

INNOVATIVE TREATMENT

options for tumors that affect the liver

Several factors can put a person at an increased risk of developing liver cancer. They include having hepatitis B or C, having cirrhosis, heavy alcohol use, tobacco use, and some inherited disorders.

The **WVU Cancer Institute** has a comprehensive team of experts in benign and malignant tumors of the liver. From the first visit, they create an individualized treatment plan that combines innovative medical, radiation, and surgical therapies tailored to the patient's needs.

For those who require surgery, our board-certified, fellowship-trained oncologists offer industry-leading minimally invasive techniques that require smaller incisions that result in less pain and faster recovery.

If you notice any symptoms of liver cancer, such as a hard lump below the right side of your rib cage, discomfort in your upper right abdomen, jaundice, or easy bruising or bleeding, talk to your doctor right away.
