

## Annual tidal flooding events today, in 2030 and 2045

Note: Events per year today represent the number of times tide heights, as measured at the nearest NOAA tide gauge, exceed local water level thresholds that have been established by the National Weather Service as triggering local flood conditions. These figures are an annual average, based on the five-year period from 2009 to 2013. The number of events per year, in each of the three time frames, is an indicator of localized flooding from the most minor to the most extensive. This analysis does not assign a specific flood type or location to these flood events.
