

The grass is growing

Repair bare spots in the lawn

Caring for a lawn to keep it lush and green can require equal measures of patience and hard work. Various invaders can attack grass or contribute to its demise. One problem many homeowners face is bare spots.

Bare spots can occur for various reasons. Heavy foot traffic, grubs or other pests, fungi, pet urine, or too much or too little water can contribute to bare spots. The how-to resource The Spruce says that correcting the source of bare spots can prevent new issues, particularly if grubs or other pests are damaging the grass. Then homeowners can address existing bare areas.

Bare spots can occur for various reasons. Heavy foot traffic, grubs or other pests, fungi, pet urine, or too much or too little water can contribute to bare spots.

It is unlikely that bare spots will just fill back in on their own. Reseeding spots or using sod to fill in bare areas can help lawns look lush.

- Begin by raking and removing any dead grass and other debris from the lawn. Check to make sure that grubs or insects are not attacking the lawn. If they are, use targeted treatment options for those pests.
- Break up and aerate any soil that is compacted in the bare spot.
- Amend the soil in the bare area with loamy soil or compost to improve on the nutritional makeup and texture so that it is amenable to grass-growing. If you notice that the entire lawn is looking a little sparse, top-dressing the rest of the lawn at this point also can help improve its vitality.
- Sprinkle seeds in the bare spot (disperse seeds over the rest of the lawn if you want to over-seed and improve the thickness of the lawn). If you prefer sod, cut a portion of the sod to fit the bare area and

place on the amended soil.

- The Scotts company says to lightly water newly seeded or sodded areas daily for at least two weeks to keep the top inch of soil consistently moist but not soggy. Gradually water more as the seedlings develop and the grass begins to fill in. Deep water at least once or twice a week after the new grass reaches mowing height.
- The grass should grow slightly longer than the rest of the lawn, and wait until the color of the patched area begins to blend in with the rest of the lawn before mowing. This could take a few weeks, and the area should be avoided until then.

Eventually, and with treatment, bare spots can be remedied and become indistinguishable from other areas of the lawn.

The dangers of mowing too low

Spring marks the return of many things. Trees and flowers begin to bloom again in spring, while warmer temperatures are welcomed back with open arms. Grass also begins to grow again in the spring. That means it's not too long before homeowners have to dust off their lawn mowers and get to work. Those who don't necessarily enjoy mowing the lawn may be tempted to cut their grass very low, as doing so can mean longer intervals between mowing sessions. However, mowing grass too low can have a very adverse effect on a lawn.

Mowing grass too low can have a very adverse effect on a lawn

- Cutting too low can injure the grass. Cutting grass too low can injure the grass, creating what's essentially a domino effect of problems to come. Injured grass will focus on its recovery efforts, thereby making it vulnerable to other issues.

- Cutting too low promotes weed growth. Injured grass is vulnerable to invaders, including weeds and insects. Weeds and insects can attack grass as it recovers from injury, and before homeowners know it, their lawns are overcome with a host of problems.

- Cutting too low allows crabgrass to thrive. Crabgrass needs ample sunlight to grow. By cutting grass too low, homeowners may unknowingly be promoting crabgrass growth. Crabgrass is unsightly and can rob surrounding grass of the moisture it needs to grow. So lawns cut too low may not only lose their lush appeal thanks to the unattractive appearance of crabgrass, but also because areas surrounding the crabgrass patches might turn brown due to lack of water.

- Cutting too low can stress the grass. Cutting too low also makes lawns vulnerable to summer heat. Without blades tall enough to block some of the summer sun, grass can quickly succumb to summer heat, leading to dried out, discolored lawns.
