that the plan is science based. I really like the removal of cap for the wolf population.	I do not want the state to allow wolf-hunting adjacent to Tribal reservations. Demand that the plan must not allow hunters from training dogs to chase down wolves.	7	I do not want a vocal minority to have the most influence over this plan. I want it science based and humane.
John Barton	All of it	Yes	Not much!	Not settling a number to control wolf numbers.	1	This plan will continue to cost millions of lost dollars in Northern Wisconsin, in land value and deer hunting opportunities.
Angela	Most of it	No	1.Removing an arbitrary wolf population goal is important to make sure the best-available science is centered in wolf management 2.The low quota zones are an important and welcome addition to the plan around tribal zones. 3.The plan is rightly focused on the ecological benefits of wolves		9	I am especially in favor of reducing hound training on wolves. Also, revisiting the plan every couple of years to be sure it is on track.
Steven Meurett	Most of it	Yes	SHortened registration period for registering a wolf harvested. There is no reason not to register within a short period of time. Zone specific harvest authorizations. It makes no sense to kill excess wolves in zone where they do not cause issues. Disrupting packs can lead to greater issues research has found. The best thing is eliminating the "goal" (which there never was a hard goal number) population number. It's proven that WI can support over 1000+ wolves in a stable population. Population trends are leveling off as saturation is reached. I do like the number of licenses to be issued for each zone based on evaluation of zone-specific harvest rates, success rates, zone-specific	The continuation of hound hunting for wolves and training hounds on wolves. This will be difficult to remove because the oversize influence of the WBHA. No other state allows this and WI should not as well.	8	Good: the plan sees value in having wolves in the state and public support for them. It's science based instead of emotion based. Problem wolf areas are targeted instead of a state wide quota, which never made sense. Shorter registration period. Concerns: against hound hunting of wolves and training, "managing" in areas there they don't need to be "managed."

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
			quotas and timing of past zone closures. I also like the science based approach for research and management.			
	Just the parts I am interested in	Yes	I like that the population cap was removed. I like that the indigenous tribes were consulted on making the plan.	I'm concerned by having the zero quota areas being the boundaries of reservations instead of a slightly larger area would mean that if a wolf from a reservation happens to cross the boundary it could get killed.	7	
Tom	Most of it	Yes	Graphic charts	Compensation for stock loss is undervalued.	2	Have an annual hunting season to take 15 to 20 % Of the statewide population. Those who live in dense urban areas cannot understand our rural concern because they have no physical presence in wolf territory.
	I have not read any of the draft plan	Yes	removing a cap on the wolf population		1	Demand that the plan disallow hunters from training dogs to chase down wolves. eliminate wolf-hunting adjacent to Tribal reservations
Heidi	All of it	No	The Mission Statement is what I like...with hopes that each statement would be supported	I dislike "management" being used instead of slaughter. Call it what it is. The killing of wolves. I can't understand why humans feel the need to "manage" wildlife, other than the fact they feel wolves, or other animals are dangerous. Wolves are VITAL to healthy ecosystems. CWD is spreading and wolves are the natural managers of such diseases~ taking out the sick animals. Less wolves~ more disease, overpopulation of deer, etc. I feel that humans just like killing.	1	Leave the wolves alone to do their jobs. Nature takes care of everything. Whenever people meddle, they create imbalances.
	Most of it	Yes	Build a CWD “No Kill Zone” where no hunting can happen as well as a “Research Zone” Tighten up the fall hunting regulations, if a hunt is held. A hound-training season is unacceptable to the majority of Wisconsin voters—that is, using packs of radio-collared hounds to track, chase and ambush wolves—is not sound policy and is akin to state-sponsored dogfighting. Outreach and education	Determine location where the dogs can be used on small parcels to pursue wolves leading to increased conflict with land owners.	6	
	Just the parts I am interested in	Yes	removing the cap on the wolf population, thank you	using dogs to hunt wolves, and hunting close to tribal lands	7	studies have shown that healthy predators make help the prey animals, and the land prosper
Mathew Christianson	All of it	Yes	Removing the cap on the wolf population	any take of wolves not associated with livestock depredation	5	Eliminate all trapping and use of domestic hunting dogs.
Josef Anderson	Just the parts I am interested in	No	Non-lethal management	Hunting		I don't want any wolves being killed by hunters. So inhumane when they kill their pups
James Eichman	All of it	Yes	All	None	10	
Cameron Reece	Just the parts I am interested in	Yes	Removing an arbitrary wolf population goal is important to make sure the best available science is centered in wolf management. The low quota zones are an important and welcome addition to the plan. The plan is rightly focused on the ecological benefits of wolves.		8	
	All of it	Yes		no set number of wolves , need to be 350 or less !!!	1	
Bethany Peterson	All of it	Yes	Protecting some wolves is better than none,unfortunately.	All wolves need protection after years of persecution.Not just some of these amazing creatures.	6	Wolves are important to our ecosystem and lives.
John W Cerkas	Most of it	Yes	Living in Forest County I am favorable to wolves. Never lost any of my livestock to wolves, nor had any unfavorable contact with them.		6	I support limited licensed control of wolves. Not a full scale hunting season open to all.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Erin Spoehr	Just the parts I am interested in	Yes	-Removing a cap on the number for the wolf population	-eliminate wolf-hunting adjacent to tribal lands -do not allow hunters to train dogs to chase down wolves	4	Wolves are important to our natural habitat and help to balance the ecological system. Please keep this in mind and eliminate wolf hunting.
Gregory Sipla	All of it	Yes	Pretty much none of it. It's a very disgusting slap in the face to the license buying sports men, & women that hunt, fish, camp, etc., in WI, both residents and NR's. THIS is what we get for our license dollars? Pathetic! Real cute releasing it the day after the Nov. 8th election, too.	1) Ignoring question 42 from the 2022 Spring Hearings, where 12,978 people voted for a population goal of 350 wolves or fewer. That's a TWO to ONE margin over the 6,410 that voted against it. The question passed in 63 of our 72 counties. What does that tell you? Not much, I guess, since you decided to go with no numeric population goal. Where did you get that crazy idea from? 2) Six mile buffer zones around reservations. Who's running this state, license buyers, or the tribes? 3) Extensive expansion of primary and secondary wolf habitat designations. Where is your science based data, to support your changes? 4) Again, nice going on your "almost" secret, 8 page survey, sent to 8,750 addresses. Lopsided sampling of addresses mostly located in concentrated areas of lakes, cities, and villages. Mostly left out were rural addresses in wolf counties that would 'tilt' the sentiment against wolves. Figures don't lie, but liars figure. More DNR credibility lost, if they had any to begin with.	1	There are more wolves in WI, than you have any idea about. But, of course, you won't admit it. Randy Johnson will take most of the flack for this report, but he's just the messenger.
Ellen Marie Lindop	All of it	Yes	Like:Removing an arbitrary wolf population goal is important to make sure the best-available science is centered in wolf management The low quota zones are an important and welcome addition to the plan The plan is rightly focused on the ecological benefits of wolves		9	
	Most of it	Yes	All	None	10	
	All of it	Yes	showing the important role wolves have in ecological management,	I noticed how compensation from depredation has increased over time as ¨hunters¨ have been sacrificing their dogs as the hunters in order to compensated for the loss of their dogs. This is shameful and unethical treatment of animals being used as ¨bait¨ more or less so the owner can collect compensation.	1	Although the cap has been removed from the wolf population, I do not see the need for a hunting season on wolves. The idea of using dogs (canines) to hunt other (canines) is comparable to using bait dogs (canines) to train pit pulls (canines) to fight. It is the greed of the humans who sacrifice their canines in order to collect profits from their demise. I think there should not be any compensation to hunters for their dead dogs that they chose to use to do their evil bidding. I know there has been some depredation to livestock over the years from wolves. I know they are compensated for it. My suggestion to livestock owners would be to look into using Great Pyrenees as they were bred to guard livestock and do a fairly fine job of it. Livestock owners need to be more responsible for their livestock in keeping them safe from predators. Lastly, I find it disrespectful that zones for hunting are so close to tribal lands. Again, Native people are being disrespected by the whites who want dominion of the Earth. Wolves have been villainized way too long; it is time to respect them as keystone species and to not put delist them from federal and state protections.
	All of it	Yes	You finally did your job and drafted a plan.	Not managing population for specific number of wolves on the landscape. Not soliciting opinions of the appropriate Wisc landowners that have direct and routine involvement with wolves on the landscape. You have sugarcoated this draft to your own liking and not the appropriate stakeholders.	1	It is clear and evident you drafted this plan based on politics. I could be specific, but you already know exactly how, what, and where. Not about the science. Not about what benefits the wildlife as a whole. Instead about your own personal ideology and what makes you feel good. The DNR has been corrupted in your decision making by a minority of peers.
Sue	All of it	Yes	The idea that the Wi DNR has more stakeholders in how we will preserve and conceive our apex predators other than hunters	That the plan includes any hunting of wolves. This is not conservation. Recent years when the wolf has been put back on the endangered species list has shown that hunting is unnecessary as the wolf population will self regulate. We also should not be reimbursing bear hunters for their dogs that are killed by a wolf pack while they are “training” their dogs during pup raising season.	5	We need a different philosophy on how we live with and interact with wolves. Hunting them is not the answer, we need to learn to coexist with nature, not kill something we have little understanding of. We almost caused extinction of these incredible animals in the past. It’s time we changed our paradigm on wolves. Thank you, Sue
David Zuckerman	Most of it	Yes	Protecting wolves near Indian Land	Using dogs to hunt wolves	6	As a retired Biologist I understand the value of wolves on the environment.
Cathy Diers	All of it	No	Adjustment for tribal adjacent lands. Recognition of ecological benefit of wolves. Removing an arbitrary wolf population goal is important to make sure the best-available science is centered in wolf management	There needs to be continued oversite and connection with environmental and scientific data to update the plan.	10	
	Just the parts I am interested in	Yes	nothing	no maximum number of population of wolves listed (it was to be 350) we all know that there are far more than that now!	1	we do not need wolves in Wisconsin. If we have wolves we don't have deer

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Mark M Giese	I have not read any of the draft plan	Yes				Please eliminate wolf-hunting adjacent to Tribal reservations. Please disallow hunters from training dogs to chase down wolves. Thank you for removing a cap on the wolf population.
Jeffrey Szymanski	Just the parts I am interested in	Yes	Factors that take into account both sides.	Not sure.	7	As a lifelong resident, I urge Wisconsin to eliminate wolf-hunting adjacent to Tribal reservations. I Demand that the plan disallow hunters from training dogs to chase down wolves. Thanks for removing a cap on the wolf population.
Christine Farrell	Just the parts I am interested in	Yes	Section 1 regarding keeping the species populated and guarding against unwarranted killing	Too drawn out before action "do" part is implemented	5	
Jaime Lardinois	Just the parts I am interested in	Yes	The historical info was good. The graphs were easy to follow, especially the showing the small amount of pet dogs killed by wolves.	Any part that allows traps or use of dogsfor hunting wolves.	3	
	Most of it	Yes				Implement plan that outlaws trapping or hunting w/dogs. Both are cruel and inhumane. Place no cap on wolf population. Aim for plan that protects the wolf population while still protecting people. Wolves are an intrinsic part of our ecosystem, and we all will be better off when they are protected.
	Just the parts I am interested in	Yes	Eliminating using dogs to hunt wolves, wolf protection barrier around tribal lands. continue monitoring and using biological science to support the health and welfare of the wolf population		5	
Jeff	Most of it	Yes	I like that DNR appears (or at least claims) to be developing a science based wolf management plan.	11 of the 22 groups that DNR is collaborating with have a religious objection to wolf harvest. These groups have no place in a science based management plan.	5	The tribes made DNR look stupid last year. Either force them to show their hand or stop consulting them.
	Just the parts I am interested in	Yes			8	
	I have not read any of the draft plan	Yes			10	
	Most of it	Yes	My heart hopes that the right thing is done for our environment so that ALL living can live their life🙏🙏🙏♡💗♡💗			What if YOU were a wolf, how would YOU want to be treated and live YOUR life?
	I have not read any of the draft plan	Yes				Want wolves left alone. Let nature be nature. It's their land too. There are non-lethal ways to co-exist with wolves used all over the world.
	I have not read any of the draft plan	Yes			6	
	Just the parts I am interested in	Yes	I do not like any attempt our WDNR makes to manage anything in the state. Their track record concerning CW D and invasive species in our lakes speak for their incompetence.	The entire plan and any other plan that comes from behind a desk in Madison's top heavy political arena.	1	Any thing our WDNR attempts to manage or control is based on money and political influence which destinies it for failure. Wolves were here long before the white man set foot in Wisconsin and did a much better job of controlling themselves and wildlife than any appointed political hack in our Capital.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Thomas E Nelson	Most of it	Yes	Apex predators (except Humans) are essential	Protect Apex predators almost everywhere with very few exceptions		
	Most of it	Yes	population goals of 350	Media portrayal	1	We are spending way to much money to maintain a population that city dwellers and tourest think we need, I would love to see the wolf population move into the cities and start eating their dogs.
	All of it	Yes	data, though outdated, data is nice to see, unbiased data that is.	The lack of new data, too much from the 70's-90's. practically nothing from 2015 on. The borders of the reservations, look at it in detail would you. Public/private. It's mainly public, you sub boundary is biased from lacking proper data.	2	Get rid of the sub boundaries, your council biased not balanced. Why is it that my friend on the GLIC says that they don't care about killing or not killing. AIM, yes they are still around, tells them that if the whites want to kill them say no to killing them. You practically have a mafia, this is first hand knowledge from one of their own.
	Most of it	Yes	While not federally protected, as naturalists we are focused on the wolves and the benefits of the wolves to the ecosystem	I would lie us to be more active about eliminating dog hunting of wolves. This is simply wrong,	7	
David Zielke	Most of it	Yes	The historical data was very thorough to the point of being overwhelming.	I don't agree with the added buffer zones around reservation lands. I disagree highly with not stating a number goal (350 wolves state wide). Lower harvest goals appear to be the future, and I very much disagree.	2	The plan is overwhelmed with historical data that distracts from the "plan". It makes reading the plan very difficult. It appears there is an extreme effort to appease the anti hunting public. The plan complicates wolf management far beyond what it's intent should be.
Al	All of it	Yes	Impact on CWD	Natural population limits would be much higher than a hundred years ago because timber wolves are an apex predator and Wisconsin's environment changed.	3	I had hunted for over 50 years in many areas of Wisconsin. I've seen the changes in deer populations in areas where I began to see wolves sign and heard them. I've seen the WDNR wolf den sites and noticed wolves in many area that were not included. I think there are many more wolves than are estimated. I think this plan should include the issues coyotes are causing the deer population and offer a plan on coyotes limits.
Kelli	All of it	Yes	Removing a wolf population number goal. Including public education. The more you understand, the less you fear. Listening to the public opinion and scientific research about wolves being a useful part of a healthy ecosystem. Realizing that the deer population controls the wolf population and not vice versa. Acknowledging that responsible farming practices can reduce predator conflict.	Needs more support for non lethal wolf control/deterrent. Guard animals such as donkeys or certain breeds of dog provide sustainable deterrents to predators. Limit the training period for wolf hunting dogs. 365 days a year is outrageous when wolves are not federally protected. Limit wolf hunting dogs in general. Hunting with dogs means the rest of the hunters/trappers don't get much of a chance. A clear plan for updating this plan so we don't go by very outdated information in the future.	9	Thank you for for writing a management plan for wolves focused on scientific, public and Tribal input!
	Most of it	Yes		to open ended peple do not understand wolves eat everthing used to see tons of small animals when that the wolves coyotes and bear got out of control the landscape died	1	should not expand no hunting zones
	All of it	Yes	Not much too vague	Too vague on numbers like the real population which I'm told off the record is well over 3500. But for people to keep there jobs it's under 1000.	1	
	Most of it	Yes				No trapping at all.
	Just the parts I am interested in	Yes		Wisconsin is the only state that still allows hunting wolves with dogs. Additionally reimbursing owners for vets bills due to injury while hunting. I strongly disagree with practice of using dogs for this plus the state paying for injury. How does the state afford this? If this practice was done away with, the stats could potentially safe some $ and keep up with other states that realize this is very outdated and ignorant.	5	
[redacted]	Most of it	Yes	None	No management numbers	1	Quit sucking up to libs
Greg Mitchell	Just the parts I am interested in	Yes	None	All	0	The tribel nation should not be able to get a bumper for any kind of hunting or fishing season
Curt Loew	Most of it	Yes	Not much where have you stuck with the original plan 350	The boundaries around the reservations.come on land owners people hunting public land.We all know where this is going.	1	Stick with the 350 Or less Stop taking hunting lands away from hunters we pay the bills for wildlife! Stop trying to appease the antis
Kathleen Camilla King	All of it	Yes	I do like the new limitations on registration and harvest permits because these should reduce kill. I like that all agencies and stakeholders and tribes are included. I like the government to government collaboration Ensuring a healthy and sustainable wolf population to fulfill its ecological role.] --EXCELLENT!!! like the new aspects that appropiately support the wolves' ecological role. Revising wolf management zone boundaries to better reflect current wolf distribution and habitat.]--Excellent!! Once again, consistent with real world. I think it's very wise to include different agencies and tribes and	trapping]??Hopefully !!Not!! with the steel jaw traps!! I like the *idea* of scientific research and science-based, !Of Course!,but science has generally been acting so goofy-nutty lately I'm not comfortable reading just "science" without specific backup statements. Reducing harvest registration times and issuing zone-specific wolf harvest permits to improve the department's ability to effectively meet harvest quotas.---Im concerned about the language here because the first half of the paragraph describes creative new strategies that would reduce kill,but the second half of the paragraph implies that hunters have to keep on killing the wolves *Until* they meet the quota. I'm pretty sure that in the real world they would harvest the wolves until a quota, but the wording is weirdly contradictory. I'm alarmed that no mention is made about changing the wolf hunting season so that it's not at the same time as their mating and pregnancy season.	8	

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
			stakeholders are being included and collaborated with because this may prevent future red tape barriers.			
	All of it	No		Why can't a group of the wolves be relocated to another state? I am totally against killing any wolves. I like them a whole lot better than man. I am not a fan of beef at all, so if the wolves eating them, is fine by me. As for pets.. if you guys want them then put them in your homes with you. I keep my dog in my house. Or do you guys up there not love your pets ? !	0	I would love to see the red wolves that were murdered in the past reestablished here in Georgia again. You guys don't really think this out, do you? If they become no'more, you will regret it , and so will the generations after you.
Larry Polenske	Most of it	Yes	background information	No specific target population number.	3	We need to be more aggressive in controlling the population at number around 500 wolves in the state. That is enough to ensure their survival and lessen the negative impacts of a larger population.
	Just the parts I am interested in	Yes	Dividing the state into different zones to recognize that various parts of the state are very different - land type, land use, human population density.	1. No specific wolf population goal.previous plans quoted 300-350 wolves. That is specific, reasonable, and achieves targets goal. 2. Trying to expand wolf habitat well beyond previous areas. 3,. Including non wolf impacted people in surveys. Only directly impacted people's opinions should be considered if any opinions at all. Otherwise wolf myths and non scientific beliefs will drive survey results.	1	It must do a better job of balancing wolf population ecological goals with current realities of human modified land conditions and use.
Nick Toth	Most of it	Yes	Nothing is good about the draft plan!	I dislike that the goal of 350 wolves has been removed, we have way too many wolves and the population needs to be knocked down to no more than 350 wolves in the state. Expanding primary and secondary wolf habitat designations is unacceptable and the last thing this state needs.	1	It is clear that the DNR wants to expand the wolf population instead of reduce i This plan does not value hunters or farmers. The deer herd in the Northwoods continues to suffer and the DNR cares more about the wolves. It is clear that you do not care about us in the Northwoods and care only about appeasing the pro-wolf crowd, many of which do not live in wolf country. This plan is a slap in the face to Wisconsin residents.
Karen Ackroff	All of it	Yes	Emphasis on science-based decision making and inclusion of all interested groups.	continued support for leg-hold traps	9	I appreciate the thoughtful and thorough construction of this plan.
James White	Just the parts I am interested in	Yes	Depredation , elk recovery , money spent on reimbursement .	Tribal influences on ceded territories outside of reservations .	4	Federal Government needs to put management back in the states management plan . Current population estimates are off skew , while scientific and counting it is not close to real numbers . Non-residents should not be allowed to draw a tag .
David Anhalt	Most of it	Yes	Nothing	The plan ignores the survey of the people through the spring conservation hearings. The plan marginalizes the people living in zones heavily affected by high wolf populations. The plan ignores the 350 wolf population goal. In fact it doesn't even state a population goal. The plan expands wolf zones into areas that shouldn't be suitable for wolves. The plan creates large buffer zones around Indian reservations that disenfranchises private property owners who shouldn't be under Indian rule.	1	The DNR needs to scrap this plan and start over. The wolf surveys presented to the DNR show that the people most affected want action to reduce the wolf population to the 350 wolf goal. A 350 population doesn't eliminate the wolf from Wisconsin which i wouldn't support. It does create a reasonable population that residents, ranchers and hunters can work with.
Jodi Koehler	All of it	Yes	Low quota, but it should be 0. We do not eat wolves. People kill them for the joy of killing something. Protecting breeding areas and seasons, and no hunting on tribal lands also critically important	We should not hunt wolves at all! They are an extremely intelligent species with strong family values. And we should never use barbaric traps or dogs to destroy these beautiful creatures	5	Again wolves should not be hunted. There is no reason to kill a wolf. It one is running livestock, farmers and ranchers already are allowed to murder them. There should NOT be a season in an animal that we don't need for food! How barbaric is our species? What does that say about us as human beings?
Gerard Makovec	I have not read any of the draft plan	Yes	protecting wolves	Any part which permits a wolf hunting season.	7	I support paying farmers for animals they lose to wolves. I oppose wolf hunting, especially using dogs and baiting. Let them be the part of the natural environment that they have always been before humans endangered their existence.
Marvin Thorell	All of it	Yes	Not much.	Most. You've overcomplicated everything.	1	It's a very simple issue. Wolves improve the deer herd by eliminating the weak and sick. They also decrease the herd by eliminating healthy and young animals. Set a maximum number of wolves as a goal, that goal being simply to prevent their extintion. 100 seems reasonable. Use a VERY willing public (e.g. hunters) to control the overall deer population. We're done, here. I own 80 acres in northern Wisconsin. I have 8 elevated stands on my land. I spent three full months deer hunting this past fall on my property. In that time I saw but a single small deer on my property. I killed it, but felt badly since the population seems to be so low, already. How many months will I need to hunt next year to see a deer now that I killed the only deer I saw in 3 long months this year? You do the math.
Bailey lee	All of it	Yes	Very good historical data on wolfs.	Too many to list but here are the top ones. 1. Where is the population goal? Without this it isn't a plan. 2. Tribes controlling wolfs outside of the reservations is wrong. 3. The word Holistic has no place in this document. 4. Too many anti wolf hunting groups on the committee. 5. People living in wolf country need a bigger say in this plan.	1	Needs to be heavily improved.
Kevin lee	All of it	Yes	Very little of it. Except some good data points.	Where is the population goal? Without a goal this is not a plan!	2	None

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Fruhwirth, Scott A.	All of it	Yes	First of all, I like that there is finally a wolf plan. The report is very detailed and shows that there was allot of hard work that went into it. So many different perspectives. There was allot of great information. The overall review of the wolf's history and repopulation of Wisconsin. Along with discussion on the different viewpoints and perspectives. The science behind the wolf recovery process. Great work by the men & women on the ground.	1) That there is no wolf population goal. The original 350 goal was never sought after, or the end game. People don't forget. The objectives sound good, but whether or not the objectives are meet will be very subjective. 2) Wolf numbers are sure to rise further, I don't see how conflicts stay the same, much less decrease. 3) I don't have land within 6 miles of a reservation, but don't like it that private landowners who do, will have more stringent hunting restrictions than others. 4) That people that live in wolf country don't have more say. They have the skin in the game. 5) Deer are the primary prey. Improved forest management should be a main objective. Increasing the amount of early succession forest, would improve deer nutrition, plus greatly increase the species diversity of the whole forest. Good for deer, wolves, and hunters.	6	
Randy priem	All of it	Yes	The fact that you actually created a plan that had management zones.	No population goal. Impossible to manage anything in life without a goal. Really amateurish. Buffer zones around Indian reservations. That's giving the tribes the de facto ability to manage non- native land.	2	Recognize the needs of the population and hunters of northern Wisconsin not just the anti hunters in our big cities. I've hunted in northern Wisconsin for 47 years. I the need to manage wolves is a necessity to save deer hunting in the north
Tina Congdon			I'm not sure since it's not written in PLAIN ENGLISH!	The fact that it's not written in Plain English!	2	I think we should leave them alone! Nature takes care of itself!
Dennis Lenzendorf	Most of it	Yes	Science based Very thorough Includes tribal input	Maybe not tge plan but The amount of compensation for loss of hunting dogs is concerning	9	I think the DNR has done a very good job in updating the Wisconsin Wolf Management Plan. It is based on science, research covering predator research, human interaction, history, and good plan to move forward in insuring Wisconsin maintains a healthy wolf population while addressing conflicts. Tolerance of wolves will require a huntingcand trapping season into the future. No special interest group or political ientity should dictate how the plan should be implemented. Being aware of Tribal history and input is well addressed in the plan. I am a wolf advocate but also have a strong understanding of wolf management. Years ago I was fortunate S a college student to observe David Mech's wolf study in the Superior National Forest and worked in Yellowstone National Park before retiring from the Park Servive.
	All of it	Yes	not much if anything	no end goal for population. What happened to 350! why are you designating areas that should not have wolves as protected areas?	0	not acceptable for those of us who live up north in :"wolf country" You people who reside outside of "wolf country" have no clue about the effect of increasing wolf populations on our lives. do not pander to the ponytail crowd!!
Scott Jacobson	All of it	Yes	The in depth study and information gathering.	The reluctance to reduce the number of wolves.	2	I think that the wolf issue in Wisconsin is being politized. Wolves need to live in remote areas such as Alaska and Canada. The Wisconsin DNR has failed in wildlife management. Wolf interaction is a problem to anyone that uses the public and private land to hunt on. Farmers always have the threat of wolf depredation and it is only amatter of time before our farm is raided by wolves. Our flock of sheep has been decades of development and we could loss 40 years of work in one attack. I also hunt with bird dogs and have had one wolf attempt to kill my best pointer. Every time I go into the woods I have to be on guard for a wolf attack. I am a farmer and a public land owner. I feel that having wolves running throughout the state impinges my rights and safety to my livestock and hunting dogs. How many people actually see a wolf in the wild. I did not see that in your report. Seeing tracks is easy if you spent time in the woods and swamps of Wisconsin. My opinion of wolves is this. They need to be wild and live in a place that provides them a natural habitat. A National Park is a good choice. Not roaming in my pasture at night. I think we have to protect the wolf from people. We can't do that by having wolves interface with high populations of human and livestock. I would like to see in the meantime the DNR and USDA allow hunters and livestock farmers to use lethal force to protect their property. When the wolf is out of prey it is their instinct to find it wherever they can get it. They kill dogs because the view them as competition. One more point I would like to make is when you live trap a wolf and release them they learn from that experience. They no longer fear humans. I seen that first hand when my pointer was being ran down by a wolf. He looked right at me and he was 30 feet from me. I shot my shotgun over the top of him and got the wolf to turn and breakoff the attack. I found out later from the local game warden that the wolf I described to him was released a year prior to my encounter. I don't want that to ever happen again. I am 63 years old and have been in the woods of Wisconsin since I could follow my father on walks. I have learned a lot and still see things the truly amaze me. Please take my opinion and comments seriously. Managing wildlife is not easy. But you need to have an open mind. If anyone that think wolves are cute and cuddly show them pictures of what they do to livestock and dogs and then ask them if they have every seen a wolf in the wild. It may change their mind. Regards, Scott Jacobson Cushing, Wisconsin Yes we have wolves.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Catherine	Just the parts I am interested in	Yes	The plan is focused on the ecologic benefits of wolves.	There is no guidance for review and updates.	9	Thank you for writing a plan that centers science on protecting an important part of the eco system.
Dennis Stensberg	Most of it	Yes	I like that this topic is being addressed and that we are finally getting an opportunity for input.	You will not consider this 'specific' but I don't like the fact that the overall tone seems to be to increase the wolf population.	3	I live near public land in Wood County and have hunted there for over 50 years. There was a time when deer were abundant and deer hunting was an enjoyable extended family activity. Since the appearance of wolves, the deer numbers have plummeted to the point that hunting has gone from enjoyable to challenging to frustrating to nearly a waste of time. Things like antlerless permits, which once guaranteed a likelihood of success are nearly impossible to obtain. The survival rate of fawns has dropped from the former level of 80+% to somewhere closer to 10%. Our group's next generation has quit hunting. "It's boring!". I once dreamed of enjoying the sport with my grandchildren. Now, I wouldn't even try to encourage them to try it. I can endure on past pleasant memories, but newcomers to the sport would only experience long, cold, lonely, boring hours of seeing nothing. Once the generational link to hunting is broken, it will be very difficult to grow it back. I used to think hearing wolves howl was music to my ears; seeing one was magical! Now, there's so [redacted] many of them, I view them as a disgusting pest. Nothing ruins a hunt like hearing wolves howl. You might as well pack up and leave; you will not be seeing any deer. The wolf numbers NEED TO BE CONTROLLED!!! As hunter numbers decline, license sales drop and the connection to nature and conservation continues to fade. Healthy numbers of deer can do a lot more to slow the trend than an ever increasing scourge of wild dogs.
	Most of it	Yes			7	I support nonlethal management techniques. NO use of traps, no dogs, no hunting by air. I support indigenous peoples' concerns and interests.
Nancy Wiegand	Just the parts I am interested in	Yes	The DNR seems to be trying to safeguard the wolves, even when the legislature/laws may make that difficult.	Using hounds to chase wolves is bad practice, and if it cannot be fully stopped, it should be severely limited, that is, only in a small space and of very short duration. Also, I'm wondering who will be closely monitoring effects on wolves and who will be in charge of changing the DNR's recommendations if needed, and at what frequency. Wolf scientists should be in charge, assuming they are committed to preserving a natural ecosystem with a healthy wolf population.	8	I personally am against hunting wolves. And, I'm absolutely against using hounds. I'd like to know how farmers are compensated for wolf damage and whether other means could be used to avoid damage by wolves, thus avoiding the need for compensation.
Steve smits	Most of it	Yes	Elk kill from wolves appears high		1	I owned a cabin and deer hunted in Florence and forest county. After seeing wolves follow my tracks as I went to my stand and the deer population non existent I sold the cabin in 2021. I kept 12 acres but there are no deer in food plot. Deer appeared for about 3 weeks and then wolves moved back into area and no deer present for the next 4 weeks. Vecause of the wolves I no longer deer hunt or ride atvs in forest and Florence counties. The wolf population is significantly higher than your estimates.
Hannah Lee	I have not read any of the draft plan	Yes	I have to say that I am in support of whatever you support because I trust The Sierra Club's analysis. I love wolves and want to support them, but don't have the time or the patience, regrettably, to read stuff like this. I count on you for that.	I guess just based on what I read in your email, I would say I dislike that there is no plan for review or guidance for updating. Further, I would like to see some specific suggestions in the plan for how farmers and others could implement non-lethal and more responsible practices, naming and describing those practices and asking the DNR to require them.	8	I would also like to see the DNR publicly display an attitude of respect for wolves rather than a simple-minded "hunt-or-don't-hunt" public stance. A more humane DNR that respects the land and its inhabitants as more than merely a resource for hunters, farmers, miners, industrialists, and recreation-seekers would be more likely to make better decisions about the issues in their purview. Wolves are iconic; how and why, and what does this tell us about why they must be respected? e.g. (I know; when pigs fly....and yet,.....)
Kelly Williams	Most of it	Yes	I like that the plan focuses on the ecological benefits of wolves while also keeping Wisconsin residents' opinions in mind. I also like the focus on science and research.	I don't see any content relating to when the next review or update will be. I think it would be in our best interest to revisit or update the plan more frequently, and each revisitation or update should require inout from science committees and tribal nations.	9	Thank you for writing a plan that takes the science and Tribal input into account. Those things are very important to me.
	Most of it	Yes	The plan removes a numeric population goal: Removing an arbitrary wolf population goal is important to make sure the numbers of wolves are adaptable, so they can be based on best-available science and ecological changes. The plan creates low quota zones around Tribal lands where the Tribes requested it: These lands are treaty-protected with documented wolf packs. Making this update is an important and welcome addition to the plan. Ideally, the plan would expand these zones beyond just the few that are listed. The plan is rightly focused on the ecological benefits of wolves The plan is reflective of the public opinions survey that was released along with the plan and finds that opinions toward wolves have grown significantly more favorable There is expressed commitment to science and continued research with partners and	The DNR should better regulate hound training on wolves. The DNR should limit wolf-focused hound training activities to only when wolf hunting is allowed in each zone. There is currently no guidance in plan for next review or update – there should be a plan for regularly updating the plan (so we don't have another plan that is used for decades) and there should be permanent, ongoing stakeholder AND science committees to oversee wolf management in Wisconsin – this oversight is critical. The plan acknowledges that there are responsible farming practices and other non-lethal options to reduce wolf and livestock conflicts, but doesn't recommend that these opportunities are prioritized.	10	Thanks for a more progressive plan!

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
			acknowledges that "keystone species such as wolves are an important component of a healthy ecosystem"			
	Most of it	Yes	The plan creates low quota zones around Tribal lands where the Tribes requested it The plan is rightly focused on the ecological benefits of wolves The plan is reflective of the public opinions survey that was released along with the plan	The DNR should better regulate hound training on wolves. There is currently no guidance in plan for next review or update The plan acknowledges that there are responsible farming practices and other non-lethal options to reduce wolf and livestock conflicts, but doesn't recommend that these opportunities are prioritized.	9	
C. Zook	Just the parts I am interested in	Yes	1. removal of fixed number goal for population size makes sense 2. focus on benefits of wolves to the environment 3. commitment to science and research to determine the best ongoing management strategies	1. would like to see more emphasis on non-lethal options for population control (such as farming practices) 2. would like to see better regulation and control of hound training on wolves	9	Thank you for this survey and for including science-driven considerations to preserve and protect our state's natural resources, especially the gray wolves in Wisconsin in the draft management plan.
Lauren Flottorp	Just the parts I am interested in	Yes	I like that the plan removes an arbitrary numeric population goal. Removing an arbitrary wolf population goal is important to make sure the numbers of wolves are adaptable, so they can be based on best-available science and ecological changes. The plan creates low quota zones around Tribal lands where the Tribes requested it. Making this update is an important and welcome addition to the plan. Ideally, the plan would expand these low-quota zones beyond just the few that are listed. The plan is rightly focused on the ecological benefits of wolves. The plan is reflective of the public opinions survey that was released along with the plan and finds that opinions toward wolves have grown significantly more favorable. There is expressed commitment to science and continued research with partners and acknowledges that "keystone species such as wolves are an important component of a healthy ecosystem."	The DNR should better regulate hound training on wolves. It would be best if wolf-focused hound training is limited to only when wolf hunting is allowed in each zone. There should be a plan for regularly reviewing and updating this plan. And stakeholders and a science committee should be a permanent part of the ongoing review. The plan acknowledges that there are responsible farming practices and other non-lethal options, to reduce wolf and livestock conflicts, but these options should be recommended as priorities over lethal options.	9	Thank you, Wisconsin DNR, for creating a plan that centers science, public input, and Tribal engagement!
Laura Herzog	Just the parts I am interested in	Yes	The plan removes a numeric population goal: Removing an arbitrary wolf population goal is important to make sure the numbers of wolves are adaptable, so they can be based on best-available science and ecological changes. The plan creates low quota zones around Tribal lands where the Tribes requested it: These lands are treaty-protected with documented wolf packs. Making this update is an important and welcome addition to the plan. Ideally, the plan would expand these zones beyond just the few that are listed. The plan is rightly focused on the ecological benefits of wolves The plan is reflective of the public opinions survey that was released along with the plan and finds that opinions toward wolves have grown significantly more favorable There is expressed commitment to science and continued research with partners and acknowledges that "keystone species such as wolves are an important component of a healthy ecosystem"	The DNR should better regulate hound training on wolves. The DNR should limit wolf-focused hound training activities to only when wolf hunting is allowed in each zone. There is currently no guidance in plan for next review or update – there should be a plan for regularly updating the plan (so we don't have another plan that is used for decades) and there should be permanent, ongoing stakeholder AND science committees to oversee wolf management in Wisconsin – this oversight is critical. The plan acknowledges that there are responsible farming practices and other non-lethal options to reduce wolf and livestock conflicts, but doesn't recommend that these opportunities are prioritized.	9	
Steven Lindstrom	All of it	Yes	At least it is being updated after 20 years	Reimbursement for hound dogs Nonlethal methods to limit human, livestock, and wolf contact should be first and foremost in the plan	4	Please use best science based practices to continue quality wolf management
	Most of it	Yes	It was great that this survey is put out for public comment. The scientific aspects of the management plan are very helpful.	I would like to see plans going forward to review the wolf management plan sooner than in previous years.	9	Thank you for considering my viewpoint.
Ella Kinney	Most of it	Yes	The plan removes a numeric population goal. Removing an arbitrary wolf population goal is important to make sure the numbers of wolves are adaptable, so they can be based on best-available science and ecological changes	The DNR should better regulate hound training on wolves. The DNR should limit wolf-focused hound training activities to only when wolf hunting is allowed in each zone. There should be a plan for regularly dating the plans (approx. 7-10 years). There should also be permanent, ongoing stakeholder and science committees to oversee wolf management in Wisconsin - this oversight is critical.	8	Thank you to the WDNR for writing a wolf management plan that centers on science and our tribal communities! They are key members of this plan!
	Most of it	Yes	Finally getting a somewhat plan for managing wolves. Long overdue.	Surveys should be for the people who live in wolf zones. I'm sure the southern half of the state has no clue on the impact wolves have on the deer herd.	1	Need a population goal of 350 or less. Tired of paying high taxes for hunting land that is overrun with wolves.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Chad Wenzel	Most of it	Yes	-Removing an arbitrary wolf population goal is important to make sure the best-available science is centered in wolf management -The low quota zones are an important and welcome addition to the plan -The plan is rightly focused on the ecological benefits of wolves	The DNR should better regulate hound training on wolves. The DNR should limit wolf-focused hound training activities to only when wolf hunting is allowed in each zone. There is currently no guidance in plan for next review or update – there should be a plan for regularly updating the plan (so we don't have another plan that is used for decades) and there should be permanent, ongoing stakeholder AND science committees to oversee wolf management in Wisconsin – The scientific oversight is critical. The plan acknowledges that there are responsible farming practices and other non-lethal options to reduce wolf and livestock conflicts, but stops short of recommending that the DNR prioritizes these opportunities, which it should do.	9	
Heidi Cassel	All of it	Yes	I like that we are not using a number quota to determine populations. I also like some of the the new wolf hunting regulations, even though I opposed wolf hunting.	I am unhappy that we are allowing wolf baiting, wolf trapping, hound hunting, and hound training. I believe science shows that is bad for all animals in the forest, and it is inhumane. Hounds and wolves suffer. I do not support the method for monitoring wolf populations. There Is is huge amount of error possible. I am very upset regarding the imbalance of power in agencies making decisions regarding wolf management. There are huge numbers of decision makers from anti wolf groups, who do not reflect the majority of Wisconsin resident's opinions. Wisconsin people support wolf protection when they have correct scientific information as is reflected in surveys. The Wisconsin Conservation Congress is a group of bear hunters, hounders, trappers, and wolf haters.	5	Try to do the right thing. Hounding is really wrong. Be a humane state.
Barb Frank	Just the parts I am interested in	Yes	Science based. Multi prong action+	None	10	
	All of it	Yes	The plan reflects the recent public survey showing the public opinion of the wolf population is growing. The plan focuses on the ecological benefit of the wolf population The plan removes a numeric population goal	The DNR should better regulate hound training on wolves. The plan does not prioritize non-lethal solutions for livestock depredation. There is currently no guidance in plan for next review or update and does not have a committee to permanently oversee wolf management	9	
Stafford Kramer	Most of it	Yes	Not killing so many wolves because of random misinformation or listening to the loudest voice in the room. Science and unbiased info should determine wolf population. Native people's wishes respected as well is a great step forward.	I wish this was the original plan implemented years ago.	8	
Brian Porter	All of it	Yes	Table of contents is well organized. A few meaningful Objective metrics are provided.	The overall theme is that the "plan" is meant to encourage expansion of the wolf range, the wolf population and to encourage public support for wolves. This is NOT appropriate for a Management plan. The writers of this plan were clearly biased to the themes I mention above and it has polluted the entire plan. Even the release date of the plan speaks loudly to the bias present in the plan. The absence of a numeric goal for wolf population is the most obvious indicator of the weakness and bias of the draft. There are many, many other indicators, such as the use of opinion based terms such as "relatively" or "adequate" or "ample". You're supposed to be highly educated people, based on science. You ought to use metrics to drive decision making, not vague words that you can twist to your own purposes! Finally, I'll use a quote from the document that is another clear indicator of the bias in this document...from your discussion about the relationship between deer and wolves...."support efforts to manage for healthy white-tailed deer populations to ensure prey abundance does not become a limiting factor for the wolf population nor cause public support for wolves to erode." So, you're telling us that the purpose of the deer in Wisconsin, and the management of that herd, is to feed the wolves. And we need to make sure we have enough deer so that wolves aren't limited. Really?	1	Why did not someone involved in the writing and review of this plan call out the "elephant in the room" when you were working on this document? It had to be very obvious to the people involved that this whole thing was designed with the purpose of wolf expansion and toting to the wolf-favoring constituencies. Shame on you all...nobody had the guts to stand up to this nonsense and write a truly fact based and balanced plan. Would you really want this on your resume? I think not. I used to be very proud of our DNR. I'm still proud of the guys and gals in the field for doing the job they do. The people involved in writing this document should be ashamed, I am sure the folks in the field are embarrassed for you.
	All of it	Yes	Monitoring wolf population information.	Plan should not include any deer harvest.	2	Wolf harvesting should not be part of plan. Hunter conflicts should be reduced by banning hunting with dogs and eliminating payments to hunters with dog death or injury due to wolf encounters

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Shayna Vendela	All of it	Yes	I want to start by saying that the management plan draft was incredibly thorough and well written. It took me days to read in its entirety however I was busy when I started reading it so I am sure that's a factor. - I like the idea of changing from 24 hr notice down to 8 however I think 12 would be sufficient for the goals. - I appreciate that you mention the introgression of coyote dna into wolves in the great lakes areas. I think there should be additional expansion in the draft on what that means for wolves in our state as well as implications for management. I wrote a proposal when I was still in college, a research proposal on the introgression of coyote dna into Wisconsin wolves and part of the paper included the dnr taking samples from all wolves shot in the future. Since personal have to look at the wolves anyway it would not be too tedious of an additional step, if you are checking the teeth for wear to age the animal you could take a swab and some hair as well. if you would be interested in seeing my research proposal, contact me at [redacted] or s[redacted] - the addition of buffer zones was a good idea; I remember reading a report out of UW on the 2011-14 hunts that recommended including buffer zones. That report had a comparison picture of where the zones would be and where wolves were harvested and there was a few that were taken in the proposed buffers. I think this is a good way to mitigate conflict, and relatively "easy" to do. Similarly, the addition of more intensive management zones was a good idea too.	- I think there should be more emphasis on how attainable a hunting season is for Wisconsin wolves There was a lot of speculation that we reduced our wolves greatly in 2021 or that we would kill them off. I think it should be noted in the plan that the other distinct population segment of wolves (NRM DPS) was delisted with just 1700 wolves in their entire dps in 2009. All of the states combined. routine harvests since then, some of them pretty intensive, and they still have a healthy wolf population out west. In idaho alone they experienced over 50% more harvest one year, but just had a population count of ten less animals the next with their single state's count being over 1500 animals, close to the population the entire DPS had at the time of delisting, 10 years previous in 2009. Their numbers have grown while being hunted. They are dispersing into new states and breeding there. They are now in Washington, Colorado, etc. - I think there should be more mention on the social carrying capacity of wolves and the fact that they have spilled into less than marginal habitat. The wolves at the cedar creek reserve in Minnesota have shown us that, while not a true "wilderness species", wolves do need some space to keep themselves out of trouble. Without that they pose a danger to pets, and people. There was a beach in Canada that actually had to be shut down because wolves were attacking people's pets while they walk them on leashes. Allowing wolves to spill into less than marginal habitat for the sake of recovery is dangerous. We have states like North Dakota nearby us saying they do not support wolf expansion; they will shoot wolves. Wolves are shot accidentally as coyotes in states like Indiana, Iowa, Missouri, Ohio, most recently one was shot in New York. Due to the admixture of Eastern Coyotes and our wolves there was some debate on that one. There are implications of this, wolves that disperse can and occasionally do interbreed with coyotes- see "Coyotes in Wolves Clothing", a report on a few pups captured in the lower peninsula of Michigan. The implications for management should be clearer, are coyote hybrids protected as wolves under the ESA? Its clear that our wolves are heavily admixed, what does WI state law say about hybrid animals? Could there be an argument that GLW are in fact descended of coyotes & gray wolves similar to the way red wolves are, and if so, does that mean they should then be listed under their own entity and not as gray wolves at all? If they were, what does that mean for management? Gray wolves in the WGL DPS are genetically distinct, this is not a state issue now that I bring up but there should be some disconnect of our states and the rest of the lower 48 similar to how the NRM is its own dps (I know that is under federal control, still going to mention it as we could continue to collect evidence and argue for our dps being disconnected from the rest of the lower.). Also, there's strong evidence that we could have our wolves down listed like Minnesota does to threatened so that it at least opens up management for wildlife services personal. We are well past recovery, however the judge that put our wolves back on the list did not agree with the part of the petition that questioned the regulatory mechanisms in the great lakes. He thinks that our state departments are sufficient, and I do too. I think that there is strong evidence that wolves are past recovery here, dispersing and we should collectively be making the argument, backing up the USFWS that wolves should not be protected past recovery in one area just so that they can spill into others for the name of checking some box on the ESA recovery list requirements. There are multiple species that do not inhabit their historic range that are currently still able to be hunted in areas where they do have sufficient populations. - I appreciate that the admixture of wolves was mentioned, like I mentioned earlier I think there should be more expansion on this. This is pretty serious for management purposes. Our wolves are smaller than the ones out west or further north. Originally, they had proposed releasing wolves from Minnesota in the Yellowstone area, which might have been a better idea and might be a better idea for Colorado since they already voted to reintroduce wolves. however, those bigger ones might just kill off any that were brought in. There's clear evidence that bigger wolves would have more advantages, we can see this with the recently reintroduced wolves to isle royale. the last-ditch effort to save the wolves on the island off the coast of Ontario might have swayed their entire plan. The goal was to mitigate the reduction of genetic diversity on the island. However, a last-ditch decision to rescue some starving wolves means that on that island those bigger Ontario Island wolves have now been the only ones to reproduce on isle royale. They even have killed off some Michigan and Minnesota wolves. these wolves were brought to isle royale starving because they had eaten all of the woodland caribou on their island, started at a disadvantage but have still managed to thrive. The Michipicoten island wolves are a grand example that genetics matter and have great implications for survival. - The supreme court Voigt decision solidified that the tribes have hunting fishing and gathering rights.	8	You can tell that a lot of time and effort was spent on this plan, I appreciate the combination of multiple viewpoints as well as how thorough the plan ended up being. Overall, this was very well done. Only complaint would be the amount of time it took, which is not reflective of this team in my opinion. It is not your fault that this is the first update in 20 years.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
				There is no right to preserve. There has been no right to preserve a portion of the identifiable harvestable surplus ever granted to anyone and there should not be. Following no tribal harvest in 2012 Cathy Stepp granted less tags to the tribes due to the fact that they were going against our management goals. When the department identifies the harvestable surplus thats the number of animals that can be harvested. It is NOT 50% of the number of animals that can be harvested. I think this needs to be stood on and hold our ground while remaining respectful. Implementing things like the buffer zones would be a step in the right direction. Allowing a portion of the quota to be reserved for preservation is against management goals and should no longer be permitted. However, steps to understand and mitigate differences should also be taken.		
Manley Glaubitz	Just the parts I am interested in	Yes	The plan removes a non-scientific population goal for wolves. The plan recognizes the public is more receptive to the balance wolves bring to the environment. People are beginning to accept that wolves are not as portrayed in fairy tales.	I would like to see hunting with hounds totally abolished. This is just harassment of a wild species. The plan should include a schedule for periodic review to insure best practices are being followed and new scientific information is included.	9	Thank you for developing an updated plan incorporating the knowledge and interests of the public, science and Tribal communities to insure a viable wolf population in Wisconsin.
Brian Giles	All of it	Yes	Removing an arbitrary wolf population goal is important to make sure the best-available science is centered in wolf management The low quota zones are an important and welcome addition to the plan The plan is rightly focused on the ecological benefits of wolves	The DNR should better regulate hound training on wolves. The DNR should limit wolf-focused hound training activities to only when wolf hunting is allowed in each zone.	7	
	All of it	Yes	Making a maximum population goal of 350 animals.	Utilizing input from areas of the state that have no impact do to wolves.	7	Do to human intervention and interference in nature. The top predator can not be the only non controlled animal. Science needs to be used to manage wolf populations as it is with all other animal species. Guilt about the past is no excuse for not allowing controlled hunting of wolves. Even common sense says the if the wolf population is higher than their food source can support, the food source disappears and so do the wolves. Also as the food diminishes in the north, the wolves will be forced to move father south into higher human populations.
Liz Reid	All of it	Yes	Lots of good data	What is the specific target number of wolfs on the landscape by region? Without this, it isn't a real plan. Too many anti wolf hunting members on the committee. I don't see that on the Bear advisory committee yet many tribes hold the bear to be apart of their heritage "Holistic" Appears 7 times in this document and has no place in management of wolfs. Where's the wolf population by zone? Seems if DNR can't provide that then how does the public have confidence in the rest of management strategy by zone.	1	
Margie	Just the parts I am interested in	Yes	Limit the number of wolves killed.	We'll.. that any are killed. Natures balance is out of sync here. Too many dear cause more problems.	5	
	All of it	Yes	Plans to increase education about wolves, and to have a thriving population of them.	Plans for any wolf hunts at all, no mention of non-lethal methods, population cap of 350, not enough.	4	350 is not enough wolves, there should be no wolf hunting or trapping, especially after your last slaughter, wolves are essential and we need them. Non-lethal methods should be the only methods to use.
David A Broadwell	All of it	Yes	Commitment to supporting the continuation of a wolf population in Wisconsin. Use of scientific study/measurements to guide regulations related to wolf management. Limiting licenses to specific hunting zones. A wide range of educational efforts to inform the population about the value and lives of wolves.	Not being a supporter of recreational hunting of wolves, I would prefer that 'taking' the of wolves be for safety, depredation, and health reasons.	8	I found the statements made by First Nation spokespersons to be enlightening. These perspectives could be more widely shared.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Drew Charpentier	All of it	Yes	A management population goal is the most important part of the plan. However, I disagree with the state/federal population estimates.	Much of the plans data references old data. I do not think the data reflects hunter input accurately. It represents residents of wolf habitat and range.	3	Deer hunting generates more money than any other recreational sport. Especially in northern Wisconsin. Wolf numbers are much much higher than the DNR/USFWS estimates would have you believe. Include input from 8-10,000 deer hunters in northern Wisconsin in the management plan and your graphs/survey results will show a much different opinion/consensus on how to manage the wolf population. Take a fair sampling of bear hunters as well. Bear hunters will attest to increasing numbers of wolves caught on trail cameras and observed in person at bait piles. Also missing from the plan, each wolf depredation incident by county. The draft plan is biased from a government/wolf loving point of view. Wolves and coyotes have clearly reduced deer populations in many northern Wisconsin counties, Minnesota counties, and Michigan counties. Countless Deer Hunting YouTube videos and Deer Hunting articles featured in Wisconsin Outdoor News, and other magazines clearly narrate how bad depredation has been for our deer herds. Many hunters in the three states I have mentioned would like a total wolf eradication, and many will not wait for a management plan to be passed. Many will defend and protect their families, pets, livestock, and other prey species at all costs whether regulated or not!
Michael	Just the parts I am interested in	Yes	Overall good plan but it means nothing unless the feds change things.	Anything involving government on any level and the HSUS is a bad mix.	4	No they can't. Government doesn't run things better and this for lack of a better term is heavy government controlled. I don't remember the people being ask if they wanted wolf reintroduction!
	Just the parts I am interested in	Yes		There is no mention of a maximum limit of 350.	1	
jon peterson	Most of it	Yes	none it sounds like a bunch of no commom sense dnr staff spending way to much time coming up with this stupid plan	the whole plan lets get some common sense in the plan not just a bunch of bs	0	this is a typical approach by dnr to a problem in nothern wi if you would like to see how many wolf there really are ican show you a 15 mile area in trego with 30 wolves time for a hunt,
	All of it	Yes	I do not like the plan at all. Iv lived in Wisconsin my entire life and the wolves and DNR have destroyed the northern deer population.	Wolves need to be harvested every year. Also removed from the endangered species list	1	You need to clean up your responsibility before people start getting attacked by wolves and I hold the DNR personally responsible
Randall Ritchie	All of it	Yes	The Historical elements.	The lack of numbers for direct predation by Wolves on Elk. The Tribes statements do not represent the opinions of all First Nations in Wisconsin.	1	The historical impact of hunting on the Wolf population is minimal yet the hunting opportunities it provides are hardly mentioned. Unfortunately the deer population in the State will never rebound in many areas until large numbers of Wolves are reduced , not .04% in a season every four years!
Dale Nixon	All of it	Yes	Limiting the population of wolves.	I think the DNR should stay with the 300+ total population in Wis..	5	
	All of it	Yes	Setting a goal.	The population goal not being based solely on biology. Leave the "social value" out of it.	0	Keep and maintain the population goal of 350 or deal with the consequences of citizens managing the population on their own accord.
	All of it	Yes	That the plan is adaptable, flexible, and ways in public opinion. Above all it calls for educating the public by providing the most up to date information. It also recognizes occurring problems.	Original plan called for 350 wolves, population is now over 1000. Material provided says 29-30% harvest would provide balance. Why has the population doubled?	3	Wolf population has doubled, wolf range is increasing, and I personally feel as Numbers move towards southern Wisconsin in heavier populated area and agricultural areas. More problems and complaints will happen.
	All of it	Yes	Very little	Most of it	1	There was a reason wolves were removed from the landscape. The state didn't listen brought them back there was a goal of 350. As people spread across the landscape even more then when the 350 goal was set what makes it possible to increase the numbers. There was a reason 350 was set it should be no more then 350 and probably less. The size of the boundaries around tribes is ridiculous. I could see a couple miles but come on.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
	All of it	Yes	Increasing education about wolves, maintaining a population of wolves	Allowing wolf hunting or trapping in general, 350 population cap, any mention of lethal management methods, no mention of non-lethal methods intended.	3	I can't believe that you still intend to have wolf hunts after that last slaughter. There's no reason whatsoever to hunt or trap wolves, there's plenty of non-lethal methods to keep wolves at bay. The small inconveniences of having wolves is completely overshadowed by the benefits of having wolves. Wolves don't require human interference, in fact in many cases that causes more problems. It's time to govern by science and proven facts. Wolf hunts are ant-science, anti-climate, anti-facts, and anti-wildlife. Wolves can prevent the spread of CWD, as well as prevent natural disasters and deforestation. They keep wildlife healthy and thriving. They balance ecosystems and we need them. On top of all that, wolves are a major tourist attraction, live healthy, thriving wolves that is, they bring people from all over the world and their tourist dollars. 350 is a minimum population, and not enough. We need to learn to coexist with wolves and end wolf hunting and trapping. Wisconsin is frowned upon and not looked at favorably after our last slaughter. Time to end the Zoosadism once and for all. There's nothing wrong with ethical prey hunting, but trophy hunting and trapping is barbaric, inhumane and plain sadistic, there's no place in today's society or our state for it. Let's evolve already.
Tal r Bodin	Most of it	No			5	I am an Illinois resident, but my family owns property in Washburn county and I keep a trailer seasonally on Petenwell Flowage at Adams county park. I am in favor of Wolves having 100% protection. Poaching takes enough of a toll. The attraction of Wisconsin is the lakes and wildlife, without which there is no reason to visit. Illinois has enacted laws protecting Wolves, Bears, and Cougars that are making their way into the state. The continuing comeback of Whooping Cranes, Elk, Raptors and other species is heartening and a definite plus to tourism. Moose and Caribou should also be reintroduced.
Michael Hilger	Most of it	Yes			8	Keep a healthy population of wolves Work hard to have and enforce the target number of wolves killed and avoid the fiasco of last couple of years. Listen to what Native Americans say about and think about the plan
Jerry Hamm	Most of it	Yes	Planning to manage areas where wolves are found based on human populations is a good idea.	I believe there should be a specific number of wolves identified where a harvest is allowed. More input from people most affected by wolves should be sought.	5	Higher wolf populations will cause more problems as they interact with people and their pets and domestic animals. There should be wolves in Wisconsin but they should be confined to lightly populated areas. Limited hunting can control the wolf population and ensure they have a healthy fear of humans.
Dave	Most of it	Yes	I like that there is not a population number to manage wolves.	Payments for injured hunting hounds.	7	Properly managed wolves are a healthy part of the ecosystem.
Deb Martin	Most of it	Yes	The plan removes a numeric population goal: Removing an arbitrary wolf population goal is important to make sure the numbers of wolves are adaptable, so they can be based on best-available science and ecological changes. The plan creates low quota zones around Tribal lands where the Tribes requested it: These lands are treaty-protected with documented wolf packs. Making this update is an important and welcome addition to the plan. Ideally, the plan would expand these zones beyond just the few that are listed. There is expressed commitment to science and continued research and acknowledges that "keystone species such as wolves are an important component of a healthy ecosystem"	The DNR should better regulate hound training on wolves. The DNR should limit wolf-focused hound training activities to only when wolf hunting is allowed in each zone. There is currently no guidance in plan for next review or update – there should be a plan for regularly updating the plan (so we don't have another plan that is used for decades) and there should be permanent, ongoing stakeholder AND science committees to oversee wolf management in Wisconsin – The scientific oversight is critical. The plan acknowledges that there are responsible farming practices and other non-lethal options to reduce wolf and livestock conflicts, but stops short of recommending that the DNR prioritizes these opportunities.	8	Thanks for asking and listening. Time to update the plan.
Jean	Just the parts I am interested in	Yes				The draft is comprehensive, thank you. It reflects insight and an understanding of the impacts from no management to management. I would most like to say that I DO NOT WANT TO REPEAT WHAT HAPPENED IN 2021 TO HAPPEN EVER AGAIN. It was disgraceful, unlawful, and brutal. The hunters who killed all of these animals were acting without direction, compassion, and lawfulness. IMO, they were savages. There MUST be a system in place that ACTIVELY allows and monitors how many wolves are killed, such as by tag and lottery; there should not be a free-for-all and then an apology later when the limit is exceeded. Huffpost summed it up well: Wisconsin officials shut down a planned weeklong wolf hunt in just three days after 216 of the animals were killed — 82% more than the maximum that had been set by the state. "This season trampled over tribes' treaty rights, the Wisconsin public, and professional wildlife stewardship," a spokesperson for the Great Lakes Indian Fish and Wildlife Commission told The Milwaukee Journal Sentinel. "It will go down as a stark example of mismanagement, and the problems that can be expected when the state Legislature and the courts embrace special interest groups over the public as a whole."

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
	Just the parts I am interested in	Yes	-Removing an arbitrary wolf population goal is important to make sure the best-available science is centered in wolf management -The low quota zones are an important and welcome addition to the plan -The plan is rightly focused on the ecological benefits of wolves		9	
	Just the parts I am interested in	Yes		To high of population objective.		The least amount of wolves the better.
	Just the parts I am interested in	Yes		I didn't see anything to limit a season to times when pups are still dependent on their dams for nursing. To me it is beyond cruel to allow wolves to be killed when doing so will condemn pups to starve b/c they're not old enough to eat solid or semi-solid food.	5	
	Most of it	Yes	Zone management and listing as nongame species.		8	Threshold numbers for enacting control measures seem a little low but managing by zones with control for dealing with problems as they emerge is a plus. Please avoid the implementation of sny more " sport" hunts!
MARK ABBOTT	All of it	Yes	1. Nice historical data. 2. Nice charts and graphs	I dislike many areas. 1. Wolf committee is too heavily weighted to the tribes and other non hunting organizations. 2. Incorporating potential control of CWD is meaningless to those who know about CWD. Ave. 95% plus of deer in Wisconsin which have CWD will never make it to an age where CWD will physically impact them. 3, To say wolf tourism has potential positive benefits, is really a stretch. Whitetail deer on the other hand has HUGE tourism benefits by a factor of 5,000 to 1. 4. To state the "ecosystem services performed" by the wolf could also be stated "Ecosystem destruction caused" by wolf presence. 5. Unless I missed something, it says a statewide survey of public opinion was done, and when I reviewed the survey results, Groups 2,3 and 5 that were most in favor of wolf expansion, etc.. had 40% or more of respondents from out of state. It's clear the wolf advocates/anti hunting groups were heavily involved in the survey taking. Throw these people out, and the overall results would have been much different. 6. The term "Holistic" has no place in a document such as this. 7. Expanding some reservation boundaries for wolf control also has no place in this document. On the reservations, that's fine but not outside of them. 8. Tribes should be required to declare how many wolf they intent on killing, and after they have their season, the wolf harvest needs to be set. Giving them half of a quota and not harvest any isn't managing the wolf numbers in the state. 9. Bear also hold special meaning to some tribes, so why are tribes treated differently on Wolf. Several Tribes state that the health of the wolf determines the health of their tribes, well Wisconsin had been without Wolfs for decades and I don't think it affected the Tribes. I can respect their ancestors lore, but even many Indians within the tribes disagree on this. 10. Need to show the estimated number of wolfs by zone. Yes I understand they may intersect other packs but assign them to most prevalent zone so it takes some of the skepticism out of the data. If unsure, then you've lost my confidence in your ability to really know how many are on the landscape. 11. It's a stretch to say they create Carrion for other species to eat. I've found two Wolf kills on my property and the only thing they left was the hide. 12. The age distribution on the public opinion survey for groups 1,4 and 6 were more evenly distributed (groups that had the least favorable attitude about wolfs) compared to groups 2,3 and 5 who skewed heavily to older people which tells me they are not very representative of the overall population. 13. Not enough real data in here on the existing negative impact on the whitetail population in Wisconsin. The only real data was that it reduced car vehicle collisions by 24% in wolf territory to try to spin it as a benefit to the public. So did the deer population go down by 24% in this same area or more because of the wolf population? 14. Define Ecological carrying capacity better. When all whitetail deer have been killed to the point that hunters lose interest like what is/has been happening in the far north of Wisconsin? Coming soon to Central Wisconsin?	2	This is a wolf population expansionist plan. People living in Wolf country and whitetail deer hunters need to have a 70% say in what the right level of wolfs need to be once taken of the federal government list.
Ken Anderson	Most of it	Yes	No wolf number needed- We don't place a number on bear, deer, turkey, grouse, etc. So I SUPPORT NOT, REPEAT NOT, placing a number on how many wolves we should have.	Expansion of zones around tribal boundaries.	8	Wolves will expand-limit their own numbers. I fish trout and have seen wolf(?) dig into beaver lodges, I believe beaver are their 2nd most utilized food source so maybe we can stop my tax dollars funding govt. trappers.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Jonathan Bloy	Most of it	Yes	1. Removing an arbitrary wolf population goal is important to make sure the best-available science is centered in wolf management 2. The low quota zones around tribal lands are an important and welcome addition to the plan 3. The plan is rightly focused on the ecological benefits of wolves	1. There should be better regulation for hound training on wolves in this plan. Hound training on wolves should only be allowed when wolf hunting is allowed in each zone. 2. There needs to be a means for regularly updating this plan (so we don't have another plan that is used for decades). There also should be permanent, ongoing stakeholder and science committees to oversee wolf management in Wisconsin – The scientific oversight is critical.	9	Thank you to the staff at the DNR for writing a wolf management plan that centers on science, public input, and Tribal engagement. Those three items are at the core of protecting, conserving, and sustaining Wisconsin's precious natural resources like the grey wolf.
	Most of it	Yes	To see how much the DNR bends to vocal minority groups that do not have to deal with wolf issues day in and day out.	Not addressing the over population of wolfs in northern Wisconsin.	1	I live in a Rual area of Bayfield. My property abuts both federal and state controlled land. The wolf population needs to be reduced. If the Madison people wants wolfs trap them up here and send them down state.
	Most of it	Yes	The 5.1 ratio for calf predation. the Michigan/ Wi minimum population # 200/100	I am concerned with the impact people and organizations influence wolf management that don't live in areas that are affected by wolves. The Tribes and asscociated orgs. are overrepresented of the advisory board. An individual has this survey and possible meetings they can attend and can be affected by wolf populations daily. It certainly from a stakeholder perspective is uneven.	4	I am looking for the portion where previously managed th Ag areas of Wi for no wolves. In that case our hunting/trapping season should not had a quota but a season of ie; 30 days. It would be easy to exclude the Central Forest, Mead Wildlife, Etc. Wolves that are hunted over time would learn where more appropriate range is. The affect on livestock is not easily quantified as wolves do more than kill, they stress livestock as they travel through the ag regions. They also stress Wildlife/deer by the regular pursuit of a meal. I was not comfortable with many of the explanations based on lack of understanding what the meaning was. I agree that significant work is completed. I have yet to see what the population goal is by region. I also would like to see present population estimates for those regions. I appreciate this opportunity
Susan Welch	Just the parts I am interested in	Yes	Population survey	It's very long, lol	6	I want to know no cruel trapping methods, like foot or leg traps are allowed. Nothing cruel. Also want to know about coywolves and mention personal siting of wolves near Union Grove
Robert E. Rand	I have not read any of the draft plan	Yes				I'm concerned about wolf harvest methods. Dogs should not be used to track and kill wolves. It is inhumane to the 10th degree. There is no way hunters can keep up with dogs once they have run a wolf to ground. It is cruel to the dogs to suffer injury from the wolf, and extremely cruel for the wolf to be set upon by a whole pack of dogs and to be killed by being literally torn apart. As for a quota, seems to me to be pretty difficult to quantify number of wolves in the State, so why have a quota? I have no sympathy for dog owners who lose dogs to wolves during bear season. It's a gamble they take, as most sports involve taking chances. I've been a hunter for 68 years, in NW Wisconsin, and have seen 1 wolf in all that time. Seen tracks, but think that wolves kill a lot less deer than vehicles. Please, ban the use of dogs to hunt wolves. Thank you.
	Most of it	Yes	Getting rid of statewide population numbers	Hunters being able to shift zones once a zone is closed… feels like a hunting frenzy could ensue as hunters rush an area looking for a kill.	8	Outside hunting groups and hunters from outside of the state should have absolutely NO say in how the Wisconsin DNR runs its department including hunting policies. If they want a say in it… move here, vote and pay taxes… otherwise stay in your lane.
	Most of it	Yes	Getting rid of statewide population numbers	Hunters being able to shift zones once a zone is closed… feels like a hunting frenzy could ensue as hunters rush an area looking for a kill.	8	Outside hunting groups and hunters from outside of the state should have absolutely NO say in how the Wisconsin DNR runs its department including hunting policies. If they want a say in it… move here, vote and pay taxes… otherwise stay in your lane.
Nathaniel	Most of it	Yes	We need to base this on science and not tolerances of what people want. When it's based on that then the science is garbage. We have too many wolves and it's out of balance in my opinion and I believe if I understand the data correctly that it backs it up. If we are going to base the draft plan on opinions of different groups then I don't believe we are harvesting enough.	I don't like that we base it on all the groups. Farmers, Natives, etc. Science should be just that. Either we have too many or not enough. If that's based on farm kill, animals, deer numbers, elk numbers, then I think we need to harvest a large number to equal out the landscape.	2	
	Most of it	Yes	I've had problems with wolves for 20 years so I'm not a big fan.	Landowners should be able to kill wolves on their own property without fear of prosecution. This would lead to a more accurate count as to how many get killed. With present policy the rule of thumb is, shoot, shovel and shut up. Your policies create your biggest problems. You claim to promote forests but any patch of a farm that has a tree on it gets taxed as recreational land. This caused farmers to clear cut thousands of acres to make it farmland so they could afford the taxes. Much of it didn't even make it to the sawmill, it just got pushed into piles and burned. This truly made me sick.	0	Get an old retired farmer on your board so he can explain to you how half of your programs don't have a snowballs chance in hell of working BEFORE you dump bib money into it. Some of your projects could actually work with minor changes but you seem to be listening to the wrong people. If CWD is what you think it is, why are wolves not dying from it? They do eat the spinal cord too.
Jeffrey D Corullo	All of it	Yes	Nothing	For years, the goal was 350, now there is more than 1,000. I have young grandson who can do the math. The tribe's should have no say, except on their land.	1	plain and simple --to many wolfs. stick to 350 not 1,000 or probably more. The season should allow 500 to 600 for the first year and then see for the next year.
	Most of it	Yes	None	Very Liberalizied	1	

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
	Just the parts I am interested in	Yes	Scientific data	Payment for sheep and cattle deaths should be increased but only if examined by DNR and proven.	2	When even the Guardian's international coverage labels the Wisconsin wolf hunt as a "slaughter" it may be time for the state to act in harmony with nature instead of clinging to outmoded procedures which are not the solution.
	All of it	No	Nothing. This does nothing to manage Wolf numbers as agreed upon when they were reintroduced.	This is a great plan for "Madison" but does nothing for those who live in Wolf country and see the deer herd being eliminated. We've hunting the same area in Northern WI for over 40 years and have never seen the population this low. We spent 24 days in the woods this fall and saw more Wolves then deer. PLEASE do your Job and manage Wolves to a numerical population goal. Keep politics out of the DNR and use real Data, not this made up political crap that "meets the needs of a diverse population ". Get out of Madison and get in the Woods and see what reality looks like. Thank you!!	1	Scrap it and go back to the old plan. I understand it's a lot more work to manage to a number and to achieve measurable goals. But at least your accomplishing something. This "Plan" will make everyone feel good in Madison but will accomplish nothing in regards to Wolf Management. Again, Do your Job!!! You manage everything else to a number. Thank you!
Jerry Shea	Most of it	Yes	Science based evaluation. Reduction of conflicts		9	I am weary of the road blocks of the anti-wolf groups especially the games the past appointees are playing. We need to get back to doing things in the Wisconsin tradition. Work together to get tough things done. This plan is a good start worthy of support.
Diane O'Krongly	Most of it	Yes	I appreciate that we are using scientific evidence to create a plan to manage the wolves. I found the following very interesting "Lethal measures may even increase predation conflicts because they can alter wolf pack structure and behavior (Borg et al., 2015), and because wolves expanding into newly vacant territories are more likely to be adolescents that are less acclimated to humans (Bradley et al."	If the plan does not consider focusing the harvest of wolves packs involved in predation of livestock or other behaviors incompatible with humans. Packs with a culture of avoiding humans should not be left alone.	8	
	Most of it	Yes	Thoroughness	Over Lengthy	4	The wolf population has been and continues to be underestimated. People purchased land with hopes and dreams of making great memorable hunts. The reintroduction of wolves has really had a negative impact on many families and groups trying to deer hunt. We really HAD a great thing going. Isn't it rich how a handful of biologists get to ruin so much for so many. Just another example of what the dnr accomplishes in Wisconsin.
Joel Verschay	All of it	Yes	I like the use of buffer zones surrounding reservations as well as the incorporation of tribal representatives in discussions. I think it is a positive relationship that should be furthered in the future in relation to wildlife management. The 100 plus mile buffer zone is good as is the expansion of Zone 2 south into the central part of the state.	There needs to be a clear plan limiting hunting and trapping of wolves. I've lived in Wisconsin, Michigan, and South Dakota. WI management of wolves has catered to revenge killings and reinforced negative sentiments mentioned on page 27 of the draft report. The report of public sentiment on pages 33 and 34 of the draft report overgeneralize the larger conversation of whether or not the DNR needs to intervene. I've encountered many people who openly admit to shooting wolves in Wisconsin at any opportunity and have experienced no consequences. The DNR has failed in policing communities in wolf heavy regions by allowing livestock and domestic pet concerns to allow humans to retaliate against a species that was extirpated from the state through bounties and mob rule regulations.	1	Please stop rolling over for the part of the population that doesn't want to share the woods with other predators. Humans are the greatest cause of environmental degradation and there is little to no management in place to protect wolves who are poached in the first place. Running dogs for bear and training involves certain risks. I'm much more concerned about the liberal allowance of deer farms throughout the state and the spread of CWD than I am of the marginal loss of game, livestock, and domestic animals that occur in wolf heavy areas. Enough already.
Yolanda St Germaine	Most of it	Yes	I don't like any of it.	I do NOT encourage the killing of my brothers or sisters at all. What has happened to one, (wolves or Natives) happens to the other. We are hunted, feared, hated and despised. I want to protect my brothers and my sisters.	1	I am furious about this plan. DNR has proven that it is no good at regulating anything.
	Most of it	Yes			2	
Chad Steckel	Most of it	Yes	There is very little in this current draft plan that I could support at any level. I supported the original wolf plan with a goal of 350 wolves, I felt there were limited areas for them to thrive and coexist. This plan does absolutely nothing to address the current state of over-population of wolves in this state, and completely fails to represent what the citizens of Wisconsin soundly portrayed by voting on the Spring survey and the results of that survey question.	#1, Failing to have a numeric population goal is irresponsible in the sound management of the wolf population, or any wildlife goal. The citizens of Wis. originally agreed to 350 wolves based on scientific information factors, including social acceptability, preferred habit availability, and depredation. The DNR has failed the citizens in the management of the wolf population by allowing the numbers to grow to unacceptable levels. #2 Expansion of the Preferred habitat zones is very careless. The social acceptability of the wolf population continues to decrease due to the depredation problems that have been created because of the over-population of wolves. Just because wolves have expanded their range does not mean that the habitat is preferred. #3 Utilizing improper polling techniques to achieve desired results is very unethical, and the DNR Biologist that is charged with obtaining information to help draft the next wolf plan should be removed from his position for inaccurately obtaining misleading information. The people and locations that were heavily polled do not accurately reflect the problem areas of the state. #4 The addition of large buffer zones in the state is completely inadequate to the proper management of the wolf population. Proper management will not allow "Safety" zones that will protect wolves from harvest goals.	1	All levels of the DNR are suppose to operate to protect the wildlife and resources of this State, for all the people of Wisconsin, with sound scientific information. The current draft of the Wolf Management plan that is being offered fails this miserably. The negative impacts that have been increasing every year due to improper management of the wolf population cannot continue. Western States have proven over and over that wolf numbers must be managed, and can be . There must be a plan brought forward that truly represents what the citizens, directly impacted by wolf numbers, can support. We cannot afford to continue to divide the citizens of Wisconsin over the direction of wolf management. The plan has to based on true factors and not feelings!

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
	All of it	Yes	allow wolf population fluxuate naturally Buffer zone around reservations better control quota limits and stop hunt.	climate change affecting population in future not adequately addressed or researched.	7	I am not in favor of wolf hunts to control population. I think we NEED More wolves in WI. CWD and deer car collisions ar a major concern that wolves help manage.
Kristin Renley	All of it	Yes	I like no numerical quota, and everything is based on science.	I dislike that any potential hunting season could extend into the wolf breeding season.	9	I really like the buffer zones for the Indian reservations.
Aleks K.	Most of it	Yes	I'm glad that wolves are being acknowledged for their importance as an apex predator/the role they play in strengthening and/or maintaining the health of their entire ecosystems--it appears that scientific methods are being taken more into consideration. I'm also glad for the addition of 'low quota' zones and for the removal of an arbitrary approach to population goals.	I'm especially glad as well to see that the plan acknowledges responsible farming practices and other non-lethal options to reduce wolf and livestock conflicts, but I wish that the DNR would make an effort to prioritize these methods. Also, I saw no guidance in the plan for a next review – there should be guidance to regularly update the plan (so we don't have to rely on outdated methodology for decades again) – scientific oversight is critical, and as conditions change, our plans should adapt to it. There should be permanent, ongoing science committees to oversee wolf management in Wisconsin for all the preceding reasons.	9	Thank you for allowing public comments, as well as respecting Tribal sovereignty, and for listening to us! It's important that we can all take part in preserving our beautiful lands and biodiversity.
Gale Lueders	All of it	Yes			2	I believe we should have no more than 350 wolves in wi thus we need a hunting season!! I live in a non wolf area but I believe we should not have to pay for wolf damage claims to ranchers and dog owners!! (350 wolves Max)
Dale Heeringa	All of it	Yes	Meeting with all persons involved was good.	Have commented before that the maximum number of 350 or less must be used to trigger hunting/trapping. Additionally I feel the area where wolves are felt Tobe able to inhabit is not good and should only be in lighty populated remote areas. With out this it will be constant conflict. Also feel the current wolf count is off and on the light side. Douglas County where I'm familiar with has a very large population in town of Highland. Several separate packs with alot of wolves. Additionally I feel that to much weight is being given to certain wolf protection groups including Native Americans. Wolves are great and there is a place in nature for them but we have to many currently and that's a problem not management.	6	Represent management of Grey Wolf not catering to special interests
	Most of it	Yes	Sub zones in areas identified as livestock conflict areas.	Calling hound dogs hunting dogs interchangeably. Wolf conflict with pets and bird dogs is exceptionally rare. Education for hound dog hunters needs more emphasis.	7	
	Most of it	Yes	Respecting tribal wishes with buffer zones. Too large however	Need to respect original proposal…350 wolf pop goal. Deceitful to chg	3	
	Most of it	Yes	I like that fact that you have removed an arbitrary wolf population goal. We need to use the best-available science focused on wolf management and includes the ecological benefits of wolves. The low quota zones are also important, which I fully support.		9	
Joe Zacharias	All of it	Yes	None	All	0	Input should only be allowed from residents that live/co-exist with wolves in their vincinity
Martha Pings	Most of it	Yes	Removing an arbitrary wolf population goal The low quota zones The focus on the ecological benefits of wolves: Aldo Leopold would approve. Recognition of indigenous values and rights		9	
	Just the parts I am interested in	Yes				In my opinion I believe that we as hunters and land owners want wolf numbers to be down around 200 state wide. Yes I know that's lots of tags needed. However people are still going to keep killing them whether they have a tag or not. So the state might as will benefit and collect money for tags
Kevin Renley	All of it	Yes	I really like the fact that it is not based on a numerical number. I do feel it allows for a sustainable wolf population not necessarily based on a ridiculous number of 350 killing 2/3 of the existing population, addresses conflict, focuses in on education, and allows for the benefits of the wolf population. I also like the buffer zones around the reservations.	The season length potentially going into the breeding season.	10	I think the department has done a good job listening to all sides and helping to ensure wolf's are on the landscape for years to come.
	All of it	Yes	Using multiple factors and input from different groups is essential to the plan.	Wolves hunts in general as nature will always take care of itself without humans interference. Provide specific avenues of protection to wolves and livestock that does not include killing.	7	
Randy Hartl	Just the parts I am interested in	Yes	Multi zones. I hope for each zone to be able to tailor its wolf management program to that sounds unique environment and interaction with wolves.	Please strengthen local residents inputs for each zones management.	8	Overall wolves have recovered substantially in Wisconsin and therefore the federal government should allow Wisconsin to tailor it's customized wolf management plan in the state of Wisconsin

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
James Schwake	Most of it	Yes	I was not in favor of re introduction of wolf's or elk in wisconsin at all this is not the 1800s if you did not spend our tax dollars on this we wouldn't have to spend more tax dollars paying foarms for lose animals.	Everything	0	The human population of the state is growing and introducing more predators is not good just like bringing in elk there is only so much food for deer and now elk, the dnr brought in the Asian beetles and we know how the planning for that worked out
	All of it	Yes	The plan removes a numeric population goal.	there should be a plan for regularly updating the plan (so we don't have another plan that is used for decades) and there should be permanent, ongoing stakeholder AND science committees to oversee wolf management in Wisconsin	6	
Ray Knoeppel	All of it	Yes	The expressed commitment to science and continued research and the recognition that keystone species such as wolves are an important component of a healthy ecosystem.	Currently there is no guidance in plan for next review or update. There should be a plan for regularly updating the plan (so we don't have another plan that is used for decades) and there should be permanent, ongoing stakeholder AND science committees to oversee wolf management in Wisconsin. The scientific oversight is essential.	8	The DNR should limit wolf-focused hound training activities to only when wolf hunting is allowed in each zone.
Gordon Foust	Most of it	Yes		It is all political and does not take in to account the people that live in wolf country. To much favoring the people that live outside of wolf country and the dnr is very biased in favor of wolfs..our ancesters were not stupid they got rid of wolfs for a good reason.	0	wisconson dnr needs to be cleared out of people that have agendas and push them regardless of what the people want or what is best for the people. you work for the people and not for your own views.
Rod Dahlen	Just the parts I am interested in	Yes	NA	There needs to be a population goal / limit. No wildlife population can be properly managed without it.	1	The plan as it's written is a joke. There needs to be an agreed upon population goal of 350 total wolves in Wisconsin!
	Most of it	Yes		No set population goal of wolves is in the management plan. Need to remove buffer safe zone around Indian reservations.	4	
Sharon Ford	Most of it	Yes	1,Removing an arbitrary wolf population goal is important to make sure the best-available SCIENCE is centered in wolf management. 2.The low quota zones are an important and welcome addition to the plan. 3.The plan is rightly focused on the ecological benefits of wolves.	I'd like to see added to the plan: 1. The DNR should better regulate hound training on wolves. The DNR should limit wolf-focused hound training activities to only when wolf hunting is allowed in each zone. 2.There is currently no guidance in the plan for a next review or update. There should be a plan for regularly updating the plan (so we don't have another plan that is used for decades) and there should be permanent, ongoing stakeholder AND SCIENCE committees to oversee wolf management in Wisconsin. The SCIENTIFIC oversight is critical. 3.The plan acknowledges that there are responsible farming practices and other non-lethal options to reduce wolf and livestock conflicts, but stops short of recommending that the DNR prioritizes these opportunities.	9	After reading the plan and understanding the Tribal submissions, it is vital to have full engagement from them.
Karen	Most of it	Yes	I appreciate the fact that there is no longer a focus on a goal number of wolves. Also the acknowledgment of ecological benefits of wolves.	I'm still concerned about the lack of regulations on hound training--it should be limited to the season when wolf hunting is allowed. Also, how often will the plan be updated/revised?	8	I appreciate that this plan has taken into consideration Tribal concerns, public input, and SCIENCE.
Jeff Hermann	Most of it	Yes	It is very comprehensive as written.	Specifically, how are you going to keep the levels down as they are pretty prolific breeders and have lots of animals domestic or not to prey upon? More emphasis should be given to the desires of the people who have to live with this animal in their environment.	5	The plan does not address the elephant in the room which is keeping the levels at the agreed upon 250 wolves. It is mentioned in at least one place, but how are you going to keep those levels down?
Frank Drew	Most of it	Yes	Nothing much good in it at all except the continuation of the State paying for livestock and other losses due to the overpopulation of wolves.	Almost everything especially no population limits on the wolves in Wisconsin. There should be a set limit close to 350 that was in the wolf plan years ago. I have nothing against some wolves in the state but the over population of wolves in many parts of the state especially in Forest County has wiped out the deer herd. You must take into account the opinions of people in the north that have to live with the wolves more so than the opinions of people from Southern Wisconsin who think wolves are so great. If there would be a season every year to keep the wolf population under control the people of the north would have a better opinion of the wolves and there would be a lot less illegal killing of wolves.	1	Start a hunting season for the wolves to lower the population. Lower the population back down closer to 350 like the original plan. If that was done I am sure that people from the Northern part of Wisconsin who have to live with the wolf in their backyards might have a better opinion and there would be less illegal killing of wolves. Please listen to the opinions of people as I am sure this plan is getting many very bad reviews from this survey.
Bob Phelps	Just the parts I am interested in	Yes	1. Removing an arbitrary wolf population goal is important to make sure the best-available science is centered in wolf management 2. The low quota zones are an important and welcome addition to the plan 3. The plan is rightly focused on the ecological benefits of wolves	• The DNR should better regulate hound training on wolves. The DNR should limit wolf-focused hound training activities to only when wolf hunting is allowed in each zone.	10	
	Most of it	Yes	The plan removes a numeric population goal: Removing an arbitrary wolf population goal is important to make sure the numbers of wolves are adaptable, so they can be based on best-available science and ecological changes. The plan creates low quota zones around Tribal lands where the Tribes requested it: These lands are treaty-protected with documented wolf packs. Making this update is an important and welcome addition to the plan. Ideally, the plan would expand these zones beyond just the few that are listed. There is expressed commitment to science and continued research and acknowledges that "keystone	The DNR should better regulate hound training on wolves. The DNR should limit wolf-focused hound training activities to only when wolf hunting is allowed in each zone. There is currently no guidance in plan for next review or update – there should be a plan for regularly updating the plan (so we don't have another plan that is used for decades) and there should be permanent, ongoing stakeholder AND science committees to oversee wolf management in Wisconsin – The scientific oversight is critical. The plan acknowledges that there are responsible farming practices and other non-lethal options to reduce wolf and livestock conflicts, but stops short of recommending that the DNR prioritizes these opportunities.	9	

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
			species such as wolves are an important component of a healthy ecosystem"			
SArah C	Most of it	Yes	What needs to be eliminated are the wolves who seem to populate a majority of the WI legislature.	Considering the number of Wolves in WI there should be NO hunting or trapping or poisoning season. The damage done by wolves is so infinitesimal that it defies logic to kill wolves.	10	Do the people who are making an issue for the killing of dumb animals not have anything else to do in Madison? They are beyond pathetic.
bill bialecki	Most of it	Yes			8	
Scott May	Most of it	Yes	trying to preserve the resource	no population cap and disregaurd for the hunting public	3	need to put a population goal in place, the landscape can only support so many wolves
	All of it	Yes	That the DNR finally recognizes the FACT that the population is WAY ABOVE the initial quota. Of course, the DNR still underestimates the number.	The DNR does not address HOW they will get to their initial quota goal.	5	
	All of it	Yes	Protecting wolf populations and leaving it to tribal communities and science to dictate when government should step in and regulate anything wildlife related.	Hound hunting shouldn't be allowed at all. The irony of their own kind hunting their own...	9	Nothing more than already stated.
Joyce Frohn	Most of it	Yes	Taking a number out of the wolf plan. Let science determine numbers like this, not politicians.	Wisconsin needs more not fewer wolves.	8	Educate public so they don't fear and hate wolves.
Lance Green	All of it	Yes	1. Removing an arbitrary wolf population goal is important to make sure the best-available science is centered in wolf management 2. The low quota zones are an important and welcome addition to the plan. 3. The plan is rightly focused on the ecological benefits of wolves 4. The plan creates low quota zones around Tribal lands where the Tribes requested it.	There is currently no guidance in plan for next review or update – there should be a plan for regularly updating the plan (so we don't have another plan that is used for decades) and there should be permanent, ongoing stakeholder AND science committees to oversee wolf management in Wisconsin – The scientific oversight is critical.	9	Please adopt this plan soon.
	Just the parts I am interested in	Yes		I don't like that the draft plan doesn't have a numeric population goal. When the wolves were reintroduced into our state. The WI DNR promised the people that they would manage their numbers to 350 or less. They lied. The people of WI voted two to one, at the Conservation Congress spring hearings to control their numbers to 350 or less. It's way past time for the DNR to keep their promise.	1	The wolf zones that are considered wolf habitat should be based on suitable wolf habitat that is backed by science. Not because the DNR wants wolves throughout as much of the state as possible, because they want them there to control the deer herd. This is wrong.
Darren Blankenship	Most of it	Yes	1. Removing an arbitrary wolf population goal is important to make sure the best-available science is centered in wolf management 2. The low quota zones are an important and welcome addition to the plan. 3. The plan is rightly focused on the ecological benefits of wolves		9	
Julie Foertsch	Most of it	Yes	It removes the arbitrary wolf population goal in favor of the best-available science at the time. It places low quota zones around the Tribal lands that have requested it. It focuses on the ecological benefits of wolves, which is critical when thinking about our state's ecosystem as a whole.	The DNR should better regulate hound training on wolves. It should also do more to emphasize responsible farming practices and other non-lethal options to reduce wolf and livestock conflicts.	9	Thanks for bringing all of Wisconsin's citizens and stakeholders into this policy-making process.
Aphrodite Bouikidis	All of it	No	Removing an arbitrary wolf population goal is important to make sure the best-available science is centered in wolf management The low quota zones are an important and welcome addition to the plan The plan is rightly focused on the ecological benefits of wolves		9	
M.Jackson	Just the parts I am interested in	Yes	Positive changes from old DNR plan.		8	
Carol Buelow	Just the parts I am interested in	Yes	Removing an arbitrary wolf population goal is important, allowing a science based, flexible plan. The low quota zones are a welcome addition to the plan, responding to tribal input. The plan is rightly focused on the ecological benefits of wolves.	There should be more restriction on hound-training activities that impact wolves. I'd like to see a built-in time frame for updating the plan.	9	
Yvonne Besyk	Most of it	Yes	I like most that tribes were consulted. Secondly, I like the use of the committee of diverse perspectives. Though I lean toward objecting to wolf hunting, I recognize that if we don't listen to all sides we may end up with unfortunate and uninformed outcomes. I also found the plan to be incredibly education with regard to species, subspecies studies, history, etc. Inclusion of attitudes and perceptions	The plan could address wolf focused hound/dog training, when the review should be updated and non-lethal options to reduce wolf related conflict.	10	Overall a well done plan.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
			seems of great importance and well covered. I particularly appreciate the science-based approach.			
Douglas Johnson	Most of it	Yes	I like the in depth review of wolf history and current statistics within Wisconsin.	Sub units surrounding sovereign nations.	5	Sovereign nations have a zero quota within their boundaries. This can act as a population reservoir. Quotas could likely be increased surrounding these areas.
Don Hacker	Most of it	Yes	I love data, and this report was full of it. The draft plan at least makes it refreshingly clear that the "official" position on managing wolves in WI is that the parts of the state inhabited by wolves and other apex predators have a superior ecosystem.	The length of the report is daunting. Plans based on an "official" position regarding wolves in WI should not over-represent the opinions of people who appear to agree with the prevailing view that the parts of the state inhabited by wolves have a superior ecosystem. These views tend to ignore the the fact that the ecosystem they hold in such high regard is extinct. People moved in long ago and they still live there and appear to be there to stay. The health and safety and well-being of those who live in what have recently become wolf habitats deserve some consideration and protection in any plan. I may have missed something in this much too long report, but I did not notice much consideration for the emotional and recreational impact the threatening presence of these and other apex predators have on people. I know I have felt threatened and was concerned about my safety when recreating with my dog in the Bayfield and Ashland county areas. Studies and payments and compensation for wolf related losses do not constitute a program that has even the slightest consideration of public safety and well-being as a first priority. I for one nearly always carry a firearm these days when recreating off-road in wolf habitat areas due to the fear of an attack by one of the apex predators. There are places I no longer recreate because I know there are wolves there. I was rarely concerned with bears, except in the spring, because they tend to be solitary. I also notice there is a lack of detail regarding the impact of apex predator predation in micro-climate areas like the Lake Superior snow belt. The deer in this area still "yard up" and have been over-stressed by excessive predation to the extent that there are fewer deer in some parts of the national forest than in the past. Deer population studies seem to show that the deer appear to have moved toward the agriculturally developed areas in the northern tier of counties. I am sure some of that is due to the availability of food, but my opinion is that they were stressed in their traditional areas and sought an area with more open spaces. I can say for a fact that I have not observed any "deer yards" in areas where they were always found when hunting for shed antlers in the spring. Also, the studies selected seem to have a common "pro wolf" conclusion, and most of them say roughly the same thing with a few different words. Did we really need to include studies in other states? It seems like they were included because their conclusions tended to support the proposed plan, not because they contained pertinent information. Do we really believe that wolves are responsible for limiting car-deer accidents? Seems to me a conclusion that that stating a specific percentage reduction would require years of data collection. Seems to me I could say I saw a bald eagle carrying an Asian carp, and that is proof that a robust bald eagle population helps control invasive fish species! Also, it is hard to believe the committee did not find a single report or study looking into the negative impact of wolf populations with enough merit for consideration. I think it is important to provide more evidence that at least one paper presenting a cogent study resulting in a contrarian opinion was considered. I find it hard to believe that none exist. Without serious consideration and inclusion of even one contrarian conclusion, how can any proposed management plan reflect a balanced approach or even be sustainable? Seems to me that without one, the proposed plan reads like propaganda, reflecting a conclusion and a resulting plan that reflects only one view of a very complex issue.	1	Based on the image outlining the location of wolf packs in WI, perhaps it is time to spread the population around a bit. It it seems the area north of HWY 29 in WI has plenty of wolf packs to go around. Perhaps we need to relocate a wolf pack to the Arboretum in Madison and a few other packs on state lands in the southern and south eastern part of the state. Apex predators like wolves and cougars used to live there too you know. Why should the folks who live up north be the only ones who have to worry when they let their pets or children run outdoors?
Gayle Davis	Just the parts I am interested in	Yes	Removing an arbitrary wolf population goal is important to make sure the best-available science is centered in wolf management The low quota zones are an important and welcome addition to the plan The plan is rightly focused on the ecological benefits of wolves	the use of hounds to run down wolves at any time is cruel to both to the wolves and the dogs alike, and makes even less common sense when a hound owner gets paid ridiculous amounts of money by DNR if a hound is killed during the "hunt"	8	With a deer population that is absolutely exploding throughout the state, and subsequently disrupting the biodiversity of our forests, it is all the more vital we maintain a wolf population that will help reduce the deer population to a more acceptable level. This is particularly important as the number of deer hunters continues to decline every year.
	Just the parts I am interested in	Yes	I like removing a specific wolf population goal. It seem very important to consider the science based facts on an ongoing basis. New information/ studies, climate change all make setting a specific arbitrary wolf population goal a bad idea. I like that the plan tries to focus on the ecological benefits of wolves in WI. I also like the low quota zones mentioned in the plan.	I really haven't read the whole plan - I just want to make sure the rights of Native Americans are considered and decisions are science based.	9	

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Denise Vine	All of it	Yes	1. Removing an arbitrary wolf population goal is important to make sure the best-available science is centered in wolf management 2. The low quota zones are an important and welcome addition to the plan 3. The plan is rightly focused on the ecological benefits of wolves	1. The DNR should better regulate hound training on wolves. The DNR should limit wolf-focused hound training activities to only when wolf hunting is allowed in each zone. 2. There is currently no guidance in plan for next review or update – there should be a plan for regularly updating the plan (so we don't have another plan that is used for decades) and there should be permanent, ongoing stakeholder AND science committees to oversee wolf management in Wisconsin – The scientific oversight is critical. 3. The plan acknowledges that there are responsible farming practices and other non-lethal options to reduce wolf and livestock conflicts, but stops short of recommending that the DNR prioritizes these opportunities.	9	
Kate Knudson	All of it	Yes	-Removing an arbitrary wolf population goal is important to make sure the best-available science is centered in wolf management -The low quota zones are an important and welcome addition to the plan -The plan is rightly focused on the ecological benefits of wolves	-The DNR should better regulate hound training on wolves. -There is currently no guidance in plan for next review or update.	10	
Rebecca Cecchini	Most of it	Yes	Removing an arbitrary wolf population goal is important to make sure the best-available science is centered in wolf management The low quota zones are an important and welcome addition to the plan The plan is rightly focused on the ecological benefits of wolves	Its length and inaccessibility to everyone interested in this issue.	9	Wolves are an important link in the chain of balance throughout our natural environment. This has been proven with scientific measure in recent years with the reintroduction to wolves in areas like Yellowstone and others. Drafting plans that are meant to support the biased wishes of hunters, or an inhumane easy solution to conflicts with livestock - over the balance, rights, and whole of our living environment is not sound practice for any of us. We need good, balanced wildlife management that TRULY includes the voices of all of our Wisconsin communities, including and especially our Native Tribal Representatives, and that respects wolves as a valuable balancing presence, not simply a nuisance or a trophy kill.
Kathleen Knoeppel	All of it	Yes	Removing an arbitrary wolf population goal is important to ensure numbers of wolves are adaptable. Numbers must be based on best-available science and ecological changes.	The DNR should limit wolf-focused hound training activities to only when wolf hunting is allowed in each zone.	9	There should be a plan for regularly updating the plan (so we don't have another plan that is used for decades) and there should be permanent, ongoing stakeholder AND science committees to oversee wolf management in Wisconsin – The scientific oversight is vital.
Jacqueline Sullivan	Just the parts I am interested in	Yes	Removing an arbitrary wolf population goal is important to make sure the best-available science is centered in wolf management. The low quota zones are an important and welcome addition to the plan. The plan is rightly focused on the ecological benefits of wolves.	There should be better regulation of hound training on wolves. The DNR should limit wolf-focused hound training activities to only when wolf hunting is allowed in each zone.	9	The DNR should better regulate hound training on wolves. The DNR should limit wolf-focused hound training activities to only when wolf hunting is allowed in each zone. There is currently no guidance in plan for next review or update – there should be a plan for regularly updating the plan (so we don't have another plan that is used for decades) and there should be permanent, ongoing stakeholder AND science committees to oversee wolf management in Wisconsin – The scientific oversight is critical. The plan acknowledges that there are responsible farming practices and other non-lethal options to reduce wolf and livestock conflicts, but stops short of recommending that the DNR prioritizes these opportunities.
Dan Henderson	All of it	Yes	I like the buffer zones around tribal lands, but believe they are too large.	No numeric population goal. When WI residents agreed to wolf introduction, we were told the max would be 350. This new plan is a total contradiction to the original plan and demonstrates unaccountability by the DNR.	3	Original promises need to be honored and people being adversely effected need to have a major hand in drafting the new plan.
	Just the parts I am interested in	Yes	Removing an arbitrary wolf population goal is important to make sure the best-available science is centered in wolf management The low quota zones are an important and welcome addition to the plan The plan is rightly focused on the ecological benefits of wolves	The DNR should better regulate hound training on wolves. The DNR should limit wolf-focused hound training activities to only when wolf hunting is allowed in each zone. There is currently no guidance in plan for next review or update – there should be a plan for regularly updating the plan (so we don't have another plan that is used for decades) and there should be permanent, ongoing stakeholder AND science committees to oversee wolf management in Wisconsin – The scientific oversight is critical. The plan acknowledges that there are responsible farming practices and other non-lethal options to reduce wolf and livestock conflicts, but stops short of recommending that the DNR prioritizes these opportunities.	9	Removing an arbitrary wolf population goal is important to make sure the numbers of wolves are adaptable, so they can be based on best-available science and ecological changes.
Michael Siebers	Just the parts I am interested in	Yes	I like the change in setting quotas for the wolf population.		10	It is better than the old plan.
Maurice Plummer	All of it	Yes	Tribal lands agreement	I like the entire plan	10	I like the hound training clause. We need to limit their harassment.
	All of it	Yes	Removing an arbitrary wolf population goal is important to make sure the best-available science is centered in wolf management The low quota zones are an important and welcome addition to the plan The plan is rightly focused on the ecological benefits of wolves	No recommendations for non-lethal resolution of wolf/human or wolf/livestock conflicts No mention of when or how to update this in the future	9	This is a very good first step to managing the wolf population in our State. Turn this into an iterative process by providing guidance for regular updates to create an ongoing process for wolf management in our State as a way to follow the science in wolf management.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
	Most of it	Yes		This reeks of an agenda and not sound wildlife management. A population goal should be set. 350 seems to be a number that most people can get behind from a social acceptance standpoint. Ranges should not be expanded. Just because wolves live in an area previously unplanned does not mean it should be added as range. All sorts of animals live in areas where they are not desired to be. The current overpopulation is pushing wolves into these areas.	0	I hate this plan. I marked zero on the support scale on purpose. If zero is not an option, please use the 1. I am not putting it past you guys to default the zero so you can say that is a "no response".
	Just the parts I am interested in	Yes	Removing an arbitrary wolf population goal is important to make sure the best-available science is centered in wolf management The low quota zones are an important and welcome addition to the plan The plan is rightly focused on the ecological benefits of wolves		9	
Ann Marie Waterhouse	Most of it	Yes	No arbitrary quotas	Other options for protecting farm animals need to be prioritized.	8	Please provide a mandate to review it periodically.
	All of it	Yes	Removing an arbitrary wolf population goal is important to make sure the best-available science is centered in wolf management The low quota zones are an important and welcome addition to the plan The plan is rightly focused on the ecological benefits of wolves	The DNR should better regulate hound training on wolves. The DNR should limit wolf-focused hound training activities to only when wolf hunting is allowed in each zone. There is currently no guidance in plan for next review or update – there should be a plan for regularly updating the plan (so we don't have another plan that is used for decades) and there should be permanent, ongoing stakeholder AND science committees to oversee wolf management in Wisconsin – The scientific oversight is critical. The plan acknowledges that there are responsible farming practices and other non-lethal options to reduce wolf and livestock conflicts, but stops short of recommending that the DNR prioritizes these opportunities.	9	
	All of it	Yes		I intensely dislike the weighting and feel it has radically skewed the findings. Particularly, how the survey discounted the people who had actual interactions with wolves such as hunters and farmers. This foolishly dilutes actual real world negative feedback and inflates the importance of uninformed emotional opinions coming from those having no skin in the game. This is biased and totally manipulative!	1	Adoption of this plan, without a reasonable minimum/maximum target number and regular, annual, managed hunts will further inflame the "redneck" wolf hating element in the northern half of this state and be tantamount to declaring an unregulated year-round open season on wolves! I think you have grossly underestimated the importance of this element. The landowners, farmers host the wolves and have skin in the game as do many lower income residents of the north, who hunt to supplement their family's meat supply. You are about to "unleash the whirlwind" if you don't throw them a bone! City folks, on the other hand, only offer their opinions and have no stake. You are sitting on a ticking time bomb. Q10
		Yes	1,2,3		9	
Juergen butt	All of it	Yes	We a plan finally!	No population limit or goal	1	The draft wolf plan needs a maximum population goal and a realistic management plan for hunting and trapping to keep the wolves at a realistic number to ensure the other animals in the forest also survive!!!
	All of it	Yes	1. Removing an arbitrary wolf population goal is important to make sure the best-available science is centered in wolf management 2. The low quota zones are an important and welcome addition to the plan 3. The plan is rightly focused on the ecological benefits of wolves	There is currently no guidance in plan for next review or update – there should be a plan for regularly updating the plan. This must by specified in this plan!	9	
	All of it	Yes	Removing an arbitrary wolf population goal is important to make sure the best-available science is centered in wolf management The low quota zones are an important and welcome addition to the plan The plan is rightly focused on the ecological benefits of wolves		10	
Amy	All of it	Yes	Removing an arbitrary wolf population goal is important to make sure the best-available science is centered in wolf management The low quota zones are an important and welcome addition to the plan The plan is rightly focused on the ecological benefits of wolves		9	
James Butler	All of it	Yes	Science based.	Plan should be updated on a regular basis using latest sconce and input from public.	10	
	Just the parts I am interested in	Yes	No magic number, low quota near tribal areas, focus on the ecology of wolves, science not politics leading the way.	Include in the plan a date by which the plan should be evaluated.	9	Thanks for doing this hard work.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Fabi	Most of it	Yes	Removing an arbitrary wolf population goal is important to make sure the best-available science is centered in wolf management The low quota zones are an important and welcome addition to the plan The plan is rightly focused on the ecological benefits of wolves		10	
Mark Pass	Most of it	Yes	Plan being based on science, removal of population quotas and creation of tribal managed zones	Recommending e hanced hunting dog training program.	9	The current draft is a vast improvement of previous years DNR management plan
Wes	Just the parts I am interested in	Yes	removing specific numerical limits on wolf numbers in the State- I own 128 acre maple farm in SW WI and the deer are devastating our woods- the population is really out of hand and wolves are the best/only predator beyond hunting special areas around tribal property allowing higher populations or limited hunting more involvement of science in determining the future of wolf management in the State	Need to include in the plan for regular review and updating so the current plan does not go outdated in ten years and beyond. more emphasis on non-lethal methods to control wolf predation on farm animals, working more with farmers on helping them adapt to living with wolves in the area. Again im a farmer who desires an increased wold population so some farmers are interested in having wolves around and increasing in population/coverage in this state	6	appreciate its being worked on and improved
Brian Risinger	All of it	Yes	None. Written to support anyone that does NOT buy license to harvest fur or game.	Vague, no a quotas, no real way to accurately survey the true estimate of the wolfs, to kill 1/3 of a species in 48 hours is ridiculous, man is not that good of a hunter and the wolf is smarter. There's more than 1100. What is the goal of this plan? If it was court for debate and making money for lawyers it is perfect.	0	Plan is not even comprehensive enough to be considered. No quotas, no good methodology to accurately survey, redraw of boundaries makes no sense has has no "why" to support it. Apparently we have created more habitat that is needed to support a grossly underestimated population.
Brian Risinger	All of it	Yes	None.	New boundary expanded with no reason why it is suitable habitat. What is the goal for wolfs,was 350 now ?? Do we even have a valid way to count wolves? Killing a quota of 400 out of 1100 in two days is impossible. Kill 1/3 in 48 hours. They species is not that stupid and man is not that good of a predator. Figure out how many we have AND set a quota. Pretty simple.	0	See Dislikes as that tells you the why.
	All of it	Yes	None	Need a numeric population goal. I suggest 350 or less	1	Do not need to extend habitat range
	All of it	Yes			0	
	Just the parts I am interested in	Yes	I appreciated the inclusion of tribal cultural perspectives on wolves included in Section 2 and the clear organization of Section 4 into goals, strategies, and products. It is apparent that a LOT of work (and science) went into this plan.	Nothing	9	I like the adaptive management approach very much and appreciate the inclusion of the ecological benefits of wolves. I am also glad that the plan recognizes and respects tribal sovereignty by establishing special zones around tribal lands. Thank you!
Dick Wolkowski	All of it	Yes	Adaptive mgt by unit. It makes sense to manage wolves site-specifically.	I believe you have find a way to really understand the misguided opinion of the non-wolf territory people that are so supportive. Unless they travel north their opinion is not based on any observable factors or experience. Find a better way to assess the difference between their opinion and that of those who live in wolf country. It's kinda like having a territory consisting of the states of Illinois and Wisconsin and then asking do you like Da Bears. I bet a greater percentage of those south of Beloit would say yes. Those north of Beloit know much better because they've dealt with a real football team.	4	In reality the issue boils down to the bad table manners of wolves who historically have eaten our livestock, game animals, or dogs...animals we value. This has been the issue since European settlers expanded their influence in the State nearly 200 years ago and the human mindset has changed little. If their appetite was similar to other predators who seldom cause such conflict we wouldn't be doing this exercise. I am a supporter of wolf number management based on a well defined carrying capacity, developed for the proposed units. Whatever management plan is developed it should be based more on biological and physical science and not soft sciences. I live in non-wolf country in S. Wis., but have two cabin properties in the north (Ashland and Bayfield Co.). I spend 6-8 weeks between the two each year. I deer hunt from each and have noted a decrease in deer numbers over the past 15 years. Coincidence, I think not.
	All of it	Yes		No real plan to help manage these animals for the people living with them everyday.	0	Needs to have specifics of when actions will be taken.
	Most of it	Yes				please do not let judges from other states determine what happens in wisconsin
	Just the parts I am interested in	Yes	recognizing that zone 6 will have greatest conflict and making B the priority to control herd size to reduce conflict with wolves.	There are no numbers for management objectives. When we manage deer we have numbers that are the goals. Why do we not have numbers for wolves? If we are considering science in managing the herd you would have numbers.	5	I think the people who are living with the wolfs should carry more weight in survey process. Otherwise lets move wolves to the cities and see if people respond the same.
Don Erdmann	All of it	Yes	I couldn't find any details that I liked.	It is unreasonable that there is no population goal regarding wolves. Not just any number, but 350 wolves or less statewide. The sportsmen and conservation groups of WI, including the CC and WWF, have been steady in this plan for years, yet they seem to be completely ignored.	0	In addition to the above, the changes in the wolf zones seem to have been made with no logic, other than to appease the tribal nations.
Michael	Just the parts I am interested in	Yes	I like seeing the overall trends via charts, the ideals behind this all makes sense to some degree.	The draft plan is just simply too large to have any meaningful input for most citizens to read.	3	Overall I truly believe there was a reason our ancestors came in and killed every last wolf. Every year as a deer hunter I see fewer deer and have seen more wolves. While I think it's admirable to bring this population back and maintain the numbers I only see it from a hunter's perspective. I see a huge resource pool in wolves and the tax money that goes into managing them. I often wonder what it was like to hunt in the 70s, 80s, and 90s (being that I'm 30.) I feel wolves only take away from a resource we have statewide and leave the average person vulnerable to not using the land to live should he need to.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Pat Clark	All of it	Yes	It's wonderful that the 350 number has been dropped and I hope everyone learned something from. As it was used as a political weapon against wolves. Hunting groups abused it, using it to push their anti-wolf and anti-life agenda.	There are no concerns about away with hound training and ending the ridiculous practice of paying hounders for their deaths as they let the hounds run wild in wolf areas, insane. Also, I don't think enough was in the plan to address the Native Indian tribes, their science and concerns over the killing of wolves. The public view of wolves are changing, they don't want killing of wolves. The plan should state that the trends are away from killing wolves and should address the future when killing will no longer be allowed. Also, in many ways your survey was corrupt towards hunting and hunters, the general public, which now out numbers them should have a say, its their outdoors too. I do believe the poaching fines should be drastically increased as well, which was not addressed in the plan.	5	The use of more science in the plan would have been nice, as more studies are now finding that killing off wolves does more damage to the ecosystem than once known. Also, from experience, wolves are saving endangered plants that get over browsed by over populations of deer. On my property, endangered orchids have returned when the wolves returned. The DNR should know this, as by their own rules and hunts are destroying rare and threatened plants.
	Most of it	Yes	The history of the wolf monitoring and harvest.	There was not enough to discuss the effects of wolves on the deer herd, particularly in how the wolves primarily go after the old and weak and not the typical trophy deer most hunters seek.	6	I would like to see the wolf population increase in size. There needs to be better public awareness, or education, in the positive affects of wolves in the environment, as well as a better understanding of the (lack of danger) wolves present to humans.
Scott PItta	All of it	Yes	The buffer around the reservations and the elimination of the 350 rule. The plan is a well rounded plan that balances the interests of hunters, farmers and naturalists.		10	The excellence of the plan and the hard work of the citizen groups that provided the department the "nuggets" of data will serve as a model for others who design management plans.
Gerard Baugnet	All of it	Yes	Nothing	My opinion you have to keep it at 350 animals that's what we agreed on 8 to 10 years ago you have no management plans .	0	The deer population northern forest county is decimated we have to sell our land and Camp because it does not pay to do hunt up there anymore there's millions of dollars that Northern Wisconsin is losing tourist dollars
Larry Schoenemann	Most of it	Yes	The constant monitoring, public input. Hunting seasons to aid in regulating numbers.	None that I dislike.	9	
david haenel	Just the parts I am interested in	Yes	nothing	the tribe buffer zone increase ,the changes increasing in primary and secondary habitat, no wolf population goal	0	I think you are political fop catering to special interest groups not to the people you are supposed to be serving. anyone who had a hand in approving this p.o.s. should be fired try, using an open scientific approach instead of political
ralph oppeneer	Most of it	Yes	well put together. i don't live in " wolf country" but this plan seems to address issues i might have if i did.	i can't say that i "dislike" any part of it that i read. i guess i would need to see it in use to give it a grade.	9	thanks for asking.
John Anny	Most of it	Yes	ALL OF IT REFLECTS A GOOD AND IN DEPTH STUDY AND PLAN		10	SOMETHING HAS TO BE DONE I FEAR OTHER WISE PEAOPLE WILL JUST START KILLING WOLVES
	Most of it	Yes	That we finally have one.	There needs to be a maximum number in the plan. This what the land will support BS sounds like anti-hunting talk for there will never be a season on them.	1	
	Most of it	Yes				For the past two plus years we have heard nothing, but we need to follow the science when it comes to Covid 19. Now despite ample scientific evidence, including 26 leading scientists, saying that the gray wolf has recovered, the state government does not want to follow the sceince.
David Bailey	Most of it	Yes		Population goals are way too high. Wildlife management decisions are being overridden by political interference. There should be an open hunting season on wolves.	5	
	Just the parts I am interested in	Yes	None, where is the resident of Wisconsin in drafting this document	You not following the agreement in the original agreement for maximum numbers and ignoring it is over three times the agreed on number. Which my bites your number is far less than what there really is	1	Involve the citizens of Wisconsin and quit listening to no state groups
	All of it	Yes	Sorry but I don't like any part of the plan	Not sticking with the original 350 wolf goal Not taking into consideration the deer being killed by wolves Wolves not being counted on Wi/Mi border Wolf encounters in Northwoods by walkers, hunters, and wolves in peoples yards	1	This is not at all based on science. We need to have a wolf hunt to keep the populations under control. Please listen to all of us that are seeing wolves often. We have owned land in the Northwoods for over 30 years and had 3 wolves in our yard this year. This has never happened. The population has exploded.
Dennis Passmore	Most of it	Yes	The tribal summary of GLifWic was very informative , both from the Ojibwe point of view and as a summary of wolf behaviors. The statistical summaries of population alsol	N/A	8	While I can appreciate tribal /religion concerns, I have lived in the Northwoods for 77 years, and I enjoy my deer season. I feel that we as a society are continuously reminded to "follow the science", and should entrust the management of wolves to those who are educated in the subject and "management" should be more than let the wolf packs do it naturally---- thus leading to bringing the whitetail herd to a low enough level to , thru starvation, reduce the wolf population. Not to mention the economic fallout of destroying the whitetail population, and thus ending the traditional family hunt. I support using DNR personnel to lethally manage the size of the population

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Jay Rosenbecker - Phelps, WI	Just the parts I am interested in	Yes	That the DNR is considering ways to limit wolf population (i.e. hunting, trapping) if not hamstrung by over-reaching federal mandates.	The plan does not address the "gorilla in the room" - deer populations and effects on deer hunting. Deer hunting is one of the most popular outdoor activities in this state and has huge economic impact. Here in the northwoods, I have seen a tremendous degradation in the quality of deer hunting - both in numbers of animals seen and especially in the number of mature bucks. Coincidentally, this all seems to have happened in direct relation to increase in wolf numbers. It seems that the DNR is abandoning the interests of deer hunters in this state. The only reference I could find to consideration of the deer population was in "Objective A". It states "Consideration of primary prey populations including white tailed deer and elk population abundance, trends, and objectives." What does this mean? That wolves will be allowed to increase until the deer population falls to levels that can no longer support wolves? Or that wolves will be allowed to increase until there is just enough deer to support THEM while leaving the deer population too low to hunt? This objective is so vague that it is laughable. I think the question of how to support and sustain quality deer hunting in all areas of the state should be specifically addressed.	2	There needs to be clear and frank discussion between the DNR and people who live, hunt, and enjoy the outdoors in wolf country. Presently, it seems to fall on deaf ears that wolves are having a detrimental impact on especially the northern deer herd. How can this be denied? It stands to reason that if predator levels increase, prey animals decrease. In my opinion, the economic and recreational opportunities afforded by deer hunting far outweigh the "feel good" benefits of observing wolves. Nobody is saying that they want wolves completely eliminated but the numbers are too high in this area. The prevailing attitude of the "guy on the street" around here is that the DNR has their head in the sand on this matter.
000508424	I have not read any of the draft plan	Yes				Ten years ago your appraisal of the bear population from the last time I baited bears provided the WI citizens with a Springtime estimate of 13,000 bears in the state. By midsummer the changed estimate rose to 26,000. And by the time the season opened that fall, it went to 39,000. Amazing how the population could triple in three short months. This is somewhat bewildering and hard to understand. Second, about two years ago the DNR admitted that there were 10,000 more bobcats than the original estimate. Again, somewhat bewildering!! Now for about 15 years WI citizens have been told that the wolf population in WI was some place between 970 and 1300. I find this number to also be somewhat bewildering considering the last wolf hunting season took two and one-half days to kill 218 wolves. That suggests a very large population of wolves. I spoke with two hunters this week and both stated that they found multiple wolf tracks in their hunting areas. The tradition of deer camps and the deer hunting heritage has changed drastically in the last 15 to 18 years. Suggestions: Bounty on coyotes More bobcat tags issued - It took 7 years for me to get the last bobcat tag. It took 10 years for my last bear tag in zone B which was deferred to my great nephew, the tag being filled in one day. In my 50 years of residing in Vilas County, I quit trapping minnows and walleye fishing due to VHS, quit land trapping with a main focus on coyotes, no small game hunting anymore as the grouse sitings are limited due to too many predators on the landscape. My only sporting activity remaining today is gun deer hunting. All in all, I find it difficult to believe that the metrics that have been used in the past and proposed in the future are very questionable. Andy Schaffer PS - What was the monetary penalty for the 126 walleyes that were speared on Squirrel Lake last spring by the two Lac du Flambeau tribe members who did not have permits to do so? This incident is being sugar-coated by the DNR biologists who give the information to the Vilas County News Review. Thank you for the opportunity to convey my thoughts, even though I question some of the DNR policies and practices.
	Most of it	Yes			7	
Bob	Most of it	Yes			5	Population is to high
Peter Weinschenk	All of it	Yes	The plan is well researched, flexible, and, wisely, avoids stating specific population goals for wolves in Wisconsin.	The plan is dishonest. It starts with a presumption that wolves in Wisconsin can be managed. This is false. The wolf is protected under the Endangered Species Act (ESA) and cannot be managed like other wildlife. The plan fails to state what the ESA demands the minimum wolf population needs to be before wolves are not endangered and can be managed like other animals.	9	It is extremely unfortunate that Wisconsin politicians, including federal officials, have so little regard for the Endangered Species Act, itself a federal law, and, like generations of politicians before them, use the wolf for political gain.
	I have not read any of the draft plan	Yes				It doesn't matter what your stupid plan is because we out here in the country will control the population ourselves because we are the ones dealing with the useless creatures not you over educated idiots.
	Just the parts I am interested in	Yes			1	

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
	All of it	Yes	That we finally got a plan way past due date.	No population target is a mistake!! No specific push or plan for a future hunt by the DNR is politically motivated. DNR knows we must hunt them but can't say that due to playing politics with Democrats and Anti Hunters. DNR needs to push for controlling population as they are the "experts" not the puppets.	1	Plan does not address population and need for lower number. Wolves have expanded their range, expanded the population, number of packs, number of incidents but we a political BS plan written to not ruffle feathers with the people who have no vested interest - non hunters. Hunters have a vested interest, pay the bill for all including DNR but get no say. DNR hides behind "they are federally protected anyway" stuff and gets a vanilla plan out that does nothing. IF they come off protection again we got no real plan to knock the population back. Deer hunting runs the state with $$$ so by all means continue to jeapordize it by letting the wolves eat most of the deer in the North.
Jeffrey Boville	Just the parts I am interested in	Yes	None	No specific maximum number of wolves is part of the plan. Sounds like the DNR is getting tired of getting animal population management wrong.	2	Looks like the insurance industry and the tribes are in charge with respect to managing wolf numbers. That is, when Federal judges in Washington D.C. and California are not getting in the way. Just know that if wolf numbers in Wisconsin get out of control, the problem will be handled by the the sportsmen and women in the state. And the DNR will make even more enemies among the citizens that use and cherish Wisconsin's woods and waters the most.
	Most of it	Yes	Specifically, education on wolves. Wolves attacks towards humans per your own admission on page 83 are rare, yet people still think of wolves as evil. More education is necessary to determine long term effects on pack mentality when members of the pack, specifically alphas, are killed decreasing pack size, the ability to operate effectively as a pack and hunt regular wildlife verses livestock.	I'm not a fan of trapping as I have seen firsthand what the animal experiences when getting caught. Trapping needs to be mandated better to be off all roads and trails and clearly marked so as to avoid pets vs predators.	5	WI is the only state that allows the use of dogs to hunt wolves! There is nothing sporting about using dogs to hunt and should be outlawed. If a hunting dog is killed the owner should not be reimbursed and this alone would save the state over a million dollars a year if I read the chart correctly. This should be mistreatment of animals and the owner should be punished by law. Don't believe hunting wolves is necessary. Wolves are not killed for sport, food, or necessity; they are killed solely for the sake of killing which is disturbing. Farmers should be allowed to protect the heard by killing wolves if necessary, but more could be done to prevent the attacks in the first place. If hunting is allowed, better management is necessary. No hunting when females are pregnant and only issue the number of tags that coincide with the number of wolves to be killed.
	Just the parts I am interested in	Yes	Not much, 178 pages of government bureaucracy. The plan should be to reduce the wolf population all the rest is bureaucracy!	Worrying about the Elk population, really, we will never have a sustainable Elk population with wolves in Wisconsin. Stop wasting money on the Elk!!!	1	The problem is the Madison DNR doesn't listen to the people in the field, these are not pet projects with gold stars you get on your report. Get to work and do something constructive. We can't have a sustainable Elk population with wolves and you can't have a deer population to keep Hunters engaged if you have wolves.
	All of it	Yes	I like that you actually put a plan together despite 95% of DNR Staff not leaving their couch over the past 3 years.	Wolf "management" is the largest boondoggle ever thrown at WI Sportsmen. Your staff has no idea what is actually going on in the woods. Eliminating the goal number of wolves has upset a lot of people who live in wolf range.	1	I don't believe you actually want to hear what I have to say about the plan. The vast majority of the WI DNR Wildlife Staff does not have a clue about management, nor do they care as long as they can sit on their couch at home eating donuts.
Kevin Jones	Most of it	Yes	None of it.	No management goals for the number of wolves.	1	I have hunted in areas where there are wolf packs; there are very few deer in the remote woods. All the deer seem to be close to peoples houses \ near the roads where there are plenty of illegal corn piles to eat from and for the most part away from most of the wolf pressure. Why is the DNR ignoring the deer hunters that are their biggest revenue source. Deer hunters spend lots of money every year and are a big boost to local economies. If you ignore them because they may not have the loudest voices they will either speak with their wallets by hunting in another state, quit hunting deer which is what I did or manage the wolf population on their own. Please cut the wolf population to a level where deer hunters can again see deer 350 - 500 is reasonable.
	Most of it	Yes	The maps and graphs are well done, percentages on responses was good.	Some of the statements were vague, and some of the responses were listed as positive or negative attitude rather than percentages in favor.	4	Not having a set population goal is a dangerous game to play. And although I agree that every Wisconsin resident has a say in the management, I feel as though there should be some weight added to those who live in the wolf range especially in rural areas. It is not fair that people who live in wolf range areas have management decided upon by those who live in cities or more heavily populated areas outside the wolf range. Essentially why should someone who lives in Dane County make management decisions for someone who lives in Douglas County. This needs to be addressed!
Daniel A Reinke		Yes		You wrote a 178 page DRAFT PLAN? If I write a 178 page reply would you honestly read the entire reply? This is a simple process and your making it political. Follow the initial plan that was written in 1999.	1	You wrote a 178 page DRAFT PLAN? If I write a 178 page reply would you honestly read the entire reply? This is a simple process and your making it political. Follow the initial plan that was written in 1999. Wisconsin still has the same area of land and 72 counties. Why have the rules changed regarding wolf numbers? "A solution is sometimes the answer you already have"
Dowe S. Tillema	Just the parts I am interested in	Yes	I like the fact that there is a plan from which to work with.	I am completely against not having a numeric management goal. There should be no more than perhaps 500 - 600 wolves in the state. There are too many wolves. The plan does not include the negative impact of wolves on the deer population. There must be a maximum population goal of perhaps 500 - 600 wolves. if not, the DNR is creating an environment where the citizenry will be forced take management into there own hands. Not a tenable situation. Listen to the deer hunters. The state needs them first and foremost!	2	we MUST have a maximum numeric population goal.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
	Just the parts I am interested in	Yes			1	Way to many wolves need at least half of what we have now which is 500 or less
paul hennes	Just the parts I am interested in	Yes	I appreciate the in-depth justifications of having the presents of a sustainable wolf population in wisconsin. a lot of sceintific work has gone into this draft	your rationalization comparing wolf attacks to other preditors. not enough focus on the fact that many rural residents are reluctant to go for a walk, simply due to the wolf presents. to me 74% of wisconsin residents who are not comfortable going for a walk near wolf habitat is a real concern, and one that could be controled.	1	sad to say but its only a matter of time, before a wolf attacks and kills a child in this state. they are intimidated by the size of an adult, but sooner or later, when a wolf gets hungry enough, he will take a child playing "in the back 40" and then the law suits will follow. you think you pay out a lot for animal loss now !! .... just wait..... it will happen. as a former vilas county supervisior, and city of eagle river alderman, please control the wolf population and keep that number at a comfortable 350 thank you...
Timothy Pattermann	All of it	Yes	That the DNR is actually trying to make a plan.	That there isn't a numeric cap on wolf population in wisconsin. Also that the DNR drastically underestimates the current wolf population. The public was told wolves would be managed to 300 or so wolves statewide when they were first released.	2	Revise it. Set a reasonable number. 500-600 wolves as a cap number for a sustainable statewide population. I'd like to deer hunt in northern Wisconsin and actually see a deer. I hunt there and see very few if any in a season. Especially since baiting and feeding is illegal.
Jeff Miller	Most of it	Yes		No cap limits. As a deer hunter in Vilas I have seen the damage 2 wolf packs have done within 5 miles of my house.	1	We need a wolf hunt by zone !
karen	Most of it	Yes	paying attention to ecology	when there are no surplus deer, you can say there are surplus wolves. until then, there is no need to kill wolves. stop calling it a wolf HARVEST. the wolves aren't something we grow to harvest. it is a wolf hunt, a wolf kill.	4	No dogs should be allowed in any. it is cruel to dogs and to prey and not sporting.
	Just the parts I am interested in	Yes			1	The new plan is clear as mud. Please reduce the wolf population, especially in Northwest WI
STEVEN NINNEMAN	All of it	Yes	ADDRESSING AND REDUCING WOLF CONFLICTS PROVIDING HUNTING AND TRAPPING	MOVING AWAY FROM A NUMERIC POPULATION GOAL MOVING AND EXPANDING ZONES, INCLUDING THE TRIBAL BOUNDRIES.	2	For years the science said that the social carrying capacity was 350, many groups were in agreement. When it came to the management plan most of the science was used from previous years except for the 350. The expansion of the zones and tribal boundaries are an outcome of the DNR not having a November hunt when it should have. I believe that many of the sportsman don't even care about the new plan because of trust with the DNR and the political process to make it. And that not good for the Wolf and the sportsman.
Rob	All of it	Yes	Nothing	No population goal, no management plan. You guys basically did nothing for two years! This plan is just political pandering. Animal rights groups offer no scientific research. This plan should be focused on managing timberwolf populations so northern county and state forest deer populations can rebound, so we curtail livestock and pet killing reimbursement, and use the license sales for further management research and depredation expenses. We could make this species sustainable instead of being a chronic net loss. Some wolves are good, but they have dropped public land deer populations in northern WI to horrifically low levels. It is such an awful and preventable turn of events over the last 20 years that the WI DNR does nothing to rectify. If you want more deer hunters and more tags sold, we need less wolves in northern WI where the largest swaths of public land are, so the deer herd can grow.	1	We need a season. Deer hunting is a billion dollar industry in WI. Their needs to be better criteria for a season framework. You have decades of data from Idaho that has shown 40% of a wolf population can be harvested every year with little or no effect on the overall population year over year. We should be aiming for a population goal of no more than 500 animals. Anything more is a disservice to the actual people that spend money on tags that pay your salaries! We need 500 wolves harvested right away. Your population estimate is also perennially flawed as well. You don't account for the 10 to 15% of a wolf population that is made up of lone wolves. We have well over 1000 wolves in WI. Get us a season now. Do your jobs that we pay you for or take a hike.
	Just the parts I am interested in	No			8	I don't support wolf hunting
Brad Schaal	Most of it	Yes	Nothing	We cannot let wolves keep moving further South. Somebody is going to be killed	1	How does the "science" change that much in 30 years. We went from a population goal of 350 to basically unlimited. The DNR is basically shooting them selves in the foot. You think license sales are low now wait until the wolves make the deer population in southern WI look like the way they decimated the herd in Northern WI
Doug Drysdale	Most of it	Yes	Elimination of a numeric wolf population target and the use of science-based data to manage wolves. Strongly support Product C2a, C2b, C3a, C3b, Objectives D and E. I strongly support requiring farmers and ranchers to practice 1) good husbandry to minimize livestock depredation and 2) non-lethal methods to deter wolves like fladry, fencing, livestock guarding dogs.	Page 105. Zones 3 & 4. I don't agree with recommendation to have wolf harvest rates be generally higher with ample harvest opportunities. These zones provide connectivity between the primary wolf zones for genetic diversity. Subzones 1B and 2B: why not include wolves removed for depredation control and vehicle kills toward the subzone limit? Any known wolf deaths decrease the population and should count toward wolf kill quotas. Product A5c: I somewhat understand the intention to avoid having too many elk killed by wolves but why can't the wolf and elk populations manage themselves as predator and prey? Strategy B2: I oppose compensation for hunting dogs depredated by wolves while at-large in known wolf territory.	7	

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Gisela Drysdale	All of it	Yes	I strongly support elimination of a numeric wolf population target and the use of science-based data to manage wolves. Strongly support Products C2a, C2b, C3a, C3b, Objectives D (this is great!) and E. I strongly support requiring farmers and ranchers to practice 1) good husbandry to minimize livestock depredation and 2) non-lethal methods to deter wolves like fladry, fencing, livestock guarding dogs.	Page 105. Zones 3 & 4. I don't agree with recommendation to have wolf harvest rates be generally higher with ample harvest opportunities. These zones provide connectivity between the primary wolf zones for genetic diversity. Subzones 1B and 2B: why not include wolves removed for depredation control and vehicle kills toward the subzone limit? Any known wolf deaths decrease the population and should count toward wolf kill quotas. Product A5c: I somewhat understand the intention to avoid having too many elk killed by wolves but why can't the wolf and elk populations manage themselves as predator and prey? Strategy B2: I oppose compensation for hunting dogs depredated by wolves while at-large in known wolf territory.	7	
Douglas Michalek	All of it	Yes	The plan covers a wide range of topics that appear to follow the science and overall understanding that the wolf is a valuable species that needs to be protected for a healthy environment. Recognizing this is the first step to maintaining a healthy wolf population. Also recognizing the importance of the Wolf to the Indigenous people of our state and surrounding states.	I don't feel that landowners should be allowed to remove wolves because of depredation of livestock. That should be done by state employees only if it is proven that the animal was killed by a wolf which also needs to be done by a state employee. Also there should be no compensation to hunters that run hounds if one of the hounds is killed or injured. These hunters know the risk of running these dogs and so should not in compensated.	5	Use science as your tool for protecting wolves. The majority of Wisconsinite want wolves on our landscape. Don't let the minority of hunters sway the DNR to make rash decisions. There is no viable reason to kill a wolf just for the sake of killing it. They deserve to be protected for future generations.
	All of it	Yes		I don't like that there is no numerical population goal in the plan. This plan is far too open-ended suggesting that there is no serious interest in actually managing the wolf population.	3	I hunt and recreate in wolf range with many days spent in the woods year round as well as monitoring over a dozen trail cameras. I strongly believe that the wolf population is underestimated. I would like to see the wolf population reduced and then maintained at a level lower than what we have on the landscape today. I can also tell you that wolves and coyotes appear to coexist just fine based on numerous trail camera observations showing routine presence of both species, contributing to a huge predator load across northern WI.
Bill Yingst	All of it	Yes	I like all items except the one item listed below.	Changing the Population Goal. Me an my constitutes believe the Population Goal should remain at 350 and the DNR should manage the Wolves to that number. That would really reduce the depradation costs.	5	
Martin Jacobson	All of it	Yes	Thoughtful approach to management of population based on geographic location of animals involved. Buffer zones, and allowing population more potential for growth in optimal habitat and more downward pressure in more problematic areas.	Continued use of dogs to hunt wolves, trapping starting at same time as hunting I would prefer hunting only (without dogs) before trapping starts. Season timing should be consistent with treating species as a trophy furbearer not a pest to be eliminated by having season align with pelt condition. I realize many of these elements have had control highjacked by legislative statute.	9	I feel that the payments for hounds that are depredated has created a perverse incentive that is demonstrated by WI having more hounds lost to wolves than Michigan has.
Justin Saari	Most of it	Yes			1	
James Newlun	All of it	Yes	I think it was important to identify the costs associated with Wolf conflicts.	I'm concerned the overall goals/objectives may not be achieved due the inability to manage populations.	7	I would ask that you review the plan goals. Let's makes sure these can be accomplished. If not, then that needs to be stated clearer or taken out. I may of overlooked if we receive any federal funding to our state to support any aspect of the plan or program. Also, it wasn't clear how many state or contracted staff work in this program. The cost's of staffing, equipment, and contracted work should be in here. Large plan so I may of missed this. Please consider adding these other costs if not included.
David Kuhr	All of it	Yes	This does seem to be a plan. To have a plan you need to arrive at a solution or in this case a method of control, which would ba a maximum # of animals on the landscape a Quota needs to be listed to fullfill that.	I live in your proposed Zond 2B and it is unacceptable that you think you have the right to establish a no quota zone just because the land we paid for, live on, and pay property taxes you are mistaken. This is leading towards another Boston Tea Party, basically stealing the rights for us to protect our land and livestock	0	At this rate next because you feel that their brother the wolf has more rights than we do you will have a subzone for their brother the bear. Or maybe their subclan the deer.
Travis	Just the parts I am interested in	Yes		I believe the wolf harvest number needs to be increased. The Dnr needs to be honest with the public and themselves on what the estimated wolf population is in Wisconsin. The estimated number of just over 1000 is absolutely way to low.	1	We need to bring the population down to the original 300 mark. The native American tribes are not going to harvest any even though they have the opportunity. Therefore the permits the get shouldn't be counted in the harvest goals. Simple math says that in the next season allowed approximately 700 wolves should be able to be registered to get down to the original management goal. Going against all of your "surveys" the majority of the people I speak with about the wolves do not agree with your findings and have no faith that the Dnr is or will do anything truly positive to effectively manage not only the wolf population but any of Wisconsin's animals.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Jesse Duhnkrack	All of it	No	I commend the DNR for being methodical and deliberate in developing the draft plan. From my perspective, I hope that the timber wolf in the Great Lakes area remains listed as an endangered species, and therefore is provided protection, possible population enhancements, and responsible management. Yes, there will be conflicts and isolated depredation, but the DNR must address these issues with active management. I like that the DNR has engaged the Tribes in Wisconsin. I like that the DNR has dropped a numerical number for "ideal" wolf population. I like that the draft plan shows consideration for the ecological role of wolves.	I would like the see the DNR more actively educate the residents of Wisconsin about the ecological role of wolves and how wolf populations can coexist with humans and current land uses through active management. The plan infers that hunting is a conflict resolution tool, which if used as managed in the past, is far from an effective tool. My greatest concern is the impact to pack social structure as well as unmanaged hunting during gestation and breeding season. If wolves need to be euthanized, this should be done by skilled marksmen in a methodical way, instead of (frankly) archaic, barbaric, and unethical (fair chase issues including hounds, snowmobiles, etc) methods. If current laws remain the same, the Wisconsin state residents need to know what is the purpose and intent of wolf "harvest"; it could be for active management, but if allowed as "hunting" it's not for food or sustenance, it is strictly for the act of killing, which has no place in today's world. I have concerns about the occupancy model used in the plan. Given the small (estimated) population size, the number of assumptions in the model is questionable; occupancy models are generally more useful for wildlife management when the population is significantly larger, as is used for deer. Keep it simple and stick with population counts and on the ground tracking, even if there is a cost. It is unclear to me how exactly the details of the plan will be implemented, and who is directly responsible for implementation. Will there be a Committee composed of balancing interests? Will there be an annual action plan? Will the residents be kept informed of management practices? It is important that the plan is in alignment with the existing wolf management plans in Michigan and Minnesota; while the laws are different in each state, the draft Wisconsin plan does not appear to take into consideration adjoining state plans.	6	I would like to acknowledge the enormous amount of work that has gone into developing this draft plan. Given the current hunting laws in Wisconsin and future uncertainty about the endangered species listing, it is a difficult task to develop a comprehensive management plan. In my profession as a wildland fire manager, I have developed fire management plans for many large national parks. One thing I have learned is that management plans must be reviewed and updated annually. Within policy and law, adaptive management strategies must be utilized. I do not support trapping or hunting. However, I recognize that active management must be utilized so that we can coexist with wolves on the landscape. Although Colorado is my legal residence, I live in Shawano County from May through October. We coexist with wolves in the nearby Miller Creek area of the Stockbridge-Munsee Band of Mohican Tribal lands. Thank you for considering my input.
	Most of it	Yes			1	There should be a hunting and trapping season on wolves in Wisconsin. There should be a limit on the amount of wolves. There should be no way some stupid judge from out of state can stop our hunting and trapping of wolves. We killed off the wolves for a reason. It should be done again.
	All of it	Yes		Re: Page 127, Product C2H/ "Pursue administrative rules to establish a designated season for dog owners to train for wolf hunting activities." Wisconsin is the only state that allows the practice of hunting wolves with dogs. While this practice is currently allowed by a law that was passed with almost no public input, there is no reason to further support this cruel practice. This form of hunting is akin to dog fighting, which under other circumstances would be considered illegal. This hunting practice is harmful to both wolves and dogs. The establishment of a training season merely supports and extends the cruelty that is currently limited to the actual hunting season. Unlike bears, which can climb trees, wolves have no way to escape these "training exercises". For wolves, a "training exercise" creates the same stress, fear, trauma, and physical harm an actual hunt would produce. The only difference is that during an actual hunt the tortured wolf is put out of its misery with a bullet. Just because hunting wolves with dogs is currently legal, it does not mean it is ethical or humane. The use of dogs to hunt wolves violates two primary tenants of hunting ethics: the idea of fair chase and the duty to kill your quarry quickly with as little pain and suffering as possible. Are a dozen hunters with a pack of six radio collared dogs against one hapless wolf and example of fair chase? Does having a wolf run down to the point of exhaustion only to be bitten and torn at by a pack of hounds sound like an effort to minimize pain and suffering? Do not support and extend the practice of hunting wolves with dogs by providing additional training days. Training days are not required by law. Do not let the practice of hunting wolves with dogs tarnish the image of true sportsmen and women who treat their quarry with the respect it deserves.	9	I support keeping wolf population goals at or near the current population of 800-1,000 wolves. There is no ecological or safety reasons to reduce wolf populations down to previous, outdated, artificial limits. The 2022 gun/deer season showed a 14 ½ percent increase over the prior season even with wolves at their present population levels. This supports the fact that wolves do not have a significant impact on the state's overall deer population. Our deer herd remains strong and hunting opportunities abound. Even with our increased wolf population, close encounters between wolves and humans remain minimal. While some people express fear of wolves, there are no supporting facts that fear is justified. Specific threats to livestock can be addressed through better farm management practices and lethal wolf controls can be applied when necessary. The entire wolf population need not be punished and reduced because of the behavior of a minority of wolves. Given the controversy and strong feelings surrounding wolves, the DNR has done an admirable job of taking into consideration the many interests involved. Wolf management should not be driven by a small group of special interests. I believe it is the DNRs responsibility to manage the forest and wildlife for the benefit of all the people of Wisconsin, whether they are hunters or non-hunters. A balanced, ecologically sound environment should be the goal of all management practices. It is my hope that the Natural Resource Board will honor the efforts of all who have contributed to this management plan and the science that supports it.
Melissa smith	All of it	Yes	sample	sample	4	sample
	All of it	Yes	Zone 1A development. The cattle conflict is real and worth a special callout.	No actual number listed as a goal population. This seems appropriate to not allow either side of special interest to influence one way or another. Why so much discussion on wolf ecology, that can be researched in many other places. This is a management plan, not a wolf 101 textbook excerpt. Stick to the basics of how and why the population needs to be managed.	3	I see no mention of setting an actual number as a goal population to be obtained. This seems important in development of a population management plan.
	Most of it	Yes	The ability to control the size of the herd	The fact that the original number of wolves to be allowed by re- interducing them is no longer the goal.	3	The plan needs to go back to the original intent. If wolves were running wild in Milwaukee and Madison, where the people veiw them as pretty little pet dogs instead of the natural born killers that they are, perhaps things would be different. Go back to the original goal of the number of wolves needed to sustain their population.
Roger heidtke	Most of it	Yes	None	All	1	Tribal imput is way out of balance

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Jim Gozdowiak	Just the parts I am interested in	Yes	Glad that there is some DNR oversight to this issue.	Quota's should be reduce in the Central and southern zones.	5	The wolf has seen enough pressure in all but the N. West part of the state. Let them live and breed in the central and southern zones. They serve a purpose.
James M Johannes	Most of it	Yes	It seems to want to try to incorporate the wishes of different interests groups.	It is not a plan. No measurable goals, no action items, no trigger events.	1	A 167 page report plus an 11 page executive summary and preamble. 96 of the 111 pages are background information, data and survey or research results. Most of the "suggested interpretation" of information in these 96 pages is not objective and is slanted clearly to pro-wolf interests as the comments below will demonstrate, Overall comment: this is not a plan to manage a population. It is much too vague. There is no specific end result presented which means there is no definitive strategy and there are no actionable "triggers" which means there is no real strategy and there are really no "tactics" designed to achieve a specific result. If Eisenhower had a plan this politically correct, vague and non-committal for D-Day we would all be speaking German. The Executive Summary (page iv) captures the pro-wolf bias in the report quite well. "The goal of this Wisconsin Wolf Management Plan is to effectively balance the tradeoffs between the following key objectives: • Ensure a healthy and sustainable wolf population to fulfill its ecological role (Objective A) • Address and reduce wolf-related conflict (Objective B) • Provide multiple benefits associated with the wolf population (Objective C)" In support of these primary objectives… There is NO mention of balancing the wishes of hunters (shouldn't that be a primary objective or at least an important consideration?) in this summary (more on this later) and no mention at all about killing wolves to achieve objectives. Another sentence captures this bias and disregard for the wishes of hunters. This single sentence highlights the DNR's attitude that this is all about wolves, not people. "In early wolf recolonization in Wisconsin, it was recommended that hunters avoid areas occupied by wolves." Page 81 (92 of the packet) What is the wolf's ecological role? Vague reference (page 111, 122 of the packet) to keep nature in balance. Need to define "balance" to make this a real plan and also need to consider the wolf's role when there are other factors keeping nature in balance, like hunters. What is the balance between wolves and hunters specifically when it comes to deer? Silent on this. "Ensure the late-winter wolf population abundance is responsibly maintained above federal and state listing thresholds." (page 111, 122 of the packet) Silent on how much above? That open ended approach is not a plan and is clearly pro-wolf! (Page 114, 125 of the packet) says to maintain deer herd to feed the wolves! No mention of maintaining deer herd to feed hunters. Clearly pro-wolf again! There is no mention of what to do when the wolf population gets too large! There are no real triggers like we have in other regulatory areas when, for example, depredation gets too large. Only vague references to target "downward to stable trends" in conflicts! Stable? At what level? (page 117, 128 of the packet) Conclusions are stated in a biased manner. Here is an example. (page 36) "More people support regulated wolf hunting and trapping than oppose it and a majority support lethal control to address conflicts, however support was conditional." Using the word "conditional" in this context is a blatant attempt to undermine the view that people generally support regulated wolf hunting! Then the narrative does not even address what "conditional" really means! Farmers are going to be taught how to reduce conflicts! (page 118, 129 of the packet) . Doesn't this absolve wolves of their actions and put the blame on farmers? This is so pro-wolf. I also will take issue with all the tribal support. While we put great weight in this report on public surveys there are no public surveys of tribal members. In other words, the rest of the report wants to put considerable weight on individual responses but not so on the individual opinions of tribal members! The excuse for this sleight of hand, as explained on page 43, is that treaty rights mean that the final word comes from tribal governments not individuals. This convenient cop out may be legally correct but that does not make it right especially as it pertains to policy that impacts non-tribal members more than tribal members. What is the purpose of Table 11? I think the DNR is saying that we have a good model to help us predict the impact of a hunt on the wolf population. I hope they do but the truth is that all the data, except the reported wolf harvest from the hunt, is totally manufactured and unreliable by the DNR's own admission later in the report on page 97! This attempt at credibility is overstated. Moreover, what the table really shows, if it is accurate (which I doubt) is that human harvest has had no detrimental impact on the wolf population in Wisconsin. In other words one could conclude from this that hunting wolves is a GOOD idea and the DNR should be a champion of wolf hunting! Despite humans killing an average of 34% (highly debatable) of the estimated wolf population each year between 2011 and 2013 the wolf population has grown a very healthy

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
						(from a wolf's perspective) average of 3% a year since 2011 (while the human population of Wisconsin has only grown on average by .4%.) This fact should be a rationale for regularly scheduled wolf hunts to control the wolf population but there is no mention of that in that report. The report seems to suggest that the only reason to limit wolf populations is to reduce conflicts arising from depredation of livestock and pets. That is ONE reason. The other, only obscurely mentioned in an appendix table but alluded to in a pejorative manner in discussion of hunter comments, is to maintain a deer herd for sportsmen and women. The tone of the report is that all that matters are wolves and livestock. The utility of sportsman and women who fund the DNR is ignored, almost totally. Page 97 contains this accurate statement which despite being accurate is a total cop out allowing the DNR to do whatever they want to do and for whatever reason. Further, estimating the abundance of wildlife populations with enough precision to determine whether the population is meeting a narrow numeric goal typically demands high resource and financial investments and may be impractical. These difficulties may lead to illusions of success or failure regardless of actual conditions on the ground. Therefore, although numeric population goals may effectively account for basic biological requirements, they can easily fail to account for other biological concerns and social factors which are ever evolving through space and time. An alternative to numeric population goals is to prioritize management actions in response to existing conditions as observed in the field and scientific data. This approach strives to find an effective balance between potentially competing objectives associated with wolf management i.e., facilitating wolf-related benefits while minimizing wolf-related conflicts." Let's dissect this for a second. First, to say "An alternative to numeric population goals is to prioritize management actions in response to existing conditions as observed in the field…" is probably correct but to implement it you need to consider all input on what is happening in the field. This includes hunter complaints of "no deer" but that is never part of this report! Apparently the only "observations" that count are reported (and I stress reported) predation and the DNR's totally unreliable (as admitted in this quote by the way) estimate of the minimum wolf population. If the DNR wants to ignore hunters they should just be honest and state that up front so that hunters can then vote with their license dollars which comprise a huge part of the DNR budget. In other words, if the DNR really means to use "balance" as indicated in this statement "This approach strives to find an effective balance between potentially competing objectives associated with wolf management i.e., facilitating wolf-related benefits while minimizing wolf-related conflicts." then use a balance that CLEARLY includes the interests of hunters, especially deer hunters in wolf management zones. There is only one mention of hunter satisfaction and it is buried in an appendix on page 102. Under Objective C there is an item called "satisfactory hunter/trapper satisfaction indices" but no mention that I can find of what these indices are or how they will be used. At a minimum one of the bullets under Objective E on page 102 should be designing an effective tool to measure the impact of the wolf population on hunter success. Apparently, that input does not matter as much as pro-wold education and surveys. The pro wolf bias in this report is captured in the fact that in that report on page 102 there is one mention of hunters as just described but many more objectives supporting more wolves: • high probability of wolf population persistence • no radical changes in wolf population abundance and distribution trends • ensuring regulated harvest does not jeopardize the security of the statewide wolf population • ensuring opportunities to enjoy other wolf- related recreational opportunities, including values-based enjoyment of the population • fostering public support for wolves through education
	Most of it	Yes	Almost nothing.	The plan is garbage and only designed to fit the wolf "anti-hunting narrative". The length of 134 pages is utterly ridiculous. The removal of a wolf population objective is just another ruse of the policy of the DNR leftist leadership and reflects no science whatsover. The entire plan is total BS garbage, but isn't that exactly where the DNR has been heading the last 4 years.	0	The are plenty of reasons for the public to no longer trust the WI DNR at anything. The DNR is simply another arm of the rotten Democratic party.
	Most of it	Yes	Having a State controlled plan instead of Federal control.	No maximum quota number for wolves.	2	Having safe zones around Tribal lands. Is bad for the overall plan.
	Most of it	Yes	I do believe there should be some level of wolf population within the state	Population goals removed. I supported the original plan of 350 but now have lost faith / trust that the State actually wants to 'manage' wolves.	2	You need to set a population goal and stick to it. Very little appetite for anything over the 350 limit originally set. I bought property in northern Price county for hunting purposes and consistently see more wolves than deer. The even interfered with my bear hunting. Perhaps with the litigation crazy world we now live in, I should bring suit against the DNR for lessening the value of my investment. And no, I'm not trying to be a smart ass but am consistently frustrated that the bureaurocrats who make up these policies don't have to live with the consequences. Enough is enough. Expand the wolf population in Milwaukee or Madison and see those residents tolerate it!

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
	All of it	Yes			1	Its down right wrong for one what is said to be the population of wolves is wrong you people should come to iron co and see how few deer there are left Its almost to the point that iron co midiswell not even have a deer hunt and skip a year what needs to be done here is a september to jan wolf hunt!
	Most of it	Yes		A wolf management plan needs to have a population goal and an accurate population estimate in order to set harvest quotas. There was a reason that 350 was set as the number to indicate wolf recovery in Wisconsin. Wolves are increasing their range, and are encroaching on more populated areas. I do support wolves being apart of the ecosystem, but the plan doesn't state what an acceptable number is. I submit it should not be more than 500.	5	
Todd Scheel	Most of it	Yes	The overall plan looks good. I like that fact that you are asking for public input.		9	If you have hunts in the future, I hope you use County lines instead of zones. Vilas County, where we live, has had 1 wolf harvested since 2013.
	I have not read any of the draft plan	Yes				survey to some 8,000 people with 55% respond rate. So approx. 5,000 people had an opinion to your survey, Please don't set policy based on 5,000 people in a state that has almost 6 million residents! That's foolish and honestly a waste of tax payer money to do such a study.
	Most of it	Yes	How the Native tribes view the wolf	No population target for best acceptance of a wolf presence in the state.	4	
David Wesener	Just the parts I am interested in	Yes	It was readable and understandable to me. I feel most people should be able to understand what was written.	choosing to use ranges rather than definite numbers, dislike the logic used in reaching conclusions, strong arguments for different conclusions could easily be reached and supported...	2	I believe the goals were predetermined by the DNR and the plan was then written to support achieving them. I don't believe that this plan represents the wishes of the majority of the citizens of the state.
Jeffrey Szymanski	Just the parts I am interested in	Yes	Zone assignment based on competing needs and values. Prosecuting poachers. Monitoring population.	Undecided.	7	The draft length prevented me from analyzing it as thoroughly as I probably should have to make valuable comments here. As a city dweller, I've never seen a wolf in the wild but understand their value in maintaining ecosystem balance.
	Just the parts I am interested in	Yes	Product A3c:Product A3d: Building partnerships and trust between the various groups interested in the outcomes of wolf recovery will be crucial to ensuring that management of this species reflects the needs and interests of the public and is grounded in science-based decision-making. science-based educational outreach. Provide leadership in collaborative and science-based wolf management in Wisconsin. Product C1d:	Product C1b: Continue to support the Wisconsin Cooperative Trapper Education Program	4	restrict foothold traps, period. restrictions wolf bait, period. poisons? really? that's so indiscriminate, it's disgusting.
Dennis Draves	Most of it	Yes	Effects on ecosystem. Effects of human intervention on pack survival	Percent of deprivation when over 29%	10	Very balancd
Edward Blau	Most of it	Yes	The value of wolves to the floral diversity and survival.	Slides showing wolf kills of dogs, cattle, etc were hard to read, The graphs were much better.	7	As long as the wolves have Federal protection, which I hope persists, there is little the WI DNR can do. I have hunted since I was 12 and see the large deer population as a Public Health and ecological disaster. I am sorry that wolves kill or drive out coyotes since they kill more fawns than wolves. Leave the wolves alone except to help them grow in numbers.
Gerald Kroll	Most of it	Yes	Informing the general public to what's going on with future wolf management plans .	You don't take in consideration the devastation wolfs are causing to the livestock operators. It's getting worse as producers have no means of protecting their livelihood.	3	Your wolf population numbers are way off… there are over 200 in Douglas county alone. If the general public was made aware of the horror wolves are causing as they kill or carry off all species of livestock and family pets maybe wolf enthusiasts will see the light. I alone have lost over 40,000$ in loses to wolf depredation with very little compensation. I don't want to join the ranks of those the wolfs put out of business. We appreciate any help to a complex situation.
Paul Hagen	Most of it	Yes	Very like.	19 deer killed by one wolf per year 1000 wolf wolves = 19,000 dead deer most in northern Wisconsin. If you put in most maybe doe and fawns what is the really total of lost deer.	1	The so called Committee is a joke all pro wolf.
Ross yeschek	Most of it	Yes	Limiting wolf populations	No plan to start population control immediately	1	Hunting season had made wolves fear people and human activity. They stayed in the forest. Without hunting they are much more dangerous to humans, pets, livestock. When they have no predators they pose a real danger to society. When they begin moving south the DNR will wake up. There is a reason no PETA meetings are held in the Chequamegon Forest.
Bruce Nelson	Most of it	Yes	Need to keep balance	Your estimate of Wolves in WI is not accurate at all. The county I hunt in probably has 900 in it alone. Other counties have wolves the DNR doesn't even know about	1	

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
	All of it	Yes	That the wolf deserves respect. They belong in Wisconsin — but not in the ridiculous numbers that currently exist.	First, why give the opinion of wolf advocates the same if not more weight than that of hunters and farmers? What do wolf advocates do for Wisconsin's natural resources outside of having an opinion? Most don't pay license dollars nor do they contribute much to Pittman-Robertson funds. Your survey shows most of them have never seen a wolf — so they live in a wolf fantasy world. Hunters pay license dollars and contribute to the Pittman-Robertson fund. Farmers need all the help they can get. Thus, since hunters and farmers have a vested interest and their opinion should carry more weight. It's like giving Russians equal say in how the United States should be governed. Secondly, you have no population goal. Without one, you're leaving all future management open to debate, which leaves future wolf hunts open to lawsuits. It's like you WANT future wolf hunts to be disrupted by lawsuits.	1	
Mark	Most of it	Yes	None	There needs to be a set population goal. There also should not be buffer zones around reservations. Any wolf hunting or trapping season should be allowed statewide regardless of reservation boundaries	1	Pick a population goal and stick to it
Andrew	Most of it	Yes	They plan to actually manage them.	They didn't provide a specific number for the population of wolves once they start managing them.	5	We need to keep the population at their original goal of 350.
Kay Scharpf	Most of it	Yes	Stated goals and objectives. No simple numeric population goal. Zone specific management. Zone 2 management: harvest secondary to long term sustainability and ecological role of functioning of wolf population. Management based on science. Description of mutualists and traditionalists. Description of wolf ecology: keystone species creating a trophic cascade effect of wolf presence on wildlife, forests and humans. Explanation of wolf population resiliency. Mission statements.	Is not specific on how to reduce conflict with farmers and hunters. How will common ground management partnerships be built in science based decisions. Not clear on how to verify zone specific pack size. The study for wolf resiliency not done in Wisconsin and should be. Harvest to target dispersed wolves should be included in management plan as a general harvest impacts the social order of the pack.	9	
Dave Gerdes	Most of it	Yes	Facts and specific info, especially related to depredation and hunting	Good plan, I think a lot of irrelevant information, but what is irrelevant to me may be important to others so maybe the more info thrown out there the better	7	I find it interesting that those who live in areas without wolves are more supportive of more wolves and those who have to deal with them are not as supportive. More relavence should be placed on those who have to deal with them.
	I have not read any of the draft plan	Yes		No number given to managing wolf population		This is a joke!
Wesley Fietzer	Most of it	Yes	I like the idea that DNR and the management plan committee in particular are finally making an effort to manage the grey wolf in Wisconsin after many years of inaction.	I dislike the fact that there is no numerical solution to the grey wolf population to minimize the inevitable conflicts between the wolves and the human population of this state. In the event there are wolf conflicts that require lethal force and there are harvest tags available. There must be a guarantee that access is granted to the harvest tag holder.	4	
JAMES SAUER JR	Most of it	Yes	TRYING TO START SOME CONTROL OVER THE OVER POPULATED WOLF NUMBERS	NOT REMOVEING ENOUGH WOLFS BEING TO SLOW AND NOT AGGRESSIVE ENOUGH TO CONTROL THE OVER POPULATED WOLF # ..... IVE LIVE AND SEE FIRST HAND THE SIGN AND OVER POP OF WOLFS AND THE DAMMAGED THEY DONE IM A BIG OUTDOORSMAN NOT JUST IN THE SUMMER ITS TIME TO PUT THE BIG BOY PANTS ON AND STOP ALLOWING THE LIBS IN THE SOUTHERN PART OF THE STATE THAT NO CLUE OTHER THAN THEY LOOK CUTE	1	LETS START ASAP TO REMOVE SOME OFF THE OVER POPULATION OF WOLFS NOW !! JUST LOOK HOW LONG IT TOOK TO REACH THE CAP IN THE LAST SEASON THE STATE HAD 2 DAYS THAT SHOULD TELL YA SOMETHING
Mark Gausman	Most of it	Yes	Overall, I liked the extent and information provided in the plan. Very well done, a lot of information to read(178 pages).	The graphs that show "wolf range" and "non wolf range" does not show the actual population of respondents. Was it 1000 people surveyed? 10,000 people? I did not participate, nor was I contacted about participating. I live in southern WI.	3	Deer hunting is culturally important to the people of WI. The addition of over 1000 wolves on the landscape has had a negative impact on deer population in northern WI if one looks just at the population of deer before the expansion of wolves and today. Northern WI has the greatest amount of public land to hunt, the lack of deer in northern WI has driven a lot of deer hunters to quit hunting or move to areas where there are greater deer numbers. How does this plan address this issue? Establish a wolf population goal of 500 wolves.
	Most of it	Yes		The subzones around the tribal land areas is a joke. It's not enough that the tribal areas have a zero quota, but to then expand that reach to surrounding areas is ridiculous. This guarantees those owning land in this area to be unfairly subject to very limited Wolf management. Sure to reduce general recreation and enjoyment of the land, negatively impact local deer populations, and ultimately have a negative effect on land prices and local economy. Non-tribal lands should not be subject to tribal land concerns. This is a spit in the face to those with a vested interest in these areas close to but outside tribal areas. Management in non-tribal areas should absolutely NOT be subdivided to the behest of tribal areas that already have a zero quota policy. This portion of the new plan among not having a goal in general is shameful. Wisconsin residents have been subject to a bait and switch from the original 350 population goal.	1	

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
	All of it	Yes	None.	No wolf population goal numbers. Unlimited expansion of wolf territory.	1	Most of the attention is placed in northern Wisconsin. The central forest region has a severe wolf over population problem. The original goal of 350 just keeps getting moved higher and higher.
	Most of it	Yes	Finally we have a plan. If you want to call it that. At the very least this is a start to some form of management. With that said the plan and lack of goal establishment is shameful. This plan is a spurn to those with the greatest interest in the intended Wolf areas. The reestablishment of Wolves in Wisconsin has been the ultimate bait and switch to the people.	So much to dislike. The lack of a true goal is extremely concerning given the constant caving to public opinion and tribal management responsibility. The population was not managed in the past, it's been let to far exceed an agreed upon population amount in the state. Now the goal posts have firmly moved beyond that agreed population total. Talk about your bait and switch. To make matters worse, now we are made to live with a new management plan that doesn't even have the guts to place a population goal on paper. Not quite reassuring. The DNR seems OK to give into animal rights groups and liberal individuals that like the idea of wolves rather than the reality. The DNR is now listening more to those individuals than the people that live and have financial connections to areas with Wolves. They are content with the fact this will deter individuals from recreating in these area. Further, this will not have a positive financial impact on landowners in these areas. But who cares right? The DNR should look to cooperate with those most affected, and this is the polar opposite. Extremely disappointing plan or lack there of.	1	Its time to start working with the people most affected and with the greatest impact by Wolves. It's time to get back to the original agreement of establishing wolves in Wisconsin rather than a continual movement of the goal post. How about a survey to those living or owning land in Wolf areas exclusively? It sure feels that nobody is listening. You talk about building a relationship between the DNR and the people in WI, this is not how to go about it.
Daniel Paulson	All of it	Yes	Integrated plan The 6 goals and objectives are well ksupported and logical Strategy B5 is critical C3 is very important. The wolves can be a draw for people, Look at how many people seek out woves in Yellowstone NP, Strengthen C2. Strengthen D. Strengthen mitigation efforts. No compensation without effective mitigation efforts!	C1 is problematic. More control over any wolf season. C2h - No dogs!!! Out of state wolf huinting licenses should be very expensive to deter ego-centric trophy hunters.	9	Do everything possible to educate the public about woves and the benefit they provide to a healthy ecocosystem.
Stephen Musial	All of it	Yes	Nothing it's a terrible plan with no population numbers when this plan started max wolf population was to be 350 and that's what it should be	No population goal terrible idea	0	This is the most idiotic idea the DNR has come up with and huge protected zones around the Indian reservations omg in the last 2 years the Indians have killed over 160 bucks in the Boulder Junction area let them hunt their reservation oh that's right they killed all the deer there already 350 should be the maximum population of wolves in Wi PERIOD
	Most of it	Yes	continued compensation for loss of pets, livestock and hunting dogs to wolves	no numerical limit to the number of wolves in the state, somehow the wolf population has to be brought down so the deer have a chance.	3	Somehow the population of wolves has to be reduced in most of Forest County. Areas around Laona and Blackwell where our family have deer hunted for over 60 years are have about 10% of the deer population of years ago and are now over run with wolf sign. I have nothing against a few wolves but now I can go into many areas after a fresh snow and see wolf tracks all over and hardly a deer track. This is a sign the wolf population has to be brought down and this alone gives many people a bad opinion of wolves. Start a wolf hunt again and bring the wolf numbers down so the deer have a chance and I would have a much better opinion of this plan. I spend a lot of time in the woods and we are have just to many wolves in many areas!!
	Just the parts I am interested in	Yes			1	There are too many wolves, especially i
	Most of it	Yes	It is nice to see all the graphs and maps that show the different data. I think the graphs and maps can show more than words can explain.	Already your draft is outdated. I happen to know of collared wolves that have set up territories in areas outside of data your plan shows. Alot of your references are from old, outdated studies. Certainly, there more reliable studies and published papers that more relevant then 14 years old.	4	I am confused why you don't list a population goal number or management population number. Just about everything fish and wildlife related is justified by numbers. Walleye and Musky fish per acre. Population of trout and salmon in Lake Michigan as it relates to stocking and baitfish biomass. The number of song sparrows nesting on a prairie. I could go on and on. So why not list a population goal for wolves. So is it ok for the state to have 6000, 7000, or 10000 wolves in the state. What is the number to scientifically state that wolves can have a sustainable population in the state and not have a biological effect, whether that is elk, deer predation, pet kills, or livestock kills. Until this state writes a management plan that list a population goal, I will not support it.
Bill Weber	Most of it	Yes	I liked the specific data. Although I feel it is under represented as there are no assumptions made when it comes to wolves.	I feel that there should be a higher management of this alpha predator. Although I do see that your hands are tied when out of state judges take away your management plans.	1	I think it needs to be recognized that when hunters shoot 200 wolves in such a short amount of time that the population is vastly under counted. I understand that we need to respect and listen to Native Americans and do feel that they have an overweighted input into the plan. I do wish you the best and know how emotional both sides are. I can tell you that I sold 300 acres of land at the end of Trappers Road in Price County in 2013 as there were lots of wolves and no deer left. This land is in MFL open and adjacent to a ton of other well managed MFL land and 500 acres of State Land. I grouse hunt here and always am very nervous with the amount of wolf sign and my Brittany's.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
brice	Most of it	Yes	charts	estimated populations	5	The process needs involvement from Conservation Congress and sporting organizations, not just DNR staff and indian reservation representatives, the model your looking to move to for management is different than what was originally approved. The total number of wolves is far from what it should be and needs management, which offers sporting opportunity to state residents. That process should be tied to the same process as bear tags but should be further weighted by those who have the ability to successfully and ethically harvest the amount of animals targeted to be harvested.
Marina Haan	Just the parts I am interested in	Yes	The overall objectives are sound	1. That funding to compensate for depredations comes from selling licenses. 2. That trapping is permitted. (=cruel & inhumane.)	5	I would like to see more emphasis on the value of wolves in the WI environment as being an attractive feature that draws tourists to the state. Using the funds from selling licenses to reimburse for depredations means pressure to increase license sales and therefore more hunts. Let's go back to funding through sales of the special license plates. There is no justification for the use of traps. It is impossible to trap without creating needless suffering.
	All of it	Yes	It does a great job of trying to justify doing away with a fixed number of wolves in Wis. It also does a great job of justifying spending more money on wolf management.	Doing away with the fixed number of wolves needed in the state. Justifying spending unnecessary money on a simple problem.	0	Keeping a fix number of 350 wolves simplifies the wolf management plan. Saving and making the state money by. One reducing the number of wolf damage payments. Less wolves less damage payments. Generating revenue by selling wolf hunting lic. Reducing the number of personnel needed for management.
	Just the parts I am interested in	Yes	None of it	Give us a Number you sold us on 350 where is this going to end. Do the Indians get to dictate wolf management?	2	What a bunch of BS A population that we are comfortable with. Manage the wolves
Mark	All of it	Yes	That the state will manage the wolves.	The fact that the state wants to move away from the original number of 350 and institute a plan that allows for a larger number on the landscape. State law must be changed before this should be allowed.	2	Hound hunters and trappers are the best tools in the states control, fast and efficient control. Work with groups to manage problem areas instead of issuing tags to those who have no intention of utilizing.
	Most of it	Yes	Not having a statewide population goal and being specific in terms of the actual areas that have wolves on the landscape	More metrics are needed.	8	More public outreach and education is needed to show the value of wolves in the ecosystem
Shannon Thielman	Most of it	No	I like the heavy emphasis on on-going scientific research. I like the emphasis placed on native cultural values.	I dislike the number of permits issued per targeted wolf.	9	My family has owned property in Lincoln County for 3 generations. My parents live there, and my son and I spend our summers there, spending much time in the woods. I saw a wolf this summer, crossing the road ahead of me on my walk, and it was thrilling. It made me reflect - I would have much greater fear of running into a stranger in the woods, than of running into a wolf. I know that top predators are extremely important in healthy ecosystems, and I appreciate the wolves' role in keeping the prey populations in check and especially the potential for them to reduce CWD in our deer herd. I believe that hunting during breeding season is unethical, but am not opposed to a hunting season that is very highly controlled and based on valid scientific population estimates. This wolf management plan is a strong step toward fulfilling the WDNR's responsibility to maintain a healthy wolf population in the state.
Don Baumgartner	Just the parts I am interested in	Yes	I am ok with a lot of it, I like breaking the state down to specific areas with wolves in them and managing them that way.	I have several dislikes mostly on the handling of the hunting, trapping and compensation. You have to get a handle on the supposaby hunting groups slottering the wolves. The bear hunters should not get any compensation for their dogs because they are not in there control and that is a chance that they are taking. In this day and age trapping should not be allowed. We need to do as much as possible to help the farmers to make their farms safer for their animals.	5	The last wolf hunt that happened in Wisconsin was a total failure and the state should be imbarassed at how it was handled. It just shows that the gun people can do what ever they want.
	Most of it	Yes			3	no increase of the population of wolves. reduce numbers to the original agreement of 350 animals located in NW portion of state.
Michael J Riegert	Just the parts I am interested in	Yes	The adaptivity	This plan appears to be a great improvement and involves admirable dedication and effort. Yet I'm afraid I can't take it seriously because of the use of the euphemism "harvest". eu·phe·mism noun a mild or indirect word or expression substituted for one considered to be too harsh or blunt when referring to something unpleasant or embarrassing. har·vest noun the process or period of gathering in crops. crop noun a cultivated plant that is grown as food, especially a grain, fruit, or vegetable. (Definitions courtesy of Google Dictionary) Wolves aren't plants that we've sown and cultivated. They're not a crop. And they're not harvested, but killed. I'll take these efforts seriously when proper terms are used and when it's acknowledged that our justifications and qualifications for trying to manage another species are inadequate.	5	"We need another and a wiser and perhaps a more mystical concept of animals. Remote from universal nature and living by complicated artifice, man in civilization surveys the creature through the glass of his knowledge and sees thereby a feather magnified and the whole image in distortion. We patronize them for their incompleteness, for their tragic fate for having taken form so far below ourselves. And therein do we err. For the animal shall not be measured by man. In a world older and more complete than ours, they move finished and complete, gifted with the extension of the senses we have lost or never attained, living by voices we shall never hear. They are not brethren, they are not underlings: they are other nations, caught with ourselves in the net of life and time, fellow prisoners of the splendour and travail of the earth." — Henry Beston, The Outermost House: A Year of Life On The Great Beach of Cape Cod Courtesy of GoodReads In appreciation and hope-free service: Michael J Riegert, Medford, Wisconsin

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Matt Lallemont	All of it	Yes	Very little	Several areas I Disliked. Missing a numeric population goal. Buffer zones around tribal lands unfairly restricted to harvest and give the tribes management authority of private and public lands surrounding them in a very clever way which will go public fast. Anti dog-hunting undertones implying dogs should not be used if wolves are present instead of manage the wolves so dog-hunters can use their dogs. Suggests restricting road access in the best habitat. Science is picked and misrepresented to tell a narrative. Ignores sporting and agricultural feedback from the advisory committee meetings. Assumes if wolves now live in an area it has become good wolf habitat. This appears to be more of a wolf expansion plan vs a management plan.	1	Expect a lot push back from all forms of sportsman, sporting groups, cattle and farming organizations for not setting a population goal and timeline to achieve it.
	All of it	Yes	Objective A is of utmost importance. Wolves should be restored wherever they can. They belong in our ecosystem.	I dislike any attempt to minimize their range or number.	9	Our habitat, and environment would be best served by having a healthy wolf population.
Logan Norman	Just the parts I am interested in	Yes	I like that harvesting wolves are part of wolf management			
Jon Peterson	Most of it	Yes	none it is obvious that the over population of wolves in wi will not be controlled	the whole plan does not adress population control a season to hunt trap is urgently needed	1	typical dnr approach to a major wolf overpopulation problem. time to take this problem into the hands of the hunters who have seen there hunting decline s s s
Sonya Dailey	Just the parts I am interested in	Yes	Follow the science	I am against hunting wolves at all	5	Stop hunting completely. Leave packs in tact so they can hunt naturally and not have to resort to livestock. Wisconsin forests need wolves
Robert Schultz	Most of it	Yes		Not having a set population goal. If you have no goal number, how will the public ever know that the DNR is truly managing the species?	0	
	Most of it	Yes		Removing the population goal	1	
	Most of it	Yes	My God, what is in this plan? This is not a plan!	Bunch of rhetoric	1	
Joseph Willman	All of it	Yes	The zones and sub-zones give the state a lot of flexibility moving forward. Being able to scale up or scale down management in those zones and sub-zones will make site-specific management much more effective. You can really tell the department made an effort to reach a diverse group of stakeholders, especially the tribes compared to the considerations for the previous harvest.	I think the wolf advisory committee should be broken down into two committees of scientists. Mixing the two seems like a recipe for conflict and not getting anything done. Sociology should be kept out of science. For the sub-zones around the reservations, the quota level of 4 still might be too high. If all four are harvested from one reservation it could wipe out an entire pack. (I acknowledge that the plan mentioned that this number will be revisited but this may be something that we just have to wait and see on)	8	Given the complexities of wolf management, I think this plan did a very good job meeting the needs of a majority of stakeholders and gives the state a lot of flexibility going forward compared to the previous plan. I look forward to seeing what changes are made and how this plan is implemented moving forward!
	I have not read any of the draft plan	Yes			10	
Timothy Bailie	Most of it	Yes	It was well laid out and I could tell that a lot of thought went into it.	I disliked the public take (hunting) of this animal was more of a, if everything else doesn't work, instead of a management tool that is used for all other large game in WI. It is leaning more on payed individuals (law enforcement and government trappers) instead of paying individuals (hunters). This is counter to manangement practices widely used in WI and is financially unwise. I do understand this issue is controversial and this wording may be best as having them delisted is priority 1 as science seems to indicate that they are indeed recovered.	7	
	Just the parts I am interested in	Yes	How comprehensive it is.	It lacks a population goal number.	5	The goal of the plan should be to decrease the wolf population within the State to a number supported by the majority. The current plan leaves too much room for population growth even to the point on non-sustainable numbers.
Paul Lemke	All of it	Yes	Nothing	All this plan tells me the liberals in Madison are up to same crap we usually see from them. The people in the northern parts of the state get dumped on again. Let's see some action and get rid of a lot of these wolves. They are taking over the state. Trap some and take them down in the Milwaukee/ Madison area. Bet you will come up with a good plan then.	1	

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
	All of it	Yes	historical look at the progam	NO poplulation number is the biggest failure of the DNR I have ever witnessed, clearly you are afraid to make a decision, this is a political hack job, you are clearly ignoring the hunters who pay for the majority of DNR law enforcement. this is unacceptable.	0	this will eventually become a public safety issue, you already have a dnr employee who had a dog killed within seconds of shooting a grouse, no fear of shotgun blasts- saw this article online. when a person finally has an encounter where public safety is a concern, the bounty on wolves will start. I no longer have any respect for the dnr with this fence riding plan, the end result is not a plan rather an attempt to please the anti hunters. sportsman will never respect the wolf unless there is a regular season to harvest the animals, look at all other species, whitetails unlimited, ducks unlimited, pheasants forever, these are all examples how wildlife thrives when sportsman respect an animal. I saw this mindset change when hunting was allowed in 2014, now with this plan with no goals, sportsman will continue to hate wolves and shoot them anytime they encounter one. Throw this plan away and start over. the landscape has changed since the 70s, I believe fewer wolves should be the goal, say 250 due to urban sprawl. there will be more conflicts as people have moved away from crime ridden cities and went rural. that means more pets killed, also potential for public safety concerns.
Jason	Most of it	Yes			0	I would like to be able to walk in the woods again and see more deer tracks than wolf track. The longer you guys wait around the worse it's going to get.
Ron Wilson	All of it	Yes	Very little	Valuing public input from people who are not impacted by the unchecked wolf population in northern Wisconsin.	2	If you don't make the decision to have an open season on wolves soon, you need to realize there are many who will do so on their own. These people are not only hunters either. The wolf is no different than other animals in our state - they need to be managed with some sort of hunting/trapping season since they have no natural predator.
CHRIS J BOUTON	All of it	Yes	none	stakeholder input. Who are these stakeholders? Are these national organizations ? Only wisconsin legal residents have any stakeholder share in managing wolves.	1	It appears to me that wdnr wants to obfuscate wolf management with the goal of eliminating any wolf harvest.
	All of it	Yes			4	
KATIE ABRAMS	Just the parts I am interested in	Yes	I believe promoting wolf harvest as a tourism aspect would be beneficial all around, it would be lucrative (hopefully) and help with nuisance populations. Educating the public is of upmost importance, in my opinion. I hope that aspect receives a lot of attention. The wolf population in Wisconsin, along with its benefits and challenges, is misunderstood by a vast majority of residents. There are many preconceived beliefs about wolves in the state and the only way to solve that is with education :)	There isn't an aspect I necessarily dislike, however, I think it would be beneficial to expand on the deer-wolf relationship. Possibly including the relationship between prey and predator populations (ex: rising white tail populations = rising wolf populations). Hopefully it would encourage individuals who are not fond of the wolf population to harvest deer.	9	Very informative, well organized plan.
	Most of it	Yes	Zone specific tags, subzones, goal of stable healthy population, and focus on science based decision-making.	8 hr registration requirement is a bit tight. 12 hrs would be better.	9	Good luck getting it approved!
john Fetzer (cdac)	All of it	Yes	60 pages and very little reference to deer populations. That is because DNR's matrix will never be correct because they will never have an accurate count until the last deer is gone.	matrix is solely based on speculation / It would take an army to collar every wolf to get a correct count.	6	it is a mute to talk about how wolves were transplanted into Wisc. But like DNR's matrix about deer pop. so is wolves. The harvest of all most 200 wolves would according to their matrix say that the population was dissipated to an unstainable level. At supposedly a 1200 pop and .25 breedable at 6 pup means that 1500 pups anchor the population. I don't believe it. I believe there is well over 2000 animals and at .15 300 breedable animals it equates to 1800 new borns. at 20 deer killed per animal it is easily 40k of deer dead a year x20 years equals a 800,000 ratio to put into deer numbers. Some may say my numbers are bloated but I say the DNR numbers are weak.
	All of it	Yes	Hard to understand.2	Didn't see any figures. All words.2		Go back to the original 350-400 max. Not the 1000(+,-).
	All of it	Yes	I like there is an actual plan so maybe now we can hunt them and knock the population back down to where it belongs which is low	I want a population goal and a plan for hunting to get it there period. Seems DNR has fallen pray to politics of this and are now catering to the anti's. Wolves need to be harvested heavily in Rusk county and all surrounding counties. The number killed last year in Ashland or Bayfield county I think was 49 in an attempt to knock them back was awesome and need needs to be done elsewhere. Also shows that the population is out of control!	1	How can statewide population be like 1097 when 49 were killed in a special hunt in Ashland or Bayfield county and that was after the last Wolf hunt. Hard to believe that many wolves taken in that area in a short period of time and I am sure there are many left so that leaves the question if that many in one country how can there possibly be that few in others when we know that's untrue!!!
Matthew Deinhardt	All of it	No	As a trapper and non resident trapper I want there to be wolves for years to come so that I can harvest them in a scientifically managed season. The wolf is sacred to me and my family and harvesting them is part of how we live our life and so not having a cap on the population makes this possible. I like that harvest will continue through scientifically managed seasons. I appreciate and enjoy that hunters and trapper are stakeholders in this discussion. Also like livestock compensation program, this will help with those stake holders whos cows, sheep, pigs, and goats get killed by wolves.	I dislike that the DNR is considering non hunting or non trapping public input. I want everybody to enjoy the wolves, even non trappers or non hunters. However its a little concerning to think that residents in Milwaukee could dictate animal management in places like Mellen, Mercer or even Eagle River. I disagree that tribal considerations should even be considered if they dont hunt or trap wolves, OR provide funding to the DNR. I have nothing but respect for other tribes, but to create pockets of no wolf hunting or trapping goes a little too far in my opinion. Again public attitudes should have zero to do with wolf management, that is the reason science exists, which will help drive management techniques.	8	If the tribal members dont want wolves killed, I recommend doing a lottery draw for their region. They should have to buy a license and put in for the lottery. If they get wolf tags, they can simply not fill the tag. This creates an equitable situation for all parties, I even would give tribal members applying for a lottery on their land a higher preference percentage point.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
	Most of it	Yes	I like the idea of having multiple stakeholders at the table and I would like to see strong representation from the hunting/outdoor community	Fostering public support for wolves through education...sounds like this would be a one-sided pro-wolf propaganda effort to justify never actually managing the wolf population	5	I feel like the push to move away from a numerical goal is an attempt to dramatically increase the wolf population in an open-ended manner with the intent to never truly manage the wolf population. I am concerned that the number of people living outside of the wolf range that are pro-wolf and anti-hunting will significantly outnumber those living, hunting, and recreating within the wolf range. Additionally, no amount of pet or livestock depredations, human safety concerns, nor decimated game populations will ever be enough for this pro-wolf and anti-hunting crowd to ever vote to manage the wolf population. Therefore, without a numerical goal, there will never truly be any control of the wolf population under this proposed wolf management plan. I would also like to see weight given to those that live in wolf range as these are the people that ultimately have to live with the results of the wolf management program. I am ok with having wolves on the landscape, but I strongly believe that they need to be managed to a population level that is lower than what we have today.
Joe Meyer	Most of it	Yes	Balancing the complex needs of wolves and people while focusing on ensuring wolves play a significant ecological role. This includes ensuring the "cultural carrying capacity" we place on wolves is not the only driver for wolf management.	We need to do a better job of utilizing our wolves as a major tourism opportunity for viewing, etc.	9	Great work! Finally we are seeing the major ecological role wolves play and the real ability for WI to sustain wolves near current levels. Thanks!
	Most of it	Yes	I like that you're using Hunting as a means to control the population. As a farmer in zone four the idea of having an uncontrolled population of wolves running on my farm seems like a bad idea. Pastured animals even inside fences get stressed from wolves which makes them loose weight. It's hard farming regenerative agriculture.	In zone four there is a lot of agriculture. If wolves populations get too high I think that people will take wolves out of season. Which will make the community look bad. I'd like to see the population in zone 4 and management included in zone 6.	8	Maintaining a small population of wolves in zone 4. Along with a hunting season so they fear humans.
Bruce HERWIG	All of it	Yes	It has no facts or numbers to the draft on what do you really want a wolf population at.	Nothing in that draft when you are going to take care of the problem with all these wolfs	2	You have lost all respect on the wolf population and people are just doing what they want to manage these wolves because you are not. They are over running the northern woods where it is not even safe for a guy to go bird hunting with his dog or people to let their dog out to go the bathroom in many areas. What is your goal ? When ? I hate hearing how people are managing our wolves I believe in managing but needs to be clean kills no animal deserves to suffer and because we have no control over them the people are doing what it takes to take care of the problem. Your numbers are so far off on what you think is in the woods and you have no plan no statistics nothing in this draft.
	All of it	Yes			0	Wolves have destroyed deer hunting and turkey in many areas of the north woods. Great job reintroducing wolves and then the elk in Jackson county to just supplement feed the wolves with expensive elk loins. What a well thought out plan that was. How many were killed over the past years by wolves?! You know and so do lots of us the answer to that question. Great waste of our tax payer dollars period. Wolves were not here for a reason. Our elders took care of the problem because wolves kill just to kill. Jackson county used to be an amazing place to hunt deer and other game and now it sucks and lots of others wont waste their time or money to hunt there either. You wonder why less people hunt now, well its because you are not doing your job protecting our natural resources. But hey dont listen to someone who hunted up there since the 80 and have seen what has seen the damage your policies have have done. You are supposed to be protecting our heritage of hunting and our best natural resource the whitetail deer but why would you want to do that?
	All of it	Yes	kill all wolves	anything leaving wolves around		kill em
	Most of it	Yes	lethal control of problem wolves, population reduction through hunting and trapping.	All aspects that contribute to a more wolves than the minimum amount to maintain a resident population	3	I live close to, but not considered to be in, Wisconsin's wolf population area and I get them often on trail camera photos (no these are not coyotes, I've trapped 100's of yotes and know the differance). There are too many wolves.
Duane Harpster	All of it	Yes	I, frankly, didn't see anything that leads me to believe population estimates will be more accurate and without faith in the numbers, no faith in the plan.	The zones remain to large to be effective in management. They should be reduced to county size at the maximum. There has to be a population goal number.	3	There is lots of information, but good management requires establishing a goal number and maintaining that number
Paul Noeldner	Most of it	Yes	The top 4 goals should have priority including supporting whole ecosystem benefits, letting wolf populations adjust naturally and state management where needed not private hunting. Goals 2, 3 and 4 will address goal 1.	Goals that put killing as sport above broad public interest and investment in fully restoring self managing wolf populations and major ecosystem benefits	5	Give goals 2, 3, and 4 the priority they were given in the survey as the best way to achieve goal 1 and other goals. Wolves do NOT 'need' to be hunted and the cultural heritage of most Wisconsin citizens is NOT killing for sport.
	Most of it	Yes	the use of zone-specific hunting areas and and extended buffer zone around reservations areas.	I have concerns with the use of dogs specifically the training of dogs on wolves. My concern is allowing the training of dogs while the DNR is monitoring wolves at the same time. Wouldn't dogs running wolves all over the woods make it difficult to get an accuruate wolf count?	8	

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
	All of it	Yes	First of all, I like the focus on population studies, the growth of the range and population, the impact of wolves on deer, elk and bears. Your extensive literature and background is admirable, so that people can truly understand the animal and their impact. Using a winter population count makes a ton of sense for wolves, and using the collar tracking mechanism to collect meaningful data is really neat. It is encouraging to see Wisconsin try to provide data and literature on these unique animals. I like the idea of the damages program and think it could provide a stronger framework to reasonable wolf range within the state. Encouraging an annual harvest season is an excellent idea to minimize human interaction while promoting financial opportunity in this space. I would really like to see this season become tighter with less dog chasing because I am a big proponent of relatively "fair chase" hunting. If you all can figure out a consistent non-hunting wolf business opportunity, you should be shouting it from the rooftops because these small communities that are mostly impacted by the prevalence of wolves have an incredibly negative perception.	I am concerned about the consistency of an annual wolf harvest, and the objectivity of a wolf committee. In today's world, it is apparent that political polarization drives too much decision making in science and fitting a narrative instead of the true scientific process (which is really frustrating as a Master's of Science prepared individual). Something that is prevalent in the plan is the "ecological benefit" of wolves which seems misleading since they were effectively eradicated for years and the ecosystem didn't collapse. Balancing the importance of deer hunting in the Wisconsin communities and culture with the presence of wolves is a difficult line to walk, and I do really appreciate the sincerity of reflection by the DNR. I am tentatively optimistic about the wolf program, and at the same time remain disappointed with the lack of consistency of hunting pressure in spite of increasing trends of population even with a hunt (which was completely misrepresented by NPR). If federal regulations remain in place, it would be interesting to see Wisconsin create more clarity of when it would be appropriate to harvest a wolf for protection of pets, children, self.	7	I'm sure you get some aggressive responses in here, and here's to hoping you maintain your enthusiasm for your job and department. I have worked with various fisheries biologist, wildlife biologists and forestry management agents within the WDNR related to managing my property and studying fishing habitats and have only worked with exceptional people that love their job and our resources. Good luck with this impossibly difficult program, and I hope the decision making leaders maintain the same integrity and conservation of their exceptional team.
	All of it	Yes	I like that no population limits are set in the plan.		8	
	All of it	Yes			1	
	All of it	Yes			1	
Mick Mlinar	All of it	Yes	Not putting a number on wolf population.	It's a long read. A summary edition would be helpful because you know most people will not read all of it. And that just leads us back to the misinformation era of the past.	10	Excellent job done by all. Professional, thought out, forward looking...if the legislature and barroom biologists can accept the overall concept of science based management, then this plan has done it's job. Again, thank you to all involved. Mick
	Most of it	Yes	The zone specific licenses and the plan to provide more education about wolves.	I'm not sure there is anything I dislike. While I don't really support a wolf hunt I understand it is needed in some areas. As long as the hunt doesn't get out of hand and respects wolves and their role in keeping nature balanced is the most important thing.	7	
Cory	Most of it	Yes	I like you are letting people harvest the animals	I don't like that you are still not letting people in the areas affected by wolves most manage them at their own discretion.	0	My dog was attacked in 2007 in my yard and you mother XXXXers swept it under the rug and stuck me with the vet bill. The wolf was drawn in by the sound of neighbor children playing on a trampoline and witnessed the attack. The neighbor also had his dog attacked in front of him, his dog died. Again you hushed it. As per usual the dnr has their heads up their asses.
Peggy McDowell	All of it	Yes	I appreciate the consideration of the input from the tribes.	I believe that hunting wolves with hounds should be completely done away with.	6	
	Most of it	Yes	Reducing the number of wolves due to deer numbers being too low in areas of WI	Allowing too many wolves in a "maintain mode" in areas were deer numbers are already too low in WI	2	We need to allow wolves to be shot during the Deer Gun season where wolves are having a negative impact on deer numbers. Some are ok but with bear, wolves, coyotes, and bobcat numbers being so high it is negatively affecting the deer population drastically. This year I'm seeing some does but none with fawns in zone #3.
	Most of it	Yes	1) The breadth - looking at all aspects of wolves in the state from history, to ecology, to population dynamics, human-wolf conflict, etc. 2) Science-based approach. Data, facts, references, etc. 3) Inclusion of the Native American statements. 4) The overall objectives seem right.	Nothing specific. It's always good to edit/ shorten wherever possible... It would be good to better integrate the Native American perspectives and requests into the plan.	8	
	Just the parts I am interested in	Yes	Starting real conservation tactics	Not protecting habitats and focusing more on non lethal measures	3	Please find non lethal ways to protect animals including deer
John Holman	All of it	Yes	The plan was released after the election. Although that is not is not something I liked, it does show that politics and not science still rules the DNR, no matter what party is in charge in Madison. However, it does show the need for an independent DNR secretary not appointed by the governor and that is a positive outcome.	I have two grandchildren living in northern Wisconsin (Wolf Zone 1) and I am disappointed in the lack of attention to "Human Safety" in the new wolf plan. There were only three pages (p. 81 – 84) dedicated to the risk of wolf attacks on people and it dismissed that possibility as almost zero. However, Human Health and Safety Conflicts have increased in the state as the number of wolves has grown above the 350 management goal. With the new plan eliminating any population goal for wolves the number of conflicts with humans will increase. My grandchildren's gym set is less than 10 meters from the woods and I fear for their safety. It's only a matter of time before a child looking for frogs down by a creek or walking with their dog in the woods is attacked by wolves. I only hope it is not fatal.	3	Livestock killed by wolves was not divided into categories like dogs (Pets / Hunting - species hunted). Were you trying to cover up the fact that wolves have also killed horses, sheep, pigs, lamas, goats, and poultry? The general public look at horses as pets and might not know that wolves have killed quit a few over the years.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
Jerry Goddard	I have not read any of the draft plan	Yes	You say that the wolfs kill the weak. I see trail cams with hind quarters of deer being dragged thru the woods. These are deer I wiuld like to feed my family with.	The draft is way to long to protect this viscious animal	0	Stop wolf management. Kill them all so I can feed my family
Rev Chad Anderson	Most of it	Yes	I do appreciate that the state continues to look at all aspects of managing the wolf population.	I was already concerned that the wolf count was over 350, and even more concerned that it was over my VERY LIBERAL friend's information that the first meetings about wolves in the state were to be no greater than 75, to which he voted YES. I am very concerned about the future of outdoor recreation and hunting in this state. I am fortunate to hunting in an area without wolves right now, but I live where they roam and I know the pain of my congregational members that have lost so much of who they are and the chance to truly live as we should be able to in this state. Wolves are one of the main problems, besides other political issues of the day.	1	It is time to bring balance back to the DNR and other levels of government in this state so that it is not just the interests of those living in Madison or Milwaukee get to control the rural areas. This goes beyond wolves, of course, but I must stand up for the rural communities that I serve as a Lutheran minister in this state. To me, wolves are no political, this is just common sense that we need to GREATLY decrease their numbers. 350 is too many. So what does that say about 1000 or more.... Thank you!
Ralph Fischer	All of it	Yes	Thanks for all of your hard work. I found the Plan informative and comprehensive.	Allowing hounds to chase wolves.	8	It deeply disturbs me to see that the many people who worked on the Plan were once again bullied by the hound runners. My Father hunted coyote and fox for 75 years in the Fox Valley and never used hounds. They relied on skill and roads. It is true that Zones 1and 2 wouldn't be as easy but there are still plenty of roads. Besides it's zones 3, 4 and 6 where you seek the greatest harvest and those areas are not much different than the Fox Valley when it comes to roads. Allowing the use of hounds will give many people a very negative view of the Department and our State.
	Most of it	Yes	Afterall these years you finally produced a plan like it or not. What took so long.	The attempt on your part to produce a "population number" and not an estimate of the population knowing it is most likely impossible. Too many units and the idea of sub-units. I know drawing lines always leaves "haves" and "have nots" but trying to figure out which side of the line you are on, well? Why not just use the counties like we do for deer since the inter play between wolfs and deer is crucial to both populations and the deer committees would be a good place to include wolf conversations on a reoccurring basis.	3	Please clear-up the air regarding the 350 number. I read sometimes that this was a "cap", to my knowledge the 350 number was the low number for population sustainability and above which a hunt could be authorized. Then provide a percentage of the population above 350 which would be the quota for the hunt. The quota should be the number you expect to be harvested in total and not reduced by any treaty agreements.
Dan Wackett	Just the parts I am interested in	Yes	None of it	Like most Government documents, it is intentionally way too long to expect anyone, including Legislators tp read and exhorb all of the content.	0	I don't understand why some ignorant people believe that species like this has to be maintained in every State possible. They have always been plentiful in Western States to the point of being shot when seen. We don't need or want them here!
Curtis Erdmann	All of it	Yes	Managing wolf populations near livestock problem areas.	Not working hard enough to get them unlisted as endangered.	2	The deer population has been dropping since hunting and trapping wolves stopped in northern Wisconsin. Deer hunting brings a lot more revenue than having wolves.
Laura Menefee	All of it	Yes	non-numerical population goals	"We can't please all crowds," especially when the "stakeholder committees" are stacked in favor of wolf removal interests by 2:1. One "group" awarded a seat doesn't even exist. The recreational hunting quotas arbitrarily assigned by WDNR disproportionately target prime habitat where there are few (if any) livestock producers and the only "conflicts" "wolves cause" are with bear hounds.	2	As long as wolves are recreationally hunted, this is an outdated plan. Use of dogs should be illegal even if you refuse to advance beyond the 17th c ideology that insists predators must be "managed" through recreational killing.
	All of it	Yes	Limiting the hunting to zone specific to address the problem area of wolf depredation. Use of scientific data and overall health of wolf populations. Use of nonlethal and mitigation problems to help livestock owners.		8	
Sarah Evenson	Just the parts I am interested in	No	I love that you consulted the tribes and included their letters. Understanding the sacredness of the wolf is much easier when reading their own stories. I'm grateful you are moving away from quotas and toward adaptive management.	I understand the recent attitudes many have or wolf hunting (as a right, and seeing them as a threat), but given their endangered status, I still feel that hunting should be majorly limited.	8	Thank you for the thoughtful plan. I appreciate the effort to educate and found the information about the elk population especially interesting.
Michelle Valadez	Most of it	No	Getting rid of the numeric population goal is a good decision.	Still allowing for a wolf harvest season is wrong when science has proven wolves regulate their own numbers and hunting does not increase tolerance of wolves nor does killing wolves reduce livestock depredation.	3	
Christine Walasek	Just the parts I am interested in	Yes	Ensure a healthy and sustainable wolf population to fulfill its ecological role.	I would prefer to eliminate wolf hunting for the purpose of elimination. Nature balances predators without humans killing for the fun of it.	8	I know this is unrelated, but I would like to see Fred Prehn step down of his own accord in the interest of fairness to all of us in Wisconsin.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
	All of it	Yes	I like that the plan does present the cultural and ecological importance of wolves to Wisconsin. These sections are important for contextualizing the place of wolves in Wisconsin.	The exclusion of the 20-21 season from the analysis of human impact on wolf populations. The lack of an analysis of the impact of having an unclear closure date for a hunting season on the over-harvesting of wolves. The lack of an analysis of the impact of high harvesting numbers on sub-adult wolves on the overall health of the wolf population.	6	The plan should do more to analyze what impacts an annual 18%+ kill rate would have on wolves. The past analysis overly relies on seasons without hunting. However the past two hunting seasons have seen 200+ wolves killed in just those hunting periods. With a consistent wolf population in the 800 to 1200 range, this would represent a bare minimum of non-poachiching kills above 17% and up to 25% just during a brief period. The borderline frenzy of the 20-21 season should not be seen as an aberration, but rather the norm for how future seasons would look. 20%+ of the population killed in under 48 hours is an extreme shock to the population and should be more thoroughly analyzed for how it impacts wolves and their interaction with humans. Any future harvest plans should involve much stricter regulation of methods of hunting, as well as of the total number of wolves that can be killed. Due to the inherent lag between when authorities are aware of a zone total being met and when hunters are notified, authorities should close zones before totals are met to better manage the populations in them. Further much more should be done to deal with the poaching of wolves and the carry on effect it has on domestic animals, both though the poisoning of dogs, and through the proven link between wolf killings and packs targeting livestock.
	Just the parts I am interested in	No			1	
	Just the parts I am interested in	Yes	A science based approach pertaining to the hunting format and structure.	Conflicting goals between wolf populations and re-introduction of elk. Using funding to support both programs seems counter productive where habitat/range overlap. If investing time, money, and resources in elk, should hunting/trapping efforts focus more in areas of higher of elk populations? Please address in more detail how both elk and wolf populations can co-exist in WI.	8	
Dale Heeringa	All of it	Yes	Pleased the plan finally came out, way over due and shouldhave been our sooner. Thinking consideration of wolf hunt tags only valid in one zone would be good idea.	Don't like increased wolf population. Need to stay at originally agreed on total of 350 or less wolves.	7	Feel Wisconsin is not wild enough to support a large wolf population without decimating the northern deer herd and causing human conflict. Need to stay at agreed number of 350 or less either yearly harvest to stay at this number.
gordon jozef	All of it	Yes		no specific number that i could find as in previous plan WAY TOO AMBIGOUS !!!!!	0	so, after ALL this time you finish the draft right after evers is elected ? no mention of 300 population goal ? a committee to establish hunting numbers ? expanded territory around reservations ? a smaller dog than a wolf is 24 / 7 year round open season? evers and his dnr have done absolutely nothing good for the sportsman in this state. just made it more political.
Henry Nisiewicz	Most of it	Yes	Reducing reporting times of a wolf kill from 24 hr to 8 hr.	The fact that there still is a wolf hunting license program.	5	As the former experiment on Isle Royale proved, wolves manage their own numbers based on available food. Except for the occasional problem wolf, there is no need to hunt wolves. I thought they're being protected by the Endangered Species Act prevented that.
	Most of it	Yes	Very good background information and outlining the management objectives. It is spelled out that harvest is recommended to achieve objectives in zones.	I believe there needs to be some numbers on the plan 1200-1500 wolves. With no set numbers it is open to interpretation and easy for one to say no wolf harvest as Objective A is not being met. I did not dig out anywhere where the objective is well defined or measurable.	3	Again, the objective doesn't appear to be measurable I support a health sustainable wolf population, but the plan seems to leave that open to whoever makes the decision of what is a healthy sustainable population.
		Yes	very little	I felt you spent to much time try to make everyone happy and less time trying to actually manage the resources. I saw no population goals (other than the 200 MI/WI delisting threshold). It really is not much of a plan without GOALS. You did a great job of explaining the process however it really doesn't mean anything without an end goal	1	A really didn't see a management PLAN. Just a procedural rhetoric and lot of political correctness.
Loretta	Most of it	Yes	Not putting a number on Wolf killings	I abhore trapping of any animals especially wolves. Should not be allowed. It's cruel.	8	Continue to listen to the Native tribes perspectives. Keep big hunters organizations from other states out of the Wisconsin management plan.
	Most of it	Yes	None	The wolf population count to me is way off as is the bear population count. Unless you are out in the forest or have cameras as most hunters do now you have no idea how many of these killing machines there are.	1	There needs to be a hunting season every year not based on ones feelings these are just pretty to look at. We should not have to fear walking or hunting with our dogs just because urban people are not affected. Trap some wolves and bring them to Madison and Milwaukee and see how much youn love them.
Steve Beining	All of it	Yes	Pretty good historical summary of wolves in WI	This looks like a PR puff piece for the DNR to provide cover to the WBHA to chase wolves.What about expansion of home range in Wisconsin, and other non-lethal methods of redistribution?	3	We need to ban hunting wolves with hounds. The last hunt, a group called Wildcat trespassed to land to harvest wolves with paying clients. THIS IS ORGANIZED THEFT of hunting opportunities for law abiding landowners by the WBHA.
	All of it	Yes	Let the wolf population rise.	Limiting wolf population.	2	Stop paying dog and livestock owners compensation for wolf predation. Wolves were here first and animal owners should be responsible for protecting their animals.

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
	Most of it	Yes	It's very thorough from all aspects.	I think the wide berth of no wolf hunting around the reservations is not fair. I believe they can do what they want on their property, but shouldn't be allowed to dictate what goes on public and private grounds elsewhere.	2	I feel that unfortunately the wolf is more of a political topic than a real concern for the vast majority of people in Wisconsin. Personally I would not want to recreate in an area that is thick with wolves. They should be allowed to have a hunting season for those interested and it should be much better planned out and not just cater to people hunting them with hounds. How can someone have a chance to trap one or hunt a wolf without the aid of a dog when the season gets cut short after 2 days. Wolf management has been very suspect as to how well it has actually been carried out. Put this kind of effort into elk.
Jon Peterson	Most of it	Yes	none a total bunch of bs by a bunch of tree hugger types	promise of 350 population goal a big lie		lets get real. we have to many wolves. to much dog predation pets cattle ect
Todd Collins	All of it	Yes	I like that if there is a harvest it will be unit specific tag so a quota can be taken out of unit not all out of 1	I do not like that there is no population goal - DNR appears to be playing politics here to appease the anti and wolf lovers. The wolves are affecting our dee population in the north so like bears, deer etc we need a conservative max population goal!!!	2	Not aggressive enough to reduce the population of wolves. Need to be aggressive so when they are delisted again for the umpteenth time we can reduce the population. There should be an escalator clause in if no season for 1 year, 2 years, 3 years that more wolves can be harvested.
Joanne	All of it	Yes	Your plan to protect our beautiful wolves instead of eliminating them. It is always a treasure to happen upon one, although I do understand the cattlemen's objection to the wolves killing their calves.	I admire your courage and the time it took to draft this plan despite the risk of irritating some persons.	10	
Dan Russler	Just the parts I am interested in	Yes	Likes: education, especially for people interacting with wolves like trappers, farmers, etc.; transition from population goal to a focus on negative wolf impact targeting and wolf population health; creation of multiple management zones.	I don't have any significant dislikes	10	This plan is a welcome change from the fighting over wolf issues in the past
	Just the parts I am interested in	Yes	I like that the plan focuses on making decisions based on other factors besides just science. With this issue, more science is not going to compel effective management, action, policy, and decision making. Values differences are high and uncertainty is high in with regard to wolves.	Recommendations are very general. Need to focus more on reducing population up north and increasing population in southern WI.	5	This is probably not unknown information to you...and it is also very much hearsay...but I hear many stories of people killing wolves illegally. That's probably something that should be recognized. How many wolves are killed illegally every year? A lot if I were to guess and the population is still increasing.
	Just the parts I am interested in	Yes	I like that you are keeping a hunt in the plan.	I do not like that you have eliminated a number goal. For many, many years the state had said their goal was for 336 wolves. Now we have somewhere around 1000 and we are being told we over harvested them during the last hunt.	2	I have very expensive english setters that i hunt and trial with in northern wisconsin woods. i am also a landowner and i can tell you that we have no shortage of wolves anymore. i do not run my dogs on my own hunting land as the wolf count is far too high. i have actual sightings and trail camera pics on a weekly basis at my 130 acres that abuts 440 acres of public land. regardless of public perception in urban areas we have plenty of wolves so the number doesnt need to get higher it actually could stand to get lowered a bit. i am not suggesting we eliminate wolves what i am saying is we have too many right now.
Steve L	All of it	Yes				I'm all done deer hunting. You can get your money from the animal rights group now.
Jeff Adee	All of it	Yes	I like the idea of zone specific differing plans based on wolf populations, environment, livestock predation, etc. I like that it is scientifically driven and not political. Keep the dumbXXX politicians out of wildlife management.	The biggest concern I have is the statement about larger populations in the 3 zones. I own land in zone 5 and see wolves very often (cameras). I understand no hard goals have been set which in this political climate is wise. I think wolves are good for the deer herd as long as not too many. I also have land and used to hunt in Vilas county. Wolves up there decimated the deer herd from the mid 1990's to 2010ish. Probably part of the reason so many wolves are in zone 5 now. I don't want to see the same thing happen in 5. I'm in a QDMA group of 100 land owners in Adams County and we have worked hard to build up the deer herd and grow bigger bucks. Don't let the wolves destroy that like Northern WI.	8	We have 30 cameras on 200 acres just south of Hwy 21 in Zone 5. We see wolves on camera EVERY week. This year it is 4 to 8 wolves in the same pic depending on if the Colburn pack drops down. All the land owners around us see wolves all the time. The wolf population in 5 is very high. We need a hunt to get this number lower.
Cody	Most of it	Yes	None of it	We need a specific population number.	0	Wolves are destroying our deer and elk population. It's crazy dnr can't see this.
Tye Seeley	All of it	Yes	The consideration of all stakeholders and groups in identifying and ranking priorities for the management plan. Strategies that are dynamic and flexible with changing data and circumstances.	Can't say there was anything I disliked. The plan really considers and uses collaborative data to formulate strategies and concepts .	10	I appreciate the work and time everyone has contributed to this and hope that the variety of stakeholders and organizations will buy in and support the continued growth and application of this plan for many years to come.
	Most of it	Yes	I like the part of the plan that focuses on not just getting a quota number for how many wolves are to be killed but to balance sustainability	I dislike the fact that there are not additional restrictions being put in place to stop over harvesting as well as no increasing penalties for poaching or illegally killing wolves	4	

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
	All of it	Yes	Overall, it is a very useful and well organized summary of WI wolf management, past, present, and proposed future.	Though the proposed objectives and actions are clearly laid out, I (somewhat ambivalently) wonder whether there should be more shared about alternatives considered.	8	1. The section on wolf health issues should be reviewed/edited by another experienced wolf health professional -- there is information available in WDNR wildlife health database and files that is missing, and the writing can be clarified for a general audience and made more scientifically precise. (Specifically, the sarcoptic mange section is particularly weak.) 2. Though the need for animal welfare oversight for the WI wolf population is acknowledged, I did not notice specific objectives/actions in the plan (which is important, given that many who are concerned about wolf hunting/trapping have welfare concerns). Examples include: acknowledging/addressing the frequency of injuries associated with trapping (documented in WDNR WH data); -- whether planned trapping for monitoring purposes, wolves caught in traps legally set for other species, etc. Also welfare issues related to hunting wolves with dogs. 3. Though I'd guess that interaction with federal regulations and federal/state judicial actions relevant to state wolf management is generally included in the objectives related to collaboration/partnership, should there be more specific objectives related to these sorts of interactions that have such huge effect on WI's wolf program and have been the source of so much of the heat wolf stakeholders in WI feel and generate?
	Most of it	Yes		the plan is to long	5	what is the managed number was 350 i read we have over 1,ooo
	All of it	Yes	Objectives:B & C	I thoroughly dislike that the individuals who do not live in a wolf pack/population range are skewing the overall numbers of a favorable opinion. I think Polar Bears are fantastic and should not be hunted. HOWEVER, I don't live among them or deal with them so my opinion should not factor into anyones decision.	4	I am not a fan of the zones of regulation nor the fact there is no established goal for management. I do believe getting a more accurate count of the total number of wolves in the state would be very beneficial. Have better numbers and science behind the actual number would help with the overall opinion of the DNR providing management of the population.
Rick	Most of it	Yes	The harvest total to harvest needs to be increased as there is more Wolves than the DNR realizes. It doesnt count for the wolves that are not counted in the algorithms.	Most of it, I dont believe most of it.	2	We eliminated wolves for a reason decades ago. That should not have changed.
Deborah Jackson	Just the parts I am interested in	No		Hunting, Trapping and Killing Wolves	0	Killing wolves is barbaric and short sighted. Cruelty is not needed to control the wolf population. Humanly sedate problem wolves and relocate them. Wolves are necessary to balance nature.
	All of it	Yes	Opening a season in the Midwest to harvest and control wolves over population of issues in the state.	I don't agree on most of what the DNR or members that make up the wolf management plan.	0	Wolves need to be below the original number of 350 in the state of Wisconsin.
	Most of it	Yes	The new flexibility.	The apparent disregard for the positive effect Wolf harvest of CWD Deer and Bird Flu Birds has on the ecosystem including the human population.	5	At this time of Wolf management in our State it should be considered that Wolves remain in a reintroduction phase for years to come.
Curt Wilson	All of it	Yes	I like the new approach to management, specifically: Moving away from a single numeric population goal and instead using an adaptive management process focused on balancing the three main objectives. Reducing harvest registration times and issuing zone-specific wolf harvest permits to improve the department's ability to effectively meet harvest quotas. Adding mechanisms to address localized concerns, including wolf harvest concerns near tribal reservation boundaries and focused wolf harvest in areas with a history of wolf-livestock conflict. Revising wolf management zone boundaries to better reflect current wolf distribution and habitat.	I do not have any dislikes with the plan as written.	10	I think it is important that the plan provides that DNR staff will continue to monitor wolves each year and address wolf-related conflict (consistent with current law). The DNR will continue supporting and conducting scientific research and science-based decision-making. Collaboration with other agencies, tribal nations, stakeholder groups and the public on items of mutual importance remains a department priority. Well done - stay the course. Wolves are an important part of a functioning ecosystem.
	All of it	Yes	The use of scientific data and studies	Most of the studies and data is old and out of date. The prejudices and biases of the past greatly influence the past studies making them far less reliable or valuable. Reliance on the old studies as a basis for current plans leads to inaccurate and dangerous conclusions.	0	update studies and get rid of past prejudices and biases
Joan Bell-Kaul (Lead, "Environmental, Nature/Wildlife" Group (800 members)/ MADISON AREA NEXTDOOR SITE	All of it	Yes	We felt that the most wolf-positive sections of your draft plan were those that favored Tribal attitudes toward wolves--and your concession that attitudes have become more wolf-positive over the decades...	Most of it. The WOLF is CURRENTLY on the US ENDANGERED SPECIES LIST....and your plan seems to disregard that listing as a major consideration in your myriad "studies" of wolves in WI.3	3	You have LIMITED our choices to only TWO EXTREMES--which is extremely unfair to those of us who commend the DNR for certain aspects of the report, but generally believe that the DNR's primary concern with hunting wolves is the REVENUE the LICENSES to HUNT will procure....

A (Name; optional)	B (Read plan?)	C (Resident?)	D (Likes)	E (Dislikes)	F (Rate 1-10)	G (Open comments)
	Most of it	Yes			7	
David Stanley	All of it	Yes	Being site specific on resolving conflicts.		9	
Luke Schwartz	Most of it	Yes	1. The fact that the DNR is doing "careful integration of biological and social information when considering harvest decisions." 2. Shelton (2004) suggested that the value of depredated livestock from predators is the “tip of the iceberg” concerning the actual costs that predators can impose on afflicted livestock producers.Figure 22. Number of individual farms that experienced verified losses (depredation or injury) of livestock (excluding fowl) to wolves from 1974 to 2021.	1. If wolves are listed as a federally endangered species in Wisconsin, conflict response is limited to non-lethal abatement options (unless a wolf is sick/injured, or in defense of human life), regardless of state listing status.	4	Deal with landowners, farmers, hunters, and trappers more personally with surveys or some form of communication to get a better determination on the actual real population of the gray wolves in Wisconsin. I feel the population is greatly underestimated and so are the cause and effects of having too many wolves in the state.
	Most of it	Yes	I sincerely appreciate the elements of the draft plan that emphasize education on wolves and their importance to the ecosystem, I believe this was primarily in Objective D. Misinformation and ignorance is the cause of unnecessary death of wolves and fear towards them, so I believe public education is a great positive step forwards. Additionally, I believe that focusing more on poaching and illegal hunting is essential to keeping our beautiful wolf population safe.	I personally feel that given that our wolf population status is so fragile, any hunting should be extremely closely monitored or not allowed at all. I feel that of course there are extenuating circumstances such as accidents or self defense, but deliberate hunting of wolves seems inapropriate still. Especially in the case of wovles being deemed a nuissance in commuities, I think the efforts should focus on removing the animals humanely instead of eliminating them. I think that humans need to remember that this is the animals land too, and if we are taking over their historical habitats, it is not fair to kill them out of fear or to not respect that this is shared land. Again, our wolf population is so fragile, and as it is not by any means overpopulated, I feel these beautiful creatures need to be kept as safe as possible.	4	
Ryan Robinson	Just the parts I am interested in	Yes		The lack of a population goal	1	Need to have a population goal and stick to that goal
Chad McGrath	I have not read any of the draft plan	Yes				I plan to read the entire plan, but reading the just published news release, I have a comment about one of your three main objectives: "Addressing and reducing wolf-related conflicts". There's a simple, guaranteed way to reduce such conflicts, simply abolish the bear hunting with dogs season. Certainly the small cadre of such hunters, and a fair number of hunters in general, would object and raise a ruckus, but you'd have the support of a large majority of the non-hunting public and maybe even hunters. "Hunting" bear with dogs is disgusting and elitist. And when you throw in the fact that dogs are put in harm's way, it's unconscionable.
Andrew Voigt	All of it	Yes	I think if implemented and followed trough with it would be a start to getting our wolf problem under control	we need to have a over winter wolf population of 200 animals	1	
	Just the parts I am interested in	No	Nothing- 178 pages is ridiculous for the average person to read and understand	What part of plan addresses effect on deer herds	1	
	Most of it	Yes	We are finally going to have a long overdue plan.	Departure from original population goal of 350 max.	3	
	All of it	Yes	very detailed	what is the population goal?		
	Just the parts I am interested in	Yes	The fact that they are a useful tool in ecology but need to be managed more than deer and bear as deer and bear are less invasive in killing livestock and hunting dog and pets we have a no limit on coyotes who cause the same amount of damage as a wolf and we consider them a nuisance and not a major part of the ecosystem so with that being said a sustainable number of 300 or so as recommended before sounds fair	The fact that there is so much discussion on why to keep the numbers of wolves up	3	
	Most of it	Yes	I like it that you have representation from the tribes and a cross section of interested parties participating in the plan development. Managing for a stable (and growing) wolf population is ecologically smart	N/A	9	My hope is that the wolf remains listed as an endangered species, it occupies significantly less of its historic range and those animals we have in our part of the world are precious and an important part of a healthy, diverse ecosystem
	All of it	Yes	Having a harvest.	Proposing a 29% harvest. We can harvest more, do not move the goal post of having 350 wolves. Everything after that is surplus.	2	Get on board with residents and regulate/control an appropriate harvest. If not, you will lose out on control and revenue.
	All of it	Yes	The education component and the identification of conflict areas	Many of your studies are 20 to 17 years old.	4	Most environmentalists are tired of the WDNR's reliance from hunters and trappers. In short if you are killing, say 130 wolves you only issue 130 tags. ALso I believe that WDNR underestimates poaching of wolves. Up here it is shoot, shovel and shutup.

Joe Weiss	Most of it	Yes		I'm wondering what kind of harvest can be approved in zones 1,3 and 5. According to what i read, those zones would not likely have a "wolf hunt" due to the fact that they are considered core areas for wolves. The problem with that is that I feel most residents in those areas would be more supportive of a hunt since they live among the wolves and have more contacts with them. Deer hunters in particular are concerned about excess wolves in those "core areas"	5	
Roxanne	All of it	No	I do not approve of your so called HARVEST! WTH do you think your doing just say it's a friggin KILL! So big corporation cattle pig etc big barn slottering of animals just for big money! Don't you think it's time to protect all wildlife inc fish waters etc!instead of killing everything for money in big deep pockets! This is wrong the balance of nature must be first after all WE HUMANS ARE CROSSING BOUNDERIES OF THE WILDLIFES LANDS! It's thier land NOT HUMANS! And definitely not big corporations an cement building! Nature will rebound '	Every bit of it is WRONG! Let's just start harvesting humans!	0	Harvest humans not wildlife
	Just the parts I am interested in	No	I do not like like any plan that includes ANY type of hunting of wolves.	Your hunts in the past just about decimated this keystone species. NO hints on wolves at all.	1	Redo it with NO wolf hunting. This would represent science and conservation.
Jenna Fastner	I have not read any of the draft plan	Yes	Thanks for all your hard work!	Thanks for all your hard work!	10	You guys rock!
